The development of the artists of this period was much helped by the growing demand for statues of the victorious athletes, which were frequently dedicated at Olympia and the seats of the great games. The influence of the palaestra, or wrestling school, on Greek art has been often discussed and in certain directions can scarcely be overestimated. Here the artist was enabled to see the perfectly developed human form to the best advantage, while the whole people became familiar with living beauty. The sculptor was furnished at once with the best models, and intelligent and appreciative judges of his work. To this period belong Calamis, famous for his Attic grace; Pythagoras of Rhegium, whose statues of athletes were especially celebrated; and above all Myron, whose "Discobolus" (q.v.) shows at once the skill and daring of the artist, who chose to fix the athlete at the height of his endeavor, and also the deficient grasp of the real limits of his material, which is not adapted for the permanent rendering of a transitory condition. Lastly may be mentioned the charming bronze, possibly a Greek original, now in the Palazzo dei Conservatori in Rome. It represents a boy drawing a thorn from his foot, and, as has been well said by Tarbell, "might be regarded as an epitome of the artistic spirit and capacity of the age."

(b) *Age of Phidias*.—In passing to the age of Phidias we come at once into the full splendor of Greek art in its noblest form. It was the time when great works were planned and executed, for the most part in honor of the gods, for the great buildings are temples, and the great statues are their adornment. Thus, at Athens we have the whole series of buildings on the Acropolis, the Parthenon, the Propylæa, the Erechtheum, and the little temple of Athene Nike (see NIKE APTEOS), and in the lower city the so-called Theseum, still the most perfectly preserved of the ancient temples; at Rhamnus the temple of Nemesis, with the statue of Agoracritus, which some attributed to Phidias; at Sunium the temple of Poseidon; at Eleusis the great hall of the mysteries, the work of Ictinus,

the architect of the Parthenon; at Argos the new temple of Hera, with its chryselephantine statue of the goddess; Polyclitus; and the temple of Apollo at Phigaleia, another work of Ictinus. (See PHICALIA: PHIGALIAN MARBLES.) Among the artists, besides the great names of Phidias of Athens and Polyclitus (q.v.) of Argos, are Agoracritus (q.v.) of Paros, the favorite pupil of Phidias; Alcámenes (q.v.), the sculptor of the famous "Aphrodite in the Gardens"; Cresilas (q.v.) of Cydonia, in Crete, to whom is attributed with great probability the original of the portrait busts of Pericles in the Vatican and the British Museum; and Pæonios of Mende, whose flying "Nike" (Victory) at Olympia shows the solution of a problem which had long perplexed the Greek artists.

Through the best work of this period runs the spirit of self-restraint; the work is not for the display of technical skill, though every line shows the sureness of the artist's touch, but for the embodiment of a high ideal. In this nobility of conception lies the great superiority of this period over the ages that follow. Less full of grace and variety of expression, the works of the latter half of the fifth century show a loftier moral tone and greater elevation of feeling. Nor is this wholly confined to the great works. The delicacy and simplicity of Greek art are seen even in the work of artisans, such as carved the great majority of the Attic tombstones. The technique of these monuments is often faulty, but the good taste is unerring. The deceased is represented as in daily life, alone or in the family circle; there is no direct suggestion of the grave, though in some of the later monuments of this class there seems to be a suggestion of melancholy in the attitude and expression; notably is this the case in a stone of the fourth century, in the style of Scopas, which seems to commemorate a young man mourned by his father and a little slave. The questions of interpretation to which this class of monuments has given rise are too numerous and intricate to be here discussed; nor is their settlement necessary to the appreciation of the merit of one of the most interesting and attractive products of Greek art.

(c) *Age of Praxiteles and Scopas*.—With the fourth century we pass from the era of great state undertakings and enter the field of the individual. Not only do the personal characteristics of the artists seem to become more marked, but the works are more frequently the result of private munificence. The style of the sculpture shows the continuance of the two great schools of Athens and Argos, Praxiteles (q.v.) being the chief representative of the former and Scopas (q.v.) of the latter; but the points of divergence are not so strongly marked, and the differences in many cases may quite as well be assigned to the personality of the artist as to the tendency of the school. In the choice of subjects and their treatment the same individuality is prominent. The earlier group of artists had idealized even their portraits, and in their statues of divinities, whether gods or heroes, had given what seemed like a final form to the loftiest aspirations of the popular religion. The religious beliefs of the fourth century were not so deeply rooted, nor was the general ethical standard so high as in the previous period; moreover, it was needful for the artist to seek a fresh point of view if he was to be other than a mere imitator, and this was found in a presen-

tation of those traits which were more directly individual. This is especially marked in portraiture, which in the work of Demetrius (q.v.) of Alopeke in Attica became realistic in every detail, and the art of Silanion, famous for his statues of living men, seems to represent the same tendency as does Parrhasius in painting—the depiction of men as they lived. This tendency to individualize influenced also the statues of the gods, which are shown by a Scopas or a Praxiteles less in their ideal perfection than in momentary and varying moods. They are more like men, and it is the desire of the artist to bring out the finer distinctions of personality which entered into the conception of the gods. This leads to an increased effort to render expression and personality in the features; in this Scopas far outstripped his predecessors. The mutilated heads from Tegea and the good copies of the "Meleager" show how, by concentrating his effort on certain parts of the face, the most intense energy and emotion could be brought home to the spectator without any painful distortion of the features. This endeavor to convey certain impressions to the spectator leads the artist to greater care in the finer points of rendering the texture of the skin, the play of the muscles, the folds and quality of the drapery; the "Hermes" of Praxiteles is an example of the mastery of technique attained by a great artist. In all this tendency to realism, and sometimes towards sentimentalism, the high standards of the past and the Greek worship of moderation, which had not yet passed away, kept the greater artists within bounds, and we seldom find the extremes which became too common in a later age.

In architecture this period sees the development of the great stone theatres, such as that designed by the younger Polyclitus for the sanctuary of Asclepius at Epidaurus (q.v.), and the theatre of Dionysus at Athens, which was probably rebuilt near the end of the period by the statesman Lycurgus. (See DIONYSUS, THEATRE OR.) Other buildings on which the great sculptors labored were the temple of Asclepius at Epidaurus, with a cult statue made by Thrasymedes of Paos and acroteria and pediments designed by Timotheus; the temple of Athene Alea at Tegea, built and supplied with pediment sculptures by Scopas; and, above all, the Mausoleum (q.v.), the funeral monument of Mausolus, Satrap of Caria, which was decorated with a multitude of reliefs and statues by the four artists, Praxiteles, Scopas, Timotheus, and Bryaxis. The rebuilding of the great temple of Ephesus also furnished Scopas an opportunity to display his skill on one of the new sculptured bases for the columns. One base of this temple is now in the British Museum. The scene has never been satisfactorily explained, though it is commonly referred to the story of Alcestis (see ADMETUS); but its style shows close affinity to that of Scopas, though it is scarcely probable that it is a work of his chisel. Among the other works of this period attention should be called to the beautiful "Demeter" from Cnidos, now in the British Museum, which has been claimed for both Praxiteles and Scopas, and the famous "Niobe" (q.v.) group at Florence, a collection of Roman copies of a lost Greek original of this time. Pliny tells us that there was a difference of opinion as to whether a certain "Niobe" group was by Scopas or Praxiteles; but if these statues go back to

the original which Pliny had in mind, which is doubtful, it seems likely that Scopas was its author.

III. The Hellenistic Period (323-146 B.C.). In entering upon this age we pass into a new phase of Greek art. The conquests of Alexander had opened the East to Greek rulers, Greek thought, Greek life, and had at the same time abolished the old supremacy of the cities of Greece. It is true that Athens still preserves a shadow of her former primacy; but the chief seats of art are now in Asia or Egypt, and the great schools which can be distinguished are those of Alexandria, Pergamus, and Rhodes. This change in the centres, however, is due to a still greater change in the artistic attitude and tradition. The great works of Greece had been completed, and the new Greek centres were now the scene of activity. These new works, however, were brought into contrast with the colossal products of the earlier Oriental civilizations, and, moreover, they were under the patronage of wealthy kings, anxious to vie with their predecessors. The earlier Greeks had not in general represented contemporary scenes, unless in an idealized form; but now the minds of men were filled with the wonderful conquests of Alexander and the fierce wars of his successors. Hence a tendency appears to commemorate the deeds of the present in colossal monuments, such as the great battle groups and the altar of Attalus and Eumenes at Pergamus (q.v.), where in fact this tendency seems to have found its most striking expression. (See ALTAR.) There is also another side to this substitution of the great monarchies for the free cities. The citizen, enriched by the new wealth and retiring from public affairs, seeks to beautify his house and gardens. More than ever art is at the service of the individual, and the taste of the patron determined the subject of the artist. The bustle and stir of the new age, with its nervous haste and constant change, seems to have produced, as so often, a sentimental reaction in favor of the good old times of innocence and the desire to retreat to nature from the great cities. The bucolic poetry is one expression of this sentiment, and in art, especially that associated with Alexandria, we find a further reflection of this tendency. Genre groups, especially those representing children or country life, are common, and a whole group of monuments, the so-called "Hellenistic reliefs," intended for insertion in walls in place of paintings, brings before us a number of these scenes, worked out with the most painstaking devotion to details, especially in the rendering of the accessories and background. (Consult Schreiber, *Brunnen Reliefs des Palazzo Grimani*, Leipzig, 1888, and *Hellenistische Reliefbilder*, ib., 1889.) For, while for the earlier artist the human figure had been of chief interest, and the background had been barely indicated or even entirely neglected, now in many cases the human figure is merely an incident. In response apparently to popular demand, art lends itself to themes hitherto but little treated; the trivial, fantastic, comic, and licentious all enter freely into the lesser products of this age. Not that all this art is to be condemned. Portraiture attained high excellence, and many of the lesser works, especially the beautiful terra-cotta figurines, show a delicacy and refinement of sentiment and a naturalness of conception which render them altogether pleasing. The technical

skill or the artists is at its height, and their careful studies of anatomy bear fruit in astonishing accuracy in the rendering of details, which compels admiration even when their sensationalism calls for censure.

At the beginning of this period stands Lysippus of Sicyon (q.v.), the last of the great artists of the mother country whose personality is known to us, and who was regarded by his pupils and contemporaries as the culmination of artistic history. It is necessary to call attention here to his peculiar position as an artist who seems to have combined much of the Attic grace in conception with the careful attention to proportion, and to the technical side of bronze casting, which belonged to a successor of Polyclitus as the leader of the Peloponnesian school. His influence was enormous, and much in Hellenistic art is little else than a modification or imitation of his peculiarities. The "Apoxomenos" of the Vatican has long been the starting point for the study of his art; but a most important addition to our sources has been made in the marble group dedicated by Daochus the Thessalian, representing his ancestors, recently discovered at Delphi, which can scarcely be anything else than a marble copy of a bronze original by Lysippus at Pharsalia. (Consult Homolle, *Bulletin de correspondance hellénique*, xxiii, Paris, 1899.) Other important works of this period are the "Nike of Samothrace," in the Louvre, which shows plainly the survival of the Attic school; the bronze figure of a seated boxer in Rome, where brutal realism is joined with a masterly appreciation of pose and technique; and a number of ideal portraits, in which the artist endeavors to give his conception of the character of the man, like the portraits of Homer, Anacreon, and many anonymous heads, which have often been most arbitrarily named. In Athens there are indications of an endeavor to return to the types of the fifth century, and towards the end of the period a pronounced archaistic imitation of the very early works with their stiff draperies and mincing gait appears. The art of Alexandria seems to have been largely decorative, and that school produced no great artists.

At Pergamus the great victories of Attalus I (241-197 B.C.) were commemorated in a series of colossal statues, of which the "Dying Gaul" of the Capitoline Museum, and the noble group of the "Gaul and his Wife" in the Museo Ludovisi, are the best examples, though there are smaller copies of other figures, which seem to have been replicas of a series at Athens, in many European museums. Eumenes II (197-159 B.C.), in his erection of the great altar (see PERGAMUS), led the Pergamene art to one of its most characteristic works. The enormous extent of surface (about 400 feet long and 7½ high), and the tumultuous character which must necessarily belong to any representation of the "Battle of the Gods and Giants," gave the artists full scope for the display of variety in imagination and technical skill in composition and execution. Though devoid of the calm simplicity desirable in monumental sculpture and characteristic of the best Greek work, the tremendous energy and the boldness of conception make the altar frieze one of the notable monuments of the world. The tendencies of the Pergamene school seem to have been continued at Rhodes, where early in the Roman Period, or possibly earlier, was produced the famous La-

ocoön (q.v.) group, a work in which the realistic representation of physical suffering reaches its highest point—a group that has been extravagantly praised and unstintingly condemned. The subject is unfitted for artistic use, but the artists have treated it with a wonderful command of technique.

IV. The Roman Period (136 B.C.-330 A.D.). This period may be briefly dismissed, as it is not in general an age of artistic originality, except in the works of Roman architecture and the marvelous accuracy of Roman portraiture. Greek art was known to the Romans through the wholesale plundering of the eastern world for the decoration of Roman temples, palaces, and villas. It is the age of copies, when many of the works which fill our museums were executed—some of them by direct transference of the original through the aid of accurate measurements, as is shown by the *punctilli* still existing on many statues which were left by the sculptor to aid him in his work. Many more are free imitations and reproductions, such as mark the works of the school of Pasiteles, who sought his models in the early fifth century, and whose pupil Stephanus produced a nude youth which is obviously inspired by the Argive school associated with the name of Ageladas, and which became so popular that we find it combined with other figures, as in the group of "Orestes and Electra" at Naples. Another example is the "Venus Genetrix" of Arcesilaus, which is almost certainly a reproduction of the "Aphrodite in the Gardens" of Alcamenes. So, too, the "Venus de Medici" is a probably debased and sensualized version of the "Cnidian Aphrodite" of Praxiteles.

PAINTING

It was in Greece that ancient painting, like other forms of art, reached its highest development, in the fifth and fourth centuries B.C. Not that skillful fresco painting had not been common earlier. The fragments from Tiryns, and still more the splendid decorations from Cnossus in Crete, show that the Mycenaean age (about 1500-1200 B.C.) possessed much of the technical skill of the Egyptian artist and far greater freedom and originality. With the fall, however, of Aegean civilization, we lose all examples of painting properly so called, though the vases enable us to trace the progress of drawing, and the statues and remains of buildings show how extensively color was employed as an auxiliary to the sister arts of sculpture and architecture. Indeed, this use continued throughout the classical period. There are traditions of Corinthian and Sicyonian painters, who drew outlines on walls or whitened tablets of clay by the aid of shadows, and indicated details by a few lines, but used only one color. There are also records of paintings which would carry back the art into the eighth century. Eumares of Athens is said to have distinguished the sexes, probably by the use of different colors, in distinction from the early monochrome artists, and Cimon of Cleonæ to have introduced correct drawing in profile, probably of the eye, and variety in the direction of the glance. These artists, who have some claim to be considered real persons, must have lived about the middle or end of the sixth century.

Fifth Century. In the great outburst of Greek genius which followed the Persian wars,

and which centred in Athens, painting rose to an equality with sculpture. This advance is directly connected with Polygnotus (q.v.) of Thasos, whom Theophrastus describes as the discoverer of the art. His works were large scenes covering the walls of public buildings, such as the "Painted Portico" at Athens and the "Lesche of the Cnidiars" at Delphi. In general his subjects were mythological, but his contemporaries and fellow workers Micon and Panæus, brother of Phidias, seem to have treated also events in recent history. At this time painting, like sculpture, is found in the service of the state for the decoration of public buildings and temples. As to the style of these artists, it was purely decorative, without perspective and treatment of light and shade. The figures were on different levels, and there was some indication of broken ground. Polygnotus' palette, we are told, contained only black, white, yellow, and red, with which he succeeded, however, in producing a variety of shades. In spite of the flat color Polygnotus was famed for his fine composition, dignity, and perfection of characterization, and severe yet expressive drawing.

The most important advance was made shortly after by the scene painter Agatharchus of Samos, who discovered some of the applications of perspective and shading. His book on his new discoveries led the philosophers Anaxagoras and Democritus to serious investigation of the laws of perspective. The new methods were transferred from the large surfaces to panels by Apollodorus of Athens, and thus within a century the way was fairly cleared for a growth of the art beyond all that the Egyptians had achieved in 3000 years. The school which now arose, about the end of the fifth century, is commonly called the Asiatic or Ionic school, and is best represented by the two great rivals Zeuxis (q.v.) of Heraclea and Parrhasius (q.v.) of Ephesus. The former was famed for his truthful and even deceptive reproduction of nature, and the latter for his delicate drawing, but both must have been masters of chiaroscuro, if any reliance can be placed in the comments that have survived. To this school also belonged Timanthes of Cythnos, famous for the variety and depth of facial expression.

Fourth Century. In the early fourth century B.C. the centre of painting seems to have been at Sicyon, where Timanthes lived late in life. Its founder was Eupompus, who was succeeded by Pamphilus (q.v.) and Melanthius, who laid great stress on systematic instruction, especially in drawing, which was introduced into the schools of the city. A pupil of the school, Pausias, perfected the encaustic painting (q.v.), which, however, did not drive out the old tempera (q.v.) process. How far the school had advanced in handling of light and shade may be judged from the praise given the black ox of Pausias. In the second quarter of the fourth century a school of Theban and Attic artists arose who seem to have given especial attention to pathos, and whose favorite subjects were battle pieces. The tendency away from the severe and lofty, which is found in sculpture, also manifested itself in painting, and many of these artists are also credited with genre scenes, flower pieces, and trifling subjects. In contrast to this tendency Nicias of Athens, who seems to have survived Alexander, insisted on the importance of great subjects. It seems very prob-

able that the release of Io by Hermes, in the "House of Livia" on the Palatine Hill in Rome, is a copy of one of his works. The highest technical skill and artistic merit were claimed by the ancients for the two great masters of the younger Ionian school, Apelles of Ephesus and Protogenes of Cagnus—the former famed for his grace, the latter for his painstaking, which in the opinion of some led him to weaken the spontaneity of his pictures. The paintings in the Etruscan tombs, though undoubtedly influenced by Greek models, are far too rude to serve as standards of reconstruction, and most of them are not later than the middle of the fourth century. Of more value is a sarcophagus from Corneto, now in Florence, on which is painted in tempera a wonderfully vigorous battle of the Greeks and Amazons, probably the work of an Etruscan artist of the early third century B.C., but evidently a close copy of a Greek model, which must have ranked in beauty and power little below the works of the best period.

Hellenistic Period. This age shows in painting, as in sculpture, two tendencies. One was towards the rendering of mythical scenes, which afforded opportunity for pathetic or tragic expression, as in the famous picture of Timomachus of Byzantium, representing Medea meditating the slaughter of her children, of which some reminiscences seem preserved in Pompeian paintings. On the other hand, many painters seem to have preferred lighter themes. They also rendered the landscape with pleasure, and even experimented with effects of artificial light, as in a painting of a boy blowing a fire. Often the choice is low, and triviality, not to say sensuality, is a prominent characteristic. The walls of Pompeii furnish abundant examples of these tendencies. It is only from this late period of Hellenistic art that many works have come down to us. In Rome are the "Aldobrandini Marriage," a series of landscapes illustrating the *Odyssey*, and a rather poor series of panels representing victims of unnatural love, while the baths, palaces, and tombs have from time to time yielded others, many of which have now perished. Among these the first place must be given to those from the Farnesina Gardens, some of which recall the best Athenian lecythi of the fourth century. The largest number are, however, from the buried cities of Pompeii and Herculaneum, preserved, for the most part, in the Museum of Naples. Of especial value are the encaustic portraits of the second century A.D., discovered in the Fayum, Egypt, where they were used to cover the faces of mummies. The Metropolitan Museum, New York, possesses a series of frescoes from Boscoreale, near Pompeii, and a very important collection of portraits from the Fayum.

Roman Painting. A mere appendix to the Greek, Roman painting developed little originality. It is decorative in character and will be found treated under ROMAN ART.

THE DECORATIVE ARTS

The artistic instinct of the Greeks pervaded every phase of their life to an extent inconceivable to a more utilitarian age. The spirit of the artist inspired also the handicraftsman, who brought articles of daily use and adornment in which the beautiful and the useful were indissolubly united, and which were in them-

selves works of art. To discuss the many branches of applied art in which the Greeks excelled is not within the scope of the present article. A general survey will be found in the article DECORATIVE ART, and a more extensive treatment under such titles as COSTUME, FURNITURE, INTERIOR DECORATION, JEWELRY, PLATE, GEMS, CAMÉO RING, EARRING, ETC. Attention is given to Greek ceramics in the article POTTERY and particularly VASE, in which both the graceful forms as well as the unsurpassed decoration of Greek vases (usually called "Vase Painting") are noticed in some detail.

BIBLIOGRAPHY AND SOURCES

The sources of our knowledge of Greek art are twofold—the extant remains and the literary tradition. The monuments are, of course, the basis of all discussion of questions of style and technique; but their value is limited in the field of architecture by the ruined condition to which most ancient buildings have been reduced; while in sculpture the vast majority of the statues which fill the museums are copies of a later age, from which the style of the great masters must be extracted by careful and extensive comparisons, in which the influence of subjective criticism must necessarily be prominent. For the history of Greek art it is necessary to turn to the documentary evidence as preserved in inscriptions, which include the signatures of artists and the records of the erection of notable buildings, or in the writings of the ancients; and as these are in general late compilations, it follows that precision is sadly lacking on many points, and that our knowledge of the individual artists rests more often on skillful combinations than on positive evidence. One reason for this is the attitude of the Greeks themselves towards artists during the fifth and fourth centuries B.C. In general, while the work was highly valued, the artist was an object of little interest. This was due to the low esteem in which the artisan was held (little or no distinction was made between artisan and artist), as one whose confining labor hindered him from serving the state or cultivating his body or mind. Consequently, when in the third century B.C. interest in the personality of the great artists of the past arose, information was not always attainable.

The earliest treatises on art are naturally technical rather than historical. The Argive sculptor Polyclitus in his *Canon* discussed the correct proportions of the human form, and Ictinus, the architect of the Parthenon, wrote a technical description of his masterpiece. Not until the early part of the third century does a history of the earlier art appear. Xenocrates, an artist of the Sicilian school, seems to have prepared a critical study of the great sculptors from the time of Phidias, in which he aimed to show that perfection had been reached only with Lysippus of Sicyon. A chronological arrangement was probably no part of his scheme, and it is not certain that he gave any account of the predecessors of Phidias, whom he chose to regard as the real founder of plastic art. At Pergamus the history of Greek art and the chronology and characteristics of the artists were worked out by such writers as Antigonus of Carystus and Polemon, often from very uncertain evidence and with not a little freedom of combination. The writings of these men have

perished, but their views have been preserved in the *Natural History* of Pliny the Elder and the *Description of Greece* by the traveler Pausanias, as well as by later lexicographers and scholiasts. The testimony of the classical writers to the history of art has been collected by J. Overbeck, *Antike Schriftquellen zur Geschichte der bildenden Künste bei den Griechen* (Leipzig, 1868), and by H. Stuart Jones, *Select Passages from Ancient Writers Illustrative of the History of Greek Sculpture* (London, 1895), containing also an English translation and commentary. There is an extensive literature dealing with the historical studies of the ancients and the sources of the extant writers, which is conveniently summarized in Jex-Blake and Sellars, *The Elder Pliny's Chapters on the History of Art* (London, 1896). This book contains the text of Pliny, so far as it bears on the history of art, with translation and commentary, and introduction discussing the sources, and a good bibliography. The signatures of the Greek artists were collected by Loewy, *Inscripfen griechischer Bildhauer* (Leipzig, 1885); but this work needs supplementing, as many more are now known. For architecture, the only surviving literary source is the work of Vitruvius (q.v.), a practical architect of the time of Augustus, who drew from lost Greek writers, whom he sometimes misunderstood and mistranslated.

General Works. Although the importance of both monumental and literary evidence has always been recognized, it is only in recent years that systematic endeavors have been made to correlate these sources and, by a comparison of extant works with the descriptions of the literature, to determine with approximate certainty the characteristics of the various schools and, within certain limits, the artists of the originals from which our copies were made. The modern histories begin with the epoch-making work of Winckelmann (q.v.), in which the periods of rise and decline in Greek art were first clearly defined. This and other works published before the middle of the nineteenth century have now chiefly an historical importance, as the discoveries of recent years have vastly increased the material and revolutionized many of the earlier views. For the lives of the artists, the fundamental works are Brunn's *Geschichte der griechischen Künstler* (Brunswick; 2d ed., Stuttgart, 1889), and Thieme and Becker, *Allgemeines Lexikon der Bildenden Künstler* (9 vols., Leipzig, 1913). The best brief work, perhaps, is Tarbell's *History of Greek Art* (New York, 1896). A standard work of the old school is Overbeck's *Geschichte der griechischen Plastik* (4th ed., Leipzig, 1893-94), which suffers chiefly from the separation of the monuments and the literature. Probably the best history at present is Collignon's *Histoire de la sculpture grecque* (Paris, 1892-97). Other good works are: Reber, *History of Ancient Art*, trans. by J. T. Clark (New York, 1882); Tarbell, *History of Greek Art* (ib., 1896); E. A. Gardner, *Handbook of Greek Art* (ib., 1905); Walters, *The Art of the Greeks* (ib., 1906); Springer, *Handbuch der Kunstgeschichte: das Alterthum*, 6th ed. by Michaelis (Leipzig, 1900); P. Gardner, *The Principles of Greek Art* (New York, 1914); Powers, *The Message of Greek Art* (ib., 1913). The great work of Perrot and Chipiez, *Histoire de l'art dans l'antiquité* (Paris, 1881-1903), has reached in vol. vii only the early archaic period and the development of the temple in

Greek architecture. ARCHITECTURE: Durm, *Handbuch der Architektur; Die Baukunst der Griechen* (Darmstadt, 1892); Penrose, *Principles of Athenian Architecture* (2d ed., London, 1888); Choisy, *Histoire de l'architecture*, vol. i (Paris, 1899), which is important from the strictly technical side; Marquand, *Greek Architecture* (New York, 1909). SCULPTURE: Friedrichs and Wolters, *Bausteine zur Geschichte der griechisch-römischen Plastik* (Berlin, 1885); Furtwängler-Urlichs-Taylor, *Greek and Roman Sculpture* (London, 1914); Waldstein, *Essays on the Art of Pheidias* (1885); E. A. Gardner, *Six Greek Sculptors* (London, 1910); id., *Handbook of Greek Sculpture* (New York, 1911); Waldstein, *Greek Sculpture and Modern Art* (Cambridge, 1914); Von Mach, *Handbook of Greek and Roman Sculpture* (Boston, 1905); Goodyear, *Greek Refinements* (New Haven, 1912). Of great value to the student are the catalogues of some of the principal collections, such as Friedrichs and Wolters, *Gipsabgüsse antiker Bildwerke des Berliner Museums* (Berlin, 1885); the *Catalogue of the Sculptures in the British Museum* (London, 1892); Helbig's *Führer durch die öffentlichen Sammlungen klassischer Alterthümer in Rom* (Leipzig, 1899; new ed., 1914); Furtwängler, *Beschreibung der Glyptothek König Ludwig's I zu München* (Munich, 1900), and *Ein Hundert Tafeln nach den Bildwerken der kgl. Glyptothek zu München* (ib., 1903). Cheap collections of excellent illustrations are Sauerlandt, *Griechische Bildwerke* (Düsseldorf, 1907); Delbrück, *Antike Porträts* (Bonn, 1912); Baumgarten-Poland-Wagner, *Die Hellenische Kultur* (3d ed., Leipzig, 1913), and *Die Hellenistisch-Römische Kultur* (ib., 1913). The new school, which seeks to determine the characteristics of the great schools of antiquity and assign the surviving works to definite artists, is best studied in Furtwängler's *Masterpieces of Greek Sculpture*, trans. by E. Sellars (London, 1895), in which the known works of Phidias, Polyclitus, Praxiteles, and others are used with great keenness and brilliancy as a basis for attributing to these artists many other statues in which the same characteristics appear. Under the title *Denkmäler der griechischen und römischen Skulptur*, the firm of F. Bruchmann in Munich is publishing large, permanent photographs of the most important remains of ancient sculpture; the more recent numbers are accompanied by a valuable descriptive text by competent German scholars. PAINTING: the best work on Greek painting is the admirable series of reproductions (some in color) with scholarly text now in course of publication, by Paul Herrmann, *Denkmäler der Malerei des Altertums* (Munich, 1906-). For the history, see Woltmann and Woermann, *History of Painting*, vol. i (Leipzig, 1878; Eng. trans., New York, 1901); Girard, *La peinture antique* (Paris, 1895). Other interesting works are: Pottier, *La peinture industrielle chez les Grecs* (ib., 1898); Laurie, *Greek and Roman Methods of Painting* (Cambridge, 1910).

GREEK CHURCH, THE. In the widest sense of the term, all those Christians following the Greek or Greco-Slavonic rite. They agree in receiving the first seven general councils of the Catholic church, but reject the supremacy of the Roman Pontiff and all the later councils of the Western church. The Greek church calls itself "the Holy Orthodox Catholic and Apostolic Church." It includes three important branches

—the church within the Ottoman Empire, subject directly to the Patriarch of Constantinople; the church in the Kingdom of Greece, ruled by the Holy Synod of Greece; and the Russo-Greek church, in the Russian Empire, ruled by the Russian Holy Synod under the authority of the Czar. There are, besides, the churches of Rumania and Servia, which no longer recognize the authority of the Patriarch of Constantinople, and the Bulgarian church, which has been independent since the Berlin Congress in 1878, and several smaller independent churches: Cyprus, Alexandria, Sinai, Montenegro, Antioch, and Jerusalem.

The tendency to make ecclesiastical dignity and authority follow political importance was noted early in the East. As a result of this, the see of Jerusalem was at first only an ordinary bishopric under the Metropolitan of Cæsarea. Slight differences between Oriental and Occidental churches manifested themselves even during the first century. The Greek language was used in the religious services of the East, the Latin in the West. Certain unimportant liturgical differences arose, though the unity of faith was not affected thereby. In the West the Pope gradually became the sole Patriarch: in the East there were at first three patriarchs—those of Constantinople, Antioch, and Alexandria—and in 451 Jerusalem also became a patriarchate. The history of the Greek church as a separate body dates from the commencement of the efforts on the part of the church of Constantinople to establish for itself a distinct jurisdiction and an independent primacy in the eastern division of the Empire. The ecclesiastical preëminence of Constantinople followed upon the political distinction to which it rose as the seat of the Imperial government. Originally Byzantium was but a simple episcopal see, subject to the Metropolitan of Heraclea. The rank of the see rose with the fortunes of the city, but there are many early instances in which questions arising within the district which afterward became the patriarchate of Constantinople, questions affecting the Bishop himself, and even his relations to other patriarchs of the Oriental church, were referred to the bishops of Rome. It was not long, however, before the political rivalries of East and West revealed a certain lack of harmony between Rome and Constantinople. The Council of Chalcedon (451) passed a decree which confirmed the precedence of Constantinople, and assigned to its Patriarch not only an extensive range of jurisdiction, but grounded these ecclesiastical privileges, in the case of the new as in that of the old Rome, upon the political precedence to which both had risen. The Roman legates protested against this canon. The consequence was a serious misunderstanding between the two churches, which was widened by certain doctrinal differences in some of the christological controversies. This culminated some 30 years later when the Emperor Zeno, in 482, issued the *Henoticon*, a decree meant to reconcile the Monophysites (q.v.). This decree carefully avoided mention of the formula of the two natures in Christ, which had been adopted at the Council of Chalcedon. The *Henoticon* was accepted by the patriarchs of Constantinople and Alexandria, who, as a consequence, were, with the Emperor, excommunicated by Pope Felix III in 484. This is the first Eastern schism, and the Eastern and Western churches were actually separated for a period of about 35 years. The

terms upon which the excommunication was withdrawn by Pope Hormisdas in 519 involved a complete acknowledgment of the exclusive supremacy of the Roman Pontiff. The Council in Trullo (see QUINTSEXT), held in 592, caused a renewal of the misunderstanding by various decrees condemning Western ecclesiastical practices. The Patriarch, John the Faster, claimed the title of Ecumenical Patriarch, i.e., Bishop of the Universal Church, towards the end of the sixth century. His claim was repudiated by Gregory the Great (see GREGORY I), but the pretension was not entirely abandoned. Finally the foundation of the Western Empire, in close relations with the Pope, completed political separation, and the rivalry of Patriarch and Pope tended to the separation of the churches.

Photius (q.v.), an energetic and learned man, was raised to the patriarchate by the Emperor while still a layman; he was deposed by Pope Nicholas I in 863. He appealed to the differences between the churches, especially the doctrine of the procession of the Holy Ghost, and the practice of celibacy among the Latin clergy; and, finding supporters, actual schism ensued. Under the next Emperor, Basil, this schism was healed, and though later Photius once more became Patriarch, he was finally banished in 886 by the Emperor Leo the Philosopher. It was almost two centuries before there was another open rupture, though there always remained some insecurity in the relations between Pope and Patriarch. Michael Cerularius addressed a letter to the bishops of Apulia, seeking closer union with the Western church, but mentioning the obstacles, such as the use of unleavened bread at the eucharist and the doctrine of the procession of the Holy Ghost. The letter fell into the hands of Pope Leo IX, who replied with scorn and, after further acrimonious messages, with formal excommunication (July 16, 1054). At last the breach between the two churches was complete. Since then the schism has continued, although many attempts have been made to repair it. In 1098 at a synod held at Bari, by invitation of Pope Urban II, the famous Anselm, Archbishop of Canterbury, stated the doctrine of the procession of the Holy Ghost in the hope of winning back the Greeks, but without effect. The presence of the Crusaders in the East might have been expected to renew sympathy between the churches; but the rapacity and cruelty manifested in the establishment of the Latin Empire at Constantinople widened the breach between East and West. The Greek emperors, partly perhaps to get help from the West against the advancing Moslems, endeavored to bring about Church union. Michael Palæologus (see PALÆOLOGUS) sent ambassadors to the Council of Lyons in 1274, who formally abjured the schism. The bishops refused to ratify the union thus brought about. John Palæologus a century and a half later brought about a reopening of negotiations for union. The Patriarch of Constantinople and a number of Church dignitaries from the East attended the Council of Ferrara-Florence (q.v.), held in 1438-39. All the doctrinal points of difference were discussed, and the Greek churchmen present, with the single exception of Mark, Bishop of Ephesus, formally signed the decrees of the council. The action of the Greek bishops was repudiated by the majority of the Greek clergy. The downfall of the Greek Empire in 1453 obliterated all

trace of the reconciliation. A number of attempts have been made by Protestant communions to establish an understanding with the Greek church. Melancthon addressed a letter to the Patriarch Joseph of Constantinople, through a deacon of the church, who visited Germany in 1558. Two well-known Tübingen divines, Andrea and Crusius, visited Constantinople during the patriarchate of Jeremias (1576-81). Both missions were unsuccessful. In the following century the celebrated Cyril Lucaris (see LUCARIS), who was educated in the West and carried home with him a strong but well-concealed bias towards Protestantism, was elevated to the patriarchate and issued a decidedly Calvinistic confession of faith (1629). This caused Lucaris' deposition and called forth a doctrinal declaration signed by the patriarchs of Constantinople, Alexandria, and Antioch, and many metropolitans and bishops, which stated the Greek positions as against both Protestants and Roman Catholics. This exposition, the author of which was Peter Mogilas, Metropolitan of Kiev, and which was published in 1640, was adopted in a synod held in Jerusalem (1672) as the creed of the Greek church. In 1722 it was published by order of Peter the Great as the authorized formulary of the Russian church.

The doctrinal differences between the Greek and Roman churches consist chiefly in the rejection by the Greeks of the word *Filioque* (q.v.) in the creed, in the interest of the supremacy of the Father in the Trinity; in their rejection of the authority of the Pope, and of the word "purgatory," though they believe in a state of purgation after death and in the efficacy of prayers for the dead. They teach seven sacraments, though the ritual of their administration differs somewhat from the Roman. Baptism is by triple immersion. Confirmation is given with baptism even to infants, and by priests, not bishops exclusively. The Greek church teaches transubstantiation, just as the Latin, and the adoration of the Host, though this has been denied by Protestants. It uses leavened instead of unleavened bread for the sacrament and gives communion in both kinds even to children. Extreme unction has certain special rites and may be given several times during the same illness. There are ritual peculiarities also in the administration of Holy Orders. (See ORDERS, HOLY.) Marriage is allowed to priests and deacons before ordination, and is in some of the churches encouraged. Bishops are required to be celibate and are consequently selected from the monastic orders. Second marriage, however, or marriage with a widow, is not permitted. Prayers to the Blessed Virgin and the saints, whose pictures are exposed for veneration, are common. Graven images are not permitted, except of the Cross, though crucifixes are not used. The sign of the cross is often employed. Instrumental music is not allowed in the churches, but vocal music, by male voices only, is developed to a wonderfully impressive degree. In general the splendor of ceremonial is not inferior to that of the Latin church. The Holy Mysteries are celebrated in a sanctuary entirely separated by a partition from the rest of the church. During Lent, except on Saturdays and Sundays, there is only the mass of the presanctified, as in the Roman church on Good Friday. (See HOLY WEEK.) The people pray standing, facing the east, and kneel only at Pentecost. The Greeks believe firmly in the

merit of good works and of self-denial. Monastic institutions have existed in the Greek church from the earliest times, and there are numerous convents of both sexes which follow almost exclusively the rule of St. Basil. This enjoins poverty, chastity, and obedience. The monks are not priests as a rule, but they are bound to recite the Divine Office. They are not permitted by rule to eat meat.

Of the three important divisions of the Greek church, that in the Turkish dominions is under the jurisdiction of the Patriarch of Constantinople, who is the acknowledged superior of the three other patriarchs of Alexandria, Antioch, and Jerusalem. The patriarch is named by the patriarchal community, consisting of the dignitaries, lay and cleric, of the patriarchal household, of the notables and the merchants of the city, and of the heads of corporations. Their choice is limited, however, to one of three candidates, who must be metropolitans, selected by the Holy Synod of bishops. The elect one does not become patriarch until invested by the government, which also has the power to depose. During the nineteenth century many of the patriarchs were deposed for extortion at the request of the synod.

The Greek church in Russia became practically independent by the appointment of a Patriarch of Moscow in 1588. The dignity was subordinate to the Patriarch of Constantinople until the reign of Czar Alexis, father of Peter the Great, when the Patriarch of Moscow, Nikon, refused to acknowledge the jurisdiction of Constantinople. About the year 1700, on the death of the Muscovite Patriarch, Peter the Great would not permit the appointment of another, but allowed the authority to be exercised to a certain extent by a bishop under the name of exarch. After the lapse of 20 years, during which time the people became accustomed to the idea of having no patriarch, a holy synod or governing committee was appointed, over which the Czar has ever since presided. The leading principle, in fact, of the new constitution of the Russian church is the absolute supremacy of the Czar. The Holy Synod is now regarded as one of the departments of the government, the Minister of Public Worship being ex officio a member. To this body, through a bishop, residing in San Francisco and bearing the title of Bishop of Alaska and the Aleutian Islands, the churches of this communion in the United States, which are partly supported by the Russian government, are responsible. There were in 1913 181 of them, with some 133 priests, and 65,000 adherents. Their periodical organ is the *Amerikansky Russky Vestnik* (New York), to which is published in English a monthly *Russian Orthodox American Supplement*.

The Greek church of the Kingdom of Greece originated with the revolution of 1821-29, which made the country independent of Turkey. The new church was organized by a formal decree in 1833. The Patriarch of Constantinople claimed jurisdiction until 1850, when he acknowledged the entire independence of the Greek hierarchy. The government of the church of Greece is modeled on that of the Russian church. Ecclesiastical authority is vested in a holy synod consisting of five members, usually archbishops, or bishops, though exceptionally a monk or a priest may be among the number. This body is supposed to be independent in spiritual affairs, but as its members are appointed by the crown and

hold office only for a year, it has become in practice a state instrument. Moreover, two officials of the crown have the right to assist at all deliberations, though without votes. The Holy Synod elects bishops, but the crown has the right of confirmation and investiture. The church of Greece was represented in the United States in 1913 by 80 priests, 70 churches, and 175,000 adherents. Of the Armenian or Turkish church there were in the United States, in 1913, 21 churches, 15 priests, and 55,000 adherents. The Syrian, Servian, Rumanian, and Bulgarian Christians of the Greek rite have together in the United States 63 priests, 59 churches, and over 140,000 adherents. Through immigration all branches of the Greek church in America are growing rapidly. The Eastern church in its various branches is estimated to number about 100,000,000 adherents, of which over 90,000,000 belong to the Russian church. For the bodies which follow in many particulars the Greek usages and liturgy, but are in communion with the Pope, see **UNIATES**; **EASTERN RITE**, **CHURCHES OF**.

GREEK EMPIRE. See **BYZANTINE EMPIRE**.

GREEK FESTIVALS. Celebrations for the most part in honor of some god, and in their regular recurrence corresponding with the weekly rest day of Jews and Christians. (See **FESTIVALS**.) Offerings to the gods on the part of the state or individuals were of almost daily occurrence, but of course caused no general cessation of labor. On the other hand, at frequent intervals occurred great celebrations, during which there seems to have been a general suspension of business, both public and private. These festivals were in general local, and their number naturally varied greatly in different places and at different

times. The Athenians were famous for the number and splendor of their festivals, while, later, Tarentum was said to have more holidays than working days in her calendar. The tendency seems to have been to increase the number and duration of these occasions, though it may well be doubted whether there was not a decrease in devotion. More and more the games, processions, and feasting at public expense seem to have become the chief attraction. Sacrifices on the part of the state were of course a part of all such solemnities, and frequently the image of the god was carried in solemn procession, but in the details there was a wide difference. Some festivals were attended with athletic contests, or recitations by the rhapsodists; some were the scene of musical or dramatic contests; others were accompanied by rites which are obviously survivals of early popular superstitions, and for which analogies may be found in the folklore of other peoples. Thus, at the festival of Apollo, held in Attica during the month Pyanepsion, which theoretically began about the end of October, cooked beans as a symbol of the fruits of the autumn were offered to the god, and an olive branch, the so-called Eiresione, hung with figs, cakes, and small jars of oil, wine, and honey, was carried through the streets, and suspended from the temple by a boy whose parents were still living. Similar branches were borne by the attending worshippers and were afterward hung at the doors of their houses. (Consult Ogle, "The House-Door in Greek and Roman Religion," in *American Journal of Philology*, xxxii, New York, 1911, and "Laurel in Ancient Religion and Folk-Lore," in *American Journal of Philology*, xxxi, ib., 1910.) A complete list of the Greek festivals does not lie within the scope of this article and may the more easily be omitted as many of them are mere names, about the ceremonies connected with which we have no information. (See FESTIVALS, and the names of various gods, e.g., JUNO.) The great national festivals were the Olympian, Pythian, Isthmian, and Nemean, for which see the articles OLYMPIC GAMES; PYTHIAN GAMES; ISTHMUS; NEMEA. The great Athenian festival in honor of Athena, which almost attained national rank, is treated under PANATHENÆA, and the Eleusinia in honor of Demeter are discussed under MYSTERIES. (See, also, GAMES, ANCIENT.) In the remainder of this article a few of the more prominent or interesting of the local festivals will be briefly described, particularly those of Athens, for about them we are best informed. For others see the articles on the various deities and heroes.

The APATURIA occupied three days of Pyanepsion (October), and were not properly a state festival, as they were celebrated by the phratries, in one of which every Athenian citizen was enrolled. On the first day the phratry dined together, on the second sacrifices were offered to Zeus and Athena as tutelary divinities of the phratries, and on the third occurred the most important act of the festival, the reception into the phratry of the children born to its members in lawful wedlock during the previous year. Each father made oath as to the legitimacy of the child and furnished an animal for sacrifice. Boys also seem to have shown their progress in their studies by recitations from the poets. At some time during the festival sacrifices were made to Apollo Patroös, Hephestus, and probably Dionysus of the black goat-

skin (μυδραγίς). The celebration of the Apaturia is declared by Herodotus to have been characteristic of all true Ionians, but of the details of the celebration outside of Athens we are not informed. In the month Munychion (April) were celebrated the DELPHINIA, in honor of Apollo. This festival was connected with the legend of Theseus' voyage to Crete, and as it occurred at the opening of navigation and was marked by a procession of maidens bearing suppliants' branches of the temple of Apollo to entreat his mercy, it seems to have been in the nature of a propitiation of the god, that he might grant favorable weather to seamen. (Consult the article "Delphinia, 2," in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. iv, Munich 1901.) A festival of the same name, accompanied by athletic contests, was celebrated at Ægina, and, as Delphinios is the name of a month in many Greek calendars, it is probable it was also celebrated elsewhere. Noteworthy for a curious ceremony were the DIPOLIA, or DIPOLIEIA, celebrated in honor of Zeus in Scirophorion (June). In the Attic festivals a prominent place was occupied by the DIONYSIA, in honor of Dionysus. Four festivals in honor of Dionysus can be distinguished, though only two of them are called Dionysia. Their purpose was to wake the sleeping spirit of generation and to render him propitious for the coming of spring and the sowing of the crops. In Poseideon (December) the Lesser or Country Dionysia were celebrated throughout the demes of Attica with every kind of merrymaking and mummary. (See DEME.) A village procession led a goat for sacrifice to the altar of the god, and, with the growth of the drama, plays, which had already been produced in the city, were performed in the country theatres. In the next month (Gamelion) a similar festival, the LENÆA, in honor of Dionysus of the Wine Vat, was celebrated in the city by the King Archon, at which plays were performed and sacrifices offered, so that they extended over several days. The next month, Anthesterion (February), was the time for the celebration of the ANTHESTERIA, which lasted three days. On the first day, the casks of new wine being opened, each family sacrificed, and rejoiced at the coming of the god of wine and spring. The second was the great day, on which the wife of the King Archon visited the ancient temple of Dionysus in Limnæ and after various ceremonies returned to the Boukoleion, which she entered alone to be wedded to the god. The evening was one of wild revelry throughout the city, in which even slaves participated, and seems to have ended in a great drinking bout at which he who first emptied his goblet received a prize. The third day was devoted to the gods of the lower world, and special offerings of the fruits of the earth were cooked for Hermes, conductor of souls to the lower world. There are indications that during this festival the ghosts of the dead were believed to return to the world, and it is certain that the temples of the heavenly gods were closed during the whole festival. It seems therefore that the joyous revelry (which resembled that of the Roman *Saturnalia*) had been added to a celebration of quite a different character. Finally in early spring, in the month Elaphebolion (March), came the GREATER or CITY DIONYSIA, which was, with the exception of the Panathenæa, the most splendid of the Athenian festivals. On the eve of the first day a

solemn procession escorted the statue of the god from his temple to the theatre. The first day was given up to the choral and lyric contests and closed with a great procession of masqueraders. The three following days were filled with the performances of the new tragedies and new comedies, in the presence of an immense throng of citizens and strangers. Before this throng the sons of those who had fallen in battle, on reaching their majority, were presented by the state with shield and spear. The importance of this festival for the development of Greek literature in its most finished and characteristic product, the Attic drama, can scarcely be overestimated. (Consult Haigh, *The Attic Theatre*, 3d ed., Cambridge, 1907.) The 7th of Thargelion (May) was the birthday of Apollo, and in preparation for its celebration a solemn purification was necessary on the 6th. The whole festival was known as the THARGELIA. Like other Greek festivals, it was a union of the solemn and the glad. The first day saw solemn sacrifices to Demeter and the Mœræ, or Fates, and there are indications that even in historical times two human victims were sacrificed to avert the wrath of the god, who sent the summer pestilence. In the fifth century B.C. these victims seem to have been simply driven from the country. The second day saw the glad offering of the first fruits to Apollo, Helios the sun, and the Horæ, or Seasons, through whose care they had ripened. Last may be mentioned the solemn rites of Demeter and Persephone, celebrated by the women, at the THESMOPHORIA, from the 9th to the 13th of Pyanepsion (October). On the first day the women retired to a village near Athens, where on the second day secret rites, seemingly full of jests and mockery, were performed. On the third day they returned to the Thesmophorion, a temple of the goddesses in Athens, where on the fourth day they fasted and offered propitiatory or expiatory sacrifices, especially of pigs. The fifth day was given up to dances and games, which were apparently of very doubtful propriety, and the celebration ended with banquets given by the wealthier women and a solemn sacrifice. A play of Aristophanes (q.v.), the *Thesmophoriazusæ* (q.v.), deals with this festival.

Among the Spartans two festivals of Apollo occupy the chief place. First come the HYACINTHIA, celebrated at Amyclæ, the ancient capital of Laconia (see AMYCLÆ, 1), and connected with the accidental death of Hyacinthus (q.v.), the favorite of Amyclæan Apollo. It drew together the whole population of Sparta, and its observance was so strong a religious obligation on the men of Amyclæ that they even sought leave from their generals in order to return for it. It came in the spring and united mourning for the death of the boy with joy at his return. The first day was given up to sorrow, and an offering at the grave beneath the altar of Apollo; on the second day were choruses by boys, processions, and dances, in honor of Apollo, while the evening was spent in feasting. The doings of the third day are not reported, but very possibly at this time the venerable image of Apollo was presented with the new robe which the women of Sparta embroidered yearly. Even more important was the great festival of the CAERNEA, held during nine days of summer and so highly regarded by the Spartans that, when it approached, no military operations were undertaken. It was originally a herdsmen's festival,

but at Sparta had assumed a military character. The men bivouacked in booths, in nine divisions, and all the exercises were governed by the commands of the herald. We hear also of musical contests, and a singular foot race in which one man was pursued by a number of others. If he was caught, it was a sign of good luck, while his escape foreboded evil. Parallel usages among other peoples seem to show that the runner is a personification of the fruits of autumn, so that his capture assured prosperity. Both these festivals were common to the whole Dorian race, but the details of their celebration at other places are unknown.

At Delphi, in the THEOPHANIA, or 'Manifestation of the Deity,' the return of Apollo in the spring after his winter sojourn among the Hyperboreans was celebrated, while in the THEOXENIA, or 'Entertainment of the Gods,' Apollo and the other gods were entertained at a sumptuous feast, to which distinguished men, such as the poet Pindar, were sometimes invited as a mark of respect. (Cf. the Roman LECTISTERNIUM.) Other festivals of this kind were celebrated elsewhere in honor of other gods. Throughout Boeotia and also at Delphi it was common to honor Apollo with processions in which laurel branches were carried. At Thebes these DAPHNEPHORIA were celebrated only every ninth year, when the god was represented by his youthful priest, who was preceded in the procession by a relative carrying a long olive rod, wound with laurel and flowers, and with iron balls at each end and the middle, to which numerous ribbons were attached. The balls represented the sun, the moon, and the stars. The priest was followed by a chorus of maidens with suppliant's branches, who sang the praises of the god. Among the splendid festivals of Greece were the DELIA, celebrated every fifth year at the beginning of spring, by the assembled Ionians, at Delos. The celebration was an old one which had fallen into disuse, but was reinstated by the Athenians in 426-425 B.C., after they had carefully purified the island by the removal of all graves. (See DELOS.) In the years of its occurrence it replaced the old annual festival of the Apollonia. To it the Athenians sent a state delegation on the ship which was said to have carried Theseus to Crete, and during its absence no death sentence could be executed—a law which prolonged the life of Socrates for nearly a month. The festival included athletic games, horse races, and competitions between choruses, and seems to have been the scene of famous musical contests. After the great victory of Plataea, Pausanias and the Greeks instituted the ELEUTHERIA in gratitude to Zeus, the Giver of Freedom (Zeus Eleutheros), and these were celebrated with annual sacrifices and athletic contests in every fifth year at least as late as the second century of our era. In connection with some festivals we hear of CALLISTELIA, contests of beauty, which were between women on Lesbos and Tenedos, in connection with the worship of Hera, and at Basilis in Arcadia, in connection with the worship of Demeter, while in Elis the contestants were men; and a similar rivalry between the old men of the tribes seems to have formed part of the Panathenaea.

The festivals of the gods are noted in Preller, *Griechische Mythologie* (4th ed. by C. Robert, Berlin, 1887-94; consult especially Index IV). They are also briefly described in Schömann-

Lipsius, *Griechische Alterthümer*, ii (Berlin, 1902), and Stengel "Griechische Kultusalterthümer," in Müller, *Handbuch der klassischen Altertumswissenschaft*, vol. v (Munich, 1898). For Athens, consult: A. Mommsen, *Die Feste der Stadt Athen im Alterthum* (Leipzig, 1898); Gulick, *The Life of the Ancient Greeks* (New York, 1902); Tucker, *Life in Ancient Athens* (ib., 1906). Consult also articles on the various festivals named above, in Smith, *A Dictionary of Greek and Roman Antiquities* (3d ed., 2 vols., London, 1890-91).

GREEK FIRE. The common name for a combustible and explosive compound employed by the Greeks of Constantinople throughout the Middle Ages. The original type of the composition is said to have been brought to Constantinople by Callicinus of Heliopolis in the seventh century and to have been invented by him. But incendiary compositions of somewhat similar character, consisting of sulphur, pitch, and charcoal, had been known and used for 1000 years before, while the use of liquid fire is shown on Assyrian bas-reliefs. Whatever its origin, Greek fire was exceedingly efficient as an incendiary material, being so nearly impossible to extinguish that it usually set fire to any vessel it was thrown upon. Its efficacy and the terror its use inspired contributed greatly to the naval strength of the Eastern Empire and enabled it to keep control of the sea for several centuries.

Its composition was probably not always the same and is variously given by different authorities. Aeneas Tacticus mentions an incendiary composition of sulphur, pitch, charcoal, incense, and tow which was used in the fourth century B.C. It was packed in wooden vessels and thrown on the decks of the enemy's ships. In 350 A.D. Vegetius gives a similar recipe with naphtha or petroleum added.

If the story of Callicinus is correct, he either rediscovered these ancient formulas or added something to them. Colonel Hime suggests quicklime, but this is a doubtful ingredient to add to a naphtha or petroleum composition. In the *De Mirabilibus Mundi*, ascribed to Albertus Magnus, the manufacture of Greek fire is thus described: "Quick sulphur, dregs of wine, Persian gum, baked salt, pitch, petroleum, and oil all boiled together." It seems reasonably clear that the early forms of Greek fire contained no saltpetre. But as crude saltpetre was found on the surface in certain parts of Asia Minor, Persia, and India, it may later have been substituted for the salt in one of the many formulas—probably by accident—and its superiority to common salt recognized. If this is so, we have the essential ingredients of gunpowder. In the early days of its use by the Greeks of the Eastern Empire tow or flax was saturated with it and attached to arrows or javelins or packed in wooden cases. After being lighted it was projected or thrown on board the galleys of the enemy. In later times tubes were fixed in the bows of galleys and the burning mass discharged through them on the decks of opposing vessels at the moment of collision. Darts and stones were mixed with the other material.

The rear ends of these tubes were arranged to receive the charging piece or cup. This cup contained the Greek fire, which was ignited at the proper moment. It is significant that the earliest guns known had a charging cup (shaped not unlike a beer stein) to contain the powder. This fact and its composition lead to the belief

that Greek fire in one of its many forms was the prototype of gunpowder. The popular idea that the latter was invented or discovered by Berthold Schwartz in the fourteenth century is now known to be incorrect, as Roger Bacon described it as an explosive in 1242. However, it was not until the beginning of the fourteenth century that gunpowder as a propellant in guns seems to have come into general use. Consult: Bury, *The Later Roman Empire*, vol. ii (New York, 1889); Oman, *The Art of War* (London, 1898); Bury's edition of Gibbon's *Decline and Fall*, vol. vi, appendix v (ib., 1912); Guttman, *Monumenta pulveris pyrii* (ib., 1908); Thucydides, ii, 77, and iv, 100; Hime, *Gunpowder and Ammunition: Their Origin and Progress* (London, 1904); Biringuccio, *De la pirotechnia* (Venice, 1540); Tartaglia, *Questi e invencioni diversi*, lib. iii. (Venice, 1546); Beckmann, *History of Inventions* (4th ed., 2 vols., London, 1846).

GREEK GAMES. See GREEK FESTIVALS.

GREEK KALENDS (Lat. *Kalendæ Græcæ*). A phrase characterized by Suetonius (*Augustus*, 87) as a peculiar expression employed by Augustus in his letters: "when Augustus wished to indicate that certain men would never pay," declares Suetonius, "he said they would pay on the Greek Kalends," i.e., never, since there was nothing in the Greek Calendar corresponding to the Roman Kalends. (See KALENDS.) The expression, though now proverbial, occurs nowhere else in the Latin that has come down to us from ancient times.

GREEK LANGUAGE. The Greek language belongs to the Indo-European or Indo-Germanic family of languages (see INDO-GERMANIC LANGUAGES), and is closely related to the Italic dialects—Latin, Oscan, Umbrian, etc. Greek, however, has preserved a far greater number of forms from the so-called parent language than have any of the Italic languages. This variety of forms, and a great power to make new words, combined to render Greek the most flexible and beautiful language of the whole Indo-European family.

Alphabet and Pronunciation. The date of the beginning of writing in Greece is unknown, although recent discoveries have made it appear probable that some system of writing existed long before 1000 B.C. The earliest Greek inscriptions cannot be dated earlier than the seventh century B.C. The alphabet in which these inscriptions are written, and which is the parent of all modern European alphabets, was derived from that of the Phœnicians. (See ALPHABET.) The Phœnician alphabet consisted of 22 signs, which the Greeks adapted to their own phonetic system, adding to them four new signs, T, Φ, X, Ψ. The value of the last two was not the same in all alphabets; the Eastern Greeks used X with the value of (hard) *ch*, Ψ with the value *ps*, while the Western Greeks gave to X the value of English *x*, and to Ψ the value of *ch*. (On these four signs, consult Earle, "The Supplementary Signs of the Greek Alphabet," in *The American Journal of Archaeology*, 2d series, vol. vii, New York, 1903.) One of the Phœnician signs for *s* was very early dropped, and in the Eastern group of alphabets *F* (the digamma, equivalent to *v* or *w*) and *Q* (koppa, equivalent to *q*) fell into disuse, in consequence of the gradual loss in the spoken language of the sounds (*w* and hard *k* respectively) which these symbols represented. Further than this, the

Ionians, as early as 550 B.C., began to use the symbol H to represent the sound of long *e* and invented a new letter Ω to represent the sound of long *o*. The Attic alphabet at first occupied a middle ground between the Eastern and the Western groups. It did not use F and rarely employed Ϙ. It had Γ, Φ, and Ξ with the values given them in the Eastern alphabets, but not Ξ or Ψ, for which it used ΞΣ and ΦΣ. It retained H for the "rough breathing" (see next paragraph) and used E for both long and short *e*, as well as for the spurious diphthong EI (vide infra), and O for long and short *o*, and the spurious diphthong OT. This old Attic alphabet was used in official documents at Athens until the archonship of Euclides (403 B.C.), when the Ionic alphabet, which had long been in use in private life, was adopted for the public records and rapidly drove out the old local alphabets. (See ALPHABET.) The 24 signs of the Greek alphabet, as finally developed, with the corresponding English letters, are as follows:

Greek	English	Greek	English	Greek	English
Α α	a	Ι ι	i	Ρ ρ	r
Β β	b	Κ κ	k	Σ σ ς	s
Γ γ	g	Λ λ	l	Τ τ	t
Δ δ	d	Μ μ	m	Υ υ	u, y
Ε ε	e	Ν ν	n	Φ φ	ph
Ζ ζ	z	Ξ ξ	x	Χ χ	ch
Η η	ē	Ο ο	ō	Ψ ψ	ps
Θ θ	th	Π π	p	Ω ω	ō

The "rough breathing" (') is placed over an initial vowel and over ρ to signify that the word begins with an aspirate (*h*); so, ἄρμα, pronounced *harma*. The "smooth breathing" (̃) means that the initial vowel is without the *h* sound. The signs for the breathings were developed out of F and 3, themselves halves of H, the sign once employed in the Attic alphabet to denote the rough breathing. (See preceding paragraph.)

Most of the consonants were pronounced in the fifth century B.C. like the corresponding English letters, except that γ was always hard (as in *go*) and before κ, γ, χ and ξ had the sound of *n* (as in *sing*); ζ was pronounced like *dz* in *adze*; θ was always pronounced like *th* in *thin*; and χ was hard, as in German *ach*. The vowels were thus pronounced: *a* like *a* in *father*, *e* like *e* in *met*, *η* like *e* in *prey*, *ι* like *i* in *machine*, *ο* like *o* in *obey*, *υ* like French *u*, German *ü*, *ω* like *o* in *tone*. The sounds of the diphthongs *ai*, *ei*, *oi*, *au*, and *ui* are those of the diphthongs in *aisle*, *eight*, *oil*, *our*, *we*, respectively; *ou* early became a simple sound as in *group*; *ev* and *yu* were pronounced *eh-oo* and *ch-oo*. In *α*, *η*, and *ω* the *ι* subscript was at first distinctly pronounced, but later its sound was lost, and these diphthongs came to have the sound of simple *a*, *η*, and *ω*.

Accent. The Greek accent, unlike the English accent, was an accent of pitch, not of stress. Three sorts are distinguished—the acute (marked '), or high tone, extending to the end of the vowel or diphthong upon which it falls; the circumflex (marked ^), or high tone followed by a lowering of pitch, used only on long vowels and diphthongs; and the grave (marked `), indicating a lowering of pitch. The grave accent is used only as a substitute for the acute on a word or on the last syllable of a word when it precedes another word. The circumflex may stand upon either of the last two syllables, but on the penult only when the last syllable is

short. The acute stands on any of the last three syllables, but on the antepenult only when the last syllable is short. With these limitations, the accent of most words is recessive, but never stands further from the end than the antepenult. A number of short words, called proclitics and enclitics, have no accent, but lean, so to say, upon the words which they immediately precede or follow.

Dialects. Long before the dawn of history Greek comprised a number of dialects, which maintained their individual peculiarities until comparatively late times, although these differences were never so great as to prevent easy communication between the inhabitants of different districts. The study of the Greek dialects has been greatly advanced in recent years by the discovery and publication of inscriptions. In general, the dialects fall into the two groups of Ionic and non-Ionic, distinguished by a tendency on the part of the Ionic dialects to change original *ā* to *ē*. Further than this we can distinguish, inside the non-Ionic group, two families of dialects, the *Æolic* and the *Doric*, although recent investigation has shown that this twofold division cannot be carried out as strictly as was formerly supposed. (See *ÆOLIANS*; *DORIANS*; *IONIA*. These articles will indicate also the areas over which Greek, in its various dialects, was spoken. For the use of the language in literature, see *GREEK LITERATURE*.) The principal characteristics of the Ionic, Doric, and *Æolic* dialects are as follows:

Ionic.—The Ionic dialect is characterized by (1) a wholesale change of original *ā* to *ē*; (2) the early loss of *F* (as early as 800 B.C.); (3) the use of *āv* = *ka*, *ke*. Two forms must be distinguished:

(1) The Ionic of the Asiatic coast and many of the *Ægean* islands, frequently named simply *Ionic*. This displays a marked aversion to contraction and admits successive vowel sounds. It includes:

(a) Old Ionic, the language of the Homeric poems, and of epic poetry in general, a dialect partially artificial and probably never spoken at any one time.

(b) New Ionic, the spoken language of the Ionian cities, with many local variations, but showing a preference for *κ* instead of *π* in pronominal roots (*κοῖος*, *κῶρος* = Att. *ποῖος*, *πόρος*), frequent preference for *ω* instead of *αυ* or *ου* (*θῶμα*, *ὄν* = Att. *θαῦμα*, *ὄν*), and dislike of aspirates (*ἐπορᾶν*, *δέκομαι* = Att. *ἐφορᾶν*, *δέχομαι*). This is the language of the early logographers (q.v.), of Herodotus and Hippocrates.

(2) **Attic.**—Attic is closely related to Ionic, but differs from it in the retention of *a* in certain positions, i.e., after *ρ*, *ε*, and *ι* (*πάρρω*, *μαρία* = Ion. *πρήρρω*, *μαρήνη*), and in a marked tendency to contraction of vowels. This is the principal literary dialect, used in the works of Thucydides, Xenophon, Plato, the dramatists and the orators. It is commonly taken by grammarians as the norm, and the other dialects are regarded as variants, although there is no historical justification for such a proceeding.

Doric.—Doric was spoken on the Isthmus of Corinth, in the greater part of the Peloponnesus, Corcyra, Magna Græcia, Sicily, Cyrene, Crete, Byzantium, Rhodes, the southwestern corner of Asia Minor, Melos, and some of the other islands of the *Ægean*. It is, in the main, the language of Pindar and Theocritus. It is characterized by (1) retention of *a* where the Attic prefers *η*

(μάτηρ = Att. μήτηρ); (2) formation of the gen. pl. in *ων*, gen. sing. masc. in *α* (πολιτᾶν, πόλῖτα = Att. πολιτῶν, πόλῖτου); (3) *μεσ*, for *μεν*, in first pers. pl. of the verb (cf. Lat. *-mus*), *ντι* in third pers. pl. of the verb (ἤκομεν, ἔχοντι = Att. ἤκομεν, ἔχουσι); (4) formation of the future in *σέω*, *σῶ*; (5) contraction of *αε* to *η*. A special group of dialects (sometimes called Northern Doric) is to be recognized in the inscriptions of Phocis, Locris, and the neighboring districts.

Eolic.—The dialect of Eolis (Northern Asia Minor). With this are commonly grouped the dialects of Boeotia and Thessaly, although they differ from it in many particulars. The poems of Alcaeus and Sappho were written in Eolic (Lesbian), as were also three idyls of Theocritus. The dialect is characterized by (1) an objection to oxytones, i.e., to words with acute accent on the last syllable (κάλος, σόφος, αὐτός = Att. καλός, σοφός, αὐτός); (2) frequent objection to an initial rough breathing (ἕτερος, ὕμνος = Att. ἕτερος, ὕμεις); (3) instability of vowel sounds, combined with a fondness for *i* and *υ* sounds (πίστυρες, δυνμα = Att. πέτταρες, δυναί); (4) preference for *οι* instead of *ου* where both arose from original *ον* (λίποισα, τοῖς = Att. λιπούσα, τοῖς). The closely related group of Arcadian and Cyprian was formerly classified as Eolic, but is now placed in a separate category by conservative scholars.

Relation to the Primitive (Indo-European) Language. The Greek vowels usually represent similar sounds in the parent language. In many cases, however, they are of secondary origin, notably the characteristic Ionic and Attic *η*, which not only represents orig. *ē* (μήν = Lat. *mensis*), but also orig. *ā* (Att. φηγός = Dor. φᾱγός, Lat. *fagus*). Short *α* before or after *λ*, *μ*, *ν*, or *ρ* is often derived from an original sonant liquid or nasal (παράσι = Skt. *pār-ṣi*). The diphthongs *αι*, *ει*, *οι*, *αυ*, *ευ*, and *ου* often represent corresponding diphthongs in the parent language (οἶνι, Lat. *oinus*, ἄνις; αἰῶνα = Lat. *auges*); often, however, they are the result of a chance concurrence of two vowels, frequently due to the loss of an intervening consonant (*ει*, from *é[σ]i*). At the end of words *φ*, *ν*, and *ψ* represent original long diphthongs (χώρῃ, ἱππῷ); elsewhere they are of secondary origin (ράδιος, from *radios*, σέξω, from *swéξw*). Apparently *ην* and *υι* were not original, but new formations during the independent existence of Greek. Often *ει* and *ου* are not true diphthongs at all (see below). Of the consonants, *β*, *γ*, *δ*, *π*, *κ*, *τ*, and *σ* usually represent the same sounds in the parent language. *φ*, *χ*, *θ* usually represent orig. *bh*, *gh*, and *dh* (φέρε, χειμῶν, τίθημι = Skt. *bhārati*, *himá*, *dadhāmi*). The liquids *λ* and *ρ* correspond, as a rule, to I. E. *l* and *r* (ἀρώ, κλύω = Lat. *aro*, *cluo*); *μ* and *ν* are commonly equivalent to I. E. *m* and *n*, although at the end of words *ν* frequently represents orig. *m* (ζυγόν = Skt. *yugám*, Lat. *jugum*). Initial *ξ* = *j* (cf. ζυγόν), but *ξ* usually represents a combination of *δ* or *γ* with *i*; *ξ* and *ψ* are simply conventional symbols for a palatal (*κ*, *γ*, *χ*) or a labial (*π*, *β*, *φ*) mute with *σ*. *φ*, when it appears, represents I. E. *v*, Eng. *w* (*Folkos* = Skt. *věśá*, Lat. *vīcus*). The rough breathing never corresponds to I. E. *h*, but often marks the loss of one or more consonants (*ἄλς* = Lat. *sal*, Eng. *salt*; ἡδύς, orig. *σῆδύς* = Lat. *suavis*, Eng. *sweet*). See PHONOLOGY.

Phonetic Changes. Many changes in the

form of Greek words are to be traced to phonetic causes. The most important of the changes are: 1. *Loss of consonants.* *F*, although retained in some dialects until comparatively late times, shows a constant tendency to disappear (οἶνος, orig. **foinos*, cf. Lat. *vinum*; εἶδον, orig. **ēfīdon*, Lat. *vidi*); single *σ* disappears at the beginning of words and between vowels (ἐπτά = Lat. *septem*, γένους, from **γενεσος*, through **γενεος*, = Lat. *generis*); even *σ* has disappeared in some cases (ἰδρῶς = Lat. *sudor*, Eng. *sweat*). At the end of words, consonants are often lost, owing to the law that only *ν*, *ρ*, and *σ* can terminate a word (nom. ἀρχων, from stem ἀρχοντ-); *τ*, *δ*, and *θ* regularly disappear before *σ* (ἐλπίς, for **ελπῖς*); so, too, *ν* (δαίμοσι, for **δαμιον-σι*), and the combinations *ντ*, *νδ*, *νθ* (γίγας, for **γιγαντ-ς*). 2. *Change of consonants.* The combination of a consonant and *ι* (representing an original semiconsonant *i*) is the cause of many changes: *δι* becomes *ζ* (φράζω for **φραδιω*); *κι* and *χι* become *σ*, Att. *ττ* (φυλάσσω, Att. φυλάττω, for **φυλακιω*); *γι* becomes sometimes *σσ* (τάσσω for **ταγιω*), sometimes *ζ* (κράζω for **κραγιω*); *λι* becomes *λλ* (ἄλλος for **ἄλιος* = Lat. *alius*); *νι* and *ρι* become *νν* and *ρρ*, with subsequent loss of one consonant and lengthening of the preceding vowel (Lesbian κτέννω, φθέρρω, Att. κτείνω, φθείρω, for **κτενιω*, **φθεριω*), or else the *ι* is lost, and the preceding vowel is strengthened by the addition of an *ι* (the so-called epenthesis, i.e. φαίνω, for **φανιω*). The vowel *ι* sometimes changes a preceding *τ* to *σ* (φέρουσι, Dor. φέροντι = Lat. *ferunt*). Before *μ*, *π*, *β*, and *φ* become *μ* (ἔλειπμαι for **λελειπ-μαι*); *κ* and *χ* become *γ* (πέπλεγμα for **πεπλεκ-μαι*); *τ*, *δ*, and *θ* become *σ* (πέπεισμαι for **πεπειθ-μαι*). The combinations *μρ* and *μλ* are strengthened and made easier of pronunciation by the insertion of *β* (μέμβλωκα for **μεμλωκα*); and *νρ* is similarly strengthened and eased in pronunciation by the insertion of *δ* (ἀνδρός for **άνρος*); at the beginning of a word, the *μ* or *ν* in such a combination is dropped (βροτός for **μβροτός*, cf. Lat. *morior*). 3. *Loss of vowels.* *ι* sometimes becomes consonant (*j*) and is then lost (Ἀθηναία for **Αθηναία*). So, too, *υ* between two vowels becomes *f* and disappears (βοός for **βοφος*, from stem *βου-*, Lat. *bovis*). 4. *Contraction of successive vowels* is frequent and in Attic regularly takes place (τιμῶ for *τιμῶν*). The contraction of *εε*, *εο*, *οο*, *οε*, produces the so-called spurious diphthongs *ει* and *ου*, which were, in early times at least, spoken and written as simple sounds. 5. *Compensative lengthening of vowels.* When one or more consonants are dropped for euphony (especially before *σ*), a preceding vowel is often lengthened (μέλας for **μελαν-ς*). The diphthongs *ει* and *ου* which arise from this process are also spurious, being simply lengthened forms of *ε* and *ο* (λύουσι for **λυοντι*). 6. *An exchange of quantity* sometimes takes place between a long vowel and a succeeding short one (epic νᾶς, βασιλῆος, Att. νεώς, βασιλέως).

Inflection. *Nouns.*—Of the eight original Indo-European cases, the Greek has preserved five: nominative, genitive, dative, accusative, and vocative. The locative, instrumental, and ablative cases are preserved only in a few adverbial forms, their functions being performed by the genitive and the dative. There are three declensions of nouns, according as the stem ends in *α* (first declension), in *ο* (second declension), or in a consonant, a diphthong, or a close vowel (third declension). For the *α* and *ο* stems the

oldest endings are—sing. nom. *s* (but feminines in *a* have no ending), gen. (*σ*) *ω*, dat. *αι*, acc. *ς*; pl. nom. *ι*, gen. *ωρ*, dat. *ωι*, acc. *ς*. For consonant and close vowel stems, the endings are—sing. nom. *s*, gen. *ος*, dat. *ι*, acc. *ν* or *α*; pl. nom. *ες*, gen. *ων*, dat. *αι*, *οι*, or *εσσι*, acc. *ς* or *ας*. Vocatives proper have no ending. The dual, which is preserved in Greek (although it shows from very early times a constant tendency to fall into disuse), has the endings *α* and *ων* for the first declension, *ω* and *ων* for the second, *ε* and *ων* for the third. The origin of these forms is uncertain. Neuters from *ο* stems form the nom., acc., and voc. sing. by adding *ν*: in stems of the third declension these cases are without ending. The nom., acc., and voc. pl. of neuters end in *α*. Many of the phonetic changes noted above are the result of the combination of stems with endings. *Pronouns*.—The pronouns that distinguish gender (demonstrative, relative, and interrogative pronouns) are inflected like nouns, with some slight variations. The inflection of the personal pronouns which do not distinguish gender differs from that of nouns in many ways, which cannot be discussed here. The stems of the personal pronouns are—singular, first person *ἐμε* (cf. Lat. *me*), second person *σε* (Lat. *te*), third person *ἐ* (Lat. *se*); dual, first person *ἡμ* (Lat. *nos*), second person *σφω*, third person wanting; plural, first person *ἡμε*, second person *ὑμε*, third person *σφε*. The nominative singular forms, *ἐγώ*, *σύ*, of the first and second persons are from separate stems (cf. Lat. *ego*, *tu*). The definite article *ὁ*, *ἡ*, *τό*, corresponds to the Sanskrit *sas*, *sā*, *tat*. *Verbs*.—The Greek verb is one of the most highly developed parts of the language. Not only has the Greek preserved more completely than any other of the Indo-European languages the verb system of the parent language (its only rivals in this respect being the Indo-Iranian and the Slavic groups), but it has added to that system a number of forms of its own. Besides the active and the passive voices, the Greek finite verb has a third voice, the middle, which represents the subject as acting on or for itself. The verb has seven tenses, present, imperfect, future, aorist, perfect, pluperfect, and future perfect. It is thus enabled to express by distinct forms momentary, continued, and completed past action (by the aorist, imperfect, and pluperfect tenses respectively). It has forms for the dual as well as for the singular and the plural. Besides the indicative and imperative, the Greek verb has two oblique moods, the subjunctive and the optative, with separate forms for continued, momentary, and completed action. There is also a future optative, used, however, only to represent the future indicative in indirect discourse. Characteristic of past tenses is the augment (syllabic, which involves prefixing of *ε* to the verb stem, or temporal, which involves lengthening of the initial vowel). The perfect and the pluperfect are distinguished by reduplication—primarily a repetition of the initial syllable, though for the most part stereotyped in the form of a syllable consisting of the initial consonant of the root and the vowel *ε*. The present and imperfect are often formed by a strengthening of the verb stem. All tenses, except the future and the so-called first aorist, exist in two forms, called respectively thematic and nonthematic (or *ω* conjugation and *μ* conjugation), according as the tense stem and the personal endings are or are not connected by a "thematic vowel." There are two sets of per-

sonal endings for both active and middle. These vary somewhat in different dialects and in the active singular have often been affected by analogy, but in general the distinction in use is observed with considerable strictness, as follows: For pres., perf., fut., and subj.:—active sing. *μι*, *σι*, *τι*, dual *τον*, pl. *μεν*, *τε*, *ντι*: middle sing. *μαι*, *σαι*, *ται*, dual *σθον*, pl. *μεθα*, *σθε*, *νται*. For imperi., aor., plup., and opt.:—active. sing. *ν*, *ς*, *τ*, dual *τον*, *την*, pl. *μεν*, *τε* *ν*: middle, sing. *μην*, *σο*, *το*, dual *σθον*, *σθην*, pl. *μεθα*, *σθε*, *ντο*. Except in the aorist and the future, the passive forms coincide with those of the middle. The addition of these endings to the verb stem, whether with or without intervention of the thematic vowel, often causes phonetic changes under one or another of the phonetic laws stated above.

Word Formation. The Greek possesses a great variety of terminations by which nominal stems are formed from roots, although it is often impossible to assign a single meaning to each of these suffixes. The most important are *ο*, *α*, *ι*, *υ*, *κο*, *λο*, *μο*, *νο*, *ρο*, *φο*, *ιο* (and corresponding forms ending in *αι*, *ας*, *ες*, *ει*, *ον*, *τηρ*, *τορ*, and various combinations of these forms. Besides such primary formations, secondary forms, i.e., nouns (and adjectives) derived from other nouns, are common. The commonest suffixes of such denominative nouns are *ευ*, *τα*, *τητ*, *συνα*, *ια*, *ιο*, *ισκο*: of denominative adjectives, *ει*, *ιο*, *ικο*, *ινο*, *εντ*. The comparative suffixes are *ιο* and *τερο*, the superlative *ισο* and *τατο*. Denominative verbs are freely formed; the commonest endings of such verbs are *αω*, *εω*, *οω*, *ευω*, *αζω*, *ιζω*, *αιρω*, *υνω*. In compound words two or more stems are combined, only the last being inflected. Except in compounds made for comic effect, the combination of more than two roots is unusual.

Later History. The conquests of Alexander the Great (330 B.C.) and the consequent spread of the Greek language over a great part of Asia led to the gradual abandonment of the other dialects and the adoption of Attic as the language of the whole Greek world. Thus arose the "common" dialect or "Koine" (*κοινή διάλεκτος*), a modified Attic, tinged with the peculiarities of the peoples by whom it was spoken. This common dialect is sometimes called Hellenistic Greek, i.e., the Greek spoken by foreigners (*Ἑλληνιστική*), not by native Greeks (*Ἑλληνες*). The Greek of the Septuagint (q.v.) and of the New Testament furnishes a good example of this Hellenistic Greek. (Consult BIBLE, 1, 2, *The Original Languages of the Bible*; HELLENIST.) It is also, in various forms, the language of Aristotle, Polybius, Pausanias, Plutarch, and Lucian. The pronunciation was changed even more than the form of the language. As early as the third century B.C. *ε* came to be sounded like *ι*; *ξ* was pronounced like Eng. *z*. In the early Christian centuries *η* also assumed the sound of *ι*; *αι* came to be pronounced like simple *ε*. The diphthong *ου* was sounded like *υ*, and later both were sounded like *ι*. The diphthongs ending in *υ* modified or lost their second vowel. *β*, *γ*, and *δ* were softened in sound. During all this time the literary language continued to follow Attic models, but by 800 A.D. the difference between the spoken and the written language had become so great that the literary language could no longer maintain itself and was gradually supplanted by the spoken language. With this date, therefore, the period of modern Greek may be said to begin.

Bibliography. The most complete Greek

grammar is that of Kühner, *Ausführliche Grammatik der griechischen Sprache*, rev. by Blass and Gerth (4 vols., Hanover, 1890-1900). Historical grammars are those of Brugmann (far the best) in Müller, *Handbuch der klassischen Altertumswissenschaft*, vol. ii (4th ed., rev. by Thumb, Munich, 1913); Meyer (3d ed., Leipzig, 1896); Kretschmer, *Einleitung in die Geschichte der griechischen Sprache* (ib., 1897); Hirt, *Laut und Formenlehre der griechischen Sprache* (Heidelberg, 1902; new ed., 1913); Hoffman, *Geschichte der griechischen Sprache, I, Bis zum Ausgange der klassischen Zeit* (Leipzig, 1911), a brief but thoroughly scholarly and modern treatment. Good working grammars in English are those of Goodwin (rev. ed., Boston, 1892) and Hadley, rev. by Allen (New York, 1884). Useful for syntax are Madvig, *Syntax der griechischen Sprache* (Brunswick, 1884), and Goodwin, *Greek Moods and Tenses* (rev. ed., Boston, 1890); Thompson, *Attic Greek Syntax* (London, 1907); Gildersleeve and Miller, *Syntax of Classical Greek from Homer to Demosthenes*, parts i-ii (New York, 1900; 1911); Stahl, *Kritisch-historische Syntax des griechischen Verbums* (Heidelberg, 1907), summarized and criticized by Gildersleeve in *American Journal of Philology*, xxix, xxx (New York, 1908-09); Wackernagel, in *Die griechische und lateinische Literatur und Sprache*, by Wilamowitz-Moellendorf and others (3d ed., Leipzig, 1912); Kretschmer, in Norden's *Einleitung in die Altertumswissenschaft*, vol. i (2d ed., ib., 1913); Wright, *Comparative Grammar of the Greek Language* (Oxford, 1912). Special works on the dialects are: Ahrens, *De Graecæ Linguae Dialectis* (Göttingen, 1839-43); Meister, *Die griechischen Dialekte* (ib., 1882-89); Hoffman, *Die griechischen Dialekte in ihrem historischen Zusammenhange* (ib., 1891-98); Smyth, *Sounds and Inflections of Greek Dialects* (Ionic) (Oxford, 1894); Monroe, *A Grammar of the Homeric Dialect* (2d ed., Oxford, 1891); Thumb, *Handbuch der griechischen Dialekte*, which gives a bibliography for each dialect (Heidelberg, 1909); Buck, *Introduction to the Study of the Greek Dialects: Grammar, Selected Inscriptions, and Glossary* (Boston, 1910), which gives selected bibliography, and "The Interstate Use of the Greek Dialects," in *Classical Philology*, viii (Chicago, 1913). There is no general treatment of the "common" dialect, but Thumb, *Die griechische Sprache im Zeitalter des Hellenismus* (Strassburg, 1901), is useful as an introduction to the subject. The best lexicon is that of Liddell and Scott (8th ed., Oxford, 1897). For the dialects a good lexicon is Van Herwerden, *Lexicon Graecum Suppletorium et Dialecticum* (2d ed., Leyden, 1910). The best etymological dictionary of Greek is that by Boisacq, *Dictionnaire étymologique de la langue grecque* (Paris, 1907-). For New Testament Greek, consult Blass, *Grammar of New Testament Greek*, trans. by Thackeray (new ed., London, 1905); Moulton, *A Grammar of New Testament Greek* (3d ed., Edinburgh, 1906); Robertson, *A Short Grammar of the Greek New Testament* (New York, 1909), and *A Grammar of New Testament Greek in the Light of Historical Research* (New York, 1914). The last-named book contains a good discussion of the "common" dialect. For Old Testament Greek, see Thackeray, *A Grammar of the Old Testament in Greek* (ib., 1909). Two periodicals are of special value with respect to the

Greek language—*Indogermanische Forschungen* (Strassburg) and *Glotta* (Göttingen). For a brief survey of various works relating to the language, consult Sturtevant, *The Classical Weekly*, ii, vi (New York, 1908; 1913).

The Greek Language, Modern. The differences between ancient and modern Greek are by no means so great as has commonly been supposed, the modern language being a direct descendant of the "common" dialect (vide supra). The beginnings of most of the changes that have affected modern Greek can be traced back into the Hellenistic period. Some of these changes have been noted above. Others are as follows: The ancient marks of accent have been retained, but they no longer represent a difference of pitch: the accent is a stress accent, exactly like that of English (traces of this change can be seen as early as 400 A.D.). The rough breathing is still printed, but is no longer pronounced. Iotacism has extended its influence until no fewer than six different vowels and diphthongs have the sound of ancient *i*, viz., *i*, *η*, *υ*, *ει*, *οι*, and *υι*. The dual number has entirely disappeared, and the middle voice appears in only a few isolated forms. In the language of the common people the dative case is practically lost, its place being supplied by the genitive or by the accusative with a preposition. Great numbers of nouns have taken the diminutive ending *ων*, which in the vernacular is reduced to *ι*, and the loss of a syllable at the beginning of words is not infrequent; so *τυρί*, cheese = *τυρίον*, *τυρός*; *ψάρι*, fish = *ψάριον*, through *ψάριον*; *μάτι*, eye = *δμμα*. In many nouns, moreover, the accusative is taken as a new nominative; so *ὁ πατέρας* = *πατήρ*.

But it is in the conjugation of the verb that the greatest changes have taken place. Here the optative has entirely disappeared and the infinitive survives only in a mutilated form. The ancient uses of both optative and infinitive are replaced by subjunctive uses: *ὅπῃνα διὰ τὸν ἰδῶ* = *ἤλθον ἵνα αὐτὸν ἴδωμι*; *θέλω νὰ ἔλθω* = *θέλω ἔλθειν*. The future, the perfect, and the pluperfect are formed by the aid of auxiliaries; *θὰ* = (*θέλω* *να*) *λύω* or *θὰ λύσω* = *λύσω*; *ἔχω λύσει* = *ἔλελυκα*; *εἶχα λύσει* = *ἔλελεκα*. The pronouns have suffered many changes. The awkward *ὅποιος* or even the adverb *ποῦ* is used in place of the relative.

The vocabulary also has suffered from the intrusion of loan words from other languages, notably from Italian and Turkish, although the infusion has not been so great as to give the language the appearance of a mixed language; cf. *σπίτι* (Latin *hospitium*), house; *βαπόρι* (Ital. *vapore*), steamer; *δερεβένι* (Turkish *dervend*), pass. Since the establishment of the Greek kingdom (1830), there has been a stronger movement towards the purification of the modern language and a closer conformity to the ancient Greek idiom. This has resulted in a curious gap between the literary language and the common speech, not unlike that which existed in the later classical times. The new movement, however, has made steady progress, and it is not too much to say that the modern Greek newspaper would be easily intelligible to Plato and Demosthenes. See ROMANIC LITERATURE.

The best Modern Greek grammars are those of Mitsotakis, *Praktische Grammatik der neugriechischen Sprache* (Stuttgart, 1891), and Pernot, *Grammaire grecque moderne* (Paris, 1897). In English, Vincent and Dickson, *A Handbook to*

Modern Greek (London, 1893), is good for the literary language; and Gardner, *A Modern Greek Grammar* (London, 1892), for the spoken language. Hatzidakis, *Einleitung in die neugriechische Grammatik* (Leipzig, 1892), treats especially the relation of the modern language to Hellenistic and Byzantine Greek. Of the greatest value is Thumb, *Handbook of the Modern Greek Vernacular*, trans. by Angus (Edinburgh, 1912), finely summarized and reviewed by Buck, in *Classical Philology*, ix (Chicago, 1914). Consult also Jannaris, *An Historical Greek Grammar, chiefly of the Attic Dialect, as Written and Spoken from Classical Antiquity down to the Present Time* (New York, 1901).

The best dictionaries are those of Kontopoulos (3d ed., Athens, 1889), and Kyriakides (Nicosia, Cyprus, 1892). Useful, also, are Sophocles, *A Greek Lexicon of the Roman and Byzantine Periods* (New York, 1887), and Ducange, *Glossarium ad Scriptores Mediæ et Infimæ Græcitatæ* (Leyden, 1688; reprinted Breslau, 1891).

GREEK LITERATURE. The literature of ancient Greece is important, not only because it is the earliest literature in Europe and the one which has had a mastering influence on all the others, but also for the intrinsic value of its remains, which prove it one of the greatest of all literatures. The Greeks possessed no such models for their guidance as later peoples have had, so that their literature is, as no other literature has been, an original and natural development; in it were determined most of the literary types employed by European peoples. Fortunately the remains of this ancient literature are large enough to enable us to trace the history of its various forms with a considerable degree of accuracy.

We can distinguish six natural divisions: 1. The Age of Epic Poetry; 2. The Lyric Period; 3. The Attic Period; 4. The Alexandrian Age; 5. The Græco-Roman Period; 6. The Byzantine Period.

1. **The Age of Epic Poetry.** This extends to the sixth century B.C. At the threshold of Greek literature we find two imperishable products of Greek genius, the *Iliad* and the *Odyssey*. But the very perfection of these poems shows that, far from being early efforts of a people unskilled in poetic composition, they represent the culmination of a long development in the art; furthermore, the contents prove that at least two, and probably three, kinds of poetic composition had been practiced from an unknown period. The earliest artistic compositions were probably hieratic in character; i.e., they formed part of the service of the gods. The earliest singers were "servants of the Muses," the goddesses who dwelt with the other celestials on Olympus in Thessaly. With the migrations of the Hellenic tribes to the south, a new centre of the Muses' worship developed on Helicon (q.v.), between Bœotia and Attica. Tradition gave the names of certain mythical singers, among whom the most famous were Orpheus, Musæus, Eumolpus, and Thamyris. Closely connected with hymns in honor of the gods were the hymeneal song and dirge for the dead, both of which were known to Homer. There also developed, among the different stocks, sagas celebrating the exploits of hero princes who led their peoples in warlike undertakings; and the material for epic song was greatly enriched by the great struggles and movements at the end of the second millennium B.C., consequent on the

migrations of Thessalian and Dorian peoples towards the south. It is clear from the two great epics preserved to us that a long period had preceded them in which shorter epics had been sung by minstrels at courts and in the market place. In these epics of the different tribes the deeds of the national heroes were celebrated—of Achilles among the Æolians, of the Atreidæ among the Achæans: the Dorians found their favorite subject in the exploits of Hercules. The struggle of the Seven against Thebes (see THEBAN CYCLE: THEBES; SEVEN AGAINST THEBES), the voyage of the *Argo* (see ARGONAUTS), and the siege of Troy were other frequent themes. (See CYCLIC POETS.) To the Trojan cycle of legends, probably the youngest of all, belong the *Iliad* and the *Odyssey*. In the view of some scholars, the story of the siege of Troy has as its historical basis the struggles of the Æolian colonists in Asia Minor with the earlier Phrygian inhabitants. Another view is that back of the two poems lies a real struggle between Troy and the Greeks for the control of the Hellespont—a control necessary to the expansion of Greece in the direction of the Euxine Sea. (Consult Leaf, *Troy: A Study in Homeric Geography*, London, 1912.) In the *Iliad* the chief figure is Achilles (q.v.), the hero of the Æolians, native in southern Thessaly. With the story of his deeds were combined shorter epics treating the deeds of other heroes. The whole is an incident in the tenth year of the war: the action covers but 49 days. The *Odyssey* belongs to the cycle of myths dealing with the return of the heroes from Troy. Although the action is confined to 41 days, the composer, by his skillful device of having Odysseus tell the story of his wanderings at the court of Alcinoos, the friendly King of the Phæacians, has succeeded in giving us a complete account of the hero's adventures during the 10 years after the fall of Troy, as well as the narrative of his dramatic return to his home. The poem, too, deals with the return of some of the other chieftains.

In antiquity these immortal poems were ascribed to a blind bard, Homer; but among the learned of the Alexandrian age some claimed that the two epics were not by the same poet. In modern times the "Homeric Question" has been a burning one since the publication of the *Prolegomena ad Homerum* by Friedrich August Wolf (q.v.), in 1795. (For an account of the controversy, the work done on the poems at the orders of Pisistratus, and the details of the general subject, see HOMER.) Many scholars now incline to regard the poems as works of the same poetic school, and each in the main the creation of a single poet (some hold that the two poems are the work of one author or that at least they belong to a single epoch, and picture exactly the same stage of culture), who drew freely on current epics, many of which may well have come into existence long before his time. (Consult Shewan, "Recent Homeric Literature," in *Classical Philology*, vii, Chicago, 1912; in opposition see Prentice, review of Drerup, "Das fünfte Buch der Ilias," in *American Journal of Philology*, vol. xxxiv, pp. 331-340 (Baltimore, 1913).) That the poems have suffered from later interpolations is certain. The date of composition is the ninth or the eighth century B.C.; the place of origin was apparently western Asia Minor, on the borders of Æolis and Ionia.

These two great epics covered but a portion of the legends about the Trojan War. Other

parts were treated by an Ionian school of epic poets which flourished from the eighth to the sixth century B.C. These bards—known in modern times as the *cyclic poets*—joined their poems to the *Iliad* and the *Odyssey* as introductions or continuations. Of their works we have only the scantiest fragments and some prose abstracts. Other cycles of myths than the Trojan were handled by later epic poets, but of their works we have little knowledge. See *EPIC POETRY*.

There has further been preserved to us a collection of 34 "Homeric hymns," in honor of various divinities. These are not hymns in the strict sense of the word, but rather preludes for rhapsodists before beginning their proper recitals. The name is misleading, as they have nothing to do with Homer, but are the product of a later time; the earliest, the hymn to the Delian Apollo, can hardly have been composed before the latter part of the eighth century B.C., and the latest is not earlier than 500 B.C.

There were also current under Homer's name some sportive writings composed in epic form. The most famous are the *Margites* (q.v.), of which we have a few lines, and the *Batrachomyomachia* (q.v.) (Battle of the Frogs and Mice), of which some 300 verses are preserved. The latter is one of the earliest examples of parody in Greek literature. Scholars disagree as to its date—some placing it as early as the Persian wars, others regarding it as a product of the Alexandrian age.

The other great poet of the first period is Hesiod (q.v.) of Ascra in Boeotia, near Mount Helicon, who flourished towards the end of the eighth century B.C. The Hesiodic poetry is distinguished from the imaginative Homeric epics primarily by its homely character; the chief poem, the *Works and Days*, deals with the daily life of the farmer and gives him directions for his work. It is the earliest didactic poem known to us. The authenticity of other works ascribed to Hesiod—the *Theogony* and the *Shield of Hercules*—has been questioned.

2. The Lyric Period. Elegiac and Iambic Poetry.—Important economic and social changes took place in Greece during the period from the eighth to the fifth century B.C. Increase of population and development of manufactures led to the planting of Greek colonies all along the shores of the Mediterranean and Black seas; and within most of the home cities the government passed successively from monarchy to oligarchy, then to tyranny and democracy. The old preëminence of the aristocracy was greatly diminished, and a powerful moneyed class developed. With these changes the importance of the individual increased, knowledge was enlarged, and, above all, reflective thought began to demand a larger poetic expression than had been given to it before. New poetic forms, the elegiac and iambic, were developed in Ionia. The elegiac couplet (see *ELEGY*) was a slight modification of the hexameter, and the older poetry composed in this measure was always accompanied by the music of the flute. While early elegy dealt with a great variety of themes, it was always the expression of the thoughts and feelings of the poet himself, and never so passionate as iambic verse. This latter was first employed for satire, its quick movement suiting it to the expression of pointed thought and of more passionate feeling than the elegiac measure. It was also used for fables. Consult: Jebb, *The Growth and Influence of Classical Greek Poetry*

(New York, 1894); Farnell, *Greek Lyric Poetry* (London 1891); Smyth, *Greek Melic Poets* (ib., 1900).

The ancients disputed as to whether Archilochus, Callinus, or Mimnermus was the inventor of the elegy; but Callinus of Ephesus, who flourished in the first half of the seventh century B.C., is usually reckoned the earliest of the elegiac poets. He employed the measure to encourage the Ionians in resistance against the barbarian invaders of their land. Tyrtaeus, about a generation later, was probably an Ionian immigrant to Sparta, who by his verses inspired the Lacedæmonians to fight against the Messenians. Mimnermus of Colophon, who flourished towards the end of the seventh century, introduced new elements—love and sentimentality—into elegy, and therefore became a favorite with the Alexandrians and Romans. Solon (c.639–c.559 B.C.), the great lawgiver of Attica, used the measure after the manner of Callinus and Tyrtaeus to incite the Athenians against the Megarians and later to celebrate the reforms he had carried through. In the hands of Theognis of Megara (c.540 B.C.), of whose works some 1400 verses are extant, elegy became the medium of moral (gnomic) precepts (see *GNOME*); it was employed for the same purpose also by his contemporaries Phocylides of Miletus and Demodocus of Leros. At the end of this century Xenophanes of Colophon employed elegy to express his philosophic thought. From the time of Simonides of Ceos (480 B.C.), famed chiefly as a lyric poet, elegy became the regular form for epitaphs. See *EPITAPH*; *EPITAPH*.

Iambic verse was first brought to perfection by Archilochus of Paros (c.650 B.C.), who employed it with masterly power as a vehicle of personal satire. He was followed by Simonides of Amorgos, whose satire was general rather than personal. Hipponax of Ephesus (c.540 B.C.) was called the inventor of parody. By substituting a trochee for an iamb at the end of the verse, he modified the iambic line into the choliambic measure, in which he gave out the venom of his hate.

Lyric—or, as the Greeks called it, melic—poetry was inseparably connected with music. The metres employed show great variety; and many forms of lyric poetry developed, differing according to the purpose of the poem and the method of its rendition, whether by an individual or by a choral band. Tradition said that Terpander (c.675 B.C.) made a great development in music, possibly by adding three strings to the four previously employed on the lyre; he also developed new measures. The greatest of the early lyric poets were the Æolians, Alcæus and Sappho of Mitylene (c.600 B.C.). The former's lyrics covered a wide range of subjects, from political themes to the praise of love and wine. Sappho, the single great poetess of Greece, made her verse express her own fierce passions. Anacreon of Teos (c.530 B.C.) wrote in the Ionian dialect in praise of pleasure and sensuous delights. There were also many poets of choral lyric among the Dorians; the most important were Aleman (c.630 B.C.), who introduced lyric forms into Sparta and, according to tradition, developed the strophic structure of choral songs. Arion (c.600 B.C.) gave the dithyramb a finished form, and Stesichorus of Himera (c.640–555 B.C.) cultivated lyric poetry in Sicily and contributed to the development of the form of the choral ode. He went beyond the usual

province of lyric poetry in that he ventured to handle epic themes. Ibycus of Rhegium (c.540 B.C.) followed Stesichorus closely. Simonides of Ceos (B.C. 556-468) was of great importance for the history of lyric poetry, for, combining the strength of Ionian genius with Dorian art, he addressed his lyrics to all Greeks and so gave this branch of poetry a universal character. His nephew, Bacchylides, who flourished in the first half of the fifth century B.C., like his uncle at one time a resident at the court of King Hiero of Syracuse, was famed for his hymns and odes, recently made known in part to us by an Egyptian papyrus. But the greatest of all the lyricists was Pindar (522-422 B.C.), a native of Thebes, yet in spirit and genius a national poet, whose extant hymns of victory attest his greatness. Pindar covered almost every province of lyric poetry and marks the culmination of this art in Greece. See LYRIC POETRY.

3. The Attic Period. The prestige which Athens gained in the Persian wars, and the power and wealth which her sea empire brought, soon made her the most prominent state in Greece. At the same time she became the centre of Greek intellectual life and maintained this position until the close of the fourth century.

The first great literary development of the fifth century was the drama. Tragedy and comedy alike had their origin in the worship of the god Dionysus (see GREEK FESTIVALS, *Dionysia*)—the former, as Aristotle says (consult his *Poetics*), developing from the dithyramb, the latter from the license of the phallic song. Tradition made Icaria, an ancient centre of the worship of Dionysus in Attica, the birthplace of Attic drama and named Thespis (q.v.) as the inventor of tragedy. The date given for the first tragic production is 534 B.C. From the end of the sixth century the state undertook the expense of the tragic choruses. Of the other tragic poets of the earliest period, Phrynichus (sixth to fifth century) most deserves mention. While the drama had as yet but a single actor, so that action in the proper sense of the word was impossible, still the extant titles show that Phrynichus handled a variety of themes. In the *Capture of Miletus* he introduced the handling of contemporary themes; in this he was followed by Æschylus (q.v.) in his *Persians*.

It was Æschylus (c.525-456 B.C.), however, who, by the introduction of a second actor, developed tragedy from a succession of narrative scenes to a play of action. The dialogue now became of more importance than the choral songs, whereas the opposite had been the case in the earlier period. Æschylus was nobly born and was deeply stirred by the dangers which threatened the Greeks from the Orient. He was a poet of the highest order and a most profound thinker, while his moral and religious feeling was genuine and intense. Many of his conceptions have a grandeur almost unparalleled in literature. Of the 90 plays which he is said to have written, but seven have been preserved; among them, however, is the single extant trilogy, the *Oresteia: Agamemnon, Choëphori, and Eumenides*. The *Agamemnon* is regarded by many as the greatest Greek tragedy extant.

Sophocles (c.496-406 B.C.) was the greatest artist among the tragedians of the fifth century B.C. His conceptions lack the grandeur of those of Æschylus, and he is less humanly pathetic than Euripides, but he excels both in representing the great human emotions. His charac-

ters are always lofty and noble. He is, further, the interpreter of the highest ideals of the age of Pericles, and he must always be interpreted as such. By introducing a third actor he gave tragedy its final form. Of more than 120 plays which were attributed to him, we have but seven. Of these, the *Edipus Tyrannus* is the greatest: in the opinion of many critics it rivals the *Agamemnon* of Æschylus for the first place among ancient tragedies.

Euripides (480-406 B.C.), in contrast to his older contemporary, Sophocles, represents Athens in transition from the age of Pericles to the new conditions of the fourth century: with him the decline of tragedy is usually said to begin. Although it is true that he is the last of the great tragedians, we can more correctly hold that he represents the last stage in the development of ancient tragedy and marks the way to the later drama. Tragedy in his hands lost much of its ideal character and came down to earth: his heroes talk and act as ordinary men talk and act; his language, too, approached that of everyday life. While he was bitterly attacked by the comic poet Aristophanes, the mouthpiece of the ultraconservatives, he still enjoyed even during his lifetime the high reputation he deserved. He exercised a profound influence on all later Greek drama, tragic and comic both, and more perhaps than any other single Greek author influenced Roman writers. (See, e.g., ENNIUS.) In tender pathos he was unexcelled, as well as in the representation of love and hate, and many scenes in his dramas are unequalled. Yet in the management of his plots he was inferior to his predecessors. Euripides left 92 plays, of which we have 18, including the *Cyclops*, the unique extant example of a Satyr play. The *Rhesus*, which is found with these plays in the manuscripts, is generally regarded as spurious. Among the best of his plays are the *Medea*, *Hippolytus*, *Bacchæ*, and *Iphigenia at Aulis*.

As has been said above, comedy also developed in connection with the worship of Dionysus. Tradition said that Megara was its first home, and that Susarion (c.580 B.C.) transplanted it to Attica. It came to perfection on Athenian soil more slowly than its sister art tragedy: the state did not undertake the expense of it until about 470 B.C. In the meantime Epicharmus (c.480 B.C.) brought a form of comedy to high development in Sicily and undoubtedly influenced Athenian writers.

Attic comedy is divided into three periods—Old Comedy (sixth century-400 B.C.); Middle Comedy (400-336 B.C.); New Comedy (336-250 B.C.). The comic poets at Athens in the early fifth century—Chionides, Epicharmus, and Magnes—are little more than names to us. The great poets of the Old Comedy were Cratinus (died c.421 B.C.), Eupolis (died c.411 B.C.), and Aristophanes (c.450-385 B.C.). Only fragments of the comedies of the first two are extant; of the plays of Aristophanes, the greatest of the three, we have 11 complete, covering the period 425-388 B.C. These exhibit the great genius of their writer, his keen wit and stinging satire, as well as his mastery of broad burlesque, and also show him to have been a lyric poet of marvelous sweetness (cf., e.g., the choral passages in the *Birds*). Further, his plays mirror the changing social and political conditions of the time in which they were produced. In the earlier plays the prevailing theme is the

sharpest personal and political satire; in the middle group there is much greater reserve; and in the last plays personal and political attack is abandoned for literary and social satire. This tendency, with the gradual decay of the chorus, marks the transition to the Middle Comedy. In this the choral element was insignificant, and the themes were frequently philosophical and literary criticism, parodies of myth—one of the stock subjects from the earliest period also—and social satire. The chief names in this period are Antiphanes, Anaxandrides, and Alexis. The New Comedy was distinctly a comedy of manners, with stock characters and situations. The most important poets were Philemon (361–263 B.C.), Diphilus, and above all Menander (342–291 B.C.). The strength of this comedy was in the fine delineation of character, smoothness of verse, and fineness of wit. Of it, as of the Middle Comedy, no play has been preserved complete (see, however, MENANDER); but the adaptations of Plautus and Terence with the extant fragments enable us to reconstruct its general characteristics.

The Greek drama had reached its full development before a prose literature in the strict sense of the word appeared. The earliest literary prose was used in Ionia, the birthplace of artistic Greek poetry. In the middle of the sixth century B.C. Pherecydes of Syros set forth his philosophical doctrine in prose; Anaximenes and Anaximander also employed the same vehicle. Towards the close of the sixth century there also appeared in Ionia the beginnings of historical writing. The earliest historians were called *logographi* (see LOGOGRAPHERS), writers of prose, to distinguish them from *epopoîi*, the writers of epic verse. They compiled genealogies, myths, and legends, and recorded the history of the founding of cities, the customs and institutions of various peoples, both foreign and Greek. Cadmus of Miletus was the earliest of the logographers; Hecataeus belonged to the period of the Persian wars. Others were Acusilaus, Xanthus, and Pherecydes of Leros. With Hellenicus of Mitylene (c.450 B.C.) more careful work began. He was a prolific writer, both on chronology and on the history of many states in Greece. But the title of "the father of history" belongs to Herodotus (c.484–c.424 B.C.). A native of Halicarnassus, born of a rich and noble family, he was a great traveler in Egypt, the remote East, and over most of the Greek world. He visited Athens twice, resided and probably died at Thurii, in southern Italy. His history was based on the material he collected in his travels and on the work of his predecessors. His purpose was to present a record of the dramatic struggle between Greece and Persia; as introduction to his main theme, he traced the rise and growth of the Persian Empire. In doing this he gave an account of the geography, history, and customs of Persia, Egypt, Libya, Babylonia, Thrace, and Scythia. The last four of his nine books relate the invasions of Greece by Darius and Xerxes. Herodotus was lacking in critical sense, did not go beneath the surface in seeking the causes of events, and had no interest in constitutional history. Yet his narrative of facts is usually correct. His real distinction is based on the fact that he was the first to compose a great historical work with unity of plan, and to bring large masses of facts into an ordered whole.

The founder of philosophical history was Thucydides (died c.399 B.C.). His history of the Peloponnesian War from its beginning to 411 B.C.—he did not live to complete it—is an attempt to give an accurate and concise record of events; it also shows deep study of causes and a careful investigation of facts. The account is dispassionate and impartial: certain passages are unsurpassed in their nobility and stern pathos. While we may regret Thucydides' neglect of social conditions, his work is one of the greatest histories ever written. Xenophon (c.434–c.355 B.C.) continued Thucydides' work in his *Hellenica* to the battle of Mantinea. Xenophon was the author of many other works, of which the most important are his *Anabasis*, an account of the expedition of Cyrus the Younger and of the successful retreat of the 10,000 Greeks from the heart of the Persian Empire; the *Cyropædia*, an historical romance with Cyrus the Great as its hero; and the *Memorabilia*, a report of the teachings of Socrates. In his minor works Xenophon appears as the first Greek essayist.

Among the later historical writers, none of whose works is preserved, must be named Ctesias, the real founder of Oriental history in Greek; Theopompus (born c.378 B.C.), and Ephorus (flourished c.350 B.C.), who introduced the rhetorical method of historical composition. From about 360 B.C. several writers known as the Attids devoted themselves to Athenian history and archaeology.

Athenian oratory received a powerful impulse from the teachings of the Sophists (q.v.), of whom Protagoras and Prodicus were the chief, and was also greatly influenced by Sicilian rhetoric, which Gorgias of Leontini introduced in 427 B.C. In the canon of the 10 Attic orators, Antiphon (c.480–411) holds the earliest place. His speeches retain the character of the older oratory and have much in common with the speeches Thucydides has placed in his history.

The next three are Andocides (born c.440 B.C.), Lysias (c.450–380 B.C.), and Isocrates (c.436–338 B.C.). Of these, Lysias shows the perfection of the simple style, while that of Isocrates is more ornate and rhetorical. The latter's prose became the literary standard from the middle of the fourth century. Isæus (c.420–350 B.C.), the pupil of Isocrates, won his chief fame in cases of inheritance. All the preceding, however, were surpassed by Demosthenes (383–322 B.C.), who, by his complete mastery of language and rhetoric, and still more by his originality, his political insight, and his ardent zeal for the freedom of his native state, is the greatest orator, not only of all Greece, but of all history. His heroic though fruitless struggle to save Greece from subjection by Macedon, which he saw impending, is a splendid example of what can be accomplished by the genius of one man. Æschines (389–314 B.C.), the great rival of Demosthenes, was second to him alone in eloquence, while Lycurgus, Hyperides, and Dinarchus were less famous contemporaries.

Although the early Ionian philosophers had in some cases reduced parts of their doctrines to writing in both prose and verse, and the Eleatics, Xenophanes and Parmenides, and also Empedocles, composed long philosophical poems, little is left of their works. The same is true of the famous work *On Nature* by Anaxagoras (born c.500 B.C.), who transferred philosophy from Ionia to Attica. Socrates left no writings. The literary history of Athenian philosophy, therefore, begins with Socrates' greatest pupil, Plato

(c.427-347 B.C.), the founder of the Academic school, although others—e.g., *Æschines*, *Euclid* of Megara, *Phædo*, and *Antisthenes*—composed works which reflected the manner and teaching of their master. Plato was born of a noble and rich family, traveled widely, and was for 10 years the disciple of *Socrates*. He was endowed with a remarkable poetic imagination and attained a charming and flexible style which lies between prose and poetry. In all 42 dialogues are extant under his name, of which 35 are probably genuine. The *Republic*, *Phædo*, and *Gorgias* are perhaps the greatest.

Plato's pupil, *Aristotle* (384-322 B.C.), the founder of the Peripatetic school, was the first to apply a rigidly scientific method to investigation. He sought to map out the provinces of human knowledge and to show the principles underlying each and the problems with which each was concerned. He was the founder, in a strict sense, of scientific rhetoric, logic, political science, and natural history. His genius has influenced human methods of thought from his day to the present time. *Aristotle's* successor, *Theophrastus* (c.372-287 B.C.), has left us two botanical works and a collection of 30 character sketches, as well as some fragments of philosophical and scientific works.

4. *The Alexandrian Age.* With the decay of local political life in Greece and the gradual withdrawal of thoughtful men from public affairs, there came an enlargement of intellectual sympathy and a cosmopolitan attitude of mind unknown to the Greeks of the earlier period. The conquests of *Alexander*, which enormously enlarged the sway of Greek ideas and bound the world together as never before, contributed greatly to the new spirit which is characteristic of the Hellenistic period. Alexandria became the centre of this new world; and in that city was developed a literature, no longer spontaneous or creative, but derivative and erudite. (See ALEXANDRIAN AGE.) Learned poetry was cultivated by *Callimachus* (c.310-c.240 B.C.), famous for his elegies, hymns, and epigrams, some of which we still have; *Aratus* (born c.270 B.C.), author of an extant astronomical epic; *Lycophron* (c.270 B.C.), whose obscure poem *Alexandra* has survived; *Apollonius Rhodius* (c.295-c.215 B.C.), whose artificial epic, *Argonautica*, is the best work of its kind that this period has left us; and finally *Nicander* (c.150 B.C.), who composed medical and other didactic works in epic form. The truest poet of the age was *Theocritus* (c.310-c.245), whose pastoral idylls are unsurpassed in any literature. *Bion*, a contemporary of *Theocritus*, and *Moschus* (c.140 B.C.) wrote also in the pastoral manner. Three of *Theocritus's* poems are mimes, dramatic pictures of common life, such as were first developed by *Sophon* in the fifth century. This class of literature was cultivated with great success by *Herondas* (c.250 B.C.). Closet tragedy, parody, and satire also flourished at this time.

Prose literature was scientific. The librarians *Zenodotus*, *Aristophanes*, and *Aristarchus* established literary scholarship and grammatical study on scientific bases; *Euclid* created a system of geometry; and *Eratosthenes* founded astronomical geography and scientific chronology. In the third century B.C. *Manetho* and *Berosus* wrote chronological histories of Egypt and Chaldaea respectively.

5. *The Græco-Roman Period* (146 B.C.-529 A.D.). After the conquest of Greece by Rome

in 146 B.C., Rome gradually took over the intellectual as well as political life of Greece, although she did not become a great centre of the world until the Imperial age. *Polybius* (c.205-c.120 B.C.), the chief Greek historian after *Herodotus* and *Thucydides*, belongs to the transition period. His history, in 40 books, records the course of Roman conquest from 264 B.C. to the fall of Carthage (146 B.C.), more especially from 220 to 168 B.C. It has reached us in a mutilated form, but is the most important source of our knowledge of the period. About 40 B.C. *Diodorus Siculus* wrote a history of the world down to *Cæsar's* Gallic Wars, in 40 books, of which we have complete only books i-v and xi-xx. *Dionysius of Halicarnassus*, in *Augustus's* reign, composed an early history of Rome, designed as an introduction to *Polybius*; of this there are extant only the first 10 books, reaching to 450 B.C., and some fragments. His rhetorical writings exhibit considerable critical ability. Other historians are *Josephus* (born 37 A.D.), whose two works on the Jews are of great value; *Plutarch* (c.46-c.120 A.D.), author of the famous *Parallel Lives and Morals*; *Arrian* (95-175 A.D.); *Appian* (flourished 150 A.D.); *Dio Cassius* (c.150-c.235 A.D.); and *Herodian* (flourished 230 A.D.). *The Lives of the Philosophers*, by *Digenes Laërtius* (third century A.D.), and *Philostratus's* *Lives of the Sophists*, are valuable historical sources. Geography is represented by *Strabo* (c.64 B.C.-19 A.D.). The work of *Pausanias* the *Periegete* (c.160 A.D.) is of the greatest value for a knowledge of Greek topography and works of art. In the same century *Ptolemy* developed his system of geography and astronomy, and *Galen* composed his medical treatises. At the close of this second century *Athenæus* wrote his *Deipnosophistæ*, a miscellany on every possible subject, cast in the form of a dialogue, which is valuable for the varied information it contains, drawn from sources now lost to us. Systematic rhetoric is represented by *Hermogenes* (second century) and *Longinus* (third century), and the new oratory of the later Sophists by *Dio Chrysostom* (first century), *Ælius Aristides* (second century), and by *Themistius*, *Himerius*, and *Libanius* (fourth century). The writings of the Greek fathers of the Church cannot be touched on here. (See PATRISTIC THEOLOGY.) Romance was cultivated by *Xenophon*, *Longus*, *Heliodorus*, *Achilles Tatius*, and *Chariton*. The most important literary philosophers were the Stoics, *Epictetus* and *Marcus Aurelius*; the Neoplatonists, *Plotinus*, *Porphyry*, *Iamblichus*, and *Hypatia*, and the Athenian *Proclus*. The poets of the period are *Babrius*, *Oppian*, *Nonnus*, and *Quintus Smyrnaeus*. Finally must be mentioned *Lucian of Samosata*, the great satirist and stylist of the second century, who most resembles *Aristophanes* in his wit and humor.

6. *The Byzantine Period, to the Fall of Constantinople* (1453). The latest of the writers mentioned in the preceding section might be counted in this period. For more than 1000 years after the removal of the capital from Rome, Constantinople was the metropolis of an empire whose language was Greek, and from which a vast literature has been preserved, much of which is of value. No adequate account can be given in the brief space here allowed; only the most important fields can be named. In history no genius appeared; but a long line of historians and chroniclers, from

Agathias, in the sixth century, to Georgius Phrantzes and Laonicus Chalcondyles, in the fifteenth, have preserved to us the record of the great Byzantine Empire. Rhetoric was best represented by Johannes Doxopater, Alexis Comnenus (Byzantine Emperor, eleventh century), Georgius of Cyprus, Nicephorus Chumnuus, and Theodorus of Hyrtace (thirteenth century), and Demetrius Cydones (fourteenth century). Philosophy was not a favorite pursuit; but Michael Psellus (1018-c.1100) deserves mention for the enormous range of his intellectual activities. The most famous of theologians was Johannes Damascenus (eighth century), while in the polemical strife of the fourteenth century Nicephorus Gregoras, Gregorius Palamas, Johannes Cantacuzenus, and Cyprissiotis took the leading parts. Naturally the study of the ancient authors occupied the learned in this period, and many commentaries have come down to us; in most cases, unfortunately, these are hardly more than stupid dilutions and expansions of ancient commentaries still extant. The best known of the Byzantine scholiasts are: Tzetzes (twelfth century); Eustathius (twelfth century), famous for his great commentary on Homer; Moschopolus (thirteenth century), who wrote on Homer, Pindar, the tragedians, and Theocritus; Thomas Magister (thirteenth to fourteenth centuries), commentator on the tragedians and others; Johannes Pediasimus, whose scholia on Hesiod have a slight value; and Triclinius (fourteenth century), whose writings include commentaries on Hesiod, Pindar, and the tragedians. The lexical work of the time is represented chiefly by Photius, Suidas, and the several *Etymologica*. (See ETYMOLOGICUM MAGNUM.) In poetry the great anthologies were collected, but little of original value was accomplished. (See ANTHOLOGY.) Profane verse was cultivated by Theodorus Prodromus (twelfth century) and by Manuel Philes (thirteenth to fourteenth centuries), but the best poetic composition appears in Christian hymns. See ROMATIC LITERATURE.

Bibliography. For the classical period, consult the histories of Greek literature in English, by Müller and Donaldson, Mahaffy, Jevons, Murray, Capps, and Fowler; in French, by Croiset; and in German, by Bergk, Bernhardt, Sittl, and

römische Kultur (ib., 1913); Bethu-Wendland, Norden, "Griechische und römische Literatur," in Norden, *Einleitung in die Altertumswissenschaft*, vol. i (2d ed., ib., 1913). More detailed works, less wide in scope, will be found cited in the articles on the various authors named above.

GREEK MUSIC. The development of music among the Greeks was never carried to that degree of perfection which characterized the other arts. Polyphony was unknown to them, and consequently their elaborate theoretical system had reference only to melody. How extensively their theories were carried out in practice we have little chance to judge, for our knowledge of Greek music is derived almost entirely from the writings of the theorists. The mathematical and technical details are very involved and are still the subject of discussion among scholars. The most noticeable general characteristics are, on the one hand, the limited compass, imperfect tonality, the thin, weak quality of their principal instrument (the lyre), and, on the other hand, perfect unison of musical form and language, a keen sense of difference in pitch, and splendid, delicate rhythms. But, as has been said, they had no conception of chords, and at its best their music must have been colorless.

Their system was the opposite of that used in modern music, for instead of taking the *major ascending* scale as a foundation, they used the *minor descending* scale, which was based, not on an octave and its repetition, but on a fourth and its repetition. Originally there were three scales—Dorian, Phrygian, and Lydian—named after the countries in which they sprang up. It would seem that at first these scales consisted of seven tones; but from the earliest times of which we have record they had eight tones, named from the strings of the lyre. The names of these tones were: *netē* (lowest, this corresponded to our highest), *paranētē* (next to *netē*), *tritē* (third), *paramesē* (next to *mesē*), *mesē* (middle), *lichanos* (forefinger string), *parhypatē* (next to the top), *hypatē* (topmost). The scale as thus formed was composed of two tetrachords, *disjoined* by a "diazematic tone" (so called because it cut the scale in two). The three original scales were approximately as follows:

Christ-Schmid (5th ed., Munich, 1908-13). For the Alexandrine age, consult: Susemihl, *Geschichte der griechischen Literatur in der Alexandrinerzeit* (2 vols., Leipzig, 1891-92); Couat, *La poésie alexandrine* (Paris, 1882); for the Byzantine period, Krumbacher, *Geschichte der byzantinischen Literatur* (2d ed., Munich, 1897). Serviceable in various ways will be Symonds, *Studies of the Greek Poets* (3d ed., 2 vols., London, 1902); Jebb, *The Growth and Influence of Classical Greek Poetry* (Boston, 1894); Wright, *A Short History of Greek Literature* (New York, 1907); Jebb's "Sketch of Greek Literature," in Whibley's *A Companion to Greek Studies* (Cambridge, 1905); Wilamowitz-Moellendorf and others, *Die griechische und lateinische Literatur und Sprache* (3d ed., Leipzig, 1912); Baumgarten-Poland-Wagner, *Die hellenische Kultur* (ib., 1905) and *Die hellenistisch-*

The diazematic tone intervals were respectively *b-a*, *a-g*, *g-f*. To these scales were added the Hypo-Dorian, Hypo-Phrygian, and Hypo-Lydian, each a fifth *below* its original, and still later three more, the Hyper-Dorian, Hyper-Phrygian, and Hyper-Lydian, each of the latter being a fifth *above* its original scale. These additional scales were composed of *conjoined* tetrachords, the so-called "diazematic tone" following the other notes in the case of the "hypo" scales and preceding them in the case of the "hyper" scales. The number of scales was ultimately increased to 15; but the above-mentioned nine were the important ones, and from them was developed the *Perfect System*, which became the basis of mediæval music. See DIAZEMATIC TONE; GAMUT; PLAIN CHANT; MODES.

How the Perfect System became a standard we cannot tell; it probably grew slowly, as the

compass of the various instruments increased. It comprised two octaves, a^1 — A . The foundation was the Dorian scale, and to this were added two conjoined tetrachords, one at either end of the scale. This arrangement gave a compass of two octaves, lacking one note, and to complete the full octaves an extra note (called *Proslambanomenos*, the acquired tone) was suffixed. Baker gives the following arrangement of the Perfect System:

It will be seen that, as in the original Dorian scale, the two middle tetrachords were disjoined. For modulations to the key of the lower quint, "the semitone above the highest note of the middle tetrachord was used: and hence was formed a special conjunct tetrachord (d^1 — c^1 — bb^1 — a^1), in apposition to the disjunct one." (Riemann.) The names of the tones in the Perfect System were derived from those of the original octave. The *mesē* was the tonic of this system, and was regarded as the central and most important note.

But though the Perfect System contained all the essential elements, there were certain defects to be remedied. Chief of these was the incompleteness of their chromatic degrees. As we have seen, their scales contained certain semitones; but to get a complete set of sharps and flats, they had recourse to *transposing scales*. The difference of their scales lay in the position of the semitone; so if, e.g., we substitute in the original Phrygian scale a conjoined tetrachord in place of a disjoined one, and by so doing change the position of the semitone, we shall have changed the scale to the Hypo-Dorian form. But although the position of the semitone is the same in both scales, the compass of this transposed Phrygian scale differs from the compass of the Hypo-Dorian. To all purposes, then, we have a new scale whose compass is Phrygian and whose form is Hypo-Dorian. This is called the transposed Phrygian scale. By this system of transposed scales the Greeks finally acquired a complete series of sharps and flats.

The musical notation of the Greeks was very complicated. They used a double set of characters, one for the singer and one for the player. At first there were 15 characters (corresponding to the notes of the diatonic scale), taken from the letters of the old Ionic alphabet. Other notes were made by changing slightly or inverting these original characters. The musical instruments were few and simple. The lyre (q.v.), the cithara (q.v.), and the magadis, or harp, with from 20 to 40 strings, were the most important stringed instruments; while the aulos, a flute, and the syrinx, a shepherd's pipe, were the sole wind instruments. Our examples of ancient Greek music are few. The oldest is a papyrus fragment of six lines of a chorus in the *Orestes* of Euripides. The fragment was written in the time of Augustus, but the music is much earlier. Two hymns to Apollo, composed in the second century B.C., were found at Delphi in 1893, engraved on the marble walls of the Treasury of the Athenians. These have been specially studied by Reinach, Weil, and Crusius. Another in-

scription from Asia Minor has preserved a short song with the musical notation. The other remnants are three hymns, two of which were composed in the time of Hadrian, and a few specimens of instrumental music. It is of passing interest to note that in 1839 a concert of ancient Greek music was given in Bremen. Consult: Geraert, *La musique de l'antiquité* (Ghent, 1875), the standard work on ancient music; *La mélodie* (ib., 1895-96); Monro, *The Modes of*

Ancient Greek Music (Oxford, 1894); E. Romanioli, *La musica greca* (Rome, 1905); and for technical treatises, Johnson, *Musical Pitch and the Measurement of Intervals among the Ancient Greeks* (Baltimore, 1896), and Ambros, *Geschichte der Musik*, vol. i (Leipzig, 1888). For the remains of Greek music and the theoretical treatises, see K. von Jan, *Musici Scriptores* (ib., 1895-99); Reinach and Weil in the *Bulletin de Correspondance Hellénique*, xvii, xviii (Paris, 1894-95); O. Crusius, *Die delphischen Hymnen* (Göttingen, 1894). See also Gleditsch in Müller's *Handbuch der klassischen Altertumswissenschaft*, vol. ii (3d ed., Munich, 1901).

GREEK PHILOSOPHY. The philosophy of the Greeks, which is the source of the Western philosophy of modern times, as Homer is the source of Western poetry, had its origin, not in Greece itself, but in the colonies of Asia Minor and Magna Græcia. The earliest or pre-Socratic period may be broadly divided into the Ionic and Italic schools. Both attempted to determine the nature, origin, laws, and destiny of the visible world. The earliest definite name is that of the founder of the Ionic school, Thales of Miletus, who began the transition from the mythological to the scientific interpretation of nature, and the search for an original substance of reality which he found in water. He was followed by Anaximander, who found this substance not in water but in indeterminate matter, while a third teacher of Miletus, Anaximenes, preferred the definite substance of air. A little younger was the greatest of the pre-Socratic philosophers, Heraclitus. He held that the one substance, changing itself into all the elements known to us, was fire, which exhibits most clearly the constant movement and activity of the world.

Next comes Pythagoras of Samos, who settled at Crotona in Italy, about 530 B.C., and there founded what is known as the Italic school. In contrast to the Ionic school, which believed in one ever-changing, self-developed universe—what Ritter has called dynamical physicism—the Italic philosophical physicists found their key to the universe, not in any known substance, but in number and proportion. After the school of Pythagoras came a second Italian school, the Eleatic, traditionally regarded as founded by Xenophanes of Colophon, who migrated to Elea about 540 B.C. Its chief representative is Parmenides; his philosophy is the direct antithesis to that of Heraclitus in assuming that all that exists has existed and will exist the same forever, and that it is change and multiplicity alone which are illusory—an early idea of the indestructibility of matter.

The Ionico-Italic school represented mechanical physicism. Empedocles of Agrigentum and Anaxagoras, the teacher of Pericles and Euripides, agreed in accepting the Eleatic principle of the immutability of substance, while denying its absolute oneness. Democritus of Abdera was the chief exponent of the atomic theory, which based the universe on combinations of indivisible, unchangeable atoms. With him and Leucippus closes the series of the pre-Socratic dogmatists, who devoted themselves to the investigation of nature as a whole. Between them and Socrates, the great regenerator of philosophy, comes the skeptical and sophistic era. The earliest of the Sophists are Protagoras of Abdera and Gorgias of Leontini; Hippias of Elis and Prodicus of Ceos were somewhat younger. The effect of their teaching was the disintegration of established beliefs, although within the last few years there has been an attempt by some thinkers to give the Sophists, especially Protagoras, a much higher value as constructive thinkers.

Socrates, while sharing the general skepticism as to natural philosophy, maintained the certainty of moral distinctions and laid down a method for the discovery of error and the establishment of truth. Among those influenced by him were certain one-sided Socratics. Antisthenes, founder of the Cynic and indirectly of the Stoic school, was an exaggerator of the ascetic and unconventional side of Socrates. Aristippus of Cyrene, founder of the Cyrenaic school, also dwelt exclusively on the practical side of his master's teaching, holding that it was impossible to attain objective knowledge, but that pleasure is the true end of life. In Hegesias the Cyrenaic doctrine reached its fullest expression, anticipating much that later was regarded as Epicurean.

The two most famous disciples of Socrates were Plato and Aristotle. While in some ways they looked at life and being from distinct points of view, giving the foundation for the famous saying that "every man is born either a Platonist or an Aristotelian," they have manifold relations. Plato's rich contributions to logic, psychology, metaphysics, ethics, and natural religion required codification. Aristotle, with perhaps the greatest gifts for analytic systematization of philosophy that have ever been seen, applied himself to the task. Thus, he developed Plato's dialectic method into the strict science of logic; Plato's "ideas," though shorn of the separate supramundane existence which Aristotle believed Plato attributed to them, survived in the Aristotelian "form" as opposed to "matter." Plato's school was known as the Academy (q.v.), and Aristotle's as the Peripatetic school.

With the death of Aristotle a new age begins. The fearless Greek genius which had soared to the contemplation of supreme ideas of good, of the form and end and cause of all existence, sank back to earth. As the great pre-Socratic movement terminated in the skepticism of the Sophists, so this greater movement found its natural reaction in the skepticism of Pyrrho and the later Academy. The post-Aristotelian school was predominantly ethical, sensationalist, and materialist, as contrasted with the more idealistic metaphysics of the preceding age. Of these schools the least original and the least important is the later Peripatetic. The most important name among the Sceptics is Pyrrho of Elis.

The later development of the Academy may be divided into three schools—the old, the middle or Skeptic, and the reformed or Eclectic Academy. To the first belong the names of Speusippus, Xenocrates, and Polemo, who modified the Platonic doctrine mainly by the admixture of Pythagorean elements. The chief exponents of the middle Academy were Arcesilaus, Carneades of Cyrene, and his disciple, Clitomachus of Carthage, who neglected the positive doctrine of Plato and employed themselves mainly in a negative polemic against the dogmatism of the Stoics. The reformed Academy began with Philo of Larissa, the pupil of Clitomachus and teacher of Cicero.

But the two most important developments of the post-Aristotelian philosophy were Stoicism (see STOICS) and Epicureanism (q.v.). As the Greeks came in contact with other races, and the law of the state and the old religion of Greece were shaken, the need was felt of finding a substitute for these, a principle of conduct which should enable a man to stand alone and rise superior to circumstances. Such a principle the Stoics claimed to have found. Their great names are Zeno, the founder, Cleanthes of Assos, and Chrysippus of Soli, called the second founder; in Panætius of Rhodes and Posidonius of Apamea, Stoicism showed a softened and eclectic tendency.

The broad distinction noticed above between the Italic or Doric and the Ionic schools reappears in the marked contrast between the two later materialistic schools. The Stoics are Doric and Roman in character, the Epicureans are Ionic and Greek. "The one might be said to represent the law, the other the gospel of paganism." Epicureanism may be briefly described as a combination of the physics of Democritus with the ethics of Aristippus; its end was even more exclusively practical than that of the Stoics. After Epicurus himself the most distinguished members of the school were Metrodorus, Hermarchus, Colotes, and Leonteus.

But beneath the antagonism of the post-Aristotelian schools there was much in common, and a constant tendency, especially in the Academic and Stoic schools, to approximate to each other. The rise of the Roman power and the growing intercourse between Greece and Rome furthered a natural movement, on the one side towards Skepticism and on the other towards Eclecticism, as it was surmised that different schools presented different aspects of truth. A consideration of the latter (see ECLECTICISM), which is typified in Cicero, would carry us outside the limits of purely Greek philosophy, as would the later synthesis of the ideas of the East and the West, known as Neo-Platonism (q.v.). Consult: Mayor, *Sketch of Ancient Philosophy from Thales to Cicero* (Cambridge, 1881); Bender, *Mythologie und Metaphysik* (Stuttgart, 1899); Erdmann, *History of Philosophy*, vol. i (Eng. trans., London, 1890); Brandis, *Geschichte der Entwicklungen der griechischen Philosophie* (Berlin, 1862-64); Bakewell, *Source Book in Ancient Philosophy* (New York, 1907); Windelband, *Geschichte der antiken Philosophie* (3d ed., München, 1912; Eng. trans., New York, 1899); Jackson and Adams, *Texts to Illustrate a Course of Elementary Lectures on Greek Philosophy* (London, 1901-02); Benn, *The Philosophy of Greece* (ib., 1898); Burnet, *Early Greek Philosophy* (2d ed.,

ib., 1908); Gomperz, *Greek Thinkers* (4 vols., New York, 1901-11); Zeller, *Grundriss der Geschichte der griechischen Philosophie* (9th ed., Leipzig, 1908; Eng. trans., London, 1885); *Die Philosophie der Griechen in ihrer geschichtlichen Entwicklung* (4th ed., Leipzig, 1909; Eng. trans., with varying dates); and see the articles on the various schools and philosophers mentioned above.

GREEK POLITICAL PARTIES. See POLITICAL PARTIES, *Greece*.

GREEK RELIGION. As considered in this article, religion is a term to express the relations in which the Greek stood to his gods. Such relations are, of course, conditioned by the beliefs held at various times as to the nature, power, and attributes of these gods, and these beliefs in turn are expressed in forms of worship, in literature, and in life. In the developed civilization of Greece this religion is a complex organism made up of various elements which the complete absence of a system of theology has left unharmonized, so that few conceptions are sharply and consistently defined, while many of the details are hopelessly blurred. In spite, however, of this lack of precision, there is a certain unity in these religious views, and, as presented in literature and art, the Greek polytheism has proved a powerful factor in the development of modern civilization. So far, indeed, as the literature is concerned, it must be admitted that it presents to us rather the mythology than the religion of the Greeks, i.e., it gives less prominence to the belief in the gods as divinities than to the stories about them, in which the strictly religious element usually occupies but a small place. The nature and growth of myth are treated in the article on MYTHOLOGY, and the chief myths relating to the gods and heroes are to be found in the separate articles devoted to them. For the secret rites connected with Greek religion, see MYSTERIES.

The Greek was a deeply religious person. He had a strong sense of his weakness, as compared with the powers of nature by which he was surrounded, and gladly owned his dependence upon the divine beings by which he believed those powers to be controlled. The perception of the uncertainty of human fortune and its apparently arbitrary course undoubtedly led to fear of the might which could produce such sudden alternations of prosperity and adversity; yet it would be a mistake to regard this as the determining principle in the attitude of the Greeks towards their gods. In general, the relations between gods and men were friendly, and the wrath of the gods was directed against those who overstepped the limits assigned to human activities, and by overweening pride, reckless ambition, or even immoderate prosperity, excited the divine envy and brought Nemesis upon themselves. The words of Herodotus, "The god suffers none but himself to be proud," are the concise expression of a thought which is to be found throughout the whole range of Greek literature. While, therefore, fear was not prominent, there was a very distinct sense of human limitation; and the gods, as the single source of all that came to men, were approached with offerings and prayers either to win their favor for the future or in thanksgiving for the past. In front of every door stood the conical stone of Apollo Agyieus (Apollo of the Streets), and often a terminal

figure of Hermes; in the court was the altar of Zeus Herkeios; at the hearth Hestia was worshipped; kitchen, storerooms, and bedchamber had their appropriate divinities. (See also GROVES, SACRED.) From birth to death there were few events in the life of a Greek in connection with which the gods were not remembered. And if this is true of the individual, much more is it true of the state. On the favor of the gods depended its existence; consequently the festivals of the gods were celebrated with devout regularity under the care of high officials, while rich offerings marked the public thankfulness for unexpected deliverance or unusual prosperity. (See FESTIVALS; GREEK FESTIVALS.) Thus, the Athenian victories over the Persians were commemorated by the erection of the colossal bronze Athena on the Acropolis and of a group of statues at Delphi, while the zenith of the Athenian Empire saw the erection of the Parthenon and the Propylæa on the Acropolis, as well as new temples at Eleusis, Rhamnus, and Sunium. The limits of this article prevent a more detailed statement, but any careful study of Greek private life and public institutions will show how closely religion was connected with both. Yet, in spite of this, sacerdotalism is almost unknown. At the seats of the Mysteries (q.v.) or the oracles (see ORACLE), such as Eleusis or Delphi, the priests were of course powerful, but in general they were merely official representatives of the community, chosen as other officials were or sometimes allowed to purchase their position. Even where the office was hereditary or confined to a certain family, it was not regarded as conferring on its possessor any peculiar knowledge of the will of the gods or special power to constrain them. The need of an intermediary between the worshiper and the god was not felt, nor was the exact performance of a complicated ritual required. It is sometimes said that the religion of the Greeks was independent of morality, and it must be admitted that many of the stories of the gods present them in a most unfavorable light. It may also be granted that the morality of the Greeks was not derived from their religion; but whatever the source of the Greek ideas about morals, they were early brought under the protection of the gods, who were deemed the special guardians of the unwritten laws by which human conduct was to be guided. The literature shows plainly that the effect of this was to lead the loftier minds to a higher conception of the gods themselves and to a rejection of the earlier legends which attributed to them acts offensive to a more developed moral sense. At the same time the absence of any belief in a revelation intrusted to a chosen few prevented the formation of any canonical system, and thus it is that, while the general attitude towards the gods remained much the same, there was a great diversity in many details. It is therefore very difficult to formulate briefly the Greek religious belief, since statements that are true for one time or place or social condition may be quite misleading if applied to another. The following characteristics may, however, be fairly said to belong to that religion during the greater part of the independent national life.

To the Greek, then, the gods were everywhere, all nature being full of divine life. They were innumerable, and naturally they differed much

in rank. In later times we find a distinction between the gods (*theoi*) and the daimones (*daimones*), inferior spirits, usually malevolent, though the name "daimones" is also applied to a host of lesser powers occupying a place between the greater gods and men and including the heroes and spirits of the dead. These gods have full control over the world and the forces of nature, but the world is not their creation; they are immortal, but they have a beginning. The various cosmogonies and legends of successive dynasties of gods are, however, scarcely parts of the religious system. The gods were generally considered to have the form of men, though possibly of somewhat greater size (the huge dimensions assigned to Ares in the *Iliad* are quite exceptional). Though regarded as possessing unlimited powers of transformation, they are quite removed from the monstrous or grotesque: the Greek love of moderation is as influential in religion as in art or literature. In general, the gods were divided into those of the heaven, the earth, and the sea, though often the latter are omitted. The heavenly gods dwell in the sky, or on some lofty mountain, usually Mount Olympus (q.v.) in Thessaly. The earth or chthonic deities are conceived of as on or under the earth and naturally often include the heroes and the dead. It should be noted that the line between these classes is very indefinite, and the same divinity is found sometimes in one and sometimes in another. Space will permit only a brief outline of the grouping of the gods in the popular mythology. (See the separate articles on the gods named below.) At the head was Zeus, "father of gods and men," and the supreme ruler of the universe, though bound in some mysterious way by the decrees of fate. (See PARCÆ.) His wife was Hera, queen of heaven, and the special guardian of the sanctity of marriage. Associated with them as the chief divinities of heaven were Hephæstus, god of fire and the patron of the workers in metal; Athena, the virgin daughter of Zeus; Apollo and his sister Artemis; Ares, the god of war; Aphrodite, goddess of love; Hermes, the divine messenger; and Hestia, properly the sacred hearth itself, but later more or less clearly personified as the divine guardian of the hearth. Around these greater gods are grouped a host of lesser deities, some of whom enjoyed high honor in certain localities. Such are Helios, the sun, Selene, the moon, and other heavenly bodies; the attendants on the Olympians, as the Horæ or Seasons, the Charites or Graces, the Muses, Iris, Hebe, and Ganymede. The sea was ruled by Poseidon, the brother of Zeus, and second in power to him alone. With him was often worshiped his wife, Amphitrite, while about them were grouped the Nereids, the Tritons, and other less important sea gods. The chief chthonic divinities were Hades, the ruler of the lower world, and his wife, Persephone, the daughter of Demeter. Demeter herself was usually reckoned among the Olympians, but her sphere of activity was more closely connected with the earth, as the giver to men of grain and the knowledge of agriculture. On earth also belonged Dionysus, god of wine, with his bands of Mænads, Satyrs, and Sileni, though he, too, is frequently found with his father, Zeus, in heaven. Gæa, the earth mother, plays a larger part in legend than in cult, but Asclepius, the god of healing, Pan, the great

god of the Arcadian herdsmen, and some others, seem to have been more frequently objects of worship than of narrative. Characteristic of the Greek religion is the specialized conception of each god, who is, on the whole, limited to a specific, though often wide, field of activity. Henotheism, so prominent in the Vedas, by which the special object of worship seems for the time being to possess all the powers of all the deities, is scarcely found in Greece, and it may well be doubted whether there is any real approach to monotheism outside of some of the philosophical schools. If we turn from the literature to the evidence afforded by inscriptions, or such works as the guidebook of Pausanias, it is at once clear that there were an immense number of local cults, sometimes attached to the names of the great gods, but more often connected with the name of some local hero, who was doubtless often an old divinity fallen from his high estate. Certainly the country population was far removed from any thought of one god.

It is a striking fact that at its first appearance in literature the Greek religious system had already received its definitive form. Some new divinities were introduced later, but the Homeric poems show us the hierarchy of the gods in substantially the organization which it retained till it was extinguished by the new faith. The origin of this religion was a mystery to the Greeks themselves, though they speculated not a little on the subject and in a somewhat crude form anticipated many later theories. Herodotus thought that many of the names of the gods had been learned from the Egyptians; Prodicus, the sophist, seems to have taught that the gods were mere personifications of the objects that brought blessings to men, such as the sun, air, light, agriculture, etc.; while Euhemerus gave elaborate expression to ideas long prevalent when he interpreted the myths as distorted history and the gods as idealized men of the past. It is not possible in this article to give a detailed survey of the many theories of Greek religion which have been advanced, only to be discredited. Two views were long prominent. One saw in the Greek religion only a corruption of an original revelation, and much ingenuity was displayed in tracing biblical teachings in the Hellenic myths. The other bore some relation to this in that it assumed that the Greek mythology and the popular beliefs were but the symbolic forms in which the priests clothed the most profound truths, which were too deep for the popular mind. The great exponent of this theory was Fr. Creuzer (q.v.), in *Symbolik und Mythologie der alten Völker* (2d ed., Darmstadt, 1820-24; Fr. ed., enlarged by Guignaut, Paris, 1825-51); the theory exercised a powerful influence, however, during the earlier half of the nineteenth century, especially in the explanation of the Greek vases and other works of art. With the growth of the science of comparative philology and a clearer recognition of the connection between the Indo-European peoples, a flood of light was thrown on the names of many of the Greek gods; and as etymological identity with Vedic and sometimes northern deities seemed obvious in many cases, it was naturally believed that here at last was the key to unlock the past. Many of the Vedic deities are clearly personifications of the powers of nature, and this is doubtless true of some of the Greek gods,

but the attempt to resolve the Greek religion into a pure nature worship has been unsuccessful. One difficulty is that original identity of name does not mean later identity in the conception of the deity to whom the name is attached. Dyaus and Zeus may be the same word, but the former is only a shadow in the Vedic mythology, while the latter is to the Greeks the greatest of the gods. An outcome of studies along etymological and ethnological lines is the view that Greek religion resulted from the blend of Indo-Germanic beliefs with the cult ideas and practices indigenous in the Mediterranean basin, the original inhabitants of that basin having been conquered by Indo-Germanic invaders. (See next paragraph.) Explanation has also been sought, with very good results, through the researches of anthropology into the primitive ideas of savage tribes and the survivals of primitive customs and superstitions among more civilized races. These studies have led to the theory which finds in *animism*, or worship of spirits, usually malevolent, the kernel of all religion and traces its development by a strict process of evolution. This undoubtedly explains much in Greek religious rites and conceptions, but it cannot be regarded as completely satisfactory. It seems as though the solution, if it can ever be reached, must be sought by a combination of these various lines. The names of the gods must be studied by the aid of comparative philology that the original conception embodied therein may be brought to light. Local cults, ritual usages, and superstitions must be collected and compared with similar rites among kindred or primitive peoples, and the history and development of the several myths examined. It is necessary, also, to consider the problem of foreign influence and contamination by the union of originally diverse conceptions under a common name. At one time the tendency was to explain everything as an importation; and in the reaction against this extravagance K. O. Müller and his followers doubtless went too far in their claim that all was autochthonous unless there is historical proof of foreign origin. Lately the tendency has been to admit a larger share of foreign influence, though it must not be forgotten that the Greeks assimilated and transformed whatever they derived from their intercourse with other nations.

In conclusion, it may be well to call attention to certain phases of Greek religion which preserve, within a system of anthropomorphic polytheism, apparently primitive elements, pre-anthropomorphic in character, which were forced into the background by the more highly developed cults. Prominent among these are the traces of fetishism in the numerous cases of sacred stones, which are sometimes called images of definite gods, as the pyramidal Zeus at Phlius, or the rough stones called Charites at the Beotian Orchomenus, but are sometimes unnamed, like the Omphalos at Delphi. Excavations in Crete have shown that in the Mycenaean or Minoan period the sacred stone and pillar played a large part. The worship of trees has in most cases been transformed into the consecration of the tree to some god, as the olive to Athena and the laurel to Apollo. (Cf. Bötticher, *Baumkultus der Hellenen*, 1856; Frazer, *The Golden Bough*, in part the 3d ed., London, 1907-13. See GROVES, SACRED.) Some

of deities in the aniconic pillar or tree trunk. The numerous cases of animals sacred to a god seem also to contain reminiscences of an animal worship, of which there are, perhaps, indications in the Mycenaean age, but the proofs of primitive totemism in Greece are as yet very scanty. The worship of the souls of the dead, or, at any rate, their propitiation by offerings, was a large part of Greek religion, though it was less prominent than the more public rites. Greek ideas about the soul and the other world were indefinite, but it was certainly the popular belief that the soul survived the body and either hovered about the tomb or departed to a shadowy region, where it led a melancholy existence in need of the offerings brought by surviving relatives. It was evidently believed to have power to inflict injury, and it is also certain that proper funeral rites for the body were needed to insure its peace. In some cases the state paid divine honors to a departed soul, usually as a "Heros" (*ἥρως*), as the Athenians honored Sophocles. This worship is, of course, important from the point of view of the animistic theories. It is fully discussed by E. Rohde, in *Psyche* (2d ed., Freiburg, 1898). In recent time French scholars in particular have laid stress on the influence of the group in the formation of religion, on the principle that the key to religious practices lies in the social structure of the community that elaborates it. This view has found followers in England, notably in Miss Jane E. Harrison: consult her *Themis: A Study of the Social Origins of Greek Religion* (Cambridge, 1912). For a summary and criticism of the book, in many ways untrustworthy, consult Hewitt in *The Classical Weekly*, vii, 86-88 (New York, 1914).

Bibliography. The number of works is enormous, but most of those published before 1850 are antiquated, and many later works can be safely neglected. The following works treat the general subject with detail: Preller, *Griechische Mythologie* (Leipzig, 1854; 4th ed., vol. i by Robert, Berlin, 1894; the second volume, containing the discussion of the Heroes, is still unpublished); Gerhard, *Griechische Mythologie* (Berlin, 1854-55), still useful for the material therein collected; Welcker, *Griechische Götterlehre* (Bonn, 1857-63), a work which was the culmination of a life of study covering the whole poetry and art of the Greeks, as the source for a correct understanding of their religious beliefs; Decharme, *Mythologie de la Grèce antique* (2d ed., Paris, 1886), of value from its references to the treatment of mythology in art. The lectures of Max Müller and the works of Andrew Lang discuss some phases of Greek religion. The former is the coryphaeus of the "comparative mythologists," while the latter writes from the anthropological point of view. Gruppe, in *Griechische Kulte und Mythen*, vol. i (1887), and in his "Griechische Mythologie," in vol. v of Müller, *Handbuch der klassischen Altertumswissenschaft* (Munich, 1897, 1902), has revived the prominence of foreign influence and collected much information on the religions of the neighboring peoples. The material is collected most completely in Roscher, *Lexikon der griechischen und römischen Mythologie* (Leipzig, 1884 et seq.), and in the mythological articles in Pauly-Wissowa, *Real-Encyclopädie der klassischen Altertumswissenschaft* (Stuttgart, 1894 et seq.). A narrower field is covered by such works as Nügelshach,

Homerische Theologie (2d ed., Nuremberg, 1861), and *Nachhomerische Theologie* (ib., 1867); Wide, *Lakonische Kulte* (Leipzig, 1893); Immerwahr, *Kulte und Mythen Arkadiens* (2 vols., Leipzig, 1891); Farnell, *Cults of the Greek States* (5 vols., Oxford, 1896-1909). The questions of primitive religious rites are treated by Mannhardt, *Wald- und Feld-Kulte* (Berlin, 1875-77), and Frazer, *The Golden Bough* (London, 1907-13). Of great importance, as treating the subject from a new standpoint, is Usener, *Götternamen* (Bonn, 1896), reviewed by Gildersleeve, in *American Journal of Philology*, vol. xvii (New York, 1896). The representations of the gods in art are collected in the unfinished work of Overbeck, *Griechische Kunstmythologie* (Leipzig, 1873-89), with a large folio atlas of plates. Consult also: Stengel, *Griechische Kultusaltertümer* (2d ed., Munich, 1898); Harrison, *Prolegomena to the Study of Greek Religion* (2d ed., Cambridge, 1908); Campbell, *Religion in Greek Literature* (London, 1898); De Visser, *De Græcorum Diis non referentibus Speciem Humanam* (Leyden, 1900); Ducharme, *La critique des traditions religieuses chez les Grecs des origines au temps de Plutarque* (Paris, 1904); Saussaye, *Lehrbuch der Religionsgeschichte* (Tübingen, 1904); Adam, *The Religious Teachers of Greece* (Edinburgh, 1909); Cumont, *Astrology and Religion among the Greeks and Romans* (New York, 1912); Fairbanks, *A Handbook of Greek Religion* (ib., 1910); Lawson, *Modern Greek Folklore and Ancient Greek Religion* (ib., 1910); Murray, *Four Stages of Greek Religion* (ib., 1912).

GREEK SLAVE, THE. A well-known statue by Hiram Powers (q.v.).

GREEK VERSION. See **BIBLE**.

GREELEY. A city and the county seat of Weld Co., Colo., on the Cache la Poudre River, 52 miles north-northeast of Denver, on the Union Pacific, the Denver, Laramie, and North-western, and the Colorado and Southern railroads (Map: Colorado, E 1). It is the seat of the State Teachers College and has a public library and Lincoln and Island Grove parks. The city is the centre of a fertile irrigated belt and makes extensive shipments of potatoes, sheep and cattle, flour, wheat, etc. There are several lumber yards, a flour mill and elevator, a beet-sugar factory, etc. Settled in 1870, Greeley was incorporated in the following year. The government is administered under a revised charter of 1886 which provides for a mayor, elected biennially, and a city council. Pop., 1900, 30,223; 1910, 8,179; 1914 (U. S. est.), 10,376; 1920, 10,883. The "Greeley Colony," named after Horace Greeley, was mainly composed of New England people. They were the first agricultural (irrigation) community in Colorado. Imbued with idealistic principles, they encountered with remarkable success, though not without many hardships and reverses, all the pioneer problems of the desert.

GREELEY, HORACE (1811-72). An eminent American journalist, born in Amherst, N. H., Feb. 3, 1811, of Scottish-Irish ancestry. His father, Zacheus Greeley, was a farmer whose unfertile acres kept him poor. Horace's early education was limited. In 1826 he entered the office of the *Northern Spectator* at East Poultney, Vt., and in 1830 he started out for himself as a journeyman printer, working at Jamestown and Lodi, N. Y., and then at Erie, Pa. In August, 1831, he went to New York City, where,

after doing journeyman work in several offices, he founded, Jan. 1, 1833, with Francis V. Story and H. D. Shepard, the *Morning Post* (said to have been the first two-cent daily ever published), which failed within three weeks, and which was succeeded in March, 1834, by the *New Yorker*, confessedly the best literary paper in America at that time. Greeley also about this time contributed leading articles to the *Daily Whig*. In 1838-39 he also edited the *Jeffersonian*, a political weekly published at Albany, and in 1840 edited and published the *Log Cabin*, a weekly, in the interest of Harrison as a presidential candidate. These ventures prepared the way to the *Daily Tribune*, of which Greeley was at first sole proprietor and publisher, as well as chief editor, and the first number of which appeared April 10, 1841, followed in the autumn by the *Weekly Tribune*, into which the *New Yorker* and *Log Cabin* had been merged. The *Weekly* ultimately circulated widely throughout the Northern and Western States and came to wield an influence unprecedented in the history of American journalism, Greeley thus becoming a recognized power in national as well as State politics.

In December, 1848, Greeley entered Congress, to fill a vacancy, and served until March 4, 1849. He was quick to discern and point out the evils and abuses of existing institutions, but he was neither a revolutionist nor an iconoclast. Though not in the strict sense of the word an abolitionist, he was an opponent of slavery, and foremost among those who sought to resist its extension to the territory acquired from Mexico. From 1850 to the end of the conflict the *Tribune*, under his direction, did much to strengthen the antislavery sentiment of the Northern people and to prepare them for the great struggle that ensued. In this Greeley was ably assisted by an unusual corps of editorial workers, including Bayard Taylor, Charles A. Dana, James S. Pike, and George Ripley. In addition to its championship of the antislavery cause, the *Tribune* became prominent through its advocacy of protection, and the extraordinary hold of the weekly edition upon the farming class was due in no small measure to the attention which the interests of agriculture received in its columns. It is said, by men who shared Greeley's confidence, that though he was too proud to be an applicant for any office or to take any step to secure a nomination, he yet felt very keenly the neglect of others to recognize his honorable claims for promotion upon the parties he served so faithfully and well. He was a delegate from Oregon to the Republican National Convention at Chicago in 1860, his own State refusing to send him, and was influential in bringing about the nomination of Lincoln in preference to Seward. When, after Lincoln's election, the South threatened to secede from the Union, he declared that if a majority of the people of any State, after full and free discussion, should sincerely and deliberately vote to leave the Union, he was willing that they should withdraw. He declared "that he hoped never to live in a Republic whereof one section was pinned to the other by bayonets." He held, however, that the votes actually taken at the South did not express the real convictions of the majority, but were the result of terrorism and panic; and when the Civil War broke out, he lent his voice and influence to the support of the government in its efforts to suppress the Rebellion by force.

He had a keen sense of the horrors of a civil war and was willing to adopt any reasonable and rational plan to avert them. The war once begun, he was in favor of its vigorous prosecution and impatient with what seemed to him unreasonable slowness on the part of the government. At times he was much discouraged and disposed to think that, to avoid worse calamities, the war should be ended by some compromise short of the result most to be desired. It was this feeling that made him willing to go to Canada in 1864, with the unofficial sanction of Lincoln, to hold a conference, which proved fruitless, with George N. Sanders, Jacob Thompson, and Beverly Tucker, the Confederate agents, on the subject of peace. At the close of the war he advocated the doctrine of universal amnesty and universal suffrage. He held that the prolonged imprisonment of Jefferson Davis, without indictment or trial, was a palpable infraction of the Sixth Amendment of the Constitution, and he therefore joined with Gerrit Smith and others in signing the bail bond of the late head of the Confederacy. This action, in the existing state of public sentiment at the North, brought upon him much odium. In 1861 he was a candidate for the Republican nomination for United States Senator, but was defeated by Ira Harris. In 1864 he served as a presidential elector and in 1869 was the unsuccessful Republican candidate for Comptroller of the State of New York. In 1870 he was a candidate for Congress in the sixth New York district, but was defeated, the district being overwhelmingly Democratic. He nevertheless ran 300 votes ahead of the Republican State ticket. In 1872 he was opposed to the renomination of General Grant for a second term and cooperated with a body of Liberal Republicans who held a convention in Cincinnati, on May 1, in advance of the regular Republican convention, to nominate another candidate. On the sixth ballot the nomination fell to Mr. Greeley and was accepted by him. Much doubt has been expressed with regard to the wisdom of Mr. Greeley in allowing himself under the circumstances to be made a candidate for President upon the platform adopted by this party (see LIBERAL REPUBLICAN PARTY); but he himself considered that he thereby merely reaffirmed the principles for which he had contended as a Republican, and that he neither made nor proposed any concession whatever to those who had opposed and resisted these principles. When the Democratic party adopted that platform in its entirety and without qualification, and nominated him as their candidate for President, he recognized the political unwisdom of their action, but accepted it as the sign and pledge of a new departure and believed that if he should be elected there would be an end of all political schemes having their root in the spirit of slavery and calculated to array the South against the North. A man of sensitive spirit and of great pride, he was deeply wounded, disappointed, and mortified on finding himself accused by many of his old friends of having thrown away his principles and of having entered into a conspiracy to turn over the government of the country to the control of the men who had instigated the Civil War. On the other hand, he received only a half-hearted support from the Democrats. The popular vote cast for him amounted to 2,834,079, against 3,597,070 for General Grant; but the only States carried by him were Georgia, Kentucky, Maryland, Mis-

souri, Tennessee, and Texas. He had overtaken his powers for many years. Near the close of the campaign he was called upon to watch at the bedside of his dying wife. During the whole contest his powers of endurance were strained to the utmost, and when it was at last over, he was prostrated by a disorder of the brain, and, sinking rapidly, died on Nov. 29, 1872. He published: *Hints toward Reforms* (1850); *Glances at Europe* (1851); *History of the Struggle for Slavery Extension or Restriction in the United States* (1856); *Overland Journey to San Francisco* (1860); *The American Conflict* (2 vols., 1864-66); *Recollections of a Busy Life* (1868; new ed., 1873); *Essays Designed to Elucidate the Science of Political Economy* (1869); *What I Know of Farming* (1871). Consult the biographies of Greeley by Parton (New York, 1855; new ed., Boston, 1872); Reavis (New York, 1872); Ingersoll (Chicago, 1873); Zabriskie (New York, 1890); Linn (ib., 1903). Consult also *A Memorial of Horace Greeley* (ib., 1873), and Benton, *Greeley on Lincoln* (ib., 1893).

GREELEY, ADOLPHUS WASHINGTON (1844-). An American Arctic explorer, soldier, and scientist. He was born in Newburyport, Mass., where he received a high-school education. Serving in the Civil War, he was thrice wounded and was brevetted major before he was 21. In the regular army, after frontier services, he was during 38 years subordinate and then chief of the Signal Corps. Within this time he established the flood or danger lines of the great rivers and reorganized the service in many respects. He commanded (1881-84) the expedition to Lady Franklin Bay, this being one of 15 international stations established for scientific work under the plans of the Hamburg International Polar Conference of 1879. Scientifically the Greeley expedition made the nearest gravity observations to the pole, ascertained the climatic conditions of Grinnell Land, made glaciological studies, determined the hitherto unknown secular magnetic variation of that region, and through its tidal observations first disclosed the conformity of the sidereal day with the diurnal inequality of the tidal waves of the earth. Although primarily scientific, the explorations of the expedition covered unknown lands one-eighth the way round the globe north of the eighteenth parallel. The discoveries included the interior of Grinnell Land, the shores of the western polar sea, and the extension of Greenland to within 15 miles of its extreme northern latitude. The attainment by Lockwood and Brainard of Greeley's command of the then farthest north, 83° 24' N., in May, 1882, wrested from England an honor held for three centuries; it is the only world's record verified by a later explorer. Unvisited by the promised relief ships of 1882 and 1883, Greeley withdrew his party from Lady Franklin Bay, and, after a 400-mile journey, landed at Cape Sabine, where, however, he found neither relief nor promised supplies. During nine months of waiting 18 of the 25 men perished; the survivors were rescued by Commodore W. S. Schley. Scientific observations ceased 40 hours before the rescue. Greeley was thanked by the British government, received the Founder's medal of the Royal Geographical Society, the Roquette medal from the Société de Géographie, and was honored by seven other foreign societies for his Arctic work. Contrary to popular belief, he received no recognition

from the United States, his work being in the line of duty. In 1887 he was appointed Chief Signal Officer of the army by President Cleveland, being the first enlisted man of the Civil War to reach the grade of general in the regular army. Under Greely, as subordinate and chief, were built 21,000 miles of military telegraph lines, in the United States, Cuba, Porto Rico, China, the Philippines, and the unique Alaskan system of land, cable, and wireless, where first was operated commercially a long wireless section. During the Spanish-American War Greely was charged with the censorship of cables; in 1906, with the rank of major general, he was in command at San Francisco for 10 weeks after the earthquake and fire; in 1907 he successfully terminated without bloodshed the Ute campaign in Wyoming; in 1908 he was retired for age. He became a member of the International Colonial Institute, and seven times represented his country abroad, the last time at London as military Ambassador at the coronation of George V. His publications include: *Three Years of Arctic Service* (2 vols., 1885); *American Weather* (1890); *American Explorers and Travelers* (1894); *Handbook of Polar Discoveries* (1896: 5th ed., enlarged, 1910); *Handbook of Alaska* (1912: new ed., enlarged, 1914); and numerous reports of much value, among which are: *Diurnal Fluctuations of Barometric Pressure* (1891); *Proceedings of the Lady Franklin Bay Expedition* (1888); *Rainfall of Western States and Territories* (1888); *Discussion of International Simultaneous Meteorological Observations, 1878-87* (1891); and *Climatology of Arid Regions* (1891). He also compiled *Public Documents of the First Fourteen Congresses, 1784-1817* (1900), and was a contributor to the NEW INTERNATIONAL ENCYCLOPEDIA. Consult Schley, *The Rescue of Greely* (New York, 1885).

GREEN (AS. grēne, OHG. grūni, Ger. grün; connected with AS. grūwan, OHG. gruoan, to grow). The color which is found on the spectrum between the blue and the yellow and is known as the color of grass and other vegetable substances, as well as that of the minerals chrysocolla and malachite. It may be made artificially by mixing varying proportions of blue and yellow pigments. Among the more important green pigments which are of mineral origin are the following: *arsenical green*, or *Scheele's green*, a precipitate obtained from a solution of copper sulphate when treated with a mixture of arsenious oxide and potassium carbonate dissolved in hot water; *Paris green*, *emerald green*, *imperial green*, *Mitis green*, or *Schweinfurth green*, made by boiling concentrated solutions of arsenious oxide in copper acetate; *Brunswick green* when pure consists of the oxychloride of copper, but the term is commonly used for mixtures of Prussian blue and chrome yellow; *chrome green*, either the green chromium sesquioxide, or a mixture of chrome yellow and Prussian blue; *Gellert's green*, a mixture of cobalt blue and zinc oxide; *Guignet's green*, a pure chrome green made in the dry way from potassium dichromate and boric acid; *mountain green*, any native earthy green mineral, such as chrysocolla, glauconite, or malachite; *Prussian green*, or *Hooker's green*, a mixture of gamboge and Prussian blue; *verdigris*, basic acetate of copper, made by exposing metallic copper to the fumes of acetic acid; *terra verde*, an earthy pigment containing ferrous silicate. The green vegetable dyestuffs have

been superseded by artificial coal-tar derivatives. See COAL-TAR COLORS; DYEING.

GREEN, ALICE SOPHIA AMELIA (MRS. JOHN RICHARD) (1840-). A British historian, born in Kells, Ireland, the daughter of Edward A. Stopford, archdeacon of Meath. In 1877 she was married to John Richard Green, author of the famous *Short History of the English People*, for which, in the edition of 1888, she wrote a memoir of her husband; with Miss Norgate she edited (1900) his *Oxford Studies*. In 1913 she received the degree of Litt.D. from the University of Liverpool. Among her own historical works are: *Henry II* (1888), in "Twelve English Statesmen"; *Town Life in the Fifteenth Century* (1894); *The Making of Ireland and its Undoing* (1908); *Irish Nationality* (1911), which, like the preceding volume, is strongly colored by her ardent Irish nationalism; and *The Old Irish World* (1912).

GREEN, ANDREW HASWELL (1820-1903). An American lawyer, financier, and philanthropist, born in Worcester, Mass., and educated at the Worcester Academy. He studied law and practiced in New York City, acting as executor of the Tilden, Ogden, and other large estates. In 1856 he was president of the New York City Board of Education; was president of the Central Park Board from 1857 to 1870, and comptroller from 1871 to 1876. He managed the city's finances in the face of enormous deficits made by the speculations of the Tweed ring and reestablished its credit. In 1868 he proposed the plan for a "Greater New York," afterward initiated in 1897, and he also originated the plan of forming the New York Public Library out of the Astor, Tilden, and Lenox foundations. He founded the New York Zoological Society, assisted in the establishment of the Metropolitan Museum of Art and the Museum of Natural History, and gave great aid to many charitable institutions in New York City. Through mistaken identity he was killed by a deranged negro.

GREEN, ANNA KATHARINE. See ROHLFS, ANNA KATHARINE.

GREEN, ASHBEL (1762-1848). An American Presbyterian clergyman and educator, the son of Jacob Green. He was born at Hanover, N. J., served in the Revolution, graduated at Princeton in 1784, and afterward became professor of mathematics and of natural philosophy there. He was then for some time a Presbyterian pastor in Philadelphia and in 1792 was chaplain of Congress. From 1812 to 1822 he was president of the College of New Jersey (now Princeton University), at the same time being president of the Board of Trustees of Princeton Theological Seminary. Beginning in 1822, he edited the *Philadelphia Christian Advocate* for 12 years. Among his works are: *Presbyterian Missions* (1820) and a *Discourse Delivered in the College of New Jersey, with a History of the College* (1822). Consult Jones, *Life of Ashbel Green* (New York, 1849).

GREEN, BARTHOLOMEW (1666-1732). An American printer and publisher, born at Cambridge, Mass. He succeeded to his brother's printing business in 1690 and established himself first in Boston and then in Cambridge with his father, Samuel Green. About 1692 he resumed printing in Boston. On April 24, 1704, the *Boston News Letter*, the first, and for many years the only, continuous newspaper in the British colonies, appeared from his press, pub-

lished for John Campbell, postmaster. Afterward it became Green's property and became widely known for the independence and originality of its political and religious utterances. Excepting the period from November, 1707, to October, 1711, this paper was printed by Green and his successors until 1776. Green printed the Bible and several religious tracts in the Indian language, with accompanying English translations. Consult Littlefield, *The Early Massachusetts Press*, vol. ii (Boston, 1907).

GREEN, BERIAH (1794-1874). An American reformer, born at Preston, Conn. He graduated at Middlebury College, Vt., in 1819, and then studied for the ministry at Andover Theological Seminary (1819-20), but his religious beliefs did not agree with any denominational creed. In 1821 he was made professor of sacred literature in Western Reserve College, though his violent opposition to slavery caused him to leave that institution after a few months. From 1823 to 1834 he was president of Oneida Institute in Ohio. He exerted a great influence in antislavery circles, served as president of the National Antislavery Convention which assembled in Philadelphia in 1834, and was one of Garrison's warmest friends. His writings include a *History of the Quakers* (1823) and *Sermons and Discourses, with a few Essays and Addresses* (1833).

GREEN, DUFF (1791-1875). An American politician and journalist, born in Woodford Co., Ky. He was educated in the country schools and was himself engaged in teaching on the outbreak of the War of 1812, in which he served in the Kentucky militia. After the war he removed to Missouri, where he again taught school and studied law at the same time. He took an active part in the movement that led to the admission of Missouri as a State, was a member of the convention that drew up the State constitution, and after its admission was, in 1823, elected to the State Senate. In the same year he became editor and proprietor of the *St. Louis Enquirer*, and two years later removed to Washington, D. C., where he purchased the *United States Telegraph*. After the accession of President Jackson in 1829, the *Telegraph* supplanted Gale's *National Intelligencer* as the administration organ and enjoyed government patronage that is said to have amounted to \$50,000 a year. Green himself became one of the confidential advisers of the President and was a member of his famous "Kitchen Cabinet." After the open break between Calhoun and Jackson the *Telegraph* was bitter in its attacks on the latter and Van Buren, as a result of which the government printing was taken away from it and given to the *Globe*, which had been established as the Jackson organ, with Francis P. Blair as its editor. Green continued in control of the *Telegraph* until 1835, making it the most bitter and violent exponent of the Nullificationists. From 1835 to 1838 he edited a paper in the same interest, known as the *Reformation*, after which he spent some years in Europe engaged in various business enterprises. In 1844 he returned to the United States and established a short-lived newspaper, the *Republic*, in New York City. He was twice sent on special diplomatic missions to Mexico. In his later years he was active in the industrial development of the South, was largely interested in railroads in Georgia, and was one of the founders of the town of Dalton, in that State, where he died.

Considerable information concerning him may be found in Benton, *Thirty Years' View* (2 vols., New York, 1854-56).

GREEN, GEORGE (1793-1841). An English mathematician, born at Sneinton. He was educated at Cambridge, devoted himself largely to original research in mathematics, and presented important papers before the Cambridge Philosophical Society. His *Essay on the Application of Mathematical Analysis to the Theories of Electricity and Magnetism* (1828)—in which the potential function first was introduced into the mathematical theory of electricity and magnetism—remained unnoticed until 1946, when it was reprinted by Lord Kelvin, as in the meantime his general theorems had been discovered by Kelvin, Charles, Sturm, and Jauss. Other important papers were: *On the Reflection and Refraction of Light at the Common Surface of Two Non-Crystallized Media* (1837); *On the Reflection and Refraction of Sound* (1837); *On the Propagation of Light in Crystalline Media* (1839). Although he held no university position and died at the early age of 47, he contributed greatly to the progress of the science of mathematics, of which he was one of the foremost representatives of his day in England. Green's *Mathematical Papers*, with a memoir, were published in 1871 by N. M. Ferrers.

GREEN, HETTY HOWLAND ROBINSON (1835-1916). An American financier. She was born at New Bedford, Mass., and was educated at Mrs. Lowell's School in Boston. Her father, Edward Mott Robinson, left her a large fortune when he died in 1865. She married Edward H. Green (died 1902) in 1867. Mrs. Green came to be known as the richest woman in America and as the greatest woman financier anywhere. She managed personally her interests in Chicago and New York real estate and her property in stocks and bonds in many large corporations.

GREEN, JACOB (1722-96). An American patriot, born at Malden, Mass. He graduated at Harvard in 1744, entered the Presbyterian ministry in 1745, and became pastor of a church of that denomination at Morristown, N. J. In 1758-59 he was vice president of the College of New Jersey (now Princeton University). In 1775 he was sent as a delegate to the New Jersey Provincial Congress and was chairman of the committee appointed to draft a State constitution. A series of articles by him on the question of the depreciation of paper money was widely read at the time, and his plan therein suggested for the redemption of the continental currency was similar to that later followed by Congress. He further published two volumes of *Sermons* (1768, 1769) and other works.

GREEN, JOHN RICHARD (1837-83). An English historian. He was born at Oxford, Dec. 12, 1837. His education, except some two or three years of private instruction, was received in his native city, at Magdalen College School, and at Jesus College, where he graduated in 1859. His interests were historical rather than scholastic. Religious, and raised in Tory and High Church principles, he took orders in 1860 and for the next five years lived in East London. In 1866 he became vicar of St. Philip's, Stepney. His health failing, and his inclination to a clerical life abating, he resigned in 1869 to become librarian at Lambeth, devoting himself henceforth to history and politics. His first important historical work, *A Short History of the English People*, was the outcome of his desire to

leave behind him some of his accumulations of knowledge in a form easily available to ordinary people. He rewrote it twice and was only persuaded to publish it in 1874. Its object, as the title suggests, was to give the story of social development of the conditions which affected the lives of the great mass of the people, in preference to mere dynastic or military chronicles. While it is not infallible in detail, its great merit is the attractive vividness with which it presents one picture after another of the past. It had a great and immediate success and was ultimately expanded, still keeping the same point of view, into the four-volume *History of the English People* (1877-80), in which he received much assistance from his wife, Alice, daughter of Archdeacon Stopford, whom he married in 1877. A visit to Egypt in 1881 aggravated his lung trouble and made labor very difficult for the rest of his life. His courage, however, enabled him to persist in the writing of another work of a less popular and more scholarly nature, *The Making of England* (1882), which came down to the consolidation of the kingdoms under Egbert. The materials for the subsequent volume, *The Conquest of England*, down to the coming of the Normans, were so far put together that his widow was enabled to publish it in the year of his death (1883). His *Stray Studies in England and Italy* (1876) was a collection of essays marked by notable historical insight. In spite of his ill health the brilliancy of his conversation and the breadth of his sympathy gave him a marked influence, especially among the historical students of his generation. Consult James Bryce, *Studies in Contemporary Biography* (New York, 1903).

GREEN, JOSEPH (1706-80). A satirical verse writer of the Revolutionary period in America, born in Boston and educated at Harvard. He was banished for his Loyalist sympathies, but he returned to the popular side, and his pen spared neither party in such works as *The Wonderful Lament of Old Mr. Tenor* (1744) and *Poems and Satires* (1780).

GREEN, JOSEPH REYNOLDS (c.1860-1914). An English botanist, born in Stowmarket, Suffolk, and educated at Trinity College, Cambridge. From 1887 to 1907 he was professor of botany to the Pharmaceutical Society of Great Britain; in 1895 he became a fellow of the Royal Society and in 1902 a fellow of Downing College, Cambridge. Among his publications, important particularly for physiological botany, are: *Manual of Botany* (1895); *The Soluble Ferments and Fermentation* (1899; German, *Die Enzyme*, 1901, by Windisch); *Introduction to Vegetable Physiology* (1900); *Primer of Botany* (1910); *History of Botany from 1860-1900* (1910), continuing the work of Sachs.

GREEN, MARY ANNE EVERETT (1818-95). A minor English historian, who wrote under her maiden name, Wood. She was born at Sheffield. Educated at home and in the British Museum, she was an industrious compiler, editor, and biographer, conscientious in original research; wrote for the reviews; and made exhaustive calendars of state papers. In 1845 Miss Wood married an artist, George Pycock Green, in London, but continued her work in the Public Record Office for 40 years. Her *Lives of the Princesses of England* was published in six volumes (1849-56); her *Letters of Royal Ladies* appeared in 1846. She edited the letters and diaries of many distinguished persons and was

herself highly esteemed as a linguist, antiquary, and philanthropist. Her *Elizabeth, Electress Palatine and Queen of Bohemia* (1909) appeared posthumously.

GREEN, NORVIN (1818-93). An American capitalist, born at New Albany, Ind. He graduated in medicine from the University of Louisville in 1840 and practiced until 1853. He served as a Representative in the Kentucky Legislature in 1849, 1850, and 1868. Entering the telegraph business in 1854, he became president of the Southwestern Telegraph Company, organized in 1856. Later he arranged a system of mutual patronage between six leading telegraph companies including his own. When these companies were reorganized in 1866 as the Western Union Telegraph Company, Green became one of the vice presidents, serving until 1870 and again from 1873 to 1878, when he succeeded to the presidency of the corporation. In 1870-73 he was head of the Louisville, Cincinnati, and Lexington Railroad. From 1884 to 1886 he served as president of the American Institute of Electrical Engineers.

GREEN, SAMUEL SWETT (1837-). An American librarian, born at Worcester, Mass. He graduated from Harvard College in 1858 and from Harvard Divinity School in 1864. From 1871 to 1909, when he retired, he was librarian of the Worcester Free Public Library, and for many years after 1890 he was a member of the Free Public Library Commission of Massachusetts. One of the founders of the American Library Association, he was its president in 1891 and in 1893 presided over the World's Congress of Librarians at Chicago. Besides his papers on library economy, he is author of *Library Aids* (1881; 2d ed., rev. and enlarged, 1883); *Libraries and Schools* (1883); *The Public Library Movement in the United States, 1853-1893* (1913).

GREEN, SETH (1817-88). An American pisciculturist. He was born in Rochester, N. Y., and was educated in the public schools there. Beginning at 20 years of age, he devoted his life to the artificial propagation of fish and the breeding of the better kinds for stocking lakes and streams. After many experiments he succeeded in hatching enormous numbers from the spawn of shad, trout, and other species, with which he stocked the Connecticut, the Hudson, the Potomac, the Susquehanna, and many other streams. He also introduced shad into Pacific coast waters. He was appointed one of the fish commissioners of New York in 1868 and soon afterward was made superintendent of the State fisheries. He received several medals from France and other honors and was the author of *Trout Culture* (1870) and *Fish Hatching and Fish Catching* (1879).

GREEN, THOMAS HILL (1836-82). An English philosopher, born in Birkin, Yorkshire. He was educated at Rugby and Oxford, was elected fellow of Balliol College in 1860, tutor there in 1866, and Whyte professor of moral philosophy in 1878. A disciple of Wordsworth, Kant, and Hegel, he turned his critical powers upon their opponents, the empiricists. He maintained that empiricism disintegrates all experience into isolated sensations, and fails to explain how such sensations can constitute a knowledge of an ordered objective world. This knowledge, he maintained, presupposes the existence of a timeless intelligence as the essential principle of all cognitive beings. This eternal principle, as it

appears in finite beings, is a "reproduction" of the one timeless omniscience which is the indispensable condition of the existence of the world of nature. And not only human knowledge, but also human volition, points to this eternal spirit, for a timeless principle is necessary to change a natural animal want into such motives as determine the will. So influential was Green's teaching that there grew up a body of thinkers, first at Oxford, then elsewhere, who are united in maintaining Green's fundamental doctrine of the eternal consciousness as the postulate of experience. These thinkers form what is sometimes called the Neo-Hegelian school. Edward Caird, F. H. Bradley, B. Bosanquet, John Watson, D. G. Ritchie, Josiah Royce, and other English and American philosophers have been influenced by Green's views, although in many cases the systems resulting show much originality. Green is supposed to be the original of "Mr. Grey" in Mrs. Ward's *Robert Elsmere*. Green's works include an *Introduction to Hume's Treatise of Human Nature* (1874), *Prolegomena to Ethics* (1883), and lectures, posthumously published under the editorial supervision of Nettleship (1885-88). His *Works* were published in three volumes (New York, 1906). Consult the biographical sketch contained in vol. iii of these collected works; also Fairbrother, *The Philosophy of T. H. Green* (London, 1896); A. Seth, *Hegelianism and Personality* (Edinburgh, 1887); Ritchie, "The Political Philosophy of T. H. Green," in *The Principles of State Interference* (London, 1891); Sidgwick, *Lectures on the Ethics of T. H. Green, etc.* (London, 1902); Upton, "The Theological Aspects of the Philosophy of T. H. Green," in *The New World*, i (Boston, 1892); Muirhead, *Four Lectures on the Political Teaching of T. H. Green* (London, 1908).

GREEN, VALENTINE (1739-1813). An English engraver, born at Salford in Oxfordshire. He studied line engraving under Robert Hancock at Worcester and then went to London in 1765, where he devoted his attention to engraving in mezzotint. His large plates after West's "The Return of Regulus to Carthage," and "Hannibal Swearing Eternal Enmity to the Romans," attracted much attention. In 1775 he was appointed mezzotint engraver to the King and afterward obtained the privilege of engraving the pictures in the Düsseldorf Gallery. The siege of that city by the French 20 years later put a stop to this work, but he had already executed 22 plates. A descriptive catalogue of these was published in 1793. His 400 or more plates include many after Reynolds, Romney, Gainsborough, and Italian and Dutch artists. They are rich in tone, clever in effects of light and shade, and vigorous in treatment. He was also a writer on antiquarian and similar subjects and fellow of the Society of Antiquaries and of the Royal Society. Consult his biography by Whitman (London, 1902). His son **RUPERT** (c.1768-1804), an engraver, assisted him in much of his work.

GREEN, WILLIAM HENRY (1825-1900). An American Presbyterian theologian. He was born in Groveville, N. J., graduated at Lafayette College in 1840, and in 1846 at Princeton Theological Seminary, where he was appointed instructor in Hebrew. From 1849 to 1851 he was pastor of the Central Presbyterian Church of Philadelphia. He then became professor of biblical and Oriental literature in Princeton Seminary. In 1868

he declined the presidency of Princeton College and was, because of his seniority, for many years the official head of the seminary. The most distinguished scholar in this country among those who held the traditional orthodox view of inspiration, he was chairman of the American Old Testament Revision Company. He published: *A Grammar of the Hebrew Language* (1861); *The Pentateuch Vindicated from the Aspersions of Bishop Colenso* (1863); *A Hebrew Chrestomathy* (1865); *The Argument of the Book of Job Unfolded* (1874); *Moses and the Prophets* (1883); *Hebrew Feasts* (1885); *The Higher Criticism of the Pentateuch* (1895); *The Unity of the Book of Genesis* (1895); *A General Introduction to the Old Testament* (2 vols., 1898-99).

GREEN ALGÆ. See **CHLOROPHYCEÆ.**

GREENAWAY, KATE (1846-1901). An English illustrator and painter in water color. She was born in London and received her first instruction from her father, John Greenaway, a wood engraver and draftsman. Afterward she went to Heatherley's Art School and studied at South Kensington and under Legros in the London Slade School. She first exhibited, at the Dudley Gallery in 1868, a water-color drawing called "Kilmeny." She continued to exhibit for many years, both at the Academy and the Water-Color Society, and her designs and illustrations became very popular on the Continent and in America as well as in Great Britain. She conducted an interesting correspondence with Ruskin, who praised her work highly in his *Præterita* and *Fors Clavigera*. Her special field is the delineation of child life, and her drawings are distinctive for their individual charm and quaint humor. Her draftsmanship and color are skillful and delicate, and her work possesses a grace and freshness that won immediate recognition. Of late years other influences have superseded hers, but she retains a unique place among English artists. Her first successful illustrations were drawn for *Little Folks* and other magazines, and she illustrated a number of children's books, such as Madame d'Aulnoy's *Fairy Tales* (1871); *The Quiver of Love*, with Walter Crane (1876); Lady Colin Campbell's *Topo* (1878); Jane and Anne Taylor's *Poems* (1883); etc. Among her most successful works were *Under the Window* (1879), of which 150,000 copies are said to have been sold; *Mother Goose*; *A Day in a Child's Life* (1881); *A Painting Book of Kate Greenaway* (1884); *Language of Flowers* (1885); Browning's *Pied Piper of Hamelin* (1879); and *Kate Greenaway's Almanacs* (1883-97). Consult Spielmann and Layard, *Kate Greenaway* (New York, 1905); *Kate Greenaway: Sixteen Examples in Color of the Artist's Work* (London, 1910).

GREENBACK PARTY. In American political history, a party organized to further the increased use of a "greenback" currency and a complete recognition of such currency as a legal tender. After the close of the Civil War the rise in the gold value of United States notes, or "greenbacks" (see **MONEY**), occasioned much distress in the States of the Middle West, where business operations had become adjusted to the high scale of prices prevailing during the war. An Act of 1866 which aimed gradually to retire the greenbacks awakened a great deal of opposition; and when it was proposed, in 1868, to make the bonds not specifying the medium of payment payable in coin, what was denominated the

"Ohio idea"—a demand that all such bonds should be payable in greenbacks at the option of the government—gained vogue, controlling the Democratic National Convention, although Seymour, who was opposed to it, received the presidential nomination. The discussion of the Resumption Bill in 1874 led to a revival of the greenback agitation. On Nov. 24, 1874, a convention, national in scope, met at Indianapolis and advanced three propositions: (1) that the note circulation of State and national banks should be prohibited; (2) that the only paper currency should be greenbacks, exchangeable on demand for bonds bearing interest at 3.63 per cent; (3) that coin should be used to pay only the interest on the national debt and the principal of bonds expressly payable in coin. The supporters of these views were at first inclined to attach themselves to the Democratic party; but when it became clear that Tilden would be the nominee of the party, they withdrew and formed the Independent party, more generally known as the Greenback party. In 1876 they nominated for the presidency Peter Cooper, of New York, who received 81,737 popular votes, chiefly from the Middle West. The labor troubles of 1877 led to the formation of numerous local workingmen's parties, which united with the Greenbackers and created the National, or Greenback-Labor, party in 1878. In the elections of the same year this party controlled a popular vote of more than a million, and elected 14 Congressmen. In 1880 the party nominated for President James B. Weaver, of Iowa. He received a popular vote of 300,867, the number of Greenback-Labor Congressmen being reduced to eight. In 1884 Gen. B. F. Butler was nominated by the Greenbackers, as also by the anti-Monopolists, and received 175,380 votes. After that year the party ceased to exercise independent influence, generally becoming merged with the Democrats in the North and the Republicans in the South. Consult T. H. McKee, *National Conventions and Platforms of all Political Parties, 1789-1905* (6th ed., Baltimore, 1906), and E. B. Usher, *The Greenback Movement of 1874-84, and Wisconsin's Part in it* (Milwaukee, 1911).

GREENBACKS'. A name popularly applied to the legal-tender notes first issued by the United States government during the Civil War. The printing upon the back of these notes has always been in green ink, which explains the origin of the term. For the history of these issues, see MONEY.

GREEN-BARKED ACACIA, á-ká'shá or á-ká'shí-á. See PARKINSONIA.

GREEN BASS. A local name for the large-mouthed black bass. See BASS.

GREEN BAY. A city, port of entry, and the county seat of Brown Co., Wis., at the head of Green Bay and at the mouth of Fox River, 113 miles north of Milwaukee, on the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, the Green Bay and Western, and the Kewaunee, Green Bay, and Western railroads (Map: Wisconsin, E 4). Among the noteworthy features are the Kellogg Public Library, municipal, courthouse, and Federal buildings, three large hospitals, while just beyond the city limits is the State Reformatory. There are six bridges, three each across Fox and East rivers. The capacious harbor admits the largest lake steamers, and the city carries on an extensive trade in lumber, coal, fish, and grain. The

manufactured products include lumber, canned goods, beer, paper, boilers, gas engines, flour, furniture, and woodworking machinery. For these there is ample water power. The government is administered under a charter of 1882, revised in 1896, by an annually elected mayor and a unicameral council, which elects the school board, assessors, street superintendent and assistant, fire chief, and poor commissioner, and confirms the executive's appointments to the board of health, police board, and police officers. Pop., 1900, 18,648; 1910, 25,236; 1914 (U. S. est.), 28,046; 1920, 31,017.

Green Bay is built near the site of an ancient Indian village, which was visited by Nicollet in 1639, and at which, in 1669, Father Allouez established a Jesuit mission, where, by 1673, over 2000 Indians had been baptized. In 1680 a military station was established here by Tonty; but both mission and fort seem to have been deserted by 1730, and the first permanent settlement in Wisconsin was made here by Langlade in 1745. In 1761 the English took possession and built Fort Edward Augustus (abandoned in 1763); in 1796 they surrendered the place to the Americans, who in 1816 built Fort Howard on the west side of Fox River, around which a settlement grew. The first newspaper in Wisconsin was published here in 1833. Green Bay was incorporated as a borough in 1838 and in 1854 was chartered as a city. Fort Howard was united with Green Bay in 1896. Consult: Durrie, *Green Bay for Two Hundred Years, 1639-1839* (Madison, Wis., 1872), and an article, "The Old Town of Green Bay," in *Magazine of American History*, vol. xxiii (New York, 1889); A. C. Neville, *Some Historic Sites about Green Bay* (Madison, 1906).

GREEN BAY. A large arm of Lake Michigan, extending from the northwestern part of the lake 120 miles southwest into Wisconsin (Map: Wisconsin, F 4). It is 10 to 20 miles wide, and its great depth (over 110 feet) gives the water a green color, whence its name. At its northern end are two deep indentations, Big Bay de Noquette and Little Bay de Noquette. Across its mouth lies a chain of islands, of which the largest are Washington Island, Martin's Island, and Summer Island. It receives the Fox River (q.v.) at the city of Green Bay.

GREEN BONE, or GOREBILL. Names in England for the gar (*Belone vulgaris*). See GAR.

GREENBRIER. See SMTLAX.

GREENBRIER MOUNTAINS. A ridge west of and parallel with the main chain of the Alleghany Mountains, in Greenbrier Co., W. Va. (Map: West Virginia, D 4). Greenbrier, the highest point of the ridge, is 3359 feet high. Near it is situated Greenbrier White Sulphur Springs, one of the most frequented and fashionable of West Virginia spas.

GREENBRIER RIVER. A tributary of New River, the head stream of the Kanawha River (q.v.), W. Va. (Map: West Virginia, D 3). It is formed by the confluence of the West Fork and the East Fork, in the Shaver's Mountains in Randolph County, and after a southwesterly course through a picturesque valley between the main Alleghanies and the Greenbrier Mountains (q.v.) flows into New River near Hinton in Summers County.

GREENBUSH, N. Y. See RENSSELAER, N. Y.

GREENCASTLE. A city and the county seat of Putnam Co., Ind., 39 miles west of Indianapolis, on the Vandalia Line, the Cleve-

land, Cincinnati, Chicago, and St. Louis, and the Chicago, Indianapolis, and Louisville railroads (Map: Indiana, D 5). It is the seat of the De Pauw University (q.v.) and has a Carnegie library. The most important manufactures include lumber, lightning rods, flour, kitchen cabinets, handles, and drag-saws. Greencastle was settled in 1822 and was incorporated in 1849. Under a charter revised in 1895 the government is administered by a mayor, elected every two years, and a municipal council. Pop., 1900, 3661; 1910, 3790.

GREEN COVE SPRINGS. A town and the county seat of Clay Co., Fla., on the St. John's River, 29 miles by rail south of Jacksonville, on the Atlantic Coast Line (Map: Florida, E 2). It is a popular resort, noted for a warm sulphur spring which is frequented because of its medicinal properties, and has a public library and a courthouse. The town is engaged chiefly in growing fruits and vegetables and in lumbering. It has adopted the commission form of government. The water works and electric-light plant are owned by the municipality. Pop., 1900, 929; 1910, 1319.

GREENE, ALBERT GORTON (1802-68). An American minor poet, born in Providence, R. I. He graduated at Brown in 1820, was admitted to the bar in 1823, and from 1832 he held the clerkship of the town as well as that of the municipal court of Providence, of which he was chosen judge in 1858. After his health failed in 1867, he removed to Cleveland, where he died. He was actively interested in education, aided in founding the Providence Athenæum, and was president of the Rhode Island Historical Society. He began the important collection of American poetry now in the library of Brown University and known as the Harris collection. He was the author of several popular poems, especially "Old Grimes" and "The Baron's Last Banquet."

GREENE, CHARLES EZRA (1842-1903). An American civil engineer, born in Cambridge, Mass. He graduated at Harvard in 1862 and at Massachusetts Institute of Technology in 1863, served as quartermaster during the last two years of the Civil War, and was United States assistant engineer from 1870 to 1872, when, for part of a year, he was city engineer of Bangor, Me. In the same year he became connected with the engineering department of the University of Michigan, later being appointed dean, a position which he filled until his death. He was an associate editor of the *Engineering News* in 1876-77. His publications include: *Graphical Method for the Analysis of Bridge Trusses* (1875); *Trusses and Arches: Graphics for Engineers, Architects, and Builders* (3 vols., 1876-79; 3d ed., 1903); *Notes on Rankine's Civil Engineering* (1891); *Structural Mechanics* (1897; 2d ed., 1905).

GREENE, CHARLES GORDON (1804-86). An American journalist, born at Boscawen, N. H. He assisted his brother, Nathaniel Greene, in editing the *Boston Statesman*, and then, after short engagements on the *Taunton Free Press* (1825) and the *Boston Spectator* (1826), he settled in Philadelphia in 1827, and started the *National Palladium*, in which the presidential candidacy of Andrew Jackson was vigorously advocated. In 1828 Greene was on the staff of the *United States Telegraph* in Washington, until after Jackson's election, when he returned to the *Boston Statesman*, of which he later became the proprietor. He founded the *Boston Post* in

1831 and conducted it until 1875, served in the Massachusetts Legislature, and was naval officer of Boston from 1853 to 1861.

GREENE, CHARLES WARREN (1840-). An American journalist and author, born at Belchertown, Mass. He graduated at Brown University and received his M.D. from Dartmouth College (1867). He wrote much on natural science for encyclopedias and was an editor of various works. His writings include, in addition to those referred to, *Animals: Their Homes and Habits* (1886) and *Birds: Their Homes and Habits* (1886).

GREENE, CHARLES WILSON (1866-). An American professor of physiology and pharmacology, born in Crawford Co., Ind. He graduated from De Pauw University Normal School in 1889, from Leland Stanford in 1892, and from Johns Hopkins (Ph.D.) in 1898. He taught at De Pauw normal and preparatory schools in 1889-91, and at Stanford between 1891 and 1900, when he became professor of physiology and pharmacology at the University of Missouri. From 1901 to 1911 he also carried on investigations for the United States Bureau of Fisheries. His researches cover the structure and function of phosphorescent organs in the toadfish, the circulatory system of the hagfish, the physiology of the Chinook salmon, and the influence of inorganic salts on the cardiac tissues. He is editor of *Kirke's Handbook of Physiology* (8th ed., 1914) and is author of *Experimental Pharmacology* (1905; 3d ed., 1909) and *Textbook of Pharmacology* (1914).

GREENE, CHRISTOPHER (1737-81). An American soldier, born in Warwick, R. I. He served in the Colonial Legislature of Rhode Island from 1770 to 1772 and in 1775 became a lieutenant of the Kentish Guards, organized in Kent County. He was rapidly promoted, displayed great courage at Bunker Hill, and was captured during General Arnold's attack upon Quebec. He was made colonel in 1776 and in October of the same year was assigned to the command of Fort Mercer on the Delaware River, which he gallantly defended against a Hessian attack in 1777. Late in 1780 he was ordered south to aid Gen. Nathaniel Greene and in May, 1781, was killed at his post on the Croton River, Westchester Co., N. Y.

GREENE, DANIEL CROSBY (1843-1913). An American Congregational missionary, born at Roxbury, Mass. He graduated from Dartmouth College in 1864, served in the Civil War as a private, and in 1869 went to Japan as a missionary under the American Board. He lived at Kobe in 1870-74, at Yokohama in 1874-80, and was professor of Old Testament exegesis at Kyoto in 1881-87. From 1873 to 1880 he served as a member of the Yokohama New Testament translation committee, and in 1908-09 he lectured at Harvard University. He edited *The Christian Movement in Japan* (2d ed., 1904; 3d ed., 1907), revised Ritter's *History of the Protestant Missions in Japan* (1898), and is author of *Chinese New Testament Prepared for Japanese Readers* (1878) and *Course of Study for Students of Japanese Language* (1903).

GREENE, EDWARD LEE (1843-1915). An American botanist, born at Hopkinton, R. I. He graduated at Albion College, Wis., in 1866, studied for the ministry, and was an Episcopal clergyman from 1871 to 1885, when he became a Roman Catholic. From 1885 to 1895 he was associate professor of botany at the University

of California, in 1895-1904 at the Catholic University in Washington, D. C., and in 1904 became associate in botany at the Smithsonian Institution. In 1893 he was president of the International Congress of Botanists, assembled in connection with the World's Columbian Exposition at Chicago. He wrote: *Illustrations of West American Oaks* (1889-90); *Flora Franciscana* (1891); *Pittonia* (5 vols., 1887-1903); *Leaflets of Botanical Observation* (2 vols., 1903-09); *Landmarks of Botanical History* (1909); "An Autobiography," in *Roads to Rome in America* (1909); besides numerous contributions to taxonomy in various serial publications.

GREENE, FRANCIS VINTON (1850-1921). An American soldier and author, son of Gen. George Sears Greene, born in Providence, R. I. He graduated at West Point in 1870. After two years in the artillery service he was transferred to the United States Corps of Engineers (1872) and was assistant astronomer and surveyor on the Northwest boundary survey (1872-76). During the Russo-Turkish War he was military attaché to the United States Legation at St. Petersburg and, after accompanying the Russian army in the field from the Danube (July, 1877) to Constantinople (March, 1878), received from the Emperor the decorations of St. Vladimir and St. Anne for bravery at the battles of the Shipka Pass and Philippopolis. In 1886 he resigned from the army, but during the Spanish-American War he served in the Philippines and received the commission of major general after the capture of Manila. He retired again in 1899. In 1903 he became police commissioner of New York City. His publications include a series of works on military campaigns, including *The Russian Army and its Campaigns in Turkey* (2 vols., 1879); *Army Life in Russia* (1881); *The Mississippi Campaigns of the Civil War* (1882); *Life of Nathanael Greene, Major-General in the Army of the Revolution* (1893); *The Revolutionary War and the Military Policy of the United States* (1911).

GREENE, GEORGE SEARS (1801-99). An American soldier and civil engineer, father of Gen. Francis V. Greene. He was born in Warwick, R. I., graduated at West Point in 1823, where for several years he was an instructor, and in 1836 resigned from the service to become a civil engineer. He was engaged in the construction and location of railroads in Maine, Massachusetts, Rhode Island, New York, and Maryland until 1857, when he entered the service of the Croton aqueduct department of New York City. He subsequently built the reservoir in Central Park and the enlargement of High Bridge. In 1862 he reentered the Union army as colonel of the Sixtieth New York Volunteers, was made a brigadier general soon afterward, commanded his brigade at Cedar Mountain, and led a division at Antietam. At Gettysburg he was stationed on the right wing of the Federal army, and on the night of July 2, 1863, withstood an attack by a superior force of Confederates. In September of the same year (1863) he was transferred to the West, and on October 28, during an engagement near Chattanooga, received a wound which disabled him till January, 1865. He then joined General Sherman's army in North Carolina and took part in the operations leading to General Johnston's surrender. In 1866 he retired from the army and was chief engineer and commissioner of the Croton aqueduct department from 1867 until 1871, when

he was appointed chief engineer of public works in Washington, D. C. General Greene designed the plan for the entire sewerage of that city (1871-73). From 1875 to 1877 he was president of the American Society of Civil Engineers.

GREENE, GEORGE WASHINGTON (1811-83). An American historian, grandson of General Nathanael Greene, born at East Greenwich, R. I. He was educated at Brown University and subsequently spent several years in study and travel in Europe. From 1839 to 1845 he was United States Consul at Rome. He returned to America in 1848 to accept the chair of modern languages at Brown University, which he resigned in 1852 to devote his time to historical writing. In 1872 he became nonresident professor of American history at Cornell University. In addition to two textbooks of botany and a French grammar, he edited *The Works of Addison* (6 vols., 1853) and published a number of historical works, of which the most important are: *Historical Studies* (1850); *History and Geography of the Middle Ages* (1851); *Biographical Studies* (1860); *Historical View of the American Revolution* (1865); *Life of Nathanael Greene* (3 vols., 1867-71); *The German Element in the War of American Independence* (1876); *Short History of Rhode Island* (1877).

GREENE, NATHANAEL (1742-86). An American general. He was born Aug. 7, 1742, at Patowomut, Warwick Co., R. I. His father was a leading preacher among the Quakers and educated his son very simply, training him from childhood to work on his farm and at his anchor forge and gristmill. By his own perseverance, however, the son acquired considerable knowledge of ancient and English history, geometry, law, and moral and political science. In 1770 he was chosen a member of the Rhode Island Assembly, was reelected in 1771, 1772, and 1775, and, to the great scandal of his fellow Quakers, was among the first to engage in the military exercises preparatory to resisting the mother country. In 1774 he enlisted as a private in an independent company, the Kentish Guards, and in 1775 was appointed to the command of the Rhode Island contingent sent to the army at Boston, with the rank of brigadier general. He was promoted to be major general on Aug. 9, 1776, and was placed in command of the troops on Long Island. In the affair of Harlem Heights, where he was for the first time under fire, he handled his command with skill and valor. The movements by which the British General Howe tried to turn the flanks of the American army forced Washington to withdraw the greater part of his forces into New Jersey, leaving Greene in command of the remainder near Fort Mifflin on the Hudson. As the obstruction to navigation had been removed by the British, Greene's position was much exposed, and he was authorized to fall back across the river. The matter was left to his discretion, however, and he deemed it inadvisable to retire at the time. Preparations were made to defend the fort, but it was invested by Howe's forces and was compelled to surrender on Nov. 16, 1776, after a spirited conflict. (See FORT WASHINGTON.) In the New Jersey campaign of 1776-77 Greene distinguished himself, particularly at Trenton and Princeton. At the battle of Brandywine he was in command of a reserve force; at Germantown he commanded the left wing, and was vigorously pressing the enemy when a panic seized a brigade of militia, which gave way, and the American forces were com-

pelled to retire, which they did in good order, General Greene commanding the rear guard. In 1778 he reluctantly consented to act as quartermaster-general at a time when the administration of that department was difficult. His particularly noteworthy service was rendered after he succeeded General Gates on Oct. 30, 1780, in the command of the Army of the South. Congress vested in him authority to raise supplies, appoint officers, and command all the troops raised or to be raised in six States. Gates had just been completely defeated by Cornwallis at the battle of Camden (Aug. 16, 1780), and Greene, upon his arrival in North Carolina in December, 1780, found the army in a wretched state. By dint of great activity he got his troops into better condition and remained for a short time on the defensive. In the meantime the prospects of the Americans had been improved by the decisive victory at King's Mountain (Oct. 7, 1780) and by Morgan's overthrow of Tarleton at Cowpens (Jan. 17, 1781). Nevertheless, Cornwallis forced Greene northward into Virginia; but Greene, being reinforced, reentered North Carolina and took his stand at Guilford Courthouse. Battle was joined here (March 15, 1781), and, although Greene retired from the fight, he remained in control of much of North Carolina, while Cornwallis found it expedient to move northward into Virginia. Carrying the war into South Carolina, Greene was defeated by Cornwallis' successor, Rawdon, at Hobkirk's Hill (April 25, 1781); but he held his own in a severe battle at Eutaw Springs against Stuart (Sept. 8, 1781) and secured finally the exclusion of the English forces from all of Georgia and the Carolinas except three coast towns. Congress struck and presented to him a medal in honor of this battle, and the Carolinas and Georgia made him valuable grants of land. When peace was restored in 1783, Greene returned to Rhode Island, where he received numerous testimonials of the public admiration. In 1785 he retired with his family to his estate in Georgia, where he died of sunstroke, June 19, 1786. As a soldier, Greene was fitly described by his distinguished opponent Cornwallis as being "as dangerous as Washington, vigilant, enterprising, and full of resource." He also possessed many of the qualities of a statesman, was well balanced, full of tact, a master of the countless details involved in raising troops in a country not wholly patriotic or friendly to the cause, in impressing Congress with the needs of the army, and in harmonizing the conflicting policies of the new States. Consult: Francis V. Greene, *General Nathaniel Greene* (New York, 1893), in the "Great Commanders Series"; G. W. Greene, *The Life of Nathaniel Greene* (3 vols., ib., 1867-71); and, less favorable to Greene, McCrady, *History of South Carolina in the Revolution* (ib., 1902).

GREENE, NATHANIEL (1797-1877). An American journalist, brother of Charles Gordon Greene. He was born in Boscawen, N. H., became an apprentice in the office of the *New Hampshire Patriot* in 1809, and in 1812 edited the *Concord Gazette*. After conducting several other local papers he founded in 1821 the *Boston Statesman*, a prominent Democratic organ. He was for 15 years postmaster of Boston and published several translations: Sforzosi's *History of Italy* (1836); *Tales from the German* (1837); *Tales from the German, Italian, and French* (1843); *Improvisations and Translations* (1852).

GREENE, ROBERT (c.1560-92). An English

poet and dramatist, born at Norwich. He was placed at St. John's College, Cambridge, where he graduated B.A. in 1579. He then traveled in Spain and Italy. On his return he reentered the university and took the degree of M.A. at Clare Hall in 1583. He was also incorporated at Oxford in 1588. Soon after leaving Cambridge he proceeded to London, where he supported himself by his pen. He died of a debauch, Sept. 3, 1592. As a dramatist, Greene was one of the precursors of Shakespeare. Of his five plays, the best known is *The Honorable Historie of frier Bacon* (performed in 1594 and perhaps earlier). In this play a story of necromancy is fused with a tender idyl. The romance *Pandosto* (1588) contributed incidents to Shakespeare's *Winter's Tale*. *Menaphon* (1589), containing much beautiful verse, is one of the best of the Elizabethan romances. Greene wrote many pamphlets, of which *A Groatworth of Wit Bought with a Million of Repentance* (published just after his death, 1592) was immensely popular for 50 years. It contains the first undoubted allusion to Shakespeare after he came to London. Though Greene's life was dissipated, his writings are singularly pure. Consult: *Plays and Poems*, ed. by Dyce (London, 1831); *Complete Works*, ed. by Grosart for the "Huth Library" (15 vols., ib., 1881-86); by J. C. Collins (2 vols., Oxford, 1905); and by T. H. Dickinson (London, 1909).

GREENE, SAMUEL DANA (1840-84). An American naval officer, born in Cumberland, Md. In 1859 he graduated at the United States Naval Academy as a midshipman and two years later became a lieutenant. During the battle between the *Monitor* and the *Merrimac*, March 9, 1862, he had charge of the *Monitor's* guns and commanded the Union vessel after the disabling of Lieutenant Worden (q.v.). He served throughout the war on various vessels, was assistant professor of mathematics at the Naval Academy from 1866 to 1868 and of astronomy from 1871 to 1875, was promoted to be commander in 1872, and acted as assistant superintendent of the institution from 1878 to 1882.

GREENE, SARAH PRATT MCLEAN. See MCLEAN.

GREENE, WILLIAM BATCHELDER (1819-78). An American author, son of Nathaniel Greene (1797-1877). He was born in Haverhill, Mass., studied at West Point, and served in the Florida War. He was connected with the Brook Farm movement, graduated at the Harvard Divinity School in 1845, and became a Unitarian clergyman. In the Civil War he was colonel and then brigadier general of volunteers, but resigned in 1862. Among his works are: *The Sovereignty of the People* (1863); *Transcendentalism* (1870); *Theory of the Calculus* (1870); *Socialistic, Communistic, Mutualistic, and Financial Fragments* (1875).

GREENE, WILLIAM CORNELL (1851-1911). An American capitalist, born in Westchester Co., N. Y. He became a government contractor in Colorado and then went into ranching in Arizona. Eight copper mines, located by him in the State of Sonora, Mexico, brought him a fortune. Several mining and cattle companies were organized by him, and in 1892 he headed a syndicate of four men to purchase for ranch purposes a tract of 7,500,000 acres in Sonora; but at this time, when the Greene holdings amounted to \$100,000,000, of which Greene himself owned more than a half, a systematic attack by John

W. Gates and others, followed by the panic of 1907, caused the loss of most of his power and much of his property.

GREEN EARTH. A name frequently applied to the mineral glauconite (q.v.). The name is also applied to pulverulent varieties of the minerals chrysocola and malachite, especially when they are used in their natural condition as pigments. Another name for these earths is *mountain green*.

GREEN EBONY. The wood of *Jacaranda ovalifolia*, a tree of the Bignonia family, which is exported in considerable quantity from South America. It yields olive-green, brown, and yellow colors in dyeing, but is also employed to some extent by turners and carpenters. The wood is hard and of an olive-green color. The tree has showy, panicked flowers. *Brya ebenus*, a West Indian leguminous tree, furnishes a fine quality of green ebony. The name is also applied to the wood of other trees that has a greenish color. See EBONY.

GREENE'S METAMORPHOSIS. See AL-CIDA.

GREENFIELD. A city and the county seat of Hancock Co., Ind., 21 miles east of Indianapolis, on the Pittsburgh, Cincinnati, Chicago, and St. Louis Railroad (Map: Indiana, F 5). It has a public library and a fine high-school building. The city is surrounded by a farming district, and manufactures fruit jars, bottles, foundry products, and bricks. Greenfield, incorporated as a city in 1876, is governed under the original charter, which provides for a mayor, elected every four years, and a unicameral council. The city owns and operates its water works and electric-light plant. Greenfield is the birthplace of James Whitcomb Riley. Pop., 1900, 4489; 1910, 4448.

GREENFIELD. A town and the county seat of Franklin Co., Mass., 56 miles by rail west of Fitchburg, on the Connecticut and Deerfield rivers, and at the junction of two divisions of the Boston and Maine Railroad (Map: Massachusetts, B 2). It has manufactures of taps and dies, cutlery, machinists' tools, machinery, silverware, jewelry, agricultural implements, woodenware, paper boxes, bricks, cement building blocks, and children's carriages. The town has an extensive park system, the county hospital, and a public library. The government is administered by annual town meetings. Greenfield was settled in 1686, but remained a part of Deerfield until 1753. During Shays's Rebellion a body of insurrectionary troops was quartered here. Pop., 1900, 7927; 1910, 10,427; 1914 (U. S. est.), 11,492; 1920, 15,462. Consult Holland, *History of Western Massachusetts* (Springfield, 1855), and Thompson, *History of Greenfield* (1904).

GREENFIELD. A village in Highland Co., Ohio, 74 miles east-northeast of Cincinnati, on the Baltimore and Ohio Southwestern and the Detroit, Toledo, and Ironton railroads, and on Paint Creek (Map: Ohio, D 7). It has manufactures of sweat collar pads for horses, show cases, oil cans and other cans, and woodenware novelties. Settled about 1802, it is governed under a charter of 1850 by a mayor and a city council. The village contains a fine high-school building. Pop., 1900, 3979; 1910, 4228.

GREENFINCH, or **GREEN LINNET**. 1. A familiar European finch (*Chloris chloris*), common in Great Britain. It is of a prevailing green tint, mingled with gray and brown. Its song is not very sweet, but in confinement it

readily imitates the songs of other birds and in consequence is a favorite cage bird. 2. In the Rio Grande valley the name "greenfinch" is given to a totally different bird (*Arremonops virgatus*), allied to the chewink (q.v.). This bird, also called Texas sparrow, is about 6½ inches long, olive green in color, with rufous markings on the head and yellow on the wing. See GROSBEAK.

GREENFISH. 1. A Southern name for the bluefish (q.v.). 2. The pollack (q.v.), called also green cod and gray cod.

GREEN FROG, or **SPRING FROG**. One of the most familiar and widespread of North American frogs (*Rana clamitans*), occurring in all kinds of waters throughout the eastern United States and Canada. The male is about 3 inches long, the female ½ inch longer. In color it is brilliant green on the head and shoulders, above, passing into brownish olive posteriorly; below, white, the throat citron yellow; sides and thighs blotched or barred. The ear drum of the male is very large, one-fourth greater than the large eye; in the female it is smaller. This frog is aquatic and does not gather in large companies. Its only notes are an occasional "chug" and a sharp cry, uttered as it leaps into the water. It can make very long leaps and is a rapid and skillful swimmer. For a very full account of the life of this frog, consult Dickerson, *The Frog Book* (New York, 1906).

GREENHALGE, FREDERICK THOMAS (1842-96). An American politician, born in Clitheroe, England. He was early brought to America by his parents, studied for about three years at Harvard, and, when his father failed in business, in 1863, went to Newbern, N. C., where he entered the Commissary Department of the Federal army. Soon afterward, having contracted a fever, he returned North. He studied law and was admitted to the bar in 1865. After he had occupied a number of minor political offices, he was elected mayor of Lowell in 1879, being re-elected in 1881. In 1884 he was elected to the Massachusetts House of Representatives; in 1888 he was sent as a Republican to Congress, where he took a prominent part in the debates on the Free Coinage Bill, the McKinley Tariff Bill, and the Force Bill; and from 1894 until his death he was Governor of Massachusetts. Consult Nesmith, *The Life and Works of Frederick Thomas Greenhalge* (Boston, 1897), and a sketch in Lodge, *A Fighting Frigate and Other Essays and Addresses* (New York, 1902).

GREENHEART, or **BEBEERU** (*Nectandra rodiei*). A valuable timber tree of the family Lauraceæ, a native of northern South America, which also yields a medicinal bark. The timber is commonly called greenheart; the bark is better known as bebeeru (otherwise beeberry, bibiru, bibiri, etc., and sipiri or sipeira); and the alkaloid to which it chiefly owes its properties is called *bebeerine*. The tree grows chiefly in British Guiana and in the greatest perfection on the low hills immediately behind the alluvial lands; it rises with an erect, slightly tapering trunk to a height of 40 or 50 feet without a branch, attaining a height of 80 or 90 feet in all and a diameter of 3, or even 4, feet. The leaves are thick, oblong-elliptical, and shining; the flowers, yellowish white, in axillary clusters; the fruit, which is about the size of a small apple, contains a single seed, about as large as a walnut. The fruit is intensely bitter, but con-

6 CYCLAMEN

tains a form of starch used as food by the natives. The wood is extremely strong and hard and is exported to be used chiefly by turners for the same purposes as *lignum vitæ*, like which it sinks in water. It is also remarkable for its durability, for being almost exempt from the attacks of the white ants on land and of the teredo in water, and for the high polish it will take. It is used in Guiana for shipbuilding and for all the most important purposes for which timber is required. Greenheart, by reason of its great durability in water, is extensively used for wharves, docks, canal locks, etc., being thus employed in the Liverpool docks and Manchester Ship Canal locks. It is specified for sills and fenders in the locks of the Panama Canal. The wood has been reemployed after service of 50 years or more, when locks were enlarged. The *Fram*, Nansen's ship, and the *Discovery*, used in Antarctic explorations, were both built of greenheart. The bark has a very bitter, somewhat astringent taste. Its tonic and febrifugal properties resemble those of cinchona bark, although it is less reliable as an antiperiodic. The bark, as well as its alkaloid, is seldom used in medicine. A second alkaloid, nectandrine, found in the bark, has somewhat similar properties. South America produces a number of species of *Nectandra*. *Nectandra puchury major* and *minor* yield the seeds called pitchurim beans, which are astringent, are regarded as febrifugal, and are prescribed in dysentery, diarrhoea, etc., and the oil of which is used as a substitute for chocolate.

GREENHILL, SIR GEORGE (1847-1927). A British mathematician and physicist. He served as professor of mathematics at the Artillery College, Woolwich, and became a member of the aeronautical committee. He was knighted in 1908. His publications include: *Differential and Integral Calculus, with Applications* (1885; 3d ed., 1896); *Applications of the Elliptic Functions* (1892); *A Treatise on Hydrostatics* (1894); *Notes on Dynamics* (2d ed., 1908); *Report on Theory of a Stream Line, with Application to an Aeroplane* (1910); *The Dynamics of Mechanical Flight* (1912).

GREENHOUSE. A general name given to glass buildings in which exotic and other tender plants, or plants out of their season, are grown. It embraces such structures as forcing houses, conservatories, hothouses, stove houses, orchard houses, graperies, bark stove houses, warm houses, etc. In its original sense, a greenhouse was a place in which plants were kept alive or green, but not expected to grow, and in this sense it is similar in meaning to conservatory. According as the temperature is raised above this point the structure becomes a hothouse or forcing house. The roofs, and generally the sides and ends of such plant houses, are made of glass supported by wooden or metal sash bars or rafters. The glass, besides making the house light, prevents the escape of much of the heat derived from the sun. When heat from this source is not sufficient for the purpose of the house, artificial heat is supplied. In the simpler and smaller structures this is furnished by fermenting horse manure, tanbark, or other organic material. Stove houses, or dry stoves, formerly heated by flues which extended from end to end of the house, are used for growing the more tender plants. In recent times the better houses are heated by hot water or steam, conducted through iron pipes. Modern greenhouses are characterized by great simplicity of

construction; the framework is usually of wood or iron and wood, and very light considering its strength, and the glass of large dimensions.

GREENHOUSE PLANTS. Plants commonly cultivated under glass for decorative purposes, either for their attractive foliage or their flowers or both. With few exceptions the species are natives of the tropics and the warmer parts of the temperate zone. There are many thousands of species raised in America and foreign conservatories, among the most popular being those figured upon the accompanying plate and described under their respective titles.

GREENHOW, ROBERT (1800-54). An American physician and historian, born in Richmond, Va. He was educated at William and Mary College, and afterward in New York, where he took his medical degree at the College of Physicians and Surgeons. He lectured upon scientific and other subjects and was an accomplished linguist. He published a *History of Tripoli* (1835) and a *History of Oregon and California* (1846), an authoritative work, and his most solid achievement.

GREEN ISLAND. A village in Albany Co., N. Y., situated on an island in the Hudson River, 6 miles from Albany, on the Delaware and Hudson and the New York Central and Hudson River railroads. It is connected by bridges with Troy and Watervliet and has shops of the Delaware and Hudson Canal Company's Railroad. The chief manufactures are iron, lumber, and machinery. Pop., 1900, 4770; 1910, 4737.

GREENLAND. The largest island in the world after the island continent Australia. Its area is estimated to be 826,000 square miles. The island is more than 1400 miles in length and, at its broadest part, 690 miles in width. In the extreme south it barely extends below the parallel 60° N.: the most northern point is in 83° 39'. Forming the extreme eastern portion of the American Arctic area, Greenland extends north and south between the Arctic and the Atlantic oceans. On the east it fronts the Arctic Ocean, and on the west it is separated from the American Arctic Archipelago by the broad areas of Davis Strait and Baffin Bay, and by the narrow waterways of Smith Sound, Kane Basin, Kennedy and Robeson channels. The outlines of Greenland have been completed within recent years—on its west coast by Inglefield to 78° 28' N., by Kane to 80° 10' N., by Hall to 82° 07' N., by Nares to 82° 20' N., by Greely to 83° 24' N., by Peary to its extremity, 83° 39' N.; on the east coast by Koldewey to 77° 01' N., by Duke of Orleans to 78° 16' N., by Myllius-Erichsen to 80° 04' N., and by Koch to 83° 30' N. Bordered by abrupt rocky coasts, rising hundreds of feet out of the very ocean, Greenland is an immense plateau of an average elevation of 4500 feet; the highest ice crossed by Koch was 9000 feet, but a few rounded mountains exceed 10,000 feet. The continuity of the coast line is broken by innumerable penetrating fiords, often scores of miles inland. The characteristic feature of Greenland is its *inland ice*, the most remarkable existent example in the Northern Hemisphere of ice-age conditions. The inland ice covers 712,750 square miles, 86.3 per cent of the entire area of the island. In this vast territory the ice attains a maximum thickness of 2000 feet or more, and only occasional peaks, called nunataks, rise above the ice plain. The only ice-free areas are along the coasts, the widest strip being in the Holsten-

borg District, west coast, 100 miles, whence it diminishes both north and south to a vanishing point. On the east coast the free land is narrower and for scores of successive miles the open sea breaks against high glacial cliffs. The vast ice sheet moves steadily seaward along lines of least resistance, and many fiords discharge their glacial ice streams at rates reaching from 50 to 100 feet per day. The glacial phenomena present endless varieties of action, which are magnificent in form and incalculable in power and extent. Large lakes, impassable rivers, plunging cataracts, and unfathomable abysses are summer phases of the inland ice in South Greenland. The immensity of action may be surmised from Helland's investigations of Jakobshavn ice fiord, which, from its sea front of 3 miles, discharges from 80,000 to 160,000 cubic meters per day; there was noted an iceberg 369 feet high. The glaciers discharging into the sea probably exceed 1000 in number. Garde in one journey along the southeast coast discovered 200, and of these 70 were a mile or more wide at the sea. In Scoresby Sound were seen two detached bergs, each consisting of about 500,000 cubic meters of ice. The Humboldt and Jøkel Bay glaciers are the most stupendous, their discharging sea fronts exceeding 50 miles in length.

The climate is very cold, the mean annual isotherm of freezing temperature crossing the island near its southern end. This fact does not prevent the prevalence of warmth suitable for vegetation during the long summer day, in the interior of the fiords and in sheltered places quite to the northern end of the island. Thus the summer temperature in favored localities often reaches an important height. The mean temperature of the three summer months at Julianehaab, in South Greenland, is 48° F.; at Upernivik, farther north, it is 38° F. As the sun is totally absent from one to five months during the winter from Upernivik to the extreme northern coast, the sunless periods are most bitterly cold in contrast with the Cape Farewell region, where the winters are rainy but relatively warm. Oceanic conditions somewhat affect the east coast, tending to raise the winter and lower the summer temperatures. The following temperatures of selected stations show extremes naturally expected from a region stretching through 24° of latitude. The means are for February and July respectively, in degrees F., followed by the number of days in the year when freezing temperatures occur: West coast, Ivigtut, 61° N. lat., 20.0, 49.3, and 206 days; Godthåab, 64° N., 13.5, 43.7, and 243; Jakobshavn, 69° N., 0.4, 45.9, and 261; Upernivik, 73° N., 10.3, 41.0, and 293; Van Rensselaer Harbor, 79° N. (March), 34.9, 38.2, and 1; Thank God Harbor (interpolated from Lady Franklin Bay, opposite), 82° N., 41.7, 37.0, and 314. East coast, Angmagssalik, 66° N., 12.6, 43.7, and 266; Denmark Harbor, 77° N., 17.3, 39.9, and 331 days. April and August bring the largest precipitation, and the climate of the northern part of the island is drier than that of the south. From the recent extended geological investigations in Greenland, summarized by O. Nordenskjöld, it appears that the island consists of a central mass of Archæan rocks, from which portions of the coasts have been lowered through faults. The shores show sedimentary and volcanic belts, the sedimentary rocks there belonging to several paleozoic horizons and to the older Trias; they

include igneous rocks similar to those of western Europe and indicate the previous geographical connection of eastern Greenland with Spitzbergen. It is thought that the central plateau of the island was existent when a Mesozoic series, including Rhætic and Jurassic, were deposited. Some Cainozoic rocks are possibly the northwestern margin of the volcanic area of Scotland. Jurassic, Cretaceous, and Tertiary fossils have been found on the east coast, Tertiary and Quaternary fossils on the west coast. Lignite coal is found in many places, the largest areas being in Godhavn District. Twenty different minerals are found on the island. Copper has been lately discovered, but not yet exploited. Greenland is the only country yielding cryolite in commercial quantities, the mines being situated at Ivigtut on the southwest coast. Iron ore is found, and the largest-known meteorites were brought by Peary from near Cape York to the American Museum of Natural History in New York City. Graphite is also found, but not in quantity nor quality suitable for commercial purposes.

Large tracts in the south coast lands and considerable areas in the north are clad in a mantle of mosses, grasses, shrubs, and flowering plants. Most of the shrubs are trailing plants, and few trees grow to a height of over 6 feet. The flora, which includes about 400 flowering plants and some hundreds of lichens, greatly resembles that of Scandinavia. Numerous edible berries (juniper, alder berries, and others) form a small part of the food resources of the southern natives; and the white agents of the Danish government have garden patches in which turnips, cabbage, and lettuce are grown. The fauna is distinctly Arctic. Among the mammals the musk ox (found only to the north of the permanent ice cap) is alone of American origin, the white bear, Arctic fox and hare, ermine, and lemming being European. Wolves, foxes, and hares thrive on the edge of the Arctic Ocean. Flies, mosquitoes, beetles, butterflies, and mollusks abound everywhere along the coast, and no part of the ice-free areas is devoid of animal life. Reindeer are much less numerous than formerly. The little auk, eider duck, and swan have also been greatly depleted. There are about 125 varieties of birds, many of which swarm in enormous numbers on the precipitous mountain sides. In the southern inspectorate the Danes have introduced a few goats and horned cattle. The neighboring waters are rich in food for many varieties of sea animal life. The seal is the largest food resource of the natives, the walrus being next in importance. Walrus ivory and hides are important articles of export.

Industries and Commerce. The industries of Greenland are principally confined to fishing and hunting, and are almost exclusively in the hands of the natives. The unfavorable climatic conditions make agriculture, except a little gardening, impossible, and some of the necessities and all of the luxuries of life are imported from Denmark. The chief products of the Danish colony are seal and fish oils, skins, and cryolite. A Pennsylvania company has the exclusive privilege of mining and exporting cryolite to the Americas, most of the output going to Philadelphia, though a little is sent to Copenhagen. The product is from 6000 to 12,000 tons a year. The value of the imports of the United States from Greenland in the fiscal year 1914 was \$40,920. Commerce is a government monopoly

and is under the control of a separate department at Copenhagen. The prices paid to the natives for their products are below their market value, a circumstance which is mitigated by the fact that the government sells the necessities of life at cost prices. The trade is carried on chiefly by barter, and commodities are supplied by the government stores, which are found in every settlement. The exports and imports amounted to \$475,000 and \$205,000 respectively in 1912.

Government. The area embraced in the Danish colony is 46,740 square miles on the southwest coast and Angmagssalik on the east coast, the whole including about one-twentieth of the area of the island. In order to protect the natives against destructive exploitation, Denmark established in 1774 a Royal Trade Monopoly. The administration is in the hands of the Greenland Commission at Copenhagen, whose head is a director, appointed by the crown. In his turn he appoints the two inspectors for the administration of the inspectorates of North and South Greenland into which Danish Greenland is divided. The inspectorates are divided into 12 districts, of which Christianshaab, Jakobshavn, Godhavn, Ritenbenk, Umanak, Egedesminde, and Upernivik are in the northern, and Holstenborg, Sukkertoppen Godthaab, Frederikshaab, and Julianehaab are in the southern inspectorate. The district administrators are appointed by the director of the commission and have councils for the regulation of local affairs. The religious and educational training of the natives is most efficiently conducted by government missionaries and teachers appointed by the Minister of Public Works in Denmark. The beneficial effects of the Danish administration are a credit to the nation. The capital of North Greenland is Godhavn, on Disco Island, the most important settlement of the colony, and that of South Greenland, Godthaab.

Population. The population of Danish Greenland in 1911 numbered 13,459, including 384 Europeans. The population has steadily increased, numbering 9588 in 1870 and 11,893 in 1901. There is a considerable admixture of European blood among the natives of West Greenland, but none among those of the east coast. Christianity is professed by all the population of Southwest Greenland, but many of the native customs and superstitions still exist. For further facts relating to these natives and the Eskimo of other parts of Greenland, see **ESKIMO**. For the exploration of Greenland, see **POLAR RESEARCH**.

History. The Norseman, Erik the Red, voyaged along the coasts about 984 and gave the country its name. Soon thereafter a settlement was made under his leadership; then Christianity was introduced. Early in the twelfth century a bishopric was founded in the country by the aid of the King of Norway. It was from Greenland that Leif Ericson set forth upon the voyage in the course of which he is supposed to have reached America. The population centred in two districts on the west coast, Western Bygd and Eastern Bygd. Greenland was at first an independent state with a constitution and in most respects followed in Iceland's course of development. About 1260 it was constituted a territory of Norway and thus came into the union of Sweden and Denmark at the close of the fourteenth century. In 1410 voyages ceased to Norway, and, as a result, Greenland became lost to the world and remained practically a

blank in history until 1576. Expeditions sent out by Denmark after 1579 to redeem the colony accomplished nothing. About that epoch, however, English explorers—Frobisher, Davis, Hudson, and others—discovered various portions of the coast. In 1616 Baffin, crossing Melville Bay, discovered and named Smith Sound, attaining a latitude that was unsurpassed for 245 years.

In 1721 a Norwegian missionary, Hans Egede, with the support of the Danish government, made a settlement at Godthaab on the west coast and introduced Christianity anew among the Eskimo. During the eighteenth and nineteenth centuries the Danes acquired control of that uninhabited portion of Greenland which extends from Angmagssalik on the east coast round Cape Farewell to Tessuisak on the west coast. The region above Melville Bay was visited by John Ross in 1818 and by Inglefield in 1852; but the geographical knowledge concerning this region is mainly due to Americans—Kane, Hayes, Hall, Greely, and Peary. One English expedition has passed beyond Cape York since the days of Inglefield—the British Admiralty expedition under Nares in 1875-76. Kane Basin and Kennedy Channel were first explored by Kane and Hayes, and the knowledge of the straits and bays above them as far as the Arctic Ocean is due to Hall. Nares's expedition traced the northwest coast of Greenland as far as Cape Britannia. Lockwood and Brainard, of the Greely expedition, pushed farther along the northwest coast line to 83° 24'. Peary reached the northern end of Greenland in 1901, possibly the most northerly land in the world (83° 39'). The east coast has been examined by various explorers, among them, Scoresby, Graah, and Koldewey. The crossing of the ice cap of Greenland was initiated by Nordenskiöld, the great Arctic explorer, who was only partly successful in 1870 and in 1883. Crossings have been made by five explorers, as follows: Nansen, 1888, from Umivik to Godthaab; Peary, 1892, from Inglefield Gulf to Navy Cliff and return, and again by the same route in 1895; Rasmussen, 1912, from Inglefield Gulf to Denmark Fiord, and the same year from Independence Sound to Wolstenholme Sound; De Quervain, 1912, from Angmagssalik to Jakobshavn; and Koch, 1913, from Denmark Harbor to Lakse Fiord, Upernivik. The last journey appears to be the most valuable, as Koch crossed the island at its widest part and traversed ice at an elevation of 9800 feet. Their Danish successors have conducted a series of expeditions which in plan and accomplishment are unsurpassed in Arctic work. They have rectified existing errors, changed entirely the features of previous charts of northeast Greenland, and established the continuity of the island from Cape Farewell to 83° 39' N. Their scientific and field work appears in the *Meddelelser om Grønland*, as follows: G. Holm, who discovered the Angmagssalik natives, ix-x; Ryder, Scoresby Sound, xvii-xix; Amdrup, Christian IX Land, xxvii-xxx; Mylius-Erichsen and Koch, Northeast Foreland, Denmark Fiord, etc., xli-xlvi.

GREENLAND DOVE. See GUILLEMOT.

GREENLAND RIGHT WHALE. See WHALE, Plate of WHALES and Colored Plate of MAMMALIA.

GREEN'LEAF, CHARLES RAVENSCROFT (1838-1911). An American physician and soldier, born at Carlisle, Pa. He graduated from the Ohio State Medical College in 1860 and, enlisting in the Civil War as assistant surgeon of the Fifth Ohio Infantry, served on the staffs of Generals McClellan, Lew Wallace, Hancock, Wright, and Thomas. In the regular service he became colonel and assistant surgeon-general in 1896, was retired in 1902, and was made brigadier general in 1904. During the Spanish-American War he served in Cuba and Porto Rico as chief surgeon of the army in the field, and in 1900 he was chief surgeon of the Division of the Philippines on the staffs of Generals Otis and MacArthur. For a time he was professor of public and military hygiene at the University of California. He published *Greenleaf's Manual for Medical Officers; Greenleaf's Epitome of the Examination of Recruits; "A System of Personal Identification,"* in Buck's *Handbook*.

GREEN'LEAF, SIMON (1783-1853). An American jurist. He was born in Newburyport, Mass., began the practice of law in Maine in 1806, and on the establishment of its Supreme Court in 1820 became reporter. He was chosen professor of law in Harvard in 1833, but resigned in 1848 and was made professor emeritus. His most important work is *A Treatise on the Law of Evidence* (3 vols., 1842-53; 16th ed., 1899, rev. and enlarged by J. H. Wigmore). He published also: *Origin and Principles of Freemasonry* (1820); *Reports of Cases in the Supreme Court of Maine* (9 vols., 1822-35); *Examination of the Testimony of the Four Evangelists by the Rules of Evidence as Administered in Courts of Justice, with an Account of the Trial of Jesus* (1846).

GREEN'LET. See VIREO.

GREEN LIN'NET. See GREENFINCH.

GREEN'MAN, JESSE MOORE (1837-). An American botanist, brother of Milton Jay Greenman. He was born at North East, Pa., and was educated at the University of Pennsylvania (B.S., 1893), at Harvard University (M.S., 1899), and at the University of Berlin

(Ph.D., 1901). After spending three years as an instructor in botany and as an assistant in the Gray Herbarium of Harvard, he became assistant curator of the botanical department of the Field Museum of Natural History, Chicago, in 1905 and also assistant professor of botany at the University of Chicago in 1908. Greenman is regarded as an authority on the flora of Mexico and the western part of the United States. He is author of several studies published by the Field Museum.

GREENMAN, MILTON JAY (1866-). An American anatomist, brother of Jesse Moore Greenman. He was born at North East, Pa., and in 1889 graduated from the University of Pennsylvania (M.D., 1892), where he was instructor in biology in 1889-92 and lecturer on physiology in 1892-93. He was assistant director of the Wistar Institute of Anatomy, Philadelphia, from 1893 to 1905, when he became director. His investigations deal with the placenta of mammals and the regeneration of peripheral nerves.

GREEN MANURING. The very old and widely employed practice of growing crops to improve the soil by plowing them under, usually while green. The value of the practice was well understood by the Romans, as is shown by the writings of Varro, Vergil, and others. It is especially suited to temperate regions and light, poor soils. Two classes of plants are used for green manuring—those that are capable of thriving in the surface soil on a limited supply of plant food, which is thus saved from loss by washing or leaching; and those that gather plant food from both the air and the subsoil and are thus able to increase the fertility of the surface soil. To the first class belong rye, buckwheat, rape, etc.; to the second the leguminous plants. The leguminous plants are peculiarly adapted to green manuring because they have the power to assimilate through their root tubercles the free nitrogen of the air and thus enrich the soil by the added stores of this valuable fertilizing constituent. Some of them also send down long roots into the subsoil and draw up supplies of plant food to the surface which would otherwise be unavailable to ordinary crops. Green manures not only increase the available plant food in soils by the stores gathered from the air and the subsoil, but by their decomposition they set free plant food already in the soil, and which would otherwise be unavailable. They also improve the physical properties of the soil by the humus they form when they decay. Among the most important leguminous green-manuring crops are red clover, crimson clover, cowpeas, vetches, and soy beans; but there are many others which are specially adapted to the purpose in particular regions. Liming is generally, and inoculation of the soil with root-tubercle organisms is often, necessary for the most successful culture of leguminous green-manuring crops. Serradella and lupines are, however, examples of such crops which grow well on soils deficient in lime. Green manures, as a rule, give the best results when followed by cultivated crops. In any case the green manure should be given time to decompose thoroughly in the soil before the succeeding crop is planted. Green manuring will usually be found unnecessary in a rotation including a leguminous crop. Where live stock is kept, it is usually considered better practice to feed the crops to the animals and return the manure to the land than

to turn them under as green manure. See also MANURES and MANURING; SOIL; CLOVER.

GREEN MONKEY. A West African monkey (*Cercopithecus*, or *Lasiopyga*, *callitrichus*). It is one of the guenons, closely allied to the grivet, and about the size of a cat. As it is numerous in its native forests and is hardy in other climates, it is to be seen in most menageries; but its tendency is to grow vicious with age. One of its peculiarities is its complete silence. In color it has a greenish hue above, though the hairs are really tinted with a mixture of black and yellow. The extremities are darker, and the whiskers and undersurface are yellowish, inclining in some individuals to decided orange color. Cf. GRIVET; VERVET; GUENON.

GREEN MOUNTAIN BOYS. The name given to the soldiers of Vermont in the Revolution, originally organized in 1775 by Ethan Allen (q.v.) to oppose the claims of New York State to the Vermont territory. The band held the Canadian passes against the British during the Revolution.

GREEN MOUNTAINS. The northernmost extension of the Appalachian system, spreading over a large part of Vermont and extending northward towards the Gulf of St. Lawrence, and southward under the names of the Hoosac Mountains, Berkshire Hills, and Taconic Mountains (a distinct range) into western Massachusetts, Connecticut, and New York (Map: Vermont, C 4). Within the State of Vermont they are but little broken, from the Massachusetts line northward to the deep valleys of the Winooski and Lamoille rivers. The ridge line is usually more than 2000 feet above sea level, and considerable reaches are above 2500 feet. The Green Mountains reach their greatest elevation in the northern and central parts of Vermont, the highest peak being Mount Mansfield, 4364 feet above sea level; other important peaks are: Killington, 4241; Camel's Hump, 4088; Lincoln, 4078; and Jay, 4018 feet. Where the range is unbroken, it forms a continuous watershed for the streams running into the Connecticut River on the east and the Hudson and Lake Champlain on the west. Geologically they are mainly of primitive structure, consisting of granite, gneiss, etc., with a layer of old red sandstone on the western slope. The hills and even the highest peaks have a smooth and rounded surface, and their ascent is easy; the summits are covered with grass, and on the slopes are large forests of pine, hemlock, spruce, etc., as well as hardwood forests on the better lands. The soil is not well adapted for agriculture, but the pasturage is fine, and the streams give abundant water power. The range contains valuable mineral deposits, including marble, iron, and manganese, slate, and some copper.

GREEN MOUNTAIN STATE. Vermont. See STATES, POPULAR NAMES OF.

GREENOCK, grēn'ok. An important seaport and manufacturing town in Renfrewshire, Scotland, on the left bank of the Firth of Clyde, 22 miles west-northwest of Glasgow (Map: Scotland, D 4). Its chief industries are shipbuilding, dating from 1760; sugar refining, since 1765; the manufacturing of steam engines, iron-work, chain cables, anchors, ropes, sails, paper, woolen goods, etc. Fisheries employ a large number of boats. Its harbor works, commenced in 1707, comprise six tidal basins, a wet dock, and five dry docks; at the "Tail of the Bank,"

part of a large sand bank lying off the town, it possesses the best anchorage in the Clyde. Trade is carried on with Ireland, North America, and the West and East Indies. In 1912 vessels representing a total tonnage of 2,240,058 tons entered and cleared in foreign and colonial trade. The value of its imports and exports amounted to about \$14,512,000. The town is built irregularly and extends for 4 miles along the shore and on the slopes of the adjacent hills. The central busy portion has overcrowded, narrow streets and lanes, but the west end has wide, well-paved streets, planted with trees, handsome residences, and an esplanade 1½ miles long. The Watt Institute was erected in memory of James Watt (q.v.), who was born at Greenock. In the graveyard of the parish church, a late Gothic edifice, Burns's "Highland Mary" lies buried. The town owns its water works, and its water power is extensively used in the factories. It also owns its harbors, gas, electric-lighting plant, tramways, artisans' dwellings, and cemeteries. It is the seat of an American consular agent. Greenock owes its growth and prosperity to the Shaw family and to the Union of 1707, which facilitated foreign trade. Pop., 1911, 75,303. Consult Campbell, *Historical Sketches of the Town and Harbors of Greenock* (Glasgow, 1879-81).

GREENOCKITE. A cadmium sulphide crystallizing in the hexagonal system, but commonly occurring in yellow coatings on sphalerite (q.v.), with which it is usually associated. Greenockite is found in Renfrewshire, Scotland; Pibram, Bohemia; and in Pennsylvania, Missouri, and Arkansas.

GREENOUGH, grēn'ō, GEORGE BELLAS (1778-1855). A British geologist, born in London. He was educated at St. Peter's College, Cambridge, at Göttingen, and at Freiburg under Werner. In 1807 he was elected a fellow of the Royal Society; and he was one of the founders of the Geological Society of London in 1807, its first president, after it was regularly organized, from 1811 to 1817, and president again in 1818 and 1833. From 1807 to 1812 he was a member of Parliament for the borough of Gatton. He published: *A Critical Examination of the First Principles of Geology* (1819), which consisted of eight lectures and was translated into French, German, and Italian; his noteworthy *Geological Map of England and Wales* (1819; 2d ed., 1839) in six sheets; and a geological map of India (1854).

GREENOUGH, HORATIO (1805-52). The first eminent American sculptor. He was born in Boston, Sept. 6, 1805, the son of a well-to-do merchant of Boston, and received his earliest training in art from carvers and modelers there, especially from a French sculptor named Binon, who modeled the bust of John Adams in Faneuil Hall. At the age of 16 he entered Harvard College, from which he graduated in 1825. While at Harvard he met Washington Allston, his lifelong friend and mentor, who inspired him and assisted in arranging his plans for study. At Harvard, also, he made a thorough study of anatomy. The most important works of this early period were a bust of Washington, modeled from Stuart's portrait, and the original design for Bunker Hill Monument. After graduation Greenough went to Rome, where his real study of art began under Thorvaldsen. His earliest works at Rome were a series of busts and the statue of "Abel"; but before the end of the first

year an attack of malaria caused his return to Boston. Proceeding to Washington, he modeled the busts of President J. Q. Adams and Chief Justice Marshall, returning to Italy in 1827. After studying the finishing of sculpture at Carrara, he established a studio at Florence. He was much encouraged by Fenimore Cooper, who gave him a commission for the "Chanting Cherubs," the nudity of which caused much discussion. Through his efforts the young sculptor also received from the United States government the commission for his greatest work, the colossal statue of Washington (1843), conceived as the Olympian Zeus. Originally intended to be placed under the dome of the Capitol, it was found too heavy for that position; but until recently, when it was relegated to a sheltered place in the Smithsonian Institution, it occupied a prominent place on the avenue leading to the east front of the Capitol. Although long the butt of ignorant ridicule, it excelled every public American monument of its day in purity of taste and loftiness of conception. On the projecting buttress of the same east front is his large group of "The Rescue" (1837-57), typifying civilization—the first large group carved by an American. He returned in 1851 to Boston, where he died December 13 of the following year.

Greenough was the first professional American sculptor, more than any other the founder of the American school. He was, besides, a man of wide culture and refinement, the intimate friend of Emerson, and a profound thinker. His art was in the classical manner of his day, without personality or emotion. In the public collections of the United States, Greenough is represented in the Boston Museum by "Angel and Child," a bust of Napoleon, "Cupid Bound," a portrait bust of Hamilton, a relief of "Castor and Pollux"; in the Boston Athenaeum by "Venus Victrix"; in the Pennsylvania Academy (Philadelphia) by the well-known bust of Lafayette; in the New York Historical Society by the bust of John Quincy Adams; in the Art Institute of Chicago by the "Angel Abdiel." Among other well-known busts are those of John Adams, Henry Clay, Josiah Quincy, Samuel Appleton, Jonathan Mason, John Jacob Astor, etc. Consult: Dunlap, *History of the Rise and Progress of the Arts of Design in the United States* (New York, 1834), in which interesting letters by the artist and his brother are published; Tuckerman, *A Memorial of Horatio Greenough* (ib., 1853); Taft, *History of American Sculpture* (ib., 1903).

GREENOUGH, JAMES BRADSTREET (1833-1901). An American classical scholar, born at Portland, Me. He graduated from Harvard College in 1856. After practicing law for a few years in Michigan, he accepted an appointment in 1865 as tutor in Latin in Harvard College. In 1873 he was appointed assistant professor, and in 1883 professor, of Latin—a position which he continued to hold until a few months before his death, when failing health forced him to resign. Professor Greenough is best known as editor of a series of Latin textbooks for schools, called the "Allen and Greenough Series," which have passed through many editions, and as the author, in conjunction with J. H. Allen, of a *Latin Grammar*, which is widely used (1872; latest ed., 1903). He was the first to offer instruction in Sanskrit and comparative philology in Harvard College in 1872 and con-

tinued to teach these subjects in connection with his regular work in Latin until 1880, when an independent chair of Sanskrit was founded. He also was a prime mover in organizing the Society for the Collegiate Instruction of Women, from which Radcliffe College was developed, and was the first chairman of its academic board. He was joint author with Prof. George Lyman Kittredge of *Words and their Ways in English Speech* (1901), an excellent work. He contributed also to *Harvard Studies* papers on Latin syntax and etymology. Besides his more serious work, he wrote many graceful verses in both English and Latin. For an account of his life and writings, consult Kittredge, in *Harvard Studies*, xiv (Cambridge, 1903).

GREENPORT. A village in Suffolk Co., N. Y., opposite Shelter Island, in Gardiner's Bay, with which it is connected by steam ferry, 94 miles east by north of New York City, on the Long Island Railroad (Map: New York, C 2). It is a popular summer resort and has a fine landlocked harbor, accessible for the largest ships, and oyster, fishing, farming, and boat-building interests. Greenport contains a high school and the Eastern Long Island Hospital. The water works and electric-light plant are owned and operated by the municipality. Greenport was settled in 1831 and was incorporated in 1868. Pop., 1900, 2306; 1910, 3089.

GREEN RIVER. One of the head streams of the Colorado River (q.v.). It rises in the Wind River Range, in northwestern Wyoming, flows southward through the Green River basin, the Uinta Mountains, and through a series of cañons to its confluence with the Grand River (q.v.) in southeastern Utah, to form the Colorado (Map: Utah, D 3). Its length is about 700 miles. By way of this river Major Powell and others have made perilous trips into the Grand Cañon of the Colorado.

GREEN RIVER. A large tributary of the Ohio. It rises in Lincoln County, near the centre of the State of Kentucky, flows in a generally westward, then northwestward, direction, joining the Ohio about 8 miles above Evansville, Ind. (Map: Kentucky, C 4). Its length is about 300 miles, and it is 200 yards wide at its mouth; locks and dams make it navigable for small steamers for 200 miles. It passes within $\frac{1}{4}$ of a mile of the mouth of the Mammoth Cave, and it has a subterranean affluent in the Echo River of the cave.

GREEN ROOM. In the theatre, a room, usually at the side of the stage, where actors wait during the intervals of their parts in the play, and from which the dressing rooms lead. It also serves as a reception room (in French, the *foyer des artistes*) where actors meet friends and callers at the close of the play. The name is derived from the hangings and furnishings, which at an earlier period were uniformly green. No such uniformity prevails at the present day, and many greenrooms are very meagrely furnished.

GREENS. A common name for any green herbage boiled as a vegetable for the table. Spinach, young beet tops, dandelion leaves, kale, and mustard are the principal plants used for this purpose, though in early spring, when the appetite craves something green, the foliage of many other plants is used. The culture of the above plants is noted under their names.

GREEN SAND. A name given to greenish, clayey, or sandy deposits of which the mineral

glauconite (a hydrated silicate of potassium and iron) is the predominant constituent, but which contain particles of other minerals, such as quartz, feldspar, hornblende, pyroxene, and garnet. Greensand occurs in formations as old as the Cambrian, but it is most abundant in Cretaceous strata. In the Atlantic coast region the deposits are distributed over wide areas and in places attain considerable thickness. Here three beds have been recognized, known as the Upper, Middle, and Lower Greensand, all of Cretaceous age. In Europe the deposits occurring in the Cretaceous are divided into the Upper and Lower Greensand. The Upper Greensand consists of beds of sand, generally green in color, with included masses of calcareous grit called firestone. The strata on the cliffs of the Isle of Wight are 100 feet thick. The Lower Greensand is made up of indurated sandstones and clays, with occasional calcareous beds, and has a thickness of 800 or 900 feet. Between the two formations is the series of strata known as the Gault. See CRETACEOUS SYSTEM.

GREENSBORO, grēnz'būr-ū. A city and the county seat of Hale Co., Ala., 100 miles west by north of Montgomery, on the Southern Railroad (Map: Alabama, B 3). It is the seat of the Southern University (Methodist Episcopal, South), opened in 1859, and of the Greensboro Female Academy. The most important industries are farming and cotton growing. Greensboro, first settled in 1816, is governed under a charter of 1898, which provides for a mayor, chosen biennially, and a council, elected on a general ticket. The city is in the heart of the famous "black belt" of Alabama. Pop., 1900, 2416; 1910, 2048.

GREENSBORO. A city and the county seat of Greene Co., Ga., 88 miles by rail east-southeast of Atlanta, on the Georgia Railroad (Map: Georgia, C 2). It is surrounded by an agricultural and dairying region, and has a cotton mill, a cottonseed-oil mill, a cotton gin, fertilizer factory, and a creamery. The water works and electric-light plant are owned by the city. Pop., 1900, 1511; 1910, 2120.

GREENSBORO. A city and the county seat of Guilford Co., N. C., 81 miles west by north of Raleigh, on the Southern Railroad (Map: North Carolina, C 1). It is the seat of the Greensboro Female College (Methodist Episcopal, South), opened in 1846, the State Normal and Industrial College for white women, the State Agricultural and Mechanical College for colored students, and the Bennett and Lutheran colleges for negroes; and it contains also a Masonic Home, public library, several hospitals, and Fisher and Lindley parks. The city carries on a considerable trade in tobacco, cotton, coal, and iron, and manufactures spokes and handles, bent rims, bobbins, cotton-mill supplies, cotton goods, flannels, carpets, saw-mill machinery, furniture, fertilizers, stoves, sewer and drain pipe, buggies, cigars, flour, brick, tile, etc. Greensboro adopted the commission form of government in 1911. The city owns and operates its water works. Greensboro was settled in 1808 and received its first charter in 1870. The battle of Guilford Court House (q.v.) was fought, March 15, 1781, 5 miles northwest of Greensboro. Pop., 1890, 3317; 1900, 10,035; 1910, 15,895; 1914 (U. S. est.), 18,391; 1920, 19,861.

GREENSBURG. A city and the county seat of Decatur Co., Ind., 47 miles southeast of Indianapolis, on the Cleveland, Cincinnati, Chi-

cago, and St. Louis Railroad (Map: Indiana, G 6). It is the centre of a fertile agricultural region, has an abundant supply of natural gas, and there are limestone quarries, flour mills, and a brush and wire factory. The city has a beautiful park, a Carnegie library, and the State Odd Fellows' Home. The government is administered by a mayor, chosen every four years, and a unicameral council. Pop., 1900, 5034; 1910, 5420.

GREENSBURG. A borough and the county seat of Westmoreland Co., Pa., 31 miles by rail east by south of Pittsburgh, on the Pennsylvania Railroad (Map: Pennsylvania, C 7). It has an extensive trade in coal which is mined in the vicinity and manufactures glass, iron, and brass goods, engines, nuts and bolts, lumber, bricks, flour, etc. The borough contains St. Joseph's Academy for young women (Catholic), and several other private institutions for secondary education. Near Greensburg stood the village of Hanna's Town, which was destroyed by the Indians in July, 1782, and in which, it is said, was held in 1773 the first regularly constituted court of justice west of the Alleghany Mountains. Pop., 1900, 6508; 1910, 13,012; 1920, 15,033.

GREEN'SHANKS. A widely distributed "tell-tale" sandpiper (*Tringa nebularia*) of the Old World, which visits Great Britain and southern Europe in winter and offers sport for gunners during its migrations. It is related to, and is about the size of, the American yellow-legs, but differs in coloration. The plumage is mostly dusky brown on the upper parts, the feathers edged with yellowish white; the under parts are white, and the legs dull olive, "green" only by contrast with the pinkish tint of those of the redshanks (q.v.). It is graceful in flight and adds interesting traits of its own to the general behavior of its race. It breeds in northern Scotland, in Scandinavia, and Siberia; and in winter many go to South Africa and even to Australia. The green sandpiper of England is a quite different bird (*Tringa ocellus*).

GREEN SICKNESS. See CHLOROSIS; ANÆMIA.

GREEN'SLEEVE'S. An old English ballad, first printed in 1580 as "A New Northern Dittye of the Lady Greene Sleeves," though the ballad was popular before that time. It appeared in *A Handefull of Pleasant Delites*, 1584, as "A New Courtly Sonnet of the Lady Greensleeves, to the new tune of Greensleeves." The lively tune, the air of "Christmas comes but once a year," has been popular since the time of Elizabeth. Shakespeare mentions it twice in *The Merry Wives of Windsor*. The words are found in Child's *English and Scottish Ballads*, and the tune in Chappell's *Old English Popular Music* (1893).

GREENSLET, FERRIS (1875-). An American editor and writer, born at Glens Falls, N. Y. He graduated from Wesleyan University, Conn., in 1897, and from Columbia University (Ph.D.) in 1900. He was associate editor of the *Atlantic Monthly* in 1902-07 and became literary adviser in 1907 and director in 1910 of the Houghton Mifflin Co., publishers. He is author of *Joseph Glanville—A Study in English Thought and Letters of the Seventeenth Century* (1900); *The Quest of the Holy Grail* (1902); *Walter Pater* (1903, 1911); *James Russell Lowell: His Life and Work* (1905); *Life of Thomas Bailey Aldrich* (1908).

GREEN SNAKE. A name given to several serpents prevailing green and including some

poisonous Oriental species. The green snake of the United States, however, is a harmless and beautiful colubrine (*Liopeltis vernalis*). It is small, extremely slender, and in color grass green above, lighter on the sides, and yellowish white beneath. It feeds upon insects, is agile in climbing, and often festoons itself upon the branches of a bush, where it is almost invisible among the leaves.

GREENSPOND. A port of entry on a barren island of the same name in the north of Bonavista Bay, on the east coast of Newfoundland, G 3). It has a safe harbor and is an important scaling station. Pop., 1901, 1358; 1911, 1304.

GREENSTONE. A term loosely applied to rocks of basic composition which have a greenish color due to the abundance of the hornblende which they contain. Most greenstones are diorite (q.v.) or altered diabase. The term "greenstone" is obsolescent and is used chiefly to describe collectively rocks which have not been carefully studied.

GREEN'S TU QUOQUE (tā kwō'kwō), OR **THE CITTIE GALLANT.** An extremely clever comedy, by John Cooke (1614). The name was due to the comedian Green, who took the part of Bubble.

GREEN STURGEON. See STURGEON.

GREEN THURSDAY (Lat. *dies viridium*). The Thursday preceding Good Friday, called also Maundy Thursday. The name first came into use about 1200, and its origin is variously referred to the Twenty-third Psalm, the usual selection for the day, and to the custom of partaking of spring herbs on that day. Green Thursday was made a Christian feast day towards the end of the seventh century to commemorate the institution of the Lord's Supper.

GREEN TURTLE. A large, vegetable-feeding marine turtle (*Chelonia mydas*), which occasionally makes its way as far north as Long Island Sound. It feeds on the eelgrass (*Zostera*). This is the turtle of turtle-soup fame and may attain a weight of 350 pounds. The flesh of the Pacific form, at proper seasons, is said to be superior to that of the Atlantic species. The eggs are prized for food. They are buried in the sand along the shores of the islands of the south Atlantic. The turtles are captured while ashore at night laying the eggs, or more often are taken in nets, and sometimes they are speared when swimming, and are transported alive to the Northern markets. See TURTLE.

GREEN'NUK. See GAZELLE.

GREEN'UP, ALBERT WILLIAM (c.1868-). An English biblical scholar. He was born at Iyde, Isle of Wight, was educated at St. John's College, Cambridge (B.A., 1890; M.A., 1893), was rector of Alburgh in 1897-99, and in 1900 became a member of the faculty of theology of the University of London, of which he was dean in 1908-12. He was then appointed principal of the London College of Divinity, St. John's Hall, Highbury. His most valuable published works are texts, in some cases previously unedited, of commentaries (Midrash, especially Yalqut Machiri) on different Old Testament books.

GREEN VAULT (Ger. *Grünes Gewölbe*). A section of the Royal Palace at Dresden, so called from the color of the walls of one of its apartments.

GREENVILLE. A city and the county seat of Butler Co., Ala., 44 miles southwest of Mont-

gomery, on the Louisville and Nashville Railroad (Map: Alabama, C 4). It has cotton gins, an oil mill, a fertilizer factory, lumber mills, and a red-cedar factory, and is a market of considerable importance for lumber and cotton. The city owns the water works. Pop., 1900, 3162; 1910, 3777.

GREENVILLE. A city and the county seat of Bond Co., Ill., 51 miles east by north of St. Louis, Mo., on the Vandalia Railroad (Map: Illinois, F 8). It has a Carnegie library and is the seat of Greenville College (Free Methodist), opened in 1892. The city is the centre of an agricultural and coal-mining region, has flour and lumber mills and a grain elevator, and manufactures bricks, wagons, gloves, condensed milk, lodge paraphernalia, etc. The water works are owned by the city. Pop., 1900, 2504; 1910, 3178.

GREENVILLE. A city in Montcalm Co., Mich., 27 miles (direct) northeast of Grand Rapids, on Flat River, which supplies abundant water power, and on the Père Marquette and the Grand Trunk railroads (Map: Michigan, D 5). It has manufactures of flour, refrigerators, lumber products, furniture, kitchen cabinets, stove fixtures, motor boats, gas engines, agricultural implements, etc., and is an important market for agricultural produce, particularly potatoes and beans. The water works are owned by the municipality. Pop., 1900, 3381; 1910, 4045.

GREENVILLE. A city and the county seat of Washington Co., Miss., on the Mississippi River, about 137 miles south by west of Memphis, Tenn., on the Yazoo and Mississippi Valley and the Southern in Mississippi railroads (Map: Mississippi, C 4). It has steamboat connection with various river ports, an extensive trade in cotton, being the centre of a remarkably productive cotton-growing region, and several cottonseed-oil mills, large cotton compresses, lumber mills, etc. There are public parks and playgrounds, a public library, sanitarium, and the King's Daughters Home. The city owns its water works and sewage system. Pop., 1900, 7642; 1910, 9610; 1914 (U. S. est.), 10,448; 1920, 11,560.

GREENVILLE. A town and the county seat of Pitt Co., N. C., about 100 miles northwest of Raleigh, on the Tar River, and on the Norfolk Southern and the Atlantic Coast railroads (Map: North Carolina, E 2). It is the seat of the East Carolina Teachers' Training School. It is the distributing centre for a tobacco, cotton, and corn region, and there are tobacco factories, cotton, veneer, and oil mills, and a buggy factory. Greenville owns its water works and electric-light plant. Pop., 1900, 2565; 1910, 4101.

GREENVILLE. A city and the county seat of Darke Co., Ohio, on Greenville Creek, 35 miles northwest of Dayton, on the Dayton and Union, the Cincinnati Northern, the Ohio Electric, and the Pittsburgh, Cincinnati, Chicago, and St. Louis railroads (Map: Ohio, A 5). It has a considerable trade in lumber and tobacco, and there are 12 large tobacco warehouses. Other industrial establishments include a foundry and machine shops, lumber mills, glove works, fence works, underwear and incubator factories, and a creamery. The surrounding country is agricultural. There are a Carnegie library, a fine courthouse, an infirmary, and a children's home. The government, under the municipal code of 1902, is vested in a mayor, elected biennially, and a council. The city owns and operates its water works. Greenville is on the site of Fort

Greenville, built by General Wayne in December, 1793, where he remained with his army until July, 1794. After the battle of Fallen Timbers in 1794, General Wayne spent the winter of 1794-95 here, and on Aug. 3, 1795, concluded his famous treaty with the Indians. Greenville was first incorporated in 1832. Pop., 1900, 5501; 1910, 6237.

GREENVILLE. A borough in Merc. Co., Pa., on the Shenango River, 85 miles north by west of Pittsburgh, on the Pennsylvania, the Erie, and the Bessemer and Lake Erie railroads (Map: Pennsylvania, A 3). It is the seat of Thiel College (Lutheran), opened in 1870. The manufacturing interests include railroad shops, bridge works, gristmills, a cement-block plant, an automobile factory, foundries and machine shops, saw and planing mills, steelworks, and flour mills. Good water power is derived from the Shenango River. Pop., 1900, 4814; 1910, 5909.

GREENVILLE. A city and the county seat of Greenville Co., S. C., 160 miles northeast of Atlanta, Ga., on the Southern, the Greenville and Knoxville, the Piedmont and Northern, and the Charleston and West Carolina railroads (Map: South Carolina, B 2). It is noted as an educational centre; among its institutions are Furman University (Baptist), opened in 1851; Greenville Female College (Baptist), opened in 1854; Ursuline Academy, founded in 1900; and Chicora College (Presbyterian) for women, opened in 1893. The city has numerous industrial establishments, including cotton mills, foundries, carriage and wagon works, bagging factories, a bleachery, an underwear factory, and smaller plants. Settled in 1776, Greenville was incorporated in 1831. The government is administered under a charter of 1902 by a mayor, chosen biennially, who appoints the board of health; police commission, elected by the people; and a unicameral council, which elects the clerk, treasurer, chief of fire department, and sextons of cemeteries. Pop., 1900, 11,860; 1910, 15,741; 1914 (U. S. est.), 17,395; 1920, 23,127.

GREENVILLE. A city and the county seat of Hunt Co., Tex., 54 miles northeast of Dallas, on the Missouri, Kansas, and Texas, the Texas Midland, and the St. Louis Southwestern railroads (Map: Texas, D 3). It is surrounded by an agricultural region, has a large cotton compress, cottonseed-oil mills, etc., and has an important trade in cotton and cottonseed-oil products. The city is the seat of Burleson College (Baptist), Wesley College (Methodist), and Holiness University, and has two public parks. Settled in 1844, Greenville was incorporated in 1875 and has adopted the commission form of government. The city owns and operates its water works, electric-light plant, and sewer system. Pop., 1900, 6860; 1910, 8850; 1914 (U. S. est.), 9696; 1920, 12,384.

GREEN VITRIOL, or COPPERAS. The commercial hydrated ferrous sulphate, which crystallizes in green monoclinic prisms. It is prepared by heating iron wire or ferrous sulphide in a dilute solution of sulphuric acid, filtering the solution, and concentrating the filtrate to crystallization. It is also found native as the mineral melanterite, usually as an efflorescence resulting from the decomposition of pyrite or marcasite. Much copperas is now produced in the "pickling" of ironwares previous to tinning, galvanizing, etc.

GREENWALD, EMANUEL. (1811-85). An

American theologian, born near Frederick, Md. After studying privately and receiving his license from the Lutheran Synod of Maryland in 1831, he settled at New Philadelphia, Ohio, which until 1851 was his headquarters for general work among the scattered Lutherans of the Middle West. He subsequently held pastorates at Columbus, Ohio, Easton, Pa., and Lancaster, Pa. He was the founder and for many years the editor of the *Lutheran Review*, was president of the Pennsylvania Ministerium, the oldest Lutheran Synod in America, from 1873 to 1877, and the next year presided over the Lutheran Diet, assembled in Philadelphia. He died at Lancaster, Pa. His published works include: *The Lutheran Reformation* (1867); *The Foreign Mission Work of Louis Harms* (1868); *Sprinkling the True Mode of Baptism* (1876); *The True Church: Its Way of Justification and its Holy Communion* (1876); and *Romanism and the Reformation* (1880). He also published several books for children.

GREENWAY, THOMAS (1838-1909). A Canadian statesman. He was born in Cornwall, England, early went to Upper Canada (Ontario), and became a merchant in Centralia. In 1875-78 he was an Independent member of the House of Commons and after removal to Manitoba was elected (1879) a Liberal member of the Manitoba Legislature. In 1887 he became leader of the Liberal Opposition, and in 1888 Premier. His administration, which was in power until 1900, enacted useful measures to promote public economy and railway building, but excited much opposition by passing laws which abolished French as an official language for the province and did away with separate schools; the aim was to prevent in Manitoba the establishment of French educational and religious rights as they had existed in other provinces of Canada. Greenway died at Ottawa.

GREENWEEED. A name given to certain half-shrubby species of *Genista*, a genus of Leguminosae. Dyers' greenweed (*Genista tinctoria*), also called woadwaxen and whin, a species 1 or 2 feet high, with lanceolate leaves and terminal spiked racemes of pale-yellow flowers, is frequent in woods, meadows, and hilly pastures in most parts of Europe, in the temperate parts of Asia, and in New York and Massachusetts, where it has become established. Its branches, leaves, and flowers—particularly the flowers—yield a fine yellow dye, chiefly used for wool; its flowers mixed with woad yield a fine green dye. Formerly it was in great esteem as a dyestuff, but other substances have now almost entirely supplanted it. The leaves and seeds were also formerly used in medicine; the former as a diuretic, the latter as a mild purgative. Hairy greenweed (*Genista pilosa*), abundant in some parts of Europe, is cultivated, particularly upon light and sandy soils in France, for sheep, which are very fond of it. It is a slender, branched, tortuous, and procumbent plant, with small pale-yellow flowers. Some of the species are used to keep sand from drifting and others for covering rocky and otherwise bare places. See BROOM.

GREENWELL, DORA (1821-82). An English writer of religious poetry and prose. She was born and spent her youth in Durham, but lived latterly in London, where her mature poetry was published: *Carmina Crucis* (1869); *Songs of Salvation* (1873); *The Soul's Legend* (1873); and *Camera Obscura* (1876). She was

also the author of works of religious edification in prose.

GREENWICH, grĭn'ij or grĕn'ij. A metropolitan borough of London, England, in Kent, a former town on the high bank of the Thames, 5 miles southeast of St. Paul's Cathedral (Map: England, G 5). It is connected with the north bank of the Thames by the Blackwall Tunnel, built in 1897, and the Greenwich Tunnel, built in 1902. It is noted for the Greenwich Hospital (q.v.) and Royal Naval College (q.v.), and for the Greenwich Royal Observatory, established in 1675, from the meridian of which British astronomers and geographers, and to a great extent those of other nations, calculate their longitude, and whence "Greenwich time" is telegraphed twice daily to all parts of the United Kingdom. In 1911 a bill was passed by France for the adoption of Greenwich time, practically 9 minutes, 21 seconds behind that of Paris. The observatory crowns a hill 180 feet high, in Greenwich Park, a favorite resort of Londoners. Greenwich was a royal residence from the thirteenth to the seventeenth century and was the birthplace of Henry VIII, Queen Mary, and Queen Elizabeth. The borough has extensive engineering establishments, iron steamship-building yards, ropeworks, and factories. Greenwich was once famous for the annual whitebait dinners held by the members of the British cabinet. The last of these dinners was held in 1894, and the celebrated Ship Tavern at which they were given was closed in 1908. Pop., 1901, 95,770; 1911, 95,968.

GREENWICH, grĕn'tch, grĕn'tch. A borough in a town of the same name, Fairfield Co., Conn., on Long Island Sound, 28 miles northeast of New York City, on the New York, New Haven, and Hartford Railroad (Map: Connecticut, A 5). It is a beautifully laid out village containing many fine homes, and is popular as a summer resort and as a residential suburb of New York City. Pop., 1910, 16,463; 1914 (U. S. est.), 18,277; 1920, 22,123.

Greenwich was first settled in 1640 by Capt. Daniel Patrick. It was part of the Dutch Province of New York from 1642 until 1650, when, by the agreement of a Dutch and English commission, it became part of Connecticut and was selected as one of the points to mark the boundary. On Feb. 25, 1779, a troop of 1200 English and Tories under Governor Tryon marched against the place, which was defended by General Putnam with about 100 militia. The latter were soon forced to retreat. Consult *History of Fairfield County, Connecticut* (Philadelphia, 1881) and Mead, *Ye Historie of ye Town of Greenwich* (rev. ed., New York, 1911).

GREENWICH HOSPITAL. An institution for naval pensioners, founded by William III in memory of his Queen. It grants outpensions to old and disabled sailors of the royal navy, and educates their children; it also gives pensions to the widows of men killed or drowned while on duty. The buildings were sufficiently completed by 1705 (at a cost of £50,000) to admit 100 disabled seamen. By July 1, 1708, 350 had been admitted. The income derived from bequests, the original royal grant, and from contributions made under coercion by sailors, amounted to £12,000 a year, half of which was expended in maintaining the charity, and the other half in completing the buildings. In the reign of George II the forfeited estates of the Earl of Derwentwater were granted to the

hospital and produced an additional income of about £6000 a year. The compulsory contribution of 6d. a month by every seaman, whether of the naval or merchant service, was in 1834 remitted, an annual grant of £20,000 from the consolidated fund being substituted. The income from all sources by 1865 had reached £150,000 a year, out of which were maintained 1600 pensioners, and the necessary executive and medical officers, nurses, and servants. Many widows of sailors were employed as nurses or servants. In the year 1910-11 the income was £205,740.

In 1865 the institution ceased to exist as an asylum for aged sailors, while its funds were converted into outpensions, providing for a larger number than were maintained in the hospital. The buildings, after lying vacant during the following five years, became a royal naval college. All officers in the combatant branch of the service, on reaching the rank of midshipmen, as well as a number of engineers, were obliged to take a course of study in this college.

Attached to the hospital, which is situated at Greenwich, England, and consolidated with it, is a school for the gratuitous education of 1000 sons of seamen, under the superintendence of the commissioners of the hospital. The education given is such as to fit the recipients for either the navy or the merchant service. The term of study is from three to four years. The Royal United Service Museum, containing many famous historical relics, is also connected with this institution. Consult Fraser's *Greenwich Royal Hospital* (London, 1910).

GREENWICH OBSERVATORY. The leading English astronomical observatory, situated at Greenwich, in lat. 51° 28' 39.1" N. and on the prime meridian. It was founded by King Charles II in 1675 for the purpose of securing more accurate knowledge of the positions of the moon and principal stars with a view to promoting navigation. It is under the official control of the Admiralty, and the director is styled the Astronomer Royal. The Astronomer Royal in 1914 was Frank W. Dyson. The equipment includes a fine 8-inch meridian circle with which the fundamental work of taking meridian observations of the sun, moon, planets, and stars is carried on; an 8-inch altazimuth; a 28-inch refractor by Grubb; the Thompson equatorial, consisting of a (Grubb) 26-inch refractor mounted with the common 30-inch silvered-glass reflector as a counterpoise, the latter being used principally for spectroscopic work; and the astrophotographic equatorial, consisting of a 10-inch visual and a 12.8-inch photographic refractor mounted side by side, and designed for work in connection with the International Photographic Chart of the Heavens. (See *ASTRONOMICAL OBSERVATIONS*.) The observatory also possesses the 24-inch Newtonian reflector with which Lassell discovered the satellites of Uranus and Neptune. Photographs of the sun are taken on every available day and are stored for reference, forming a continuous sun-spot record since 1873. Magnetic and meteorological observations have been carried on regularly since 1838 and form an important part of the work. A continuous record of the moon's position since the middle of the eighteenth century is contained in the *Astronomical Observations*, the publication of which was begun in 1750; since 1838 it has appeared annually. Bradley laid the foundation of accurate sidereal astronomy by his observations at Greenwich; and in 1908 Melotte discovered

the eighth satellite of Jupiter. Among the noted astronomers who have held the position of Astronomer Royal were: John Flamsteed, from 1675 to 1719; Edmund Halley, from 1720 to 1742; James Bradley, from 1742 to 1762; Nevil Maskelyne, from 1765 to 1811; and Sir George Biddle Airy, from 1835 to 1881 (q.v.).

GREENWOOD. A city and the county seat of Leflore Co., Miss., about 90 miles north of Jackson, on the Yazoo River, at the head of navigation, and on the Southern and the Yazoo and Mississippi Valley railroads (Map: Mississippi, E 4). It is an important shipping point for cotton, and has a number of industrial establishments, including oil mills, cotton compresses, furniture, wagon and ice factories, bottling works, lumber and planing mills, etc. The city contains also a Carnegie library, Elks Home, and fine courthouse and school buildings. The water works and electric-light plant are owned by the municipality. Greenwood adopted the commission form of government to take effect in 1915. Pop., 1900, 3026; 1910, 5836.

GREENWOOD. A city and the county seat of Greenwood Co., S. C., 84 miles northwest of Columbia, on the Seaboard Air, the Piedmont and Northern, the Southern, and the Charleston and West Carolina railroads (Map: South Carolina, B 2). It is the seat of the Brewer Normal School for negroes, Lander Female College, Bailey Military Institute, and the Connie Maxwell Orphanage. It has manufactories of overalls, lumber, cottonseed oil, cotton, spools, bobbins, etc. The city owns and operates the water works, electric-light plant, and sewage system. Pop., 1900, 4824; 1910, 6614.

GREENWOOD, FREDERICK (1830-1900). A British journalist, born in London. Early in life he wrote several novels: *The Loves of an Apothecary* (1854); *The Path of Roses* (1859); *Under a Cloud*, with his brother James (1860); and his most pretentious work of fiction, *Margaret Denzil's History* (1864). He was editor of the *Queen* (1861-63) and joint editor (1862-64) and sole editor (1864-68) of the *Cornhill Magazine*. Under his editorship the *Pall Mall Gazette*, which he established with George Smith in 1865, became an influential Conservative organ. In 1875 it was on Greenwood's suggestion that Lord Beaconsfield bought for the government the Khedive's shares in the Suez Canal, thereby forestalling a purchase by France. When the *Pall Mall* went into Liberal hands in 1880, he resigned, editing soon afterward the *St. James's Gazette*, which was started for him by H. H. Gibbs. In 1891-92 he published a weekly review called the *Anti-Jacobin*, which, however, did not gain public support. Later he contributed frequently to various magazines and newspapers, and he wrote *Louis Napoleon Bonaparte* (1853), *The Lover's Lewison* (1893), and *Imagination in Dreams and their Study* (1894).

GREENWOOD, GRACE. See LIPPINCOTT, SARA JANE (CLARKE).

GREENWOOD LAKE. A picturesque sheet of water, partly in Orange Co., N. Y., and partly in Passaic Co., N. J., 49 miles northwest of Jersey City. The lake is about 6 miles long (northeast by southwest), and has an average width of somewhat more than half a mile. Along its shores are hills from 700 to 1200 feet in altitude; the village of Greenwood lies at its north end.

GREER, DAVID HUMMELL (1844-1919). An American Protestant Episcopal bishop. He

was born in Wheeling, Va. (now West Virginia), graduated at Washington College (Pa.) in 1862, and studied at the Protestant Episcopal Seminary, Gambier, Ohio. Ordained a priest in 1868, he was rector successively at Covington, Ky. (1868-71), Providence, R. I. (1871-88), and New York City (St. Bartholomew's Church, 1888-1904). In 1903 he was elected Bishop Coadjutor for the New York diocese and in 1908 succeeded Bishop Potter upon the latter's decease. Bishop Greer made himself known as an untiring personal worker in his parishes and his diocese, and as a believer in direct and unceremonious relationship between clergy and laymen. He wrote: *Moral Power of History* (1890); *From Things to God* (1893); *The Preacher and his Place* (1895); *Visions* (1898).

GREER, JAMES AUGUSTIN (1833-1904). An American naval officer, born in Cincinnati, Ohio. He entered the navy in 1848 and graduated as midshipman at Annapolis in 1855. In 1861 he was serving as a lieutenant on the *San Jacinto* when Mason and Slidell were seized aboard the *Trent*. During the naval campaigns of 1863 he took part in the siege of Vicksburg. In 1864 he was stationed at the naval recruiting office in Cincinnati to correct abuses there and during the winter of 1866-67 was for four months the protector of American interests at Acapulco, Mexico. He commanded the *Tigress* of the *Polaris* relief expedition in 1873 and was made captain in 1876. The *Constitution*, *Constellation*, and *Harford* were successively under his command. He served on various naval boards, was in command of the United States European Naval Station from 1887 to 1889, and in 1892 was made a rear admiral. He was retired in 1895.

GREET, BEN (?-). An English actor manager. He was born in London and was educated at the naval school, New Cross. About 1890 he began presenting Shakespeare's comedies and other pastoral plays outdoors. Subsequently, in connection with the Elizabethan Stage Society, he presented early plays in the original fashion, especially *Everyman*, a fifteenth-century morality play, and many of Shakespeare's plays. His parts include Malvolio, Dogberry, Benedict, Tony Lumpkin, Hamlet, and Triplet, which he played more than 1000 times. In 1902 he toured America with *Everyman* and thereafter was largely identified with the American stage.

GREG, WILLIAM RATHBONE (1809-81). An English essayist. He was born in Manchester and was educated at the University of Edinburgh. For a time he managed a mill of his father's at Bury and began enterprises of his own in 1832; but his preoccupation with political, economic, and theological questions led him in 1850 to give up business for writing. He was an ardent free trader. In 1856 he was appointed Commissioner of Customs and later Comptroller of the Stationery Office. His writings include: *Essays on Political and Social Science* (1853); *Literary and Social Judgments* (1869); *Political Problems* (1870); *Enigmas of Life* (1872); *Rocks Ahead* (1874); *Mistaken Aims and Attainable Ideals of the Working Classes* (1876); *Miscellaneous Essays* (1882).

GREGARINE (from Neo-Lat. *Gregarinus*, from Lat. *gregarius*, pertaining to a herd, from *grex*, herd). A parasitic protozoan of the group Sporozoa (q.v.).

GREGG, DAVID McMURTIE (1833-). An American soldier, born in Huntingdon, Pa. He

studied for a time at the University of Lewisburg (now Bucknell University), graduated at West Point in 1855, and served in many Indian campaigns on the Western frontier until the outbreak of the Civil War. He was made colonel of the Eighth Pennsylvania Cavalry Volunteers, took part in the Peninsula campaign, and in 1862 was promoted to be brigadier general of volunteers. Until August, 1864, he commanded various cavalry divisions of the Army of the Potomac, participating in the battle of Gettysburg, the Richmond campaign, and other important operations, and was brevetted major general of volunteers for his distinguished conduct throughout the war. From August, 1864, until his resignation in 1865 he commanded all the cavalry of the Army of the Potomac. He was United States Consul at Prague, Bohemia, from February to June, 1874, and in 1891 was elected Auditor General of Pennsylvania. He published *Second Cavalry Division of the Army of the Potomac in the Gettysburg Campaign* (1907).

GREGG, JOHN IRVIN (1826-92). An American cavalry officer, born in Bellefonte, Pa. He served in the Mexican War, rising to the rank of captain in September, 1847. He entered the Civil War as captain in the Third Cavalry. Very soon afterward he was transferred to the Sixth and in 1862 was made colonel of the Sixteenth Pennsylvania Cavalry. From April, 1863, to April, 1865, he commanded a cavalry brigade in the Army of the Potomac and fought in the battles of Gettysburg and Cold Harbor. He was severely wounded in the action at Deep Bottom and again at Amelia Court House. At the close of the war he was brevetted major general of volunteers and brigadier general in the regular army. In 1866 he was commissioned colonel of the Eighth Cavalry and in 1879 was retired.

GREGG, WILLIAM (1817-1902). A Canadian Presbyterian clergyman and educator. He was born in Donegal, Ireland, of Scottish parents, and was educated at Glasgow and Edinburgh universities. He came to Canada as a missionary in 1846 and in the following year was ordained to the ministry of the Free Presbyterian church in Canada. After taking several pastoral charges in Ontario he entered Knox College, Toronto, in 1864 as lecturer, and was professor of apologetics from 1892 until his retirement in 1895. In 1861 he was moderator of the Free Presbyterian church in Canada, and in the same year took place the union of that body with the United Presbyterian church of Canada. He published a *Book of Prayer for Family Worship* and a *History of the Presbyterian Church in the Dominion of Canada* (1885).

GRÉGOIRE, gr'gwi'r', HENRI (1750-1831). A Frenchman, prominent in the Revolution and constitutional Bishop of Blois. He was born of poor parents at Vého, near Lunéville, Dec. 4, 1750. He received his education from the Jesuits at Metz and Nancy and entered into orders. In 1788 he published *Essai sur la régénération civile, morale et politique des Juifs*, which attracted considerable notice and was crowned by the Academy of Metz. He had meanwhile become curé of Embarmesnil in Lorraine, and at the election for the States-General in 1789 he was chosen one of the deputies of the clergy. An ardent Democrat in all his views, he deserted his own class for the Third Estate and immediately began to play a prominent part in the Revolution. He was one of those who ad-

vised the secession of the Third Estate and became one of the secretaries of the National Assembly. He was one of the most enthusiastic advocates, on the night of August 4, of the abolition of the privileges of the nobles and clergy. He also gave his support to the civil constitution of the clergy and later accepted election as constitutional Bishop from the Department of Loire-et-Cher, taking the title of Bishop of Blois, although the old Bishop (De Themines) was still alive. In the debates of the Convention, Grégoire continued to be prominent as the representative of his diocese. He was an ardent advocate of the abolition of the kingship and the establishment of a republic. He favored the condemnation of Louis XVI, but sought, by proposing the suspension of the death penalty, to save the life of the unfortunate monarch; nor would he vote for his execution. Already, in 1789, Grégoire had figured as an advocate of negro emancipation, and in 1793 he further interested himself in behalf of the oppressed race, the result being that by a decree of Feb. 4, 1794, slavery was abolished in all the French possessions. After returning from an important diplomatic mission to Savoy in 1793, Grégoire acted on the Committee of Public Instruction and devised measures for the protection, and as far as possible the encouragement, of art, science, and literature. On Nov. 7, 1793, when Gobel, the recalcitrant Bishop of Paris, renounced the Catholic religion and proclaimed the cult of Reason, Grégoire, who was pressed to do likewise, bravely refused. He showed his tolerant spirit by advocating the granting of full civil rights to Jews resident in France. Throughout the later phases of the Revolution and under the Directory, Grégoire continued to take part in public affairs; and to his activity are due many of the measures connected with the public organization of literature and science which still form a part of the French system of administration. After the 18th Brumaire he became a member of the Five Hundred and in 1801 was raised to the Senate. He opposed the proclamation of the Empire, and after the conclusion of the concordat between Pius VII and Bonaparte he ceased to exercise his ecclesiastical functions. Although he was created a count of the Empire and an officer of the Legion of Honor, Grégoire resisted every step towards the establishment of the absolute authority of Napoleon, and in 1814 he was one of the first to pronounce against him. On the Restoration he was most earnest in demanding from Louis XVIII the acceptance of the constitution. During the Hundred Days he attracted no notice; but after the second return of the King he was excluded from the Senate, and, when chosen as a deputy from the Department of Isère, in 1819, his election was annulled. The last years of his life were spent in poverty and obscurity, for he had been expelled from the Institute and refused his pension as an ex-senator. He died at Auteuil, May 28, 1831. Always a devout Catholic, he, however, refused to yield his revolutionary principles. Therefore the Archbishop of Paris refused to give him the last rites of the Church unless he would break his oath to the civil constitution of the clergy. He would not do this, and, in defiance of the Archbishop, clerical friends administered the final sacraments.

Grégoire was a voluminous writer on political and ecclesiastical subjects, among his most important works being *Histoire des sectes reli-*

gicuses (1810) and *Essai historique sur les libertés de l'église gallicane* (1818). For his life, consult: Carnot (ed.), *Mémoires ecclésiastiques, politiques et littéraires de Grégoire* (Paris, 1839); Gregory, *Grégoire, the Priest and the Revolutionist* (Leipzig, 1876); Pressensé, *L'Eglise et la révolution française* (Paris, 1864); Grazier, *Études sur l'histoire religieuse de la révolution française* (ib., 1877); A. Pouget, *Les idées religieuses et réformatrices de l'évêque constitutionnel, Grégoire* (ib., 1905).

GREGORAS, NICEPHORUS (c.1295-1350). A priest in Constantinople, who proposed a reformation in the calendar by a plan which came very near exactness. It was practically the same as that later adopted by Gregory XIII. He was a theological controversialist, was much involved in the disputes between the Eastern and Western branches of the Church, and engaged in a dispute with Barlaam (q.v.). He wrote a history of the Byzantine Empire from 1204 to 1359. It is published in Migne, *Patrologia Græca*, cxlviii, cxlix (Paris, 1854-66).

GREGORIAN CHANT. The ritual music of the early Christian Church, as revised and introduced by Pope Gregory the Great. How much of a revolution he really made in the then existing Ambrosian forms is a disputed question. There can be, however, no doubt that he began certain needed reforms by the rejection of frivolous embellishments and the establishment of the whole musical system on a more representative basis. A full discussion of the development of mediæval Church music will be found under PLAIN CHANT. See also SACRED MUSIC; MODES.

GREGORIANUS. A Roman jurist of the third century. Little is known of his life except that he compiled the collection of laws known as the *Codex Gregorianus*, a work which, although transmitted to us in a very imperfect form, is said to have furnished the basis for the later Code of Justinian. Evidences of its value may be found in the frequent references to it by the later lawgivers of the Roman Empire. It was compiled probably about the close of the third century. Consult Sohm, *Institutes of Roman Law*, trans. by Ledlie (2d ed., Oxford, 1901).

GREGOROVIVS, grēg-ō-rō-vi-us, FERDINAND (1821-91). A German historian and poet, born at Neidenburg, East Prussia, and educated at Königsberg. He began his travels in Italy in 1852 and wrote in a novel and original manner the series *Wanderjahre in Italien* (1857-77). In 1880 he traveled in Greece and in 1882 in Egypt, Syria, and Turkey; then lived alternately at Rome and Munich until his death in 1891. In the same vein as the *Wanderjahre* are: *Corsica* (3d ed., 1878; trans. into English); *Figuren: Geschichte, Leben und Scenerie aus Italien* (1850); *Siciliana* (1860); *Lateinische Sommer* (1863); *Die Insel Capri* (1868; 3d ed., 1897); *Von Ravenna bis Mentana* (1871); *Apulische Landschaften* (1877). To an earlier period belongs his poetical and critical work, including: *Wardomar und Wladislaw* (1845); *Goethes Wilhelm Meister in seinen sozialistischen Elementen* (1849), a very valuable critique; *Die Polen und Magyarolieder* (1849); the tragedy *Der Tod des Tiberius* (1851); and the idyllic epic on Pompeii, *Euphorion* (6th ed., 1891). To his historical works belong the *Geschichte des römischen Kaisers Hadrian* (1851; and revised, 1884, under the title *Der Kaiser Hadrian*) and the great works on mediæval Italy: *Die Grab-*

denkmäler der Päpste (2d ed., 1881), and his most important work, the *Geschichte der Stadt Rom im Mittelalter* (8 vols., 1859-72; 5th ed., 1906), translated into English by Hamilton, from the fourth German edition, as *History of the City of Rome in the Middle Ages* (1894-1900). An Italian translation appeared at Venice at the expense of the Roman municipality in 1874-76. The work is scholarly and original and in matter and method ranks as one of the greatest historical studies of the century. Further studies in Roman history are: *Lucrezia Borgia* (3d ed., 1875); *Urban VIII im Widerspruch zu Spanien und dem Kaiser* (1879); *Una Pianta di Roma delineata da Leonardo da Besozzo* (Milanese (1883). Gregorovius also published: *Kleine Schriften zur Geschichte und Kultur* (1887-92); *Athenais, Geschichte einer byzantinischen Kaiserin* (1882); *Geschichte der Stadt Athen im Mittelalter* (2d ed., 1889); and an edition of the *Briefe Alexanders von Humboldt an seinen Bruder Wilhelm* (1880). Among his posthumous works are: *Gedichte*, edited by Schack (1892); *Römische Tagebücher*, edited by Althaus (2d ed., 1893); and *Briefe von Ferdinand Gregorovius an den Staatssekretär Hermann von Thilo* (1894). Consult: Münz, *Ferd. Gregorovius und seine Briefe an Gräfin Lovatelli* (Berlin, 1896); Simonsfeld, article in *Allgemeine deutsche Biographie*, vol. xlix (Leipzig, 1905); Heigel, *Biographisches Jahrbuch für Altertumskunde*, vol. xv (Berlin, 1892).

GREGORY (Lat. *Gregorius*). The name of sixteen popes and two antipopes.—GREGORY I, the Great (Pope, 590-604). He was born in Rome about 540 of an illustrious family and was a lawyer by profession. As early as 571 he was made prætor of Rome by the Emperor Justin II. By the death of his father he inherited much wealth, which he used for religious purposes. He founded six monasteries in Sicily and one in Rome, with the title of St. Andrew's, and, resigning his office, withdrew from the world and retired to the latter. Previously he had bestowed on the poor his costly robes, his gold, jewels, and furniture, and, refusing the abbacy of the convent, he began with the lowest monastic duties and devoted himself altogether to God. This was probably about 575. In this period of his life is laid the story of the Venerable Bede, that he met the Anglo-Saxon youths in the slave market and, being struck by their beauty and learning that they came from a pagan land, resolved to devote himself to the conversion of that land to Christianity. The story may be only a legend to account for Gregory's interest in England. He is said to have set forth on his journey; but the clamor of the Romans at his loss led the Pope, Benedict I, to compel his return and eventually to enroll him in the secular ministry by ordaining him one of the seven regionary deacons of Rome. Benedict's successor, Pelagius II, sent Gregory as nuncio to Constantinople to implore the Emperor's aid against the Lombards. He resided in Constantinople from 578 to 585, during which time he commenced and perhaps completed his great work, the *Exposition of Job*. On his return to Rome he reentered his monastery and became abbot and on the death of Pelagius was unanimously called by the clergy, the Senate, and the people to succeed him. He used every means to evade the dignity, but was forced to yield, and was consecrated Sept. 3, 590. Few pontiffs have equaled, hardly one has surpassed, Gregory as

the administrator of the concerns of the vast charge assigned to him. To him the Roman church is indebted for the complete and consistent organization of her public services and the details of her ritual, for the regulation and systematization of her sacred chants. The mission to England, which he was not permitted to undertake in person, was intrusted by him (597) with all the zeal of a personal obligation to Augustine (see AUGUSTINE), and under his auspices Britain was brought within the pale of Christian Europe. Under him the Gothic Kingdom of Spain, long Arian, was united to the Church. Nor was his zeal for the reformation of the clergy and the purification of the morality of the Church inferior to his ardor for its extension. On occasion of the threatened invasion of Rome by the Lombards, Gregory performed the part of a true king in protecting the state, and in his general administration he was, in fact, if not yet in avowed authority, a temporal sovereign. Though not a great philosopher, he was a great leader of men. To his administrative skill is due the organization of the mediæval papacy. In his writings, too, the details of the whole dogmatic system of the modern Church are very fully developed. His posthumous fame is of the highest, and he is one of the four greatest doctors of the Western (Latin) church. His works are in Migne, *Patrologia Latina*, lxxv-lxxvi. The best edition of his *Letters* is by Ewald and Hartmann (Berlin, 1891-93). In English have appeared: *The Book of Pastoral Rule*, and many epistles in *Nicene and Post-Nicene Fathers*, 2d series, vols. xii and xiii with prolegomena; his book of *Dialogues* (London, 1874), from which there are extracts in *Little Flowers of Saint Bonet, Gathered from the Dialogues* (London, 1901); his *Morals in the Book of Job*, in "A Library of the Fathers of the Holy Catholic Church," vols. xviii, xxi, xxiii, xxxi. Consult: Pfahler (Frankfort, 1852), of which the first volume only was published; Barmby (London, 1879); Snow (ib., 1892); Kellett, *Pope Gregory the Great and his Relations with Gaul* (ib., 1889); Dudden, *Gregory the Great* (2 vols., ib., 1905); Howorth, *Saint Gregory the Great* (ib., 1912); Mann, *Lives of the Popes of the Middle Ages* (ib., 1902-14).

GREGORY II (Pope, 715-731). He was born in Rome in 669 and educated at the Lateran. His pontificate is specially noticeable as forming an epoch in the progress of the territorial preeminence of the Roman see in Italy. The authority of the Eastern emperors in the West had sunk into little more than a name, and the tyrannical and barbarous measures by which the Emperor Leo the Isaurian attempted to enforce his decrees against image worship (see LEO III; ICONOCLASM) weakened still more the tie which bound Italy to the Eastern emperors. The natural result of the diminution of the Imperial authority in Italy was the growth of that of the Pope, to whom the deserted Italian provinces looked, partly as their spiritual counselor and head, partly as their mediator with the barbarous enemy, partly as the centre of the political federation of self-defense which their isolation necessitated. Gregory convened a council in Rome on the subject of the honor due to images and addressed an energetic letter to the Emperor. He built up the monasteries and was a patron of the work of Boniface, the missionary of Germany. He died in Rome, Feb. 10, 731. His *Epistolæ et Canones* are in Migne, *Patrol.*

Lat., lxxix. Consult Dahmen, *Das Pontifikat Gregors II.* (Düsseldorf, 1888).—GREGORY III (Pope, 731-741). He was a Syrian by birth and followed the policy of his predecessor, Gregory II. In 730 he sent a deputation to Charles Martel, soliciting his succor against the Lombards, and proposing, if it was granted, to recognize him as protector of the Romans and to confer on him the title of "Consul and Patrician of Rome." This offer was made by the Pope "in virtue of a decree of the Roman Primus" and is of great historical importance in the consideration of the nature and origin of the papal power in Italy. Owing to the pressure of the war with the Saracens, the embassy failed; but it was a step towards the consummation of the independence of the West. Gregory bestowed the pallium on Boniface, the Apostle of Germany (732). He died in Rome, Nov. 28, 741. His extant writings are in Migne, *Patrol. Lat.*, lxxix and xlviii.—GREGORY IV (Pope, 827-844). He was a native of Rome. He tried unsuccessfully to arrange the quarrel between Louis the Pious (q.v.) and his sons and rebuilt Ostia as a defense for the mouth of the Tiber. His *Epistolæ* are in Migne, *Patrol. Lat.*, cvi.—GREGORY V (Bruno of Carinthia) (Pope, 996-999). He was the first German Pope, a relative of the Emperor Otto III. His authority was unsuccessfully disputed by an antipope, John XVI (997-998). His *Epistolæ* are in Migne, *Patrol. Lat.*, cxxxvii.—GREGORY VI (John Gratianus) (Pope, 1045-46). He had been a priest in Rome and bought the papacy from Pope Benedict IX. Sylvester III was also named Pope, and in the conflicts which followed the Emperor took him prisoner, after having compelled his resignation (1046), and brought him to Germany. He died in 1048 at Cologne. His *Epistolæ* are in Migne, *Patrol. Lat.*, cxlii.—GREGORY VI was also the title of an antipope to Benedict VIII in 1012.

GREGORY VII (Hildebrand) (Pope, 1073-85). Preëminently the representative of the temporal claims of the mediæval papacy. He was born in Tuscany about 1020, perhaps at Soana, a village of the southern border. His family belonged to the plebeian class. Although nothing of his remoter ancestry is known, his family name, Hildebrand, would imply a Teutonic descent; but by birth and education at least he was Italian. His youth was passed in Rome, in the monastery of St. Mary, on the Aventine, of which his uncle was abbot, and he probably took monastic vows. The Emperor Henry III took him to Germany, and he continued his studies in Cologne. Very likely he also visited Aix-la-Chapelle and Cluny. He attended the council at Worms at which Bishop Bruno of Toul was chosen Pope (Leo IX), and the latter took him to Rome (1049) and made him a cardinal subdeacon. He had great influence during the pontificate of Leo. On the latter's death (1054) the Roman people manifested a desire to have Hildebrand as successor; but this honor he declined, preferring to gain more experience. Besides important domestic employments which were assigned to him, he was sent as legate to the Council of Tours (1054), in which the cause of Berengarius was examined. (See BERENGARIUS or TOURS.) He was likewise one of the three legates dispatched to Germany to consult about a successor to Leo IX. Under the four popes who followed Leo—Victor II, Stephen IX, Benedict X, and Alexander II, known in history as the German popes—Hildebrand continued to be

the predominant power and inspired into their government of the Church the great principles to which his life was devoted. Three days after the death of Alexander II he was unanimously elected at Rome; but he declined to be consecrated until the Emperor's sanction had been gained. The German bishops, who feared the reforms of which his name was a guaranty, endeavored to prevent the Emperor Henry IV from assenting to the election; but Henry gave his approval, and the new Pope was crowned July 10, 1073. Regarding as the great evil of his time the thoroughly secularized condition of the Church in a great part of Europe, and especially in Germany and northern Italy, Gregory directed against this all his efforts. In his reforming crusade he first attacked the evil of clerical marriage and the probably much less frequent offense of clerical incontinence. These he combated by stirring up the people to refuse the sacraments from any other than a celibate and pure priest. Simony also was denounced in the most explicit and vigorous terms. But it was against the fundamental abuse of investiture (q.v.) that his main efforts were directed. In 1075 he prohibited this practice under the pain of excommunication both for the investor and the invested, and in the following year he actually issued that sentence against several bishops and counselors of the Empire. The Emperor Henry IV (q.v.) disregarding these menaces and taking the offending bishops under his protection, Gregory cited him to Rome to answer for his conduct. Henry's sole reply was a haughty defiance, and in a Diet at Worms, in 1076, he formally declared Gregory deposed from the pontificate. Gregory was not slow to retaliate by a sentence of excommunication; and in this sentence, unless revoked or removed by absolution in 12 months, by the law of the Empire at the time, was involved the forfeiture of all civil rights and deposition from every civil and political office. When, at a Diet held at Tribur (September, 1076), the bishops actually began to discuss the election of a new Emperor, Henry deemed it necessary to appear to yield. Accordingly he sought the Pope, who was then at the castle of Matilda, Countess of Tuscany, at Canossa (q.v.). He arrived there with his wife and son in the dead of a very severe winter. Gregory himself is authority for the statement that the Emperor, "having laid aside all belongings of royalty, wretchedly, with bare feet and clad in wool, continued for three days [Jan. 25-27, 1077] to stand before the gates of the castle," and it was not till the pitiful state of the royal penitent moved all hearts that the Pope admitted him to his presence and absolved him. Henry's submission, however, was but feigned; and on his subsequent triumph over his rival, Rudolf of Swabia, he resumed hostilities with the Pope, and in 1080 again declared him deposed and caused to be appointed in his place the antipope Guibert, Archbishop of Ravenna (see GUBERT OF RAVENNA), under the name of Clement III. After a protracted siege of three years Henry, in the year 1084, took possession of Rome. Gregory shut himself up in the castle of Sant' Angelo. Just, however, as Gregory was on the point of falling into his enemy's hands, Robert Guiscard, the Norman Duke of Apulia, entered the city, set Gregory free, and compelled Henry to return to Germany; but the wretched condition to which Rome had been reduced obliged Gregory to withdraw, first to

Monte Cassino, and ultimately to Salerno, where he died, May 25, 1085. His dying words were: "I have loved justice and hated iniquity; therefore I die in exile." He was canonized in 1728. Gregory's writings, dealing mostly with Church government, are in Migne, *Patrol. Lat.*, xcviii. His *Epistles* were separately edited at Paris (1877); a selection was translated (London, 1853). The literature upon him is abundant, but that written prior to 1850 is superseded by more critical work. Of chief value and interest may be mentioned: Gfrörer, *Papst Gregorius VII und sein Zeitalter* (Schaffhausen, 1859-61; index vol., 1864); Villemain, *Life of Gregory VII* (trans., London, 1874); Stephens, *Hildebrand and his Times* (ib., 1886); Delarc, *Saint Grégoire VII et la réforme de l'église au XIème siècle* (Paris, 1889-90); Vincent, *The Age of Hildebrand* (New York, 1896); Barry, *The Papal Monarchy* (ib., 1902); Mathew, *Life and Times of Hildebrand* (London, 1910); Martens, *Gregor VII, sein Leben und Werke* (Leipzig, 1904). For the numerous special discussions, and in general, consult Cerroti, *Bibliografia de Roma medievale e moderna*, vol. i (Rome, 1893), and Chevalier, *Répertoire des sources historiques du moyen âge* (Paris, 1887; supplement, 1888).

GREGORY VIII (Pope, 1187). He succeeded Urban III, Oct. 21, 1187, and died eight weeks later. His *Epistolæ et Privilegia* are in Migne, *Patrol. Lat.*, cclii. Consult the dissertation of Nadig, *Gregors VIII. 57 tägiger Pontifikat* (Basel, 1890).—GREGORY VIII was also the title taken by Mauritius Burdinus, Archbishop of Braga, set up as antipope to Gelasius II by the Emperor Henry V in 1118. He was taken prisoner by the successor of Gelasius, Calixtus II, in 1121, and died in captivity, 1125.—GREGORY IX (Ugolino, Count of Segni) (Pope, 1227-41). He followed the policy of Gregory VII and had a long dispute with the Emperor Frederick II (q.v.), whom he twice excommunicated. The Emperor marched upon the papal territories, took Ravenna, and intercepted a fleet from Genoa which was conveying a hundred Church dignitaries to Rome. Gregory died before the trouble was settled. He was active in strengthening the orders of monks and made an attempt to bring the Eastern church into union with Rome. He instituted the Monastic Inquisition and gave it in charge to the Dominicans. For his life, consult: Balan (Modena, 1872-73); J. Marx, *Die Vita Gregorii IX quellenkritisch untersucht* (Berlin, 1890); Felten, *Papst Gregor IX* (ib., 1886); Auvray (ed.), *Les registres de Grégoire IX, 1227-35* (Paris, 1890-96). His *Epistolæ* are in D'Achery, *Spicilegium*, vol. iii (ib., 1723).—GREGORY X (Teobaldo di' Visconti) (1210-76) (Pope, 1271-76). He was born at Piacenza, Italy, 1210. At the time of his election (1270) he was in the Holy Land as a crusader. He arrived at Rome, March 13, 1271, and was consecrated Pope March 27. He held at Lyons the fourteenth general synod for action upon (1) the Greek schism, (2) the Saracen oppression of the Holy Land, and (3) the moral degeneracy of the times. The synod was opened by the Pope in person, May 7, 1274. He exerted himself to attain the ends sought and succeeded as far as the council was concerned. But the plans for a crusade came to nothing; the union with the Greeks was short-lived, and the times did not noticeably improve. He died in Rome, Jan. 10, 1276. Consult J. Guiraud (ed.), *Les registres de Grégoire X* (Paris, 1892-98).—GREGORY

XI (Pierre Roger de Beaufort) (1331-78) (Pope, 1370-78). He was born in 1331, chosen Pope at Avignon, Provence, 1370, and was the last of the French popes. At the request of the Romans, and influenced by the pleadings of St. Catharine of Siena, he returned to Rome in 1377, and there he died, March 27, 1378. The works of Wiclif came under his censure. Consult Chaillan, *Recherches et documento inédito sur l'orphantrophium du pape Gregoire XI à Avignon* (Avignon, 1904).—GREGORY XII (Angelo di Corario) (1327-1417) (Pope, 1406-15). He was a Venetian and was chosen Pope in 1406. He was deposed by the Council of Pisa (1409), but held on till at the Council of Constance (1415) he voluntarily abdicated. (See CONSTANCE, COUNCIL OF.) He died as Cardinal Bishop of Porto, Oct. 18, 1417.

GREGORY XIII (Ugo Buoncompagno) (Pope, 1572-85). He was born in Bologna, Jan. 7, 1502. He was educated in his native city, where he held the professorship of law for several years. He settled in Rome in 1539 and was one of the theologians of the Council of Trent (q.v.). On his return to Rome he was created Cardinal in 1564 and sent as legate to Spain. On the death of Pius V, Gregory was elected Pope in 1572. He showed great zeal for the promotion and improvement of education, especially for the clergy, as a means of combating Protestantism; a large proportion of the colleges in Rome were wholly or in part endowed by him, and his expenditure for educational purposes is said to have exceeded 2,000,000 Roman crowns. The most interesting event of his pontificate is the correction of the calendar (see CALENDAR), which was the result of long consideration, and was finally proclaimed in 1582. When the news of the Massacre of St. Bartholomew reached Rome, Gregory and his cardinals solemnly celebrated the event at the church of San Marco, on Sept. 6, 1572, as the suppression of a conspiracy not alone against Charles IX, King of France, but also against the Church. He had a medal struck with his portrait on the obverse, and on the reverse an angel bearing a cross and sword, while the inscription reads, *Hugonotorum strages* (Overthrow of the Huguenots). Gregory did much to help the Jesuits. He died in Rome, April 10, 1585, in the eighty-third year of his age. He published in 1582 a valuable edition of the *Decretum Gratiani*.—GREGORY XIV (Niccolò Sfondrati) (1535-91) (Pope, 1590-91). He was a native of Cremona. He put Henry IV of France under the ban (1591).—GREGORY XV (Alessandro Ludovisi) (1554-1623) (Pope, 1621-23). He was born in Bologna, 1554. Although an old and infirm man when chosen Pope, his pontificate, thanks to his nephew, Ludovico Ludovisi, whom immediately after his elevation he made Cardinal at the early age of 25, was a very successful one. The Counter Reformation (q.v.) accomplished much in Bohemia, Austria, and Hungary; the Congregation for the Propagation of the Faith, and the Papal Conclave as at present carried on, were established.

GREGORY XVI (Bartolommeo Alberto Cappellari) (1765-1846) (Pope, 1831-46). He was a Venetian, who became a Camaldolese monk, ultimately rose to the head of the order, was learned in Eastern languages and a teacher of theology. When Napoleon carried Pius VII away as a prisoner in 1809, Cappellari left Rome for his native place and remained in quiet for three years. On

the return of the Pope (1814) he was promoted to various important positions and in 1826 was made Cardinal and the Prefect of the Propaganda (q.v.). In this capacity he was practically Minister of Foreign Affairs. He made an agreement with the Netherlands regarding Roman Catholic citizens, regulated Church matters in the United States, and secured emancipation for the Catholics in Armenia from the Sultan. He was elected to the papacy Feb. 2, 1831, and for 15 years was zealous and energetic in promoting the interests and expanding the power and influence of the Church. He was a munificent patron of architecture, engineering, and literature. His famous work, *The Triumphs of the Papacy* (Rome, 1799), has been translated into German and French and incorporated in Migne's *Démonstration évangélique* (vol. xvi). He was a bad financier and left the papal treasury in difficulties. For his life, consult: Sylvain (Paris, 1880); Cardinal Wiseman, *Recollections of the Last Four Popes, and of Rome in their Times* (London, 1858); Garavzi, *My Recollections of the Four Last Popes* (ib., 1857).

GREGORY V (1739-1821). A Greek Patriarch of Constantinople. He was born at Dimitzani in Arcadia and was baptized Georgios Angelopoulos. Educated at Mount Athos, he was an anchorite for many years; became Bishop of Smyrna (1784) and Patriarch of Constantinople (1795). At this time, during the difficulties between France and Turkey over Egypt, he was accused by the Turkish populace of treason and banished to Athos. His studies there made him a great educational power, when he was recalled to Constantinople in 1806, and contributed to his reinstatement as Patriarch in 1819 after a second banishment of 11 years. On the outbreak of the Greek Revolution Gregory anathematized the rebels; but he was accused of giving them secret assistance, and on Easter Day, 1821, he was hanged by the Janizaries in his patriarchal robes at the main entrance of his own church, together with three bishops and eight novices. His body, which was mutilated and thrown into the sea, was rescued and buried in the cathedral at Athens. Gregory wrote a translation in modern Greek of the Epistles of Paul, with a commentary.

GREGORY, AUGUSTA, LADY (?-). An Irish dramatist, née Isabella Augusta Persse, of an old Galway family of Roxborough. In 1880 she married Sir William Henry Gregory (1817-92), of Coole Park, Galway, who had been member of Parliament for Galway and Dublin and Governor of Ceylon, where he founded the Colombo Museum, and whose *Autobiography* Lady Gregory edited in 1894. In 1898 she edited *Mr. Gregory's Letter Box*, the correspondence in 1812-30 of her husband's grandfather, William Gregory (1766-1840), Undersecretary of State for Ireland. Deeply interested in the movement known as the Irish Literary Revival, which was well under way in the nineties, Lady Gregory was a constant friend of William Butler Yeats, on the whole the representative man of that movement, who owed much to her help and encouragement. Her renderings of the Irish sagas in *Cuchulain of Muirtonne* (1902) and *Gods and Fighting Men* (1904) are substantial literary achievements, and, more closely than other translations, they stand in a relation to Irish romance which corresponds to the relation of the works of Malory and Lady Charlotte Guest to the Arthurian ro-

mances. A novel and most effective feature of Lady Gregory's renderings is the use of the Irish idiom, the modified form of English fashioned by the Celtic peasant to express better the thoughts and feelings which had formerly found utterance in the expiring Gaelic tongue. Taking a lively interest in the dramatic side of the Literary Revival, Lady Gregory devoted herself especially to the Irish Literary Theatre in Dublin, which she and Yeats and Edward Martin and George Moore were instrumental in founding in 1899, and which now is comfortably established as the endowed Abbey Theatre. In addition to her two most important books named above, Lady Gregory also wrote stories, sketches, and short plays. Her work as a playwright grew out of the assistance she rendered to Yeats in his dramatic activities—George Moore says she collaborated with Yeats in *Kathleen ni Houlihan* and *A Pot of Broth*—and one interesting phase of it was her translations of three plays of Molière into the Irish idiom, which were published as *The Kiltartan Molière* (1910). She had applied the same procedure to Sudermann's *Teja* in 1908 and to Goldoni's *Mirandolina* in 1910. Her interest in the Irish Players brought her to America with them in 1911-12 and in 1913. Her important books, in addition to those named above, are: *Poets and Dreamers* (1903); *Gods and Fighting Men* (1904); *Saints and Wonders* (1908); *The Kiltartan Wonder Book* (1910); *Seven Short Plays* (1911); *The Kiltartan History Book* (1912); *Irish Folk History Plays* (1912); *New Comedies* (1913). See IRISH LITERATURE, in English, and consult: Horatio S. Krans, W. B. Yeats and the Irish Literary Revival (New York, 1904); Lady Gregory, *Our Irish Theatre* (ib., 1913); Weygandt, *Irish Plays and Playrights* (Boston, 1913); and George Moore's unsympathetic but brilliant and entertaining account of his decade's experience of the Irish Literary Revival in the three volumes of his trilogy *Hail and Farewell* (New York, 1911-13).

GREGORY, BENJAMIN (1820-1900). An English Wesleyan Methodist clergyman. He was a student at the Woodhouse Grove School for 13 years, entered the ministry in 1840, in 1869 was appointed one of the connectional editors, and from 1880 to 1893 was sole editor for his church. He was the author of *The Holy Catholic Church*, *The Communion of Saints* (the Fernley Lecture for 1873); *The Thorough Business-Man*, *Memoir of Walter Powell* (1872); *Side Lights on the Conflicts of Methodism* (1899).

GREGORY, CAPE. See CAPE ARAGO.

GREGORY, CASPAR RENÉ (1846-1917). An American biblical scholar, born in Philadelphia, Pa. After graduating at the University of Pennsylvania in 1864 and at Princeton Theological Seminary in 1870, he studied at Leipzig, where he received the degree of Ph.D. in 1876. He rendered an important service to philology and biblical criticism in furthering the work on the New Testament text left uncompleted by Konstantin von Tischendorf (q.v.) and in discovering new manuscripts. He is one of the few Americans who have held an academic position in a German university—that of professor of New Testament exegesis in the theological faculty at Leipzig. He was connected editorially with the *Systematic Theology* of Dr. Charles Hodge (1870-73), and with Schürer and Harnack's *Theologische Literaturzeitung* (1876-84). Under the title *Saint John the Author of the*

Fourth Gospel (Edinburgh, 1875), he translated Luthardt's *Der Johanneische Ursprung des vierten Evangeliums*, and he also published a translation of the same author's *Das Johanneische Evangelium as Commentary on Saint John's Gospel* (1876-78). His original writings include pamphlets on Tischendorf (1875); *Les cahiers des manuscrits grecs* (1885); the *Prolegomena* to Tischendorf's *Editio Octava Critica Major* of the New Testament, the three parts of which appeared in 1884, 1890, and 1893; *Textkritik des Neuen Testament* (3 parts, 1900, 1902, 1909); *Canon and Text of the New Testament* (1907); *Einleitung in der Neuen Testament* (1909).

GREGORY, DANIEL SEELYE (1832-1915). An American Presbyterian clergyman and editor, born in Carmel, N. Y. He graduated at Princeton College in 1857 and at Princeton Theological Seminary in 1860; was tutor in rhetoric at Princeton from 1858 to 1860, and held several pastorates up to 1871, when he was appointed professor of metaphysics and logic at Wooster University. Four years later he was transferred to the chair of English literature. From 1878 to 1886 he was president of Lake Forest University. He received the degree of LL.D. from Wooster University in 1895. In 1890-94 he was managing editor of the *Standard Dictionary*, in 1895-1904 was editor of the *Homiletic Review*, and in 1904 became managing editor of the *Bible Student and Teacher*. His publications include: *Christian Ethics* (1875); *Why Four Gospels?* (1877); *The Tests of Philosophic Systems* (1880); *The Church in America and its Baptisms of Fire* (1896), with S. B. Halliday; *The Crime of Christendom* (1900); *Bible League Primer No. 1* (1904); *Constructive Studies in John, the Gospel for the Christian* (1909).

GREGORY, DAVID (1661-1708). A Scottish astronomer, born in Aberdeen and educated at Marischal College and the University of Edinburgh. Shortly before graduating at the latter institution in 1683, he had been appointed professor of mathematics there, holding this position for eight years, during which time he added extensively to the methods of quadratures discovered by his brother James Gregory (q.v.), besides actively advocating the philosophy of Newton. From 1691 until his death he was Savilian professor of astronomy at Oxford, was elected a fellow of the Royal Society in 1692, and in 1705 was made honorary fellow of the Edinburgh Royal College of Physicians. His most important writings, besides numerous papers in the *Proceedings* of the Royal Society, are: *Exercitatio Geometrica de Dimensione Figurarum* (1684); *Catoptrica et Dioptrica Elementa* (1685); *Astronomice Physicæ et Geometricæ Elementa* (1702); *Euclidis Opera Omnia* (1703). Several manuscript treatises and notes on Newton's philosophy were found after his death, and in 1745 his lectures on mathematics were published as *A Treatise of Practical Geometry*.

GREGORY, EDWARD JOHN (1850-1909). An English genre painter, born at Southampton. He was a pupil at Southampton of Hubert Herkomer, with whom he then studied in the South Kensington Art Schools. He assisted his master in the decorations of South Kensington Museum and was associated with him on the *Graphic* till about 1875. He was elected to the Royal Academy in the same year and received gold medals at the national exhibitions of Paris

(1889 and 1900), Brussels (1898), and at Munich in 1891. Gregory is best known for his water colors and drawings, which surpass his oils. He was elected member of the Royal Institute of Painters in Water Colors in 1876, president in 1898. His paintings include "St. George," "The Signal," "A Rehearsal," "Drawing-Room Day," "Marooning" (Tate Gallery, London), "Sir Galahad," and "Is It a Mouse?" Among his best water colors are "The Honey-moon" and "The Fugitive."

GREGORY, ELIOT (1854-1915). An American author and painter. He was born in New York City, studied at Yale University, and received his art education at Rome and in Paris under Carolus Duran. He exhibited painting and sculpture in the Paris Salon, where his painting entitled "Children" received honorable mention. Besides his portraits, two of his best-known pictures are "Soubrette" (1883) and "Coquetterie" (1884). He was a founder of the New Theatre, New York, and became a director of the Metropolitan Opera, New York, and Chevalier of the Legion of Honor. Under the pen name of "An Idler," he published, besides *Idler Papers*, two volumes of essays, *Worldly Ways and By-Ways* (1898) and *The Ways of Men* (1900), for the most part made up of clever though superficial reflections upon current American society.

GREGORY, ELISHA HALL (1824-1906). An American physician and surgeon, born in Logan Co., Ky. He graduated from the medical department of the University of St. Louis in 1849 and thereafter practiced in that city. In 1851 he became professor of surgery at the St. Louis Medical College (Washington University). He also served as president of the State Board of Health of Missouri, of the St. Louis Medical Society, of the State Medical Association of Missouri, and of the American Medical Association in 1887.

GREGORY, FRANCIS HOYT (1789-1866). An American naval officer, born in Norwalk, Conn. He entered the merchant service in 1807, was appointed a midshipman in the United States navy in 1809, served on several vessels, engaged in the suppression of the slave trade, and on the outbreak of the War of 1812 was attached to the command of Commodore Chauncey on Lake Ontario. In 1814 he was captured by the British and confined as a prisoner in England until the close of hostilities. In 1815-16 he served against the Algerine pirates, and in 1821-23, in command of the *Grampus*, took part in the expeditions against pirates in the West Indies and in the Gulf of Mexico, where he captured the notorious *Pandrita*. He became a captain in 1838 and commanded the *Raritan* of the blockade squadron during the Mexican War. From 1849 to 1852 he was in command of the African squadron. In July, 1861, he was made superintendent of the construction of the new iron war vessels and attained the rank of rear admiral on the retired list in July, 1862.

GREGORY, HERBERT ERNEST (1869-). An American geologist. He was born at Middleville, Mich., and was educated at Yale University (A.B., 1896; Ph.D., 1899), where he was assistant in biology (1896-98), instructor in physical geography (1898-1901), assistant professor of physiography (1901-04), and Silliman professor of geology after 1904. He also became a geologist of the United States Geological Survey and associate editor of the *American Jour-*

nal of Science. His papers deal chiefly with the geology of Connecticut and glacial geology, and he is part author of *Physical and Commercial Geography* (1910).

GREGORY, JAMES (1638-75). A Scottish mathematician and inventor, born at Aberdeen and educated at Marischal College in that city. At the age of 23 he invented the reflecting telescope known by his name, which he described in a work entitled *Optica Promota* (1663). About 1665 he went to the University of Padua, where he continued his scientific studies. In 1667 he produced his *Vera Circuli et Hyperbolæ Quadratura*, followed in 1668 by two other works, *Geometrica Pars Universalis* and *Exercitationes Geometricæ*. On his return to London he was elected a fellow of the Royal Society, and in 1669 he obtained the professorship of mathematics at St. Andrews. In 1674 Gregory was called to Edinburgh to fill the chair of mathematics.

GREGORY, JAMES (1753-1821). A Scottish physician, born at Aberdeen, the son of John Gregory (1724-73). He studied at the University of Edinburgh and at Christ Church, Oxford, where he acquired a considerable knowledge of the classics; graduated from the medical department of the University of Edinburgh in 1774, and continued his studies at continental universities until 1776. Upon his return he was made professor of medicine at Edinburgh and in 1777 began to lecture at the Royal Infirmary. In 1790 he became professor of the practice of medicine and continued lecturing upon that subject until his death. He was acknowledged to be the foremost medical practitioner and lecturer in Scotland during his maturity; but he preferred to display his great mental powers in controversy rather than in the advancement of medical science. In 1809 he became involved in a long argument against a recommendation to allow more freedom to members of the Edinburgh medical faculty, was charged with divulging university proceedings, and was suspended from fellowship in the college. His principal writings are: *De Morbis Cruri Mutatione Melendia* (1774); *Conspectus Medicinæ Theoreticæ* (2 vols., 1780-82); *Theory of the Moods of Verbs* (1790); *Philosophical and Literary Essays* (1792); *Memorial to the Managers of the Royal Infirmary* (1780); *Historical Memoirs of the Medical War in Edinburgh in the Years 1785-86-87*; *Epigrams and Poems* (1810).

GREGORY, JOHN (1724-73). A Scottish physician, grandson of James Gregory the mathematician. He was born at Aberdeen, was educated at King's College (Aberdeen), at Edinburgh, and at Leyden, was professor of philosophy at King's College from 1746 to 1749, became professor of the practice of physic at Edinburgh in 1766, and enjoyed a high reputation as a teacher and practicing physician. His complete works were published at Edinburgh in 1788.

GREGORY, JOHN MILTON (1822-98). An American educator, born at Sand Lake, N. Y., and educated at Union College. After a brief study of law he took up theology and was ordained as a pastor in the Baptist faith; but he soon abandoned his pastoral duties for educational work in the West. He was appointed principal of a classical school in Detroit, Mich., and served as State Superintendent of Public Instruction from 1858 to 1863. In 1854 he assisted in the establishment of the *Michigan Jour-*

nal of Education, which he edited for several years. He was president of Kalamazoo College, Mich., from 1863 to 1867, and from 1867 to 1880 was the first president of the Illinois Industrial University (now the University of Illinois). In 1873 he served as United States Commissioner to the World's Fair at Vienna, and he was a member of the United States Civil Service Commission from 1882 to 1885. His publications include: *Handbook of History* (1866); *Map of Time* (1866); *New Political Economy* (1882); *Seven Laws of Teaching* (1883); *Political Economy* (1887).

GREGORY, OLINTHUS GILBERT (1774-1841). An English mathematician, born at Yaxley, Huntingdonshire. He was professor at the Royal Military Academy, Woolwich, from 1807 to 1838. His most important contributions to physical science were his experiments, made in 1823, to determine the velocity of sound. He was one of the projectors of London University, edited the *Gentleman's Diary* (1802-19) and the *Ladies' Diary* (1819-45), and published treatises on astronomy and mechanics, *Letters on the Evidences of the Christian Religion* (1815), and memoirs of *John Mason Good* (1828) and of *Robert Hall* (1833).

GREGORY, ORDER OF SAINT. A papal order founded in 1831 by Gregory XVI and reorganized in 1834. It was originally bestowed as a reward for services in defense of the Roman church, but is now given for any distinguished achievement.

GREGORY, ROBERT (1819-1911). An English clergyman of the Established church. He was educated at Corpus Christi College, Oxford. Between 1843 and 1853 he was curate at Bisleigh, Panton, Wragby, and Lambeth, and from 1853 to 1873 he served as rector of the church of St. Mary the Less at Lambeth. In early life he participated in the controversy over religious education in the elementary schools. He became canon in 1868 and dean in 1891 of St. Paul's Cathedral, which he succeeded in making a place of popular worship. He published *A History of Elementary Education* (1895) and *Lectures at St. Paul's*. Consult his autobiography, edited by W. H. Hutton (London, 1912).

GREGORY, STEPHEN STRONG (1849-1920). An American lawyer, born at Unadilla, Otsego Co., N. Y. He was educated at the University of Wisconsin (A.B., 1870; LL.B., 1871), practiced law at Madison, Wis., in 1871-74, and after 1874 was a member of several law firms, finally of the firm of Gregory, Poppenhusen, and McNab in Chicago. He represented the city of Chicago before the Supreme Court of the United States in the Lake Front case, was counsel for defense in the Prendergast murder case, upheld the constitutionality of the law establishing the Sanitary District of Chicago, and obtained a jail sentence for Eugene Victor Debs as the leader of the great American Railway Union strike. He was president of the Chicago Bar Association in 1900, of the Illinois State Bar Association in 1904, and of the American Bar Association in 1911.

GREGORY, THOMAS WATT (1861-). An American lawyer and cabinet officer, born at Crawfordsville, Miss. He graduated from the Southwestern Presbyterian University at Clarks-ville, Tenn., in 1883, studied law at the University of Virginia in 1883-84, and graduated from the law department of the University of Texas in 1886. Admitted to the Texas bar in

the latter year, he then practiced law in that State, was city attorney of Austin in 1891-94, and became a member in 1900 of Gregory and Batts, who were special counsel to the State of Texas in the prosecuting of corporations violating the antitrust laws (the firm name was changed to Gregory, Batts, and Brooks in 1908). In 1913 Gregory became special Assistant Attorney-General of the United States in the investigation of the New York, New Haven, and Hartford Railroad; and in 1914 he was appointed United States Attorney-General by President Wilson.

GREGORY, WILLIAM KING (1876-). An American paleontologist. He was born in New York City and graduated (A.B., 1900; Ph.D., 1910) from Columbia University, where he became a lecturer on zoölogy in 1907. He was also appointed research assistant and associate in vertebrate paleontology at the American Museum of Natural History. His investigations cover the evolution of teleostomous fishes and the orders of mammals.

GREGORY OF ARMENIA, called THE ILLUMINATOR (c.257-332). The apostle of Christianity among the Armenians. Little is known of his early history, and the facts of his life are so mingled with fiction that it is difficult to separate them. He is said to have been born at Valarshabad, the capital of the Province of Ararat, Armenia, about 257, and educated at Cæsarea in Cappadocia, where at the same time he was instructed in the Christian religion. He afterward entered into the service of Tiridates III, King of Armenia, by whom he was subjected to severe persecution on account of his refusal to worship idols. Some severe public calamity which followed being looked upon as a proof of divine wrath, and the King being himself afflicted, both the ruler and his subjects put themselves under Gregory's instruction. The people were converted in great numbers, and churches immediately erected throughout the country; and Gregory, after receiving ordination at Cæsarea (302), returned as Metropolitan of Armenia and baptized his converts. He is said to have retired from office in 331 to live in a cave and to have died there in 332. The memory of Gregory is held in great reverence in the Greek, Coptic, Abyssinian, and Armenian churches, and he is one of the saints of the Roman Catholic Calendar. He did not introduce Christianity into Armenia, but seems to have been influential in placing this religion in control of the land. The discourses attributed to him are probably spurious. There are two lives in Armenian accessible—one in a French translation by Langlois in vol. i of his *Historiens de l'Arménie* (Paris, 1867), and the other in the English translation by Malan, *Life and Times of Saint Gregory the Illuminator* (London, 1868); other lives and his works are in Migne, *Patrologia Græca*, cxvii, and in the *Ante-Nicene Fathers*, vol. vi. See ARMENIAN CHURCH.

GREGORY OF NA'ZIAN'ZUS, SAINT, called THE THEOLOGIAN (c.329-389). Bishop of Constantinople, and one of the "three Cappadocians," famous leaders of orthodoxy in the latter half of the fourth century, the other two being Basil the Great (of Cæsarea) and Gregory of Nyssa (q.v.). He was born probably in 329. His father, who bore the same name, was for many years Bishop of Nazianzus, a town in southwest Cappadocia, identified by Ramsay with the modern Nenizi. Gregory enjoyed the

best educational advantages, studying at Cæsarea of Cappadocia, at Cæsarea of Palestine, and at Athens, where Basil and Julian (afterward Emperor) were among his fellow students. Some of the most celebrated rhetors of the fourth century were his teachers. Study and travel occupied all his time up to about his twenty-eighth year, when he returned home and was baptized. He more than once visited his friend Basil at his hermitage in Pontus, seeming inclined to remain there. But his unexpected ordination to the presbyterate, at the hands of his father, made it necessary for him to settle at Nazianzus, where he preached, and eventually assisted his aged father in episcopal functions also, although never made Bishop of that see.

After Basil had been persuaded to abandon his solitary life and assume the duties of Bishop of Cæsarea (370), he consecrated Gregory Bishop of Sasima, an obscure village, where he never actually served. This appointment temporarily threatened a rupture of the friendship between Basil and Gregory, as their letters show. After his father's death and a period of retirement to Seleucia, he accepted an appeal to come to Constantinople as leader of the orthodox Christians of that frankly Arian city. At the head of the only Catholic parish in the capital, and in the face of public opinion overwhelmingly hostile to his views, Gregory's power as a preacher steadily gained for him influence and enlarged his following. He called his church *Anastasia* (resurrection), to symbolize the revival of the true faith, in opposition to Arianism. When the religious policy of Theodosius had turned the state church back to orthodoxy, and the Second Ecumenical Council (Constantinople, 381; see CONSTANTINOPLE, COUNCILS or) had registered its verdict correspondingly, Gregory was made Bishop of the patriarchal city and Primate of the East. But opposition, arising in part from the defeated Arians, in part from criticism of his translation from Sasima, and in part from the disappointment of rival candidates, led Gregory speedily to resign his position. Weary of controversy, he withdrew from Constantinople and passed the remaining eight or nine years of his life in quiet near his old home. He died in 389 or 390.

Gregory is famous chiefly as a theologian and defender of the orthodoxy of his time. To the three Cappadocians together is due the final triumph of the Nicene theology over Arianism, so far as that was independent of politics. And to Gregory belongs the credit of leading the way to this end by formulating the orthodox doctrine in such a way as to command support. The result was the definition of the Trinity as consisting of one substance, or essence, and three hypostases, or persons. (See HOMOUSION; HYPOTASIS.) If Athanasius emphasized the *oneness* of God, Gregory emphasized His *threefoldness*. And so far did he push this conception that he was charged with teaching tritheism. His theological system is best studied in the famous *Theological Orations*, five in number, originally delivered in Constantinople. We have from him 40 other addresses and sermons, among them two denunciations of Julian the Apostate; many letters; and a considerable number of poems, partly autobiographical. Together with Basil, he prepared the *Philocalia*, a collection of excerpts from Origen, of great value.

The best edition of Gregory's complete works is still the Benedictine (2 vols., Paris—i edited

by Clemencet, 1778; ii edited by Caillau, 1840, reprinted by Migne, *Patrologia Græca*, vols. xxxiv-xxxviii, Paris, 1857-62); a good modern edition of the *Five Theological Orations* is by Mason (Cambridge, 1899). The *Nicene and Post-Nicene Fathers*, 2d series, vol. vii (New York, 1894), contains an unsatisfactory translation of selected orations and letters. In general, consult Smith and Wace, *Dictionary of Christian Biography* (London, 1877-87), article "Gregorius Nazianzenus." A popular treatment is in Farrar, *Lives of the Fathers*, vol. i (Edinburgh, 1889). For literary criticism, consult Krumm-bacher, *Geschichte der byzantinischen Litteratur* (2d ed., Munich, 1897).

GREGORY OF NYSSA, nis'sá, SAINT. A Greek Church father, who flourished during the latter part of the fourth century. He is one of the famous "three Cappadocians" (Basil of Cæsarea, Gregory of Nazianzus, and Gregory of Nyssa), and a younger brother of Basil. The dates of his birth and death are uncertain, but he died after 394. Gregory's early education was of the best, and we see evidences of his rhetorical training in his fine literary style. There is no good reason to doubt that he was married. About the year 371 Basil forced Gregory to accept the bishopric of Nyssa, a village of Cappadocia, whose chief claim to distinction is that he presided over its church.

From the outset Gregory encountered opposition on the part of the Arians, who were numerous and powerful throughout the East, and who enjoyed court favor under the Emperor Valens. A local synod deposed Gregory in 376, and he was banished by the Emperor's command. The death of Valens and the accession of Theodosius mark a turning point in the history of Arianism and usher in the triumph of the Nicene orthodoxy. Gregory was restored to his see (378), and from this time onward his sphere of influence widens. He went to Antioch, Palestine, Constantinople, and Arabia, everywhere aiding in establishing the Catholic faith. He was an influential member of the Second Ecumenical Council, held at Constantinople in 381. (See CONSTANTINOPLE, COUNCILS or.) There is no reason to believe that he wrote the clauses said to have been added to the Nicene symbol at that time. (See NICENE CREED.) But his influence upon the final formulation of the doctrine of the Trinity was considerable, especially in drawing a distinction between the one divine essence, or substance, and the three hypostases, or persons. (See ARIUS; HYPOTASIS; HOMOUSION.) He also emphasized the attributes of the three persons in the Trinity, viz., that the Father is eternally Father, unbegotten; that the Son is eternally begotten; and that the Holy Spirit eternally proceeds (from the Father). In addition to these fundamental articles of the faith, Gregory maintained certain ideas, derived from Origen, which never met with favor in the Church, notably the theory of a final restoration of all men to harmony with God (the *apokatastasis*). He visited Constantinople three times after the Council of 381. On one of these occasions he delivered funeral orations over the Princess Pulcheria and the Empress Flaccilla. We hear of him for the last time in 394.

Gregory had none of those accidental marks of distinction which attach to popes and patriarchs. His episcopal see was insignificant, except as he himself shed lustre upon it. His place in history depends upon his service to the

development of Catholic theology and in particular to the formulation of the trinitarian dogma. His doctrinal views may be read in his extensive work *Against Eunomius* (who was a pronounced Arian); in his book *Against Apollinarius*; or in his *Great Catechism*, which was designed for the use of the clergy in dealing with candidates for admission to the Church. In his treatise on *The Soul and the Resurrection* we have an illustration of his power as a speculative philosopher; in that *On Virginity* we may examine one side of his ethical system and also notice his regret that he is himself shut out by marriage from the more excellent life he praises. An adequate edition of his works is much to be desired.

Bibliography. Migne, *Patrologia Græca*, vols. xlv-xlvi (Paris, 1863), gives the text of most of Gregory's works. Consult also an edition of the *Oratio* by Strawley (Cambridge, 1903). An English translation by Moore and Wilson is given in *The Nicene Fathers*, 2d series, vol. v (New York, 1893). In general, consult the article "Gregorius Nyssenus," in Smith and Wace, *Dictionary of Christian Biography* (London, 1877-87); Harnack, *History of Dogma*, vol. iv (Eng. trans., Boston, 1898); Vollert, *Die Lehre Gregors von Nyssa vom Guten und Bösen* (Leipzig, 1897).

GREGORY OF TOURS, *TOUR* (Lat. *Gregorius Turonensis*), originally called *GEORGIUS FLORENTIUS* (538-594). A celebrated ecclesiastic, the chronicler of Frankish history. He was born in Auvergne, Nov. 30, 538. His family was of high rank and distinguished for piety, having furnished several bishops to the see of Tours. Gregory was educated under the direction of his uncle, St. Gallus, Bishop of Clermont, and, after the latter's death, of St. Avitus, also afterward Bishop of Clermont. Ordained deacon (563), Gregory left Auvergne and went to the court of Sigebert, King of Austrasia. In 573 he was elected to the see of Tours, and was consecrated by Giles Archbishop of Rheims. The first years of his episcopacy were a season of great perplexity, owing to the contentions of the Merovingian kings. By resisting royal authority on some occasions he drew upon himself the hatred of Queen Fredegunda of Neustria and her husband, King Chilperic. Gregory was accused of seditious and other treasonable actions and summoned before a council of bishops in 580. Here, however, he defended himself with such clearness and vigor that Chilperic ceased to be his foe and trusted him afterward with many important political missions. No less favored by the King's successors, Guntram and Childbert II, Gregory used all his influence with the court for the advantage of the Church. His travels had, apart from their political purposes, the object of everywhere restoring peace and piety. His last journey seems to have been to Orléans, whither he accompanied the King in 593. He died at Tours, Nov. 17, 594. Gregory's chief work is his *Historia Francorum Libri Decem* (Ten Books of Frankish History), the first attempt at French history. The style is crude, and the selection of topics and arrangement indiscriminate. There is a German translation in the *Geschichtschreiber der deutschen Vorzeit* (Berlin, 1887). It has been separately edited by Omont and Colton (Paris, 1887-93). The *Miraculorum Libri Septem* and other minor writings were translated into French by Bordier (Paris, 1857-64). Gregory's complete

works are in Migne, *Patrologia Latina*, lxxi; the best edition is that by Arndt and Krusch, in the *Monumenta Germaniæ Historica: Scriptores Rerum Merovingicarum*, vol. i (Hanover, 1885). For his biography, consult Lübell (Leipzig, 1839; 2d ed., 1869); also Bonnet, *Le Latin de Grégoire de Tours* (Paris, 1890).

GREGORY THAUMATURGUS (Gk. Γρηγόριος Θαυματουργός, *Grégorios Thaumaturgos*, Gregory the Miracle Worker), SAINT (c.210-270). Bishop of Neocæsarea in Pontus, his native city. Sprung from an illustrious and wealthy heathen family, he was educated as a rhetorician; but an acquaintance with Origen at Cæsarea in Palestine in 233 led him to give up the law and apply himself under his new master to the study of the Holy Scriptures and Greek philosophy. When Maximin's persecutions forced Origen to leave Cæsarea, Gregory went to Alexandria and stayed there for a time. Gordian having succeeded Maximin, Origen returned to Cæsarea, and Gregory went thither to renew his studies under him. Most probably it was at that period also that he was baptized, and changed his name from Theodorus to Gregory. Recalled to his family (238), instead of striving for those posts of honor for which he had been destined, he retired into solitude, but was so often besought to return and labor for the Church that he allowed himself to be consecrated Bishop of Neocæsarea about 240. The city was wealthy and populous, but utterly unchristian. Gregory applied himself to his work with the utmost zeal. According to the stories, he wrought many miracles, thereby winning his epithet, the "Miracle Worker." During the persecution of Decius, which broke out in 250, Gregory fled, with a great part of his flock. In 251 the Emperor Decius died, and Gregory returned to Neocæsarea. He now instituted a general festival for those Christians who had fallen during the persecution and permitted the faithful to celebrate it with banquets and sports like those which accompanied heathen festivals—a proceeding by which he intended to draw over the pagan multitude to Christianity, but which has been severely blamed. In 265, with his brother Athenodorus, he was at the Council of Antioch, which had been convoked for the purpose of condemning the heresies of Paul, Bishop of Samosata. Whether Gregory also took part in the second council (270), necessitated by Paul's refusal to abdicate, is very uncertain. He died at Neocæsarea (270). The genuine works of Gregory are a panegyric on Origen, delivered in public before his return to his native place; a creed said to have been revealed by the Virgin Mary; a paraphrase of Ecclesiastes, often and wrongly attributed to Gregory of Nazianzus; and a "Canonical Epistle," setting forth the punishments and penances to be undergone by such Christians as had bought booty from pagan soldiers. The first collected edition of his works was published by Vossius (Mayence, 1604); a more complete edition appeared in Paris (1622). They are in Migne, *Patrologia Græca*, x (Eng. trans. in *The Ante-Nicene Fathers*, vi, Buffalo, 1886-96). Much of our knowledge of Gregory comes from Gregory of Nyssa's life of him (in Migne, *Patrologia Græca*, x). For his life, consult Ryssel (Leipzig, 1880) and Köttschau (Freiburg, 1894).

GRÉGR, gré'gr', *EDUARD* (1829-1907). A Czech politician, born at Brězhrad. He studied medicine, became a lecturer at Prague, and from

1861 was known for his active participation in Austrian political affairs. He assisted in founding the Young Czech party and was acknowledged its foremost spokesman. In 1861 he was elected to the Bohemian Diet and in 1883 a deputy to the Imperial Reichsrat. His programme sought the establishment of an independent Czech state and hence brought him into severe opposition alike to the Old Czech faction, which he denounced for its conservatism, and the Germanizing element.

GRÉGR, JULIUS (1831-96). A Czech politician, brother of Eduard Grégr, born at Březhrad. He was educated at Prague and became distinguished as a publicist and legislator. For nearly 35 years he was a member of the Bohemian Diet. During his long career in these assemblies he was a prominent representative of the Young Czech party, which he assisted in founding, and vigorously opposed the German influence in Bohemia. Owing to his equally strong opposition to the tactics of the feudalist Old Czech party, he resigned his seat in the Austrian Reichsrat in 1880. The Czech organ, *Národní listy*, was founded by him, in association with Rieger and Palacky, in 1861.

GREGUSS, gré'gúsh, AUGUST (1825-82). An Hungarian critic, born at Eperies. He was a student at the University of Halle, became professor at Szarvas (1846), and finally (1870) professor of aesthetics at the University of Budapest, where he produced a manual of poetics entitled *Magyar Költészet* (1880). He is particularly known as an analyst and critic of Magyar poetry, and his works are written in that language. Some of them were translated into German by himself (1846) and by Gustav Heinrich (1875).

GREIF, grif, MARTIN (adopted name of FRIEDRICH HERMANN FREY) (1830-1911). A German poet and dramatist. He was born at Speyer and was educated at Munich. His power of expression, as well as the nobility of thought, depth of sentiment, and simple style, entitles his lyrics in the estimation of many to be ranked among the best modern productions. His dramas are not successful. With the exception of the drama *Hans Sachs* (latest ed., 1894), his numerous productions appear under the name of Martin Greif. Among these are his collected poems, *Gedichte* (1868), *Neue Lieder und Mären* (1902); and dramas, *Nero* (1877), *Marino Falieri* (1879), *Konradin* (1889), *Ludwig der Bayer* (1891)—perhaps his best drama, *Francesca da Rimini* (1892), *Agnès Bernauer* (1894), *General York* (1899), and *Schillers Demetrius* (1901). Consult Kummer, *Deutsche Literaturgeschichte des 19. Jahrhunderts* (Dresden, 1909).

GREIFFENHAGEN, grif'en-ha'gen, MAURICE (?-). An English painter and illustrator. He was born in London and studied there, entering the classes of the Royal Academy at the age of 16. A serious attitude towards the stories he illustrated made him one of the most valuable contributors to the better class of popular magazines. His painting is characterized by strong emphatic line and tapestry-like beauty of color. He exhibited abroad on many occasions, his work being well known in America through its frequent appearance at the Carnegie Institute, Pittsburgh. He received gold medals at Munich (1897) and Dresden (1901). After 1906 he was master of the life class in the schools of the Edinburgh Academy. Important works by him are the "Idyll" in

the Liverpool Museum, and the "Judgment of Paris," in the Museum of Sydney, New South Wales. He is also represented in the Carnegie Institute and the Municipal Museum of Ghent, Belgium.

GREIFSWALD, grifs'vált'. The capital of a district of the same name in the Prussian Province of Pomerania, situated on the navigable river Ryck, 18 miles by rail southeast of Stralsund, near the Baltic Sea (Map: Germany, E 1). It is well built, with modern improvements, and surrounded by promenades laid out on the site of ancient fortifications. There are three mediæval Lutheran churches, of which the Gothic St. Nicholas is the most conspicuous, owing to its high tower and beautiful windows. The town hall is also an interesting old building, and there are a number of curious private houses—gabled brick structures dating from the fourteenth and fifteenth centuries. The University of Greifswald was founded in 1456. It has four faculties—theology, law, medicine, and philosophy—with an attendance in 1913 of 1554 students, and a library of 241,000 volumes (1913), besides a number of interesting manuscripts. It has an art collection, a display of antiquities dating from before Christ, a botanical garden, and a zoölogical museum. At the university is shown every tenth year the valuable Croy tapestry, belonging to the sixteenth century and representing Luther preaching. The town has also a Gymnasium, a dairy school, and a geographical and scientific museum. The chief manufacturing establishments are the royal railway shops, machine works, foundries, electrical works, chicory factories, and shipbuilding yards; chains and monuments are also made. Fisheries and the herring-salting industry are important. Sugar of lead, dried fish, and fruit preserves are exported, but the trade is principally in grain and wood. Pop., 1900, 22,950; 1910, 24,679.

Greifswald received its municipal rights in the thirteenth century and became in the same century a member of the Hanseatic League. It suffered greatly from frequent sieges, but regained its prosperity under the dominion of Sweden, into whose hands it fell in 1631. It became Prussian in 1815.

GREIN, grin, CHRISTIAN WILHELM MICHAEL (1825-77). A German philologist. He was born at Willingshausen, Hesse, was educated at Marburg and Jena, and in 1865 became archivist to the Elector of Hesse at Cassel. In 1873 he was elected professor at Marburg and in 1877 archivist at Hanover, where he died. Besides several valuable translations of Anglo-Saxon poems, he published the work entitled *Bibliothek der angelsächsischen Poesie in kritisch bearbeiteten Texten, mit Glossar* (4 vols., 1857-64), a work of basic importance on Anglo-Saxon literature, and the first which may be regarded as a compilation of the various editions of the poems discussed. In collaboration with Holtzhausen he published the *Sprachschatz der angelsächsischen Dichter* (2 vols., 1861-64), of which a new edition has recently been edited by Köhler (Heidelberg, 1912-13). Unfortunately Grein did not live to complete his work on Anglo-Saxon prose, entitled *Bibliothek der angelsächsischen Prosa* (1872), which has been continued by Wülker and others, vols. ii-v (1885-1900).

GREIZ, grits. The capital of the German Principality of Reuss (Elder Branch), situated on both banks of the White Elster, 40 miles

south of Leipzig (Map: Germany, E 3). The picturesque old town is on the right bank, the new town on the left. It has an old castle situated on a rock above the town, also the residence of the Prince of Reuss, and a fine Gothic Rathaus, built in 1841. The summer residence of the Prince stands in a beautiful valley which has been converted into a park surrounded by wooded mountains. The town has a Gymnasium, a Realgymnasium, a textile school, and a seminary. It owns its water works, a gas and an electric plant, and a savings bank. Greiz is the seat of a highly developed textile industry employing in the neighborhood of 10,000 people. The chief manufactures are dress goods, woollens, shawls, quilts, dyestuffs, leather, cigars, paper, castings, and machinery. Pop., 1900, 22,346; 1910, 23,245, nearly all Protestants.

GRELL, gröl, EDUARD AUGUST (1800-86). A German organist, born in Berlin. He was the pupil of Kaufmann, Ritschl, and Zelter. He entered the Singakademie in 1817 and was director of it for 20 years. He was court organist and teacher of the cathedral choir and teacher of composition at the academy. His compositions are vocal and usually sacred. Among them are an oratorio, *Die Israeliten in der Wüste*; a mass in 16 parts, which has been given repeatedly in Europe and the United States; a four-part arrangement of the choral melodies of the Evangelical *Gesangbuch*; organ preludes, motets, cantatas, and hymns. Consult H. Bellermann, *Eduard August Grell* (Berlin, 1899).

GRELLET, STEPHEN (originally ETIENNE DE GRELLET DE MABILLIER) (1773-1855). A Quaker missionary and philanthropist, born in Limoges, France, of a wealthy and noble family. He was originally a Roman Catholic and was educated at the military college at Lyons. At the time of the Revolution he belonged to the bodyguard of Louis XVI. After the execution of the King he escaped and came to America. In 1795 he joined the Society of Friends. During the yellow-fever epidemic in Philadelphia, in 1798, he was untiring in his attentions to the sick and the dying. A little later he engaged successfully in business in New York and after 1800 traveled as a missionary over much of the United States and Canada and made two missionary tours in Europe, personally addressing the Czar and the Pope, who is said to have heard him kindly, on the subject of religion. He died in Burlington, N. J. Consult Seebohm (ed.), *The Life and Gospel Labours of Stephen Grellet* (3d ed., London, 1862).

GREMIAL (grēmī-al) **VEIL**. See COSTUME, ECCLESIASTICAL.

GRENADA, grē-nā'dā. The smallest and most southerly of the three (British) Windward Islands colonies, consisting principally of the island of Grenada, which is situated 68 miles south-southwest of St. Vincent and about 90 miles north of Trinidad (Map: West Indies, G 4). The Grenadines are included partly in the Colony of St. Vincent and partly in the Colony of Grenada. The latter has a land area of 133 square miles; the island of Grenada occupies about 119 square miles and the attached Grenadines about 14 square miles, almost all of which is comprised in the island of Carriacou. The island of Grenada is of volcanic origin and contains several craters, now extinct; it abounds in streams and in mineral and other springs. Grenada is mountainous and pictur-

esque. The highest point is Mount St. Catherine (2749 feet): Mount Sinai is 2300 feet high. Remarkable natural curiosities are the lakes Antoine and Grand Etang, each situated on a mountain; the former is in the northern part of the island, and the latter, at an elevation of 1740 feet, about 6 miles from St. George's, the capital. The climate is healthful and, during the dry season, delightful. The average annual rainfall at St. George's is 77.6 inches, but in other parts of the island it is much greater; at the Grand Etang in 1910 it was nearly 187 inches. In recent years the highest temperature at St. George's is reported at 87°, and the lowest at 67.8°, the average mean temperature being 78.8°. The chief occupation of the people is agriculture, and the area under cultivation exceeds 30,000 acres. Formerly the cultivation of sugar cane was the principal industry, but it has been almost wholly superseded by cacao culture. The cultivation of nutmegs and other spices is important. Cotton culture has declined in Grenada, but remains the chief industry of Carriacou. Some sugar cane is still grown and is used chiefly for the production of rum. In 1912 the colony's export of cacao amounted to 101,043 hundredweight; nutmegs, 12,215; other spices, 2392; cotton, 3395; cottonseed, 9567. In 1902 imports and exports were valued at £230,103 and £310,602 respectively; in 1911, £309,227 and £264,640 (imports from the United Kingdom, £142,017, and exports thereto, £172,001). The administration of the island is vested in the Governor of the Windward Islands and in a legislative council of 13 members, consisting of six official and seven unofficial members appointed by the crown for six years. Revenue and expenditure increased from £72,802 and £68,669 respectively in 1902-03 to £98,645 and £81,012 in 1911-12; public debt (1912), £123,670. The capital, St. George's, the headquarters of the government of the Windward Islands, situated on a strongly fortified bay on the southwest coast, has a fine harbor, capable of accommodating the largest vessels, and is an Imperial coaling station. The population of the colony, as returned by the several censuses, has been as follows: 1844, 29,650; 1851, 32,671; 1861, 31,900 (the decrease was due to the cholera epidemic of 1854); 1871, 37,684; 1881, 42,403; 1891, 53,209; 1901, 63,438; 1911, 66,750. The population of Carriacou, included above, was 6497 in 1901 and 6886 in 1911. The inhabitants are mostly colored, only about 2 per cent being white. The average birth rate in the 10 years ended 1907 was 41.09, and death rate 21.49; in 1911, 37.88 and 18.65. In 1912 there were 51 government and government-aided elementary schools, with 10,372 pupils; the average attendance was only 5261. English is spoken, but among themselves the people speak a French patois. The chief town is the picturesque port, St. George's (pop., 4916); other towns are Gouyave, or Charlotte Town (about 2500), Grenville, or La Baye, next in importance to St. George's (about 1500), Sauteurs, Victoria, and, in Carriacou, Hillsborough. Grenada was discovered by Columbus, Aug. 15, 1498, and was settled by the French in 1650-51. In 1762 Grenada was captured by the British, from whom it was retaken by the French in 1779, but restored in 1783. Consult *The Grenada Handbook* (London, annually).

GRENADA. A city and the county seat of Grenada Co., Miss., 100 miles south of Mem-

phis, Tenn., on the Illinois Central and the Yazoo and Mississippi Valley railroads (Map: Mississippi, F 3). It is the seat of Grenada College (female). There are cottonseed-oil mills and a brick plant. Settled about 1840, the city is governed by a mayor, elected biennially, and a city council. The city owns the water works and electric-light plant. Pop., 1900, 2508; 1910, 2814.

GRENADÉ (Fr. *grenade*, from Sp., Portug. *granada*, grenade, pomegranate, from Lat. *granatus*, filled with grains, from *granum*, seed). A small explosive shell, thrown from the hand. They were formerly in general military use and were regarded as being particularly effective when thrown among troops making an assault. They were largely used at Port Arthur (1904-05) by both the Japanese and Russians. They were found so effective that there developed an increased interest in the invention and adoption of improved hand and rifle grenades. The latter are projected several hundred feet by the use of the rifle employing a cartridge with reduced charge. Grenades for use with air craft also have been developed. See MILITARY AERONAUTICS.

GRENADIER, grén'a-dér'. Originally a soldier detailed and equipped for throwing hand grenades. They were tall men, selected because of special qualifications for the purpose; afterward separate companies of grenadiers were formed, in France about 1670 and in England soon afterward. The flank company or companies of every infantry regiment, because of their superior height, were known as grenadier companies. The grenadier regiments of modern European armies belong in every instance to royal household troops or select guard corps. See GRENADÉ.

GRENADIER. A book name for a large family of pelagic fishes, Macruridae, allied to the cods, which inhabit the deep parts of the ocean and often present extraordinary shapes. They are frequently called onion fishes by the fishermen, or popeyes, on account of the size and shape of their eyes, which are large and prominent, as is usual among deep-sea animals. They occur frequently in the western Atlantic, and sometimes in forms that are edible. They are known to fishermen through their proclivity for stealing bait and making off with trawl-line hooks. The species best known to the fisherman and the largest is *Macrurus rufescens*, called rat-tail fish as well as onion fish. This form abounds off the north Atlantic coast and reaches a length of 3 feet and a weight of four or five pounds. Prominent genera are *Bathygadus*, *Steindachneria*, *Chalinura*, *Corpyhcnoides*, *Hymenoccephalus*, *Macrurus*, *Calorhynchus*, and *Isionurus*. See Plate of CODFISH AND ALLIES.

GRENADIER GUARDS. Certain regiments of foot guards in European armies. In England the regiment of Grenadier Guards consists of the first, second, and third battalions and takes seniority of all other infantry regiments. It was organized in 1660 as the First Foot Guards. See GRENADÉ; GRENADIER.

GRENADIERS, TIE (Ger. *Die Grenadiere*). A famous poem by Heine, celebrating the devotion of Napoleon's soldiers.

GRENADINES, grén'a-dénz'. A chain of islets belonging to the Windward group of the West Indies, situated between Grenada and St. Vincent (Map: West Indies, G 4). They num-

ber about 30 and cover an area of 20 square miles, but only three are inhabited, viz., Carriacou, Petit Martinique, and Isle de Rhodé. The two former are connected administratively, forming a dependency of Grenada, with a population of 6497 in 1901 and 6886 in 1911.

GRENELLE, gré-nél'. A southwestern quarter of Paris, on the left bank of the Seine. It is an important junction on the Circular Railway, with branches to the Champ de Mars and to Les Moulinaux, and has many manufactures.

GRENELL, BERNARD PYNE (1869-1926). An English classical scholar, born in Birmingham. He was educated at Clifton College, where his father was a master, and at Queen's College, Oxford, of which he became a fellow in 1894. For his important work (mostly with A. S. Hunt) in Egypt, discovering and editing important texts on papyrus, he received honorary degrees from Graz, Dublin, and Königsberg, and in 1908 was made professor of papyrology at Oxford. Hunt and Grenell's great finds were at Oxyrhynchus (Behnesa) in 1896-97 and in 1905 and the years following, and included the *Logia* of Jesus, parts of Menander's *Colax* and *Perinthia*, and fragments of Callimachus' *Elia* and of Sophocles' satyr play, the *Ichnecata*. With Hunt he edited *The Oxyrhynchus Papyri* (9 vols., 1897-1912); *Menander's Georgos* (1898); *The Amherst Papyri* (1900-01); *The Tebtunis Papyri* (1902, 1906), excavations for the University of California; the *Hibeh Papyri* (1906); and, with Hunt and Hogarth, *Fayûm Towns and their Papyri* (1900).

GRENELL, FRANCIS WALLACE, first BARON KILVER (1841-1925). An English soldier, born in London. He entered the Sixtieth Rifles in 1860 and was commissioned captain in 1871 and major in 1878, during which year he served in the Kafir War as deputy assistant adjutant and quartermaster-general at headquarters. In the Boer War of 1881 he was assistant quartermaster-general under the command of Sir Evelyn Wood. During the Egyptian War of 1882 he was assistant adjutant and quartermaster-general on the headquarters staff and fought at Tell-el-Kehir; was sirdar of the Egyptian army from 1885 to 1892 and directed the operations near Suakin in 1889. From 1894 to 1897 he was at the War Office as inspector general of auxiliary forces and in 1897-98 commanded in Egypt. He was Governor-General and commander in chief of Malta in 1899-1903, was in command of the Fourth Army Corps in 1903-04, and was made a field marshal in 1908.

GRENELL, GEORGE (1840-1906). An English missionary and explorer, born at Sancreed, near Penzance, Cornwall. In 1875 he went as a Baptist missionary to Cameroon, West Africa, with Alfred Saker (1814-80), and thereafter did some exceedingly important work in exploring little-known rivers of the Congo Basin. In 1877 he removed to Victoria and explored the Wuri River and in the following year he ascended Mongo ma Loba Mountain. In 1881, co-operating with the Rev. T. J. Comber and others, he established a chain of missions at Musuko, Vivi, Isangila, Manyanga, and other points, and in 1884, in a small steam vessel, he explored the Congo to the equator. He established headquarters at Arthington, near Leopoldville, in 1884, and launched on Stanley Pool a river steam vessel, the *Peaco*, in which he explored the Kiva, the Kiwango, and the

Kaisai rivers, discovered the Ruki, or Black, River, and ascended the Mubangi for 200 miles to Grenfell Falls, at lat. 4° 40' N. In 1885 he explored other tributaries of the Congo, notably the Busira, along which he found the dwarf tribes of the Batwa. In the following year he examined the Kasai, the Sankuru, and the Luebo and Lulua, and made careful records of the Bakuba and Bakete tribes. He was awarded the medal of the Royal Geographical Society for his map of the Congo Basin. In 1891 he was appointed a plenipotentiary for Belgium to delimit the boundary line between the Belgian and Portuguese possessions along the Lunda frontier. He protested to King Leopold against Belgian maladministration in the Congo Free State, but with little effect. Consult: Johnston, *George Grenfell and the Congo* (2 vols., London, 1908); Hawker, *Life of George Grenfell* (ib., 1909); Dickins, *Grenfell of the Congo* (ib., 1910).

GRENFELL, HELEN LORING (?-). An American educator and penologist. She was born at Valparaiso, Chile, and was educated at the State Normal College, Albany, N. Y., and at the University of Denver (M.A., 1904). She was married to Edwin I. Grenfell in 1889. She was three times elected superintendent of the schools of Gilpin Co., Colo. While State superintendent of public instruction (three terms) from 1890 to 1905, she greatly increased the school revenues by leasing the State lands and also revised and annotated the school laws. From 1909 to 1914 she was commissioner of the State Penitentiary and Reformatory, thus having full control of the penal institutions of the State. Mrs. Grenfell was the only woman who had ever been intrusted with the duties of such an office when she took up the work in 1909. She became vice president of the Colorado Equal Suffrage Association.

GRENFELL, WILFRED THOMASON (1865-). An English missionary physician. He graduated at Oxford University and later studied at the London Hospital, Whitechapel. A daring and skillful sailor, he became interested in reform work among the mariners of the North Sea; for them he established homes on land and arranged mission vessels at sea. In 1892 he began his work in Labrador, cruising along the coast in a sailing vessel fitted out as a hospital. Through his efforts were built four hospitals, a series of coöperative stores, mills, an orphanage, and a school. His inadequate sailing hospital was replaced by a steamship in 1895, and in 1897 by the *Strathcona*, a well-equipped steel steam vessel, the gift of Lord Strathcona. In 1912 Grenfell opened in St. John's, Newfoundland, the King George the Fifth Seaman's Institute. From the first he emphasized the bettering of physical and economic conditions as the necessary introduction to evangelistic work. His books include: *Off the Rocks* (1906), stories; *Adrift on an Icepan* (1909); *Labrador, the Country and the People* (1909; new, enlarged ed., 1913), with others; *Down to the Sea* (1910), stories; *Down North on the Labrador* (1911); *The Adventures of Life* (1912), the W. B. Noble lectures for 1911. Consult: Duncan, *Dr. Grenfell's Parish* (New York, 1905); Johnston, *Grenfell of Labrador* (London, 1908); Gilliat, *Heroes of Modern Crusades* (Philadelphia, 1909); O. Lee, *With Dr. Grenfell in Labrador* (New York, 1914).

GRENOBLE, grē-nôbl' (Lat. *Gratianopolis*, city of Gratian). The capital of the Department of Isère, France, and a fortress of the first class, in the valley of the Isère, 81 miles from Lyons by rail (Map: France, S., K 3). It is surrounded by high mountains and divided by the river, which is confined within handsome quays, into two unequal portions; the ancient quarter on the right bank is small and uninteresting; above it are the fortresses Rabot and La Bastille; while the modern portion on the opposite bank has a number of fine streets and squares. Among the chief public buildings are the Palais de Justice, in Renaissance style; the cathedral of Notre Dame, dating from the twelfth century; and the museum with an extensive gallery of ancient and modern paintings and a library of over 400,000 volumes and 10,000 pamphlets and college theses, one of the finest in France. The University of Grenoble, founded in 1339, has three faculties, a library of 72,000 volumes, and had, in 1913, 1746 students; there are also a school of medicine, an electrical institute, an artillery institute, trade schools, a theological seminary, and military and art schools. The chief industrial products are gloves (this product alone employing 18,000 persons), leather, dyestuffs, straw hats, metal ware, silk, liquors, and cement. It carries on a good trade in grain, wood, and cheese. Pop., 1911, 77,438. Grenoble, originally the Cularo of the Allobroges, was fortified by Gratian in the fourth century and became Burgundian in the following century. Later it was the capital of Dauphiné until 1453.

GRENVILLE, GEORGE (1712-70). An English statesman, brother of Richard Grenville, Lord Temple, and brother-in-law of the first Earl of Chatham. Educated at Eton and at Christ Church College, Oxford, and admitted to the bar in 1735, he abandoned the law to enter Parliament in 1741 and from 1744 to 1762 filled various government offices. In 1758 he secured the passage of a bill for the regulation of the payment of the navy; four years later he became Secretary of State for the Northern Department, and in the following year he succeeded Lord Bute as Prime Minister, uniting in himself the offices of Chancellor of the Exchequer and First Lord of the Treasury. He is best known from his connection with the Stamp Act and the famous Wilkes case. He advocated the passage of the Stamp Act and opposed its repeal. He was forced in 1765 to resign the premiership and died five years later without again holding important office. Grenville was distinguished for eloquence, public spirit, business qualities, and extensive knowledge. For accounts of his life, consult: *The Grenville Papers* (London, 1852-53); Chatham, *Correspondence* (ib., 1838-40); Walpole, *Memoirs of the Reign of George II* (ib., 1847); id., *Memoirs of the Reign of George III* (ib., 1859); Lecky, *History of England* (New York, 1891); Macaulay, *Essays* (ib., 1860).

GRENVILLE, GEORGE, VISCOUNT LANS-
DOWNE. See LANSDOWNE.

GRENVILLE, or GREYNVILLE, SIR
RICHARD (?1541-91). An English naval officer. As a young man, he served with distinction against the Turks, under the Emperor Maximilian II. Upon returning to England he became interested in the exploration of the New World, and in 1585 commanded a fleet of seven ships, which under the patronage of his cousin,

Sir Walter Raleigh, sailed to Virginia for exploration and plunder. He left a colony on Roanoke Island and on his return voyage captured a rich prize. He carried fresh supplies to Roanoke the year following, but found the settlement abandoned, the people having returned to England with Sir Francis Drake. During the homeward trip he landed at the Azores, where he pillaged towns and carried off prisoners. In 1591, as second in command, on the *Revenge*, he accompanied Lord Thomas Howard to the Azores to intercept the treasure fleet of Spain. The English were surprised the last day of August by a powerful Spanish armada, and for some obscure cause the *Revenge* was delayed until the Spaniards got to windward of her and cut her off from the rest of the squadron. Grenville attempted to break through the Spanish line and was overpowered and captured, after 15 hours of desperate fighting with 150 men against 15 Spanish ships and 5000 men. Grenville was mortally wounded and died a few days afterward. The fight is commemorated in Tennyson's "Revenge, a Ballad of the Fleet." Consult Arber, "Last Fight of the *Revenge* at Sea," in *English Reprints*, vol. xiv (London, 1871). The narratives of Grenville's voyages are in Hakluyt, *Voyages*, vols. ii and iii (ib., 1809-12; Edinburgh, 1889-90).

GRENVILLE, RICHARD TEMPLE. See TEMPLE, EARL.

GRENVILLE, WILLIAM WYNDHAM, LORD (1759-1834). An English statesman, the youngest son of George Grenville (q.v.). He was born on Oct. 25, 1759. After studying at Eton and at Christ Church, Oxford, with brilliant success, he studied law at Lincoln's Inn, but did not enter the profession. He became a member of the House of Commons in 1782 and attended his eldest brother, Lord Lieutenant of Ireland, in the character of secretary. In 1783 he became paymaster-general of the army. In 1787 his cousin, William Pitt, sent him on a diplomatic mission to Holland, where he was largely instrumental in preparing for the Triple Alliance of 1788. In 1789 he was chosen Speaker of the House of Commons, but resigned the same year to become Secretary of State for the Home Department, and the year following he was raised to the peerage with the title of Baron Grenville. In 1791 Pitt made him Foreign Secretary, a post which he held until 1801, when he resigned along with his chief, on the refusal of George III to give his assent to the Catholic Emancipation Bill. He was Premier of the "All the Talents Ministry" (q.v.) in 1806-07, the chief act of which was the abolition of the slave trade. In 1809 he was chosen chancellor of the University of Oxford. From 1815 he acted along with Earl Grey and generally supported Mr. Canning. He died at Dropmore, Buckinghamshire, Jan. 12, 1834. Grenville was the author of an *Essay on the Supposed Advantages of a Sinking Fund* (London, 1828). Consult Adams, *The Influence of Grenville on Pitt's Foreign Policy* (Washington, 1904).

GRESH'AM, SIR THOMAS (1519-70). An English merchant and financier. He was educated at Gonville Hall, Cambridge, was apprenticed to his uncle, Sir John Gresham, merchant, and was admitted to membership in the Mercers Company (1543). In 1551 he became King's factor at Antwerp, in which office it was his business to negotiate royal loans with Flemish

merchants, to buy arms and military stores, and to divert to England as much bullion as possible. As a result of his skillful management of the finances, the rate of exchange, which had been very unfavorable to England, was much improved. Since he was a Protestant, he was dismissed upon Mary's accession to the throne; but he had proved himself indispensable and was quickly reinstated. Elizabeth's successful financial policy owed much to his shrewd advice. At his suggestion the debased currency was restored, and later, when the troubles in Antwerp curtailed foreign resources, he persuaded her to secure a forced loan from the merchant adventurers and staplers by the detention of their fleets. In 1554 he was sent to Spain to procure bullion, and in 1559 he was employed as Ambassador to the Duchess of Parma, Regent of the Netherlands. On this occasion he was knighted. He also carried on an extensive private business as banker, goldsmith, and mercer, and was held to be the wealthiest merchant of his time. He possessed much landed property and established the earliest paper mills in England. He applied his wealth to public uses, after the death of his only son, in 1564. He founded a bourse in London, in imitation of the one at Antwerp, and named it the Royal Exchange. He also founded Gresham College (London) and eight almshouses. Consult Burgon, *Life and Times of Sir Thomas Gresham* (London, 1839). See GRESHAM'S LAW.

GRESH'AM, WALTER QUINTON (1832-95). An American jurist and politician, born near Lanesville, Harrison Co., Ind., March 17, 1832. He was educated at the Indiana State University, but left before completing the course and, after studying law at Corydon, Ind., was admitted to the bar in 1853. He stumped the State of Indiana for Fremont in the campaign of 1856 and in 1860 was elected as a Republican to the State Legislature. In 1861 he enlisted as a private in the Thirty-eighth Indiana Volunteers, but was chosen lieutenant colonel of the regiment before it left the State. In December, 1861, he was commissioned colonel of the Fifty-third Indiana Volunteers and commanded it at Shiloh, at Corinth, and in the Vicksburg campaign. For bravery at the siege of Vicksburg he was promoted to be brigadier general in August, 1863. He commanded the Fourth Division of the Seventeenth Army Corps of Sherman's army at the beginning of the march to the sea; but at Leggett's Mill, near Atlanta, was so severely wounded in the knee as to be compelled to retire from active service. In March, 1865, he was brevetted major general for gallantry before Atlanta. After the war he resumed his law practice at New Albany, Ind., and in 1866 was an unsuccessful Republican candidate for Congress. After spending the greater part of the next two years in New York City as financial agent for his native State, he was appointed in 1869 by President Grant United States district judge for Indiana. In 1880 he was an unsuccessful candidate for the United States Senate. In 1882 he resigned his seat on the bench in order to accept President Arthur's tender of the office of Postmaster-General, made vacant by the death of Timothy O. Howe, and it was largely upon his recommendation that Congress passed the Act excluding all lottery matter from the United States mails. In 1884 he

was made Secretary of the Treasury, a position which he held for a few months, when he was appointed United States judge for the seventh judicial district, and in 1886 attracted national attention by his adjudication of the Wabash Railroad case, particularly by ordering the removal of Jay Gould's receiver and appointing in his place Judge Thomas M. Cooley. He was a candidate for the Republican nomination for President in 1884 and 1888. Later he found himself out of sympathy with his party on the tariff question, having always been a low-tariff Republican. Several of his judicial decisions had won for him the support of the Populists, and had he consented he could have been nominated for the presidency at the national convention of that party held at Omaha, Neb., in July, 1892. He refused to allow his name to be considered, however, and soon after issued a public statement declaring his purpose to support Grover Cleveland's candidacy. After his election President Cleveland named Judge Gresham Secretary of State, a post he held until his death, on May 28, 1895.

GRESHAM'S LAW. A principle of political economy formulated by Sir Thomas Gresham (q.v.) to the effect that in a monetary circulation bad money drives out good. It was originally applied to the effect upon the circulation of mutilated, worn, or depreciated coinage. If into such a coinage new, full-weight coins be injected, it will not be long before the latter are exported or find their way to the melting pot, while the worn-out coins still continue to fulfill their function as money. The reason for this lies in the higher bullion value of the new coin. For exportation or industrial uses the value of the coin is determined by the weight. It is therefore the best coins which are sought for this purpose, and it is a familiar experience that the export of coin works towards the deterioration of the coinage. In latter days Gresham's law has been applied to concurrent circulation of different types of money—gold, silver, and paper. Under the joint circulation of gold and silver, that which in the currency of the country is the cheapest as compared with the valuations of other countries, and the world's market, will tend to displace the other metal. In like manner the infusion into the circulation of irredeemable paper money promotes exportation of metallic money. Gresham's law, in the familiar form that bad money drives out good, of course applies absolutely only where there is a redundancy of currency. In such a case there is a natural movement towards the exportation of money, and that metal will be chosen for exportation which is of least value at home. Unless such redundancy exists, gold and silver may and do circulate side by side despite the fact that legal ratios do not conform to the general market, or, in other words, that in the sense of the maxim one is good and the other bad. See **BIMETALLISM**; **MONEY**.

GRESSET, grés'sé', JEAN BAPTISTE LOUIS (1709-77). A French poet and playwright, born at Amiens. At 16 he became a Jesuit and later taught in Jesuit colleges. *Vert-Vert*, the delightful tale of an indiscreet parrot, appeared at Rouen in 1734 and soon went the rounds of Europe. His *Chartreuse*, *Carême impromptu*, *Lutrin vivant* soon afterward dismayed the Jesuits. Gresset was sent off to La Flèche and shut out of the company. In 1740 he was in Paris, and there he had played his *Edouard III*,

a tragedy, a comedy called *Sydney* (1745), and *Le Méchant* (1747), which was then a success and is to-day considered one of the best comedies of the eighteenth century. Famous in Paris, where he became an Academician in 1748, Gresset went to Amiens, and founded an academy in 1750. In 1759 we find him forswearing the theatre, even indulging in a little severity to placate his brethren whom he had scandalized by his satire on selfish court prelates. Gresset's works appeared in three volumes in 1811 and again in 1859. *Fert-Fert* and other pieces were Englished by "an officer of the army" (New York, 1801) in the *Select Translations and Imitations from the French of Marmontel and Gresset*. Consult also: Dérome, *Poésies choisies*, with bibliography and biography (Paris, 1883); Daire, *Vie de Gresset* (ib., 1779); Robespierre, *Eloge de Gresset* (London, 1785); Bailly, *Eloge de Gresset* (Geneva, 1785); Saint-Albin Berville, *Gresset, sa vie et ses œuvres* (ib., 1863); E. Vogué, *Gresset* (Paris, 1894).

GRESSMANN, HUGO (1877-1927). A German Old Testament scholar, born in Mülln, Holstein. He was educated at GroiBswald, Göttingen (Ph.D., 1899), Marburg, and Kiel, taught at Kiel, and in 1907, after a few months in Jerusalem, became professor in Berlin. He wrote: *Studien zu Eusebs Theophanie* (1903); *Der Ursprung der israelitisch-jüdischen Eschatologie* (1905); two valuable works on archæology and excavations in Palestine, *Ausgrabungen in Palästina und das Alte Testament* (1908) and *Palästinas Erdgeruch in der israelitischen Religion* (1909); *Altorientalische Texte und Bilder zum Alten Testament* (1909); *Das Gilgamesch-Epos erklärt* (1911); *Mose und seine Zeit* (1913).

GRETA (gré'tá) HALL. The residence of the poet Southey from 1803 to his death. It is situated in the Vale of Keswick, Cumberland.

GRETCH, gré'ch, NIKOLAI IVÁNOVICH (1787-1867). A Russian author, born in St. Petersburg, of a Bohemian family. He studied law, but later devoted himself to literature. From 1809 to 1813 he was professor of Russian literature in the school of St. Peter and for three years more in a Russian Gymnasium. He traveled in Germany and France, and in 1829 became connected with the Ministry of the Interior. Transferred to the Department of Finance, he traveled in England, France, and Germany, studying the subject there. His rapid political advancement was due to his conservative politics. His literary fame dates from 1812, when he became editor of the periodical called *Syn Otečestva* (The Son of the Fatherland), a position he held for 26 years. From 1825 to 1860 he edited also (with Bulgarin, q.v.) another Russian periodical, *Sévernaia Pčela* (The Northern Bee). Both of these publications greatly affected Russian politics and literature, especially between 1830 and 1840. But his books are better known than either his political or his journalistic work. He wrote a handbook of Russian literature (1819-22), a work on Russian grammar (2d ed., 1830), two novels, two books of travel, and posthumous memoirs (1886). His complete works were published at St. Petersburg in 1855 in three volumes. Gretch's sketch of Russian literature, translated into German, is included in Otto, *Lehrbuch der russischen Litteratur* (Leipzig, 1837). Consult also K. Waliszewski, *History*

of *Russian Literature* (New York, 1900), and A. Brückner, *The Literary History of Russia* (ib., 1908).

GRETCH'EN. The heroine of Goethe's *Faust*, a simple, confiding girl of the people, who gives her love to the title character.

GREYNA. The parish seat of Jefferson Parish, La., on the Mississippi River, opposite New Orleans, with which it is connected by ferry, and on Morgan's Louisiana and Texas, the Texas and Pacific, and the New Orleans, Southern, and Grand Isle railroads (Map: Louisiana, J 7). There are a Catholic college for boys and a fine courthouse here. It is engaged extensively in the manufacture of cottonseed oil, lard and soap, barrels, and fertilizers. Gretna was founded in 1835 and on several occasions, particularly in 1880 and 1891, suffered from breaks in the levee. Pop., 1900, 3069; 1914 (local est.), 7000.

GREYNA GREEN. A village of Dumfriesshire, Scotland (near the Solway and just over the border from England), which gained great notoriety as the favorite place for runaway couples from England to celebrate marriages and so easily evade the English Marriage Act, which required the consent of parents and guardians, publication of banns, and the presence of a priest. The law of Scotland required nothing but a mutual declaration of intention to be exchanged in presence of witnesses—a ceremony which could be performed instantly; and it was immaterial whether the parties were minors or not. This declaration generally took place in presence of a blacksmith, who in reality was no more necessary than any other witness, but who gradually assumed an authority which imposed on the credulity of the English strangers, and profited by the liberality usually dispensed on such auspicious occasions for his trifling services. The declaration of marriage being exchanged, the parties could return at once to England, and their marriage was held valid there and the world over, under the rule of law that the validity of a marriage is governed by the law of the place where it is contracted (*lex loci contractus*). The severity of the English marriage law has been modified; the Scottish law has been altered, with a view of checking this evasion of English law; and, since 1856, by 19 and 20 Vict., c. 96, no irregular marriage of that kind in Scotland is now valid unless one of the parties had at the date thereof his or her usual place of residence there, or had lived in Scotland for 21 days next preceding such marriage. See MARRIAGE.

GRÉTRY, grâ'trè', ANDRÉ ERNEST MODESTE (1741-1813). A once celebrated French dramatic composer, born at Liège. His earliest musical experience was as a chorister in a local church, but, as it proved unsatisfactory, he was placed under private teachers. About this time he first heard an operatic performance, which strongly incited him to the study of harmony and counterpoint on his own account. He was, however, a poor student, and so impatient to create that at 17 years of age he had produced six symphonies, and in 1759 wrote a mass which so interested an influential Church dignitary as to gain for its composer the means to study in Rome, where for five years he studied at the Collège de Liège. Here the same characteristics that had previously marred his educational progress prevented any real advancement in the broader field of musical art, and, following his

own inclinations, he turned towards dramatic music, his first venture, an intermezzo, *La vendemmia* (1765), being well received. After staying in Rome nine years, he went to Geneva on a fruitless mission to secure a libretto from Voltaire. Acting on the latter's advice, he made his way to Paris, where, after two years of hardship, he succeeded in obtaining the patronage of Count Creutz, the Swedish Minister, who secured him Marmontel's *Le Huron* (1768), for which he wrote the music, and through which he rose to fame. Nearly everything he wrote subsequently was enthusiastically received, notwithstanding a great many musical defects, and the overshadowing of his work by the greater genius of Méhul and Cherubini. However, his influence on the development of *opéra comique* was lasting, Boieldieu, Adam, and Auber continuing on the principles laid down by Grétry. In his *Mémoires*, published in 1789, he clearly stated his conviction regarding dramatic composition. In general his views coincide with those of Gluck (q.v.), but in subordinating mere singing to the dramatic requirements he is even more radical than the great reformer. He wrote about 50 operas and much dramatic music, piano sonatas, instrumental numbers, masses, and Church music generally, most of which were published, and enjoyed more or less popularity. Breitkopf and Härtel commenced in 1883 a complete edition of his works, of which 39 volumes had been published up to 1915. Consult: A. J. Grétry, *Grétry en famille* (Paris, 1815); M. Brenet, *Grétry, sa vie et ses œuvres* (ib., 1884); H. de Curzon, *Grétry* (ib., 1907); R. Rolland, *Musiciens d'autrefois* (ib., 1912).

GREUZE, grüz, JEAN BAPTISTE (1725-1805). A French genre and portrait painter, one of the most eminent of the eighteenth century. He was born at Tournus in Burgundy, Aug. 21, 1725, the son of a tiler. The lad's talent for drawing induced his father, who wished him to become an architect, to follow the advice of the Lyonnese painter Grandon, who taught him at Lyons and took him to Paris. There Greuze studied in the schools of the Academy and attracted attention by his first picture, "A Father Explaining the Bible to his Children," so novel in theme and of such excellence that its authorship by so young a painter was not believed. It was, however, followed by others. His succeeding works placed him at the head of the French genre painters of the day. "The Deceived Blind Man" (1755) secured his election to the Royal Academy; and with the kindly aid of Abbé Gougenot he went to Rome in 1755, but his stay there luckily exercised little influence upon his art. Rome was, however, the scene of his sincere and ideal love affair with the beautiful Princess Letitia, daughter of the Duke del Orr. On his return to Paris he exhibited the series of genre paintings of moral intent, which were greeted with acclaim: "The Village Marriage" (1761), "The Father's Curse" (1765), "The Wicked Son Punished" (1765)—all in the Louvre—and "La Bonne Mere" (The Beloved Mother). Not until 1769 did he send his long-delayed diploma picture, "Severus and Caracalla," for admission to the Academy. He was admitted, but expressly as a genre painter. Greatly incensed, Greuze held aloof from the Academy, and did not exhibit until after the Revolution, in 1804. Greuze now stood at the zenith of popular favor. His portraits also were prized, and the most prominent personages, in-

GREUZE

"THE BROKEN PITCHER," FROM THE PAINTING IN THE LOUVRE, PARIS

cluding the Dauphin, were among his sitters. In 1777 the Emperor Joseph II bestowed upon him a patent of nobility and 4000 ducats to support the rank. His income from engravings after his popular works was very great. But his happiness was marred by the outrageous conduct of his beautiful wife, who browbeat her gentle and confiding spouse, pilfering his resources in the interest of her many amours. Such celebrated paintings as "The Broken Pitcher" (Louvre) and "The Broken Mirror" (Wallace collection, London) are said to typify his unhappiness. After their separation in 1785 he lived with two daughters, both painters. The French Revolution greatly reduced his income, although leaders such as Robespierre, Gensonne (Louvre), Danton, and Bonaparte (Versailles) sat to him for portraits. He died in poverty in Paris, March 21, 1805.

Greuze's art is a reaction from the frivolous and artificial themes of the rococo and typifies tendencies like those of Jean Jacques Rousseau in literature. He was for France the originator of a particular kind of genre, depicting the virtues of the middle classes, in contrast to the prevailing vices of the aristocracy. But better than these more ambitious productions are his representations of young girls of subtle and innocent yet somewhat voluptuous charm, usually with a touch of melancholy and in rather sentimental poses. In such works he ranks among the first French painters of the eighteenth century. His paintings are excellent in line, and, notwithstanding their high finish, they are admirable in color. His very mannerisms are attractive. Among his best-known paintings are "The Milkmaid" and "Friendship," in the Louvre; "Girl with Doves," "Grief," and "Innocence," in the Wallace collection, London; "The Dead Canary," National Gallery, Edinburgh; "Girl with a Bird Cage," South Kensington Museum, London; and "Girl Winding Wool," J. P. Morgan collection (Metropolitan Museum, New York). Among the best of his portraits are those of Jeaurat, Fabre d'Églantine, and the Artist, in the Louvre, and of Sophie Arnould, in the Wallace collection. He is represented in nearly all the principal public collections of France, including most provincial museums, and in Germany and England; but best of all in the Louvre and the Wallace collection, and in Montpellier, St. Petersburg, and Edinburgh.

Bibliography. No satisfactory biography of Greuze has yet appeared. Consult: Goncourt, *L'Art du dix-huitième siècle*, vol. i (Paris, 1880); Lalaing, *Watteau et Greuze* (ib., 1888); Normand, *Joan Baptiste Greuze* (ib., 1892); Lady Dilke, *French Painters of the Eighteenth Century* (London, 1899); Frantz, in Foster, *French Art from Watteau to Prud'hon*, vol. iii (ib., 1907); Rivers, *Greuze and his Models* (ib., 1912).

GRÈVE, grâv, PLACE DE LA. The former name of the present Place de l'Hôtel de Ville at Paris, so called from its position on the river bank. It was a favorite gathering place of unemployed laborers and the scene of the chief popular festivities. In it many famous criminals and political offenders have been executed, among them Ravailiac, the murderer of Henry IV, the Marquise de Brinvilliers, the highwayman Cartouche, and Damiens, the would-be assassin of Louis XV. The place received its present name in 1806.

GREVILLE, CHARLES CAVENDISH FULKE

(1794-1865). An English diarist. He prepared for college at Eton, entered Christ Church College, Oxford, but left without a degree to become the private secretary of Lord Bathurst. Later he was appointed to the secretaryship of Jamaica—a sinecure position, as he never visited the island. At the age of 27 he became clerk of the council, a position he held till 1859, and by means of it became conversant with the plans and purposes, as well as with the men themselves, of every ministry of these 40 years. As he was keen, honest, and unbiased, and possessed of a vigorous and interesting style, he was qualified to record the events and life around him. He improved his opportunity by keeping a political diary or journal for a large portion of his life. These memoirs were placed in the hands of his friend, Mr. Henry Reeve, with the injunction to have them published at a not too distant date after his death. Acting on this request, the diary for the reigns of George IV and William IV (1820-37) was published in 1875 in three volumes. Later, other volumes, covering the years from the accession of Queen Victoria to 1860, were issued. The memoirs afford a valuable insight into the private views and motives of the leaders of English political life. Greville records not so much public events as the private causes which led to them; and perhaps no English memoir writer has left behind him a more valuable contribution to the history of last century. Greville published anonymously, in 1845, a volume on the policy of England towards Ireland, in which he advocated the payment of the Roman Catholic clergy; he was also the author of several pamphlets on the events of his day.

A biographical notice by Henry Reeve may be found in the preface to his edition of the *Greville Memoirs* (London, 1875); consult also the *English Historical Review*, January, 1886, and April, 1887. His works have been collected and edited under the title *Greville Memoirs: Journal of the Reigns of George IV, William IV, and Queen Victoria* (8 vols., London, 1896).

GREVILLE, SIR FULKE, first LORD BROOKE (1554-1628). An English poet and courtier, born at Beauchamp Court, Warwickshire. He entered Shrewsbury School in 1564 on the same day with Sir Philip Sidney, and an intimacy grew up which remained unbroken until Sidney's death. Though he matriculated at Jesus College, Cambridge (1568), while Sidney went to Oxford, the two kept in constant communication, and in 1577 they went together to the court of Queen Elizabeth, where Greville at once found great favor. He made several visits to the Continent, where he met many men of distinction. He saw some service in Normandy under Henry IV about 1591, was four times a member of Parliament between 1592 and 1620, became Treasurer of the Navy in 1598, and in 1603 was confirmed for life as Secretary for Wales, to which position he had originally been appointed in 1583. On the accession of James I, Greville was made Knight of the Bath. From 1614 to 1621 he was Chancellor of the Exchequer. He was made Baron Brooke in 1621, but his political activity as a peer was limited to service in the Council of War in 1624 and membership in a few committees. He was stabbed by an old servant, one of the witnesses of his will, to whom he had not left a legacy, and died Sept. 30, 1628. Of Lord Brooke's literary work little appeared during his lifetime except a few scattered poems and

The Tragedie of Mustapha (1609), the text of which was subsequently altered. The bulk of his poetical work was published in 1633, in a single folio containing *A Treatise of Humane Learning; An Inquisition upon Fame and Honour*; and *A Treatise of Warres*, together with an improved text of *The Tragedie of Mustapha*; *The Tragedie of Alaham*; and *Calica*, the last a collection of so-called "sonnets," which, however, were not written in the sonnet form. His longest work, *The Life of the Renowned Sir Philip Sidney*, in prose, which was as much autobiography as biography, with interesting and original views on politics, appeared in 1652. A reprint of this work, edited by N. C. Smith, was published in Oxford in 1907. All of his metrical writings, save his "sonnets," were written in a close, subtle style, and his subjects were not well adapted to poetic expression; and all tendencies towards fanciful grace are lost in the philosophy and argumentativeness that characterize his versified tracts. His extant works, in four volumes, were reprinted in the *Fuller Worthies Library*, edited by Grosart (1870).

GRÉVILLE, grā'vêl', HENRY (1842-1902). Pseudonym of Alice Marie Cécile Durand. A French novelist and very popular purveyor of emotional sensationalism. She was born in Paris. Of her many volumes those of Russian life are best. Of these *Dosia* (1876) and *Sonia* (1877), both reprinted in America, are sufficiently typical. Her literary career began in Russia with stories and sketches contributed to the *Journal de Pétersbourg* (1868-72), but when her husband lost his professorship in the law school there she returned to Paris. In 1886 she lectured in the United States on French and Russian literature and embodied parts of her experience in *Frankley* (1887), a mediocre novel. She wrote also dramas, and several times revisited America. Consult Ernest-Charles, *Les samedis littéraires* (Paris, 1903).

GREVILLEA (Neo-Lat., named in honor of the English botanist Robert Kaye Greville). A genus of about 150 species of Australian trees and shrubs, which belong to the family Proteaceae. Some species are of considerable economic importance. One of the most common and important is the silk oak (*Grevillea robusta*), a tree of rapid growth, which attains a height of 150 feet or more. Since it resists drought remarkably, it is of value for desert cultivation. The wood is elastic and durable and is especially valued for barrel staves. In every country where this tree has been introduced it is highly esteemed. It is hardy in California, where it is valued as a shade tree in the vicinity of San Francisco. It is easily grown from seed to some extent in hothouses on account of its graceful fernlike foliage. For decorative purposes it is used only while young. The timber of *Grevillea linearis* is harder and closer-grained and, since it takes a good polish, is extensively used for furniture, cabinet, and fancy work.

GRÉVY, grā'vê', ALBERT (1824-99). A French statesman, born at Mont-sous-Vaudrey (Jura), the brother of Jules Grévy, President of France. He studied law and became president of the Corporation of Barristers at Besançon. In 1871 he represented the Department of Doubs in the National Assembly, was Vice President of the Chamber, was civil and military Governor of Algeria (1879), and was elected life

senator in 1881. He was seriously involved in the Panama Canal scandal and was under a cloud for some time.

GRÉVY, JULES (1807-91). President of the French Republic. He was born Aug. 15, 1807, at Mont-sous-Vaudrey (Jura), of an old and respected family. After receiving a good classical education Grévy went to Paris to study law. While still a student, he took part in the revolution of 1830, and, being later admitted to the bar (1837), he showed his Republican sympathies by acting for political prisoners before the Paris tribunals, notably in 1839, in the case of two Republican friends of Barbès (q.v.). In 1848 Grévy was appointed by the provisional government Commissioner General in the Jura District and was returned as deputy to the Constituent Assembly. In this capacity he was an independent and generally voted with the extreme Left. After Louis Napoleon's coup d'état Grévy withdrew from politics and devoted himself to his professional work. He rose to great eminence in his profession and was elected *bâtonnier*, or president, of the Paris bar. He returned to politics in 1868 as a deputy to the Corps Législatif from the Jura Department and acted as a moderate Republican. After the Franco-German War he was elected to the National Assembly at Bordeaux and was chosen its President, a post he resigned in 1873. He reentered the Chamber in the general election of 1876 and became its President. When Marshal MacMahon resigned the presidency of the Republic in 1879, Grévy was elected his successor, January 30, and he was reelected in 1885. During his first term of office Grévy was distinguished by the moderation of his views, his sagacity, and unostentatious mode of life. Calm and judicious, he was able to intervene successfully in the problems of the day. But unfortunately his popularity was destroyed entirely during his second term by the revelations of a scandalous trade in offices and decorations of honor carried on by his son-in-law, Wilson, and he was forced to resign, Dec. 2, 1887. He died at Mont-sous-Vaudrey, Sept. 9, 1891. In 1873 Grévy published a pamphlet, *Le gouvernement nécessaire*, in which he pleads for the strengthening of the Republic. His *Discours politiques et judiciaires, rapports et messages* were edited with an introduction by Delabrousse (1888). Consult also Bertrand, *Le président Grévy* (Besançon, 1892). For short biographies in English, consult King, *French Political Leaders* (New York, 1882), and "Biographies of Eminent Persons," reprinted from the *London Times* (London, 1896).

GREW, NEHEMIAH (1641-1712). An English physician and botanist, born in the parish of Mancetter. He graduated at Cambridge in 1661 and 10 years later took the degree of M.D. at Leyden. In 1677 he was appointed secretary of the Royal Society and held this position for several years. He was the first to write upon the anatomy and physiology of plants, although his priority in this field was for a time doubtful owing to the researches of Marcello Malpighi. His works include: *The Anatomy of Vegetables Begun, with a General Account of Vegetation Grounded Thereon* (1672); *The Comparative Anatomy of Trunks* (1675); *A Discourse of the Colors of Plants* (1677); *Cosmologia Sacra, or a Discourse of the Universe* (1701).

GREWIA, grū'wī-ā (Neo-Lat., named in honor of Nehemiah Grew). A genus of trees which

belong to the family Tiliaceae. Its members have simple and more or less ovate leaves and a drupaceous fruit. They are African, Australian, and Asiatic, mostly tropical and subtropical. Some species, as *Grewia spida* and *Grewia asiatica*, natives of the warmer parts of India, yield edible fruits, much used in the manufacture of sherbet. By the inhabitants of the Himalayas the inner bark, or bast, of *Grewia oppositifolia*, like that of the lime tree in Europe, is used for cordage; and the leaves of *Grewia lavigata* and other species are given as fodder to cattle. The wood of this species is used for boats. That of *Grewia asiatica* is much valued where strength and elasticity are required, as for making bows and the shafts of carriages. The Australian species, *Grewia polygama*, and the Malaccan *Grewia latifolia*, yield respectively a fruit used to make a pleasant beverage, and a hard, close-grained wood that takes a high polish. The trees do not attain sufficient size to be very valuable. One or two species have been introduced into Florida and California. The bast fibre of a number of species is used for rope-making.

GREWINGK (grü'wink) ISLAND. One of the remarkable ever-changing volcanic islands of the Bogoslov group, Alaska. Grewingk, sometimes called Fire, or New, Bogoslov, was up-thrown from the sea in 1883, since which time it has frequently changed its form and mass.

GREY, ALBERT HENRY GEORGE, fourth EARL (1851-1917). A British administrator. He was educated at Harrow and at Trinity College, Cambridge, where he graduated in 1873. He early entered upon a political career and in 1874 was elected a Liberal member of the House of Commons for the southern division of Northumberland, though unseated on a technicality the same year. Later he sat for the same division (1880-85), and for another division of the same county (1885-86), being defeated in 1886. In 1896-97 he was Administrator of Rhodesia, British South Africa, and from 1898 to 1904 a director of the British South African Company. He was the close friend and to some extent the political ally of Cecil Rhodes (q.v.) in the latter's work of consolidating British power in South Africa. In 1904-11 he was Governor-General of Canada and made himself very popular by his active interest in the social life and economic progress of the country. He inaugurated the new provinces of Alberta and Saskatchewan in 1905 and made a journey through the Arctic regions by way of Winnipeg, Fort Churchill, Hudson Bay, and Newfoundland, to establish the practicability of the sea route for trade and other purposes. He published *Hubert Hervey: A Memoir* (1899).

GREY, CHARLES, first EARL GREY (1729-1807). A British general, born at Howick, England. He was made an ensign in the English army in 1748 and accompanied his regiment upon various expeditions, serving as aid-de-camp to Ferdinand of Brunswick during the Seven Years' War. In 1776 he went to America with Howe's forces and was promoted to the local rank of major general (1778). He defeated Gen. Anthony Wayne at Paoli and Baylor's corps of Virginia Dragoons at Tappan. He commanded a brigade at the battle of Germantown. Upon his return home in 1782 Grey was made lieutenant general, and given command of the entire British army in America, but the war came to an end before he could resume his military

duties. In 1793, with Jervis, he commanded the expedition to put down the revolt in the West Indies. He was made Baron Grey of Howick in 1801, and in 1806 his title was advanced to Viscount Howick and Earl Grey.

GREY, CHARLES, second EARL GREY (1764-1845). An English statesman, born March 13, 1764, near Alnwick, Northumberland, of an ancient family, and educated at Eton and at King's College, Cambridge. After traveling on the Continent he became, in his twenty-second year, a member of Parliament for his native county. Abandoning the politics of his family, he became a follower of Fox, making his maiden speech in opposition to the address of thanks to the King for negotiating the commercial treaty with France. He soon obtained a leading position in the House of Commons and was one of the managers of the impeachment of Warren Hastings. A prominent member of the Society of Friends of the People, in 1793 he was solicited to present a petition from this society in which the defects and abuses of the "rotten borough" system were forcibly exposed. On a motion for reform he was outvoted on this occasion and again in 1797. In 1799 he opposed the proposal for the Irish union, but recommended the abolition of 40 "rotten boroughs" in Ireland as a means of securing the independence of Irish members. When the Whig administration of Lord Grenville came into office in 1806, Grey, now Lord Howick, became First Lord of the Admiralty. Fox died in September and was succeeded by Grey as Secretary of State for Foreign Affairs and leader of the House of Commons. The cabinet was broken up in 1807, but not before it had carried the abolition of the slave trade and the enlistment of soldiers for a limited period instead of for life. By the decease of his father in 1807 he was removed from the House of Commons to the Upper House. Grey and Lord Grenville, as the leaders of the Whig opposition, were more than once desired by the Prince of Wales, after he had become Regent, to coalesce with the Tory ministry, but his overtures were firmly rejected. Grey actively opposed the bill of pains and penalties against Queen Caroline. During the long period in which he remained in opposition, from 1807 to 1830, he gave a strenuous support to the abolition of religious tests, the removal of Roman Catholic disabilities, and the amelioration of the criminal code. When Parliament met in November, 1830, he again urged the adoption of measures of temperate reform. In answer to this the Duke of Wellington indiscreetly pronounced the existing system of representation as nearly perfect as possible. The overthrow of the administration followed speedily as a consequence, and the Whigs, returning to power, were permitted to fix the character and extent of reform.

Grey now became Prime Minister, and, March 1, 1831, his ministry presented a bill, prepared by a subcommittee of the cabinet led by Lord John Russell (q.v.), which provided for moderate yet extensive changes: (1) in the distribution of seats in the Commons (disfranchising many "rotten boroughs" and increasing the representation of the northern cities and boroughs); (2) in extending and simplifying the suffrage; and (3) in equalizing conditions in many other ways. The bill was fiercely opposed, and upon the motion of General Gascoyne amended, an act which caused Grey to advise

William IV to dissolve Parliament and appeal to the people. When the new Parliament met, the bill was carried through the Lower House by large majorities. The second reading was moved by Grey in the House of Lords, Oct. 3, 1831. After five nights the bill was thrown out by 199 votes against 158. The reply of the House of Commons was an immediate vote of confidence in the Ministers. The King prorogued Parliament in order that after the shortest possible interval the bill might be again introduced. Riots took place at Nottingham, Derby, and Bristol. At Birmingham a large mob threatened to march upon London. A second reform bill passed the House of Commons, which also passed a second reading in the House of Lords, the Tories being determined to mutilate it in committee. Lord Lyndhurst moved the postponement of the disfranchising clauses, and, the Whigs being beaten, Grey resorted to the extreme remedy of demanding from the King a new and large creation of peers. Consent to this was refused, and Grey resigned. The King thereupon sent for the Duke of Wellington, but, Sir Robert Peel refusing to join the Duke in the attempt to form a government, Grey again returned to office, armed with the written authority of the King to create as many peers as might be necessary to secure the safety of the bill, and on June 4, 1832, without the exercise of that authority, the Reform Bill passed the House of Lords.

Grey took office on the principles of peace, retrenchment, and reform. His government, however, lost a good deal of its popularity in England by his deference to the Lords, and his attempts to conciliate his opponents by a division of patronage. In Ireland Stanley's quarrels with O'Connell and the Irish repealers also tended to weaken the government. Many important measures were, however, passed—as the measure for national education in Ireland, the Irish Church Temporalities Bill, and the bill for abolishing slavery in the West Indies. In December, 1834, the Grey ministry fell to pieces on the Irish Coercion Act, and Grey retired from public life. He died July 17, 1845. Consult: Grey, *Life and Opinions of Charles, Second Earl Grey* (London, 1861); Lord Holland, *Memoirs of the Whig Party* (ib., 1842-54); Roebuck, *History of the Whig Ministry* (ib., 1890); Strange, *Correspondence of Princess Lieven and Earl Grey, 1824-34* (ib., 1890); *The Correspondence of William IV and Earl Grey* (ib., 1867).

GREY, SIR EDWARD (1862—). A British statesman, born in Northumberland, April 25, 1862. He was educated at Winchester and at Balliol College, Oxford, entered Parliament in 1885 as a member for Berwick-on-Tweed, and thereafter continued to sit for the same constituency. He was Undersecretary of State for Foreign Affairs in 1892-95 and later was a follower of Lord Rosebery in that statesman's policy of opposition to a continuance of the alliance between the Liberals and the Irish Nationalists. He was made Privy Councillor in 1902. In December, 1905, he became Secretary of State for Foreign Affairs, and at this post he rapidly became the most commanding figure in European diplomacy. Although he preserved unusual reticence, he won the confidence of his own countrymen of both parties to a remarkable degree, and he dominated the councils of Europe more completely than had been done by any other English Secretary subsequent to the Crimean War.

He consummated the Triple Entente uniting Great Britain, France, and Russia, but, on the other hand, he failed to effect more cordial relations with Germany. When, in 1908, Austria formally annexed Bosnia and Herzegovina, Sir Edward demanded that the matter be submitted to a conference of the Powers; but, finding himself powerless to enforce his demand, he suffered a diplomatic defeat and injured the relations between Great Britain and Austria. In 1911, during the quarrel between Germany and France over Morocco, Sir Edward took a firm stand against permitting German expansion in North Africa, and to the charge of the German Minister of Foreign Affairs that Great Britain had gone beyond its proper sphere in the matter, he replied that his country had not been aggressive, but only consistently firm in upholding its right to be consulted and in letting it be understood that Great Britain would not be willing that France should make unwarrantable concessions. In the following year Russia reaped in Persia some advantages from the Anglo-Russian *entente* of August, 1907. Sir Edward was at his best in the crisis of 1912 in which the Balkan peoples made war on Turkey, for on this occasion he instituted the conference of European ambassadors in London and presided over their deliberations with a dominating influence for peace. But in 1914, when a quarrel arose between Austria and Serbia, occasioned by the assassination of the Austrian Crown Prince by Servians in Sarajevo, Sir Edward's appeals to Germany and Austria to submit the matter to arbitration were in vain, and he was powerless to prevent a great European war. Among the speeches of Sir Edward the best known is one entitled *The Peace of the World*, delivered in the House of Commons March 13, 1911. For an appreciation of his public services, consult Sydney Brook's article "Europe's Ablest Diplomat," in *Harper's Weekly* (New York, May 3, 1913); and for an adverse criticism, consult Perrier, *Our Foreign Policy and Sir Edward Grey's Failure* (London, 1913). See **WAR IN EUROPE**.

GREY, FRANCIS THOMAS DE. See **COWPER**.

GREY, SIR GEORGE (1812-98). A British colonial governor. The son of Lieutenant Colonel Grey, who fell at Badajoz, he was born at Lisbon, Portugal, April 12, 1812. He was educated at Sandhurst Military College, and on attaining his captaincy he received an official commission, on application, to explore interior Australia. He started on his journey in 1837 and the following year organized another expedition to explore the Swan River District. The results were embodied in two books published on his return to England in 1840. His enterprise and ability obtained for him, unasked, in 1841, the post of Governor of South Australia. In 1845 he was made Governor of New Zealand. His government was so wise and conciliatory that in 1848 he was made K.C.B. (civil), and in 1854 was appointed Governor of Cape Colony. The task of allaying the irritation left by the Kaffir War demanded high powers of statesmanship, and Grey was equal to the occasion. In 1858, however, the Colonial Office interfering with measures which he considered necessary, he threw up his post and came to England. Public opinion at the Cape was so strongly manifested in his favor that he was requested by the government to resume his governorship. On the breaking out of the Indian Mutiny Grey

sent every soldier he could spare to the assistance of the Indian government. In 1861 he was again appointed Governor of New Zealand, in the hope that he would bring the war then raging there to a satisfactory conclusion, and he succeeded in bringing about pacific relations with the Maoris. He resigned his office and returned to England in 1867, but afterward resided in New Zealand and from 1877 to 1879 was Premier of the colony. He returned to England in 1894 and died in London, Sept. 18, 1898. Grey was the author of *Journals of Discovery in Australia* (1841); *Polynesian Mythology* (1855); *Proverbial Sayings of the Ancestors of the New Zealand Race* (1858). Consult Rees, *The Life and Times of Sir George Grey* (London, 1892), and Henderson, *Sir George Grey* (ib., 1907).

GREY, HENRY GEORGE, third **EARL** (1802-94). An English parliamentarian and administrator, eldest son of Charles, second Earl Grey. He was born at Howick, Northumberland, Dec. 28, 1802, and was educated at Trinity College, Cambridge. He held the title of Viscount Howick from 1807. His long parliamentary career began in 1826, with his election to the House of Commons as a Whig, from Winchester. When, in November, 1830, the Wellington ministry gave place to that of his father, Earl Grey, he became Undersecretary of State for the Colonies. In this position he introduced a bill for the encouragement of emigration and opposed the practice of making large land grants. In 1833 he resigned his office, on account of the refusal of the cabinet to undertake the immediate rather than the gradual emancipation of slaves in the West Indian colonies. For the first six months of 1834 he was again in office as Undersecretary of State for Home Affairs, and in April, 1835, became Secretary of State for War in Lord Melbourne's cabinet and received an appointment as Privy Councillor. The independence which marked his whole career led in 1839 to his withdrawal from the cabinet because of his opposition to its measures in regard to colonial affairs, particularly the crisis in Canada. He continued to take a prominent part in parliamentary debates and was the author of the amendment to the Irish Franchise Bill in 1841 which eventually led to the defeat of the government.

He took advanced views in favor of free trade, and his speeches had an important influence in leading his party to accept that doctrine. Upon the death of his father, in 1845, he succeeded to his title and took his seat in the House of Lords, where he soon became the Whig leader. Upon Lord John Russell's attempt to organize a ministry in December, 1845, he was offered a portfolio, but refused at the time, because Lord Palmerston had also been invited to join it. Six months later he changed his mind and became Secretary for the Colonies in the same cabinet in which Lord Palmerston was Foreign Secretary. His administration of the Colonial Office, which lasted until 1852, was marked by many experiments, not all of which were successful, by a policy of extension of representative government to the colonies wherever practicable, by the establishment of colonial free trade, and by the recognition that colonies should be governed for their own benefit. From the close of Lord Russell's administration in 1852 until his death, although never again holding office, he was an active and important figure in Par-

liament. He pursued a course of great independence, allied himself with neither party, always sharply criticized both Liberals and Conservatives, particularly in their administration of colonial and foreign affairs, and was one of the most strenuous opponents of Gladstone's home-rule policy for Ireland. He died Oct. 9, 1894. He wrote: *The Colonial Policy of Lord John Russell's Administration* (2 vols., 1853); *Parliamentary Government* (1858); *Free Trade with France* (1881); *Ireland: The Causes of its Present Position* (1888); *The Commercial Policy of British Colonies and the McKinley Tariff* (1892); and edited his father's *Correspondence with William IV* (1867).

GREY, LADY JANE (1537-54). The great-granddaughter of Henry VII and second cousin of Edward VI, daughter of Henry Grey and Lady Frances Brandon. Her teacher, Aylmer, afterward Bishop of London, taught her Greek, Latin, French, and Italian, in addition to something of the arts and sciences. At the age of nine she entered the household of Queen Catharine Parr, with whom she remained till the death of that lady two years later, when she appeared as the chief mourner. After Catharine's death she became the ward of Thomas Seymour, whom the Queen had married on the death of Henry VIII. Seymour planned to marry her to Edward VI; but in this he was thwarted by his brother, the Duke of Somerset, who wished Edward as the husband of his own daughter. This rivalry led to the death of her guardian. Her father, now Duke of Suffolk, after the fall of Somerset in 1549, allied himself with John Dudley, Duke of Northumberland, perhaps the ablest man—certainly one of the most ambitious men—of his time. Northumberland was now Lord Protector to Edward VI and resolved to win the crown for his own family. To this end he arranged a marriage of Lady Jane with his fourth son, Guilford Dudley, and persuaded Edward to change the order of succession as established by Henry VIII, passing his sisters, Mary and Elizabeth, thus leaving the crown to his cousin, Lady Jane. Lady Jane seems to have been kept in ignorance of the intent of her father and father-in-law until the death of Edward (July 6, 1553). Two days later the public announcement was made, and on the 9th she was taken before the Council for acknowledgment. At this meeting she is said to have swooned, and only after the most earnest persuasion was she prevailed upon to issue the proclamation of her accession to the throne. In 10 days the intrigue was ended; Mary was the acknowledged Queen of England. Mary recognized Lady Jane's innocence and for some months resisted the demands of the Spanish Minister and the radicals of Mary's party that she should be tried and beheaded. Her father weakly joined the Wyatt rebellion, thus losing his own life and bringing death upon his daughter, who with her husband was beheaded Feb. 12, 1554. Consult: Howard, *Lady Jane Grey and her Times* (London, 1822); Nicolas, *Memoirs and Literary Remains of Lady Jane Grey* (ib., 1832); Burnet, *History of the Reformation of the Church of England* (Oxford, 1865); Sidney, *Jane the Queen* (London, 1900); L. A. Taylor, *Lady Jane Grey and her Times* (New York, 1908); Davey, *The Nine Days' Queen, Lady Jane Grey and her Times* (London, 1909). Original material may be found in *Letters and Papers of Henry VIII*, edited by Brower

and Gairdner for the "Rolls Series"; Ellis, *Original Letters*, 1st series (London, 1824).

GREYCOAT SCHOOL, or HOSPITAL. A noted London charity school, founded in 1698 by Anne, the future Queen of England, for the education of poor boys and girls. The uniform of the inmates is gray in color. It is now a school for 400 girls.

GREYFF, SEBASTIAN. See GRYPHIUS, SEBASTIAN.

GREYFRIARS. A Franciscan monastery in London, established during the reign of Henry III and once the burial place of many prominent persons. Its site was till 1902 occupied by Christ's Hospital.

GREY'HEN'. The female of the black-cock (q.v.).

GREY'HOUND' (AS. *grighund*, Icel. *grey-hundr*, greyhound, from Icel. *grey*, dog [cf. *grey-baka*, bitch, *grey-karl*, dogged churl], Ir., Gael. *grech*, hound + *hundr*, AS. *hund*, Goth. *hunds*, hound; ultimately connected with Lat. *canis*, Gk. *κῠων*, *kyōn*, OIr. *cu*, Lith. *szū*, Skt. *śvan*, dog). Specifically and colloquially, the term "greyhound" indicates the dog used in England to course the hare and in America the jack rabbit. But in a broader sense and in fact the greyhounds are a group of dogs generically known as "long dogs," having a common origin and form and, in all cases but one, a uniform method of pursuing their quarry, i.e., by sight and not by scent. They vary from one another only in their hairy covering and the kind of game which they pursue, both of which characteristics are due to local environment. The group embraces the English and American greyhounds, the borzoi or Russian wolfhound, the Scotch deerhound, the Irish wolfhound, the Persian and Levantine "long dogs," and the Italian greyhound.

The earliest notices of the long dogs in literature are those in Ovid's *Metamorphoses* and in the poem on "Hunting" by Gracian the Faliscan. Mention of the *Canis gallicus* is also to be found in the works of Martial, Julius Pollux, and Oppian. In the time of Arrian (150 A.D.) coursing with greyhounds had become an established recreation, and in the *Cynogetica* of Nemesian, in the third century, the greyhound, and the arts of breeding, rearing, and feeding him, are treated at length. There is no doubt as to the similarity of these dogs to the entire group of the dogs of to-day. The greyhound was so highly esteemed that it was protected even by the Salic, Burgundian, and German barbaric codes, and Spelman is authority for the statement that at the court of Charlemagne there was a special officer of the greyhound kennel.

The essential characteristics of both the English and the American greyhound are keen sight and great speed; consequently they have great muscular development of the hind legs and great chest capacity. The standard laid down by the Greyhound Club, the ruling authority on the subject, comprises the following points: "Head large between the ears and pointed; long, strong jaws; eye bright and penetrating; ears small and folding when at rest, but semipricked when at gaze; a chest fairly deep and as wide as consistent with speed; strong shoulders, a broad and powerful back, and very muscular hind quarters." The hair is as close, short, and fine as velvet. Color in the modern dog is by no means as uniform as it must have been in early times, when black or black and white prevailed.

Irish Wolfhound or Greyhound. This vari-

ety has a legendary history of great antiquity, and it was often seen in the Roman arena. The breed has never been absent from the royal kennels of England since the reign of King John. Undoubtedly up to the time of the disappearance of the last wolf, about 1710, it was a great rough-coated dog of the greyhound type. As the wolf became scarce and the dog began to be used more for hunting deer and foxes, it became smaller and more slender, though still of proportions exceeding any other of this type of dog. One measured early in the nineteenth century for the Linnæan Society was 61 inches long, including the tail (17½ inches), and stood 28½ inches high at the shoulder. The hair had by that time become shorter and smoother, and the color varied from browns to black and white. Gradually the breed became smaller, until about 1850, when interest in it revived, and to-day there are clubs on both sides of the Atlantic devoted to its development. The standard adopted is that of the earlier rough-haired dog, with a minimum height for dogs of 31 inches and 120 pounds' weight, with 28 inches and 90 pounds' for bitches. Large modern specimens have been bred. "Thiggum Thu" was 34 inches high, and his female mate 30, yet both were true to the type and graceful in their movements. See Wolf Dog.

Scotch Deerhound. This is one of the oldest British breeds, is still used for deer hunting in the Scottish Highlands, and hunts by both sight and scent. In general appearance it strongly resembles the old Irish wolfhound, with a rough-haired coat, a bearded snout, and half-pricked ears; but it is sharper, swifter, and more sagacious than the Irish hound. It is a great favorite wherever it goes. The clubs especially devoted to it call for dogs from 28 to 30 inches high, or even more, weighing from 85 to 105 pounds, with harsh wiry hair 3 to 4 inches long, straight strong forelegs, and hind legs well bent at the stifle, with great length from hip to hock; a chest deep rather than broad, and a very strong neck, an essential for holding a deer. The earliest record of the Scotch deerhound is on the sculptured stones in the churchyard of Meikle in Perthshire, Scotland, which Chalmers attributed to the ninth century.

Borzoi, or Russian Wolfhound. This variety, sometimes called "psovic," is one of the greyhound family adapted to withstand the intense cold of the Asiatic plateaus and to travel over snow. To this end all these hounds, whether from Tibet, Persia, or Russia, have an abundance of warm silky hair, and large hair-covered feathery feet. The modern specimens, from which the typical show dog is chosen, come from Russia, where the ears have for a long period maintained a large kennel of the best specimens. In that country they are used to kill wolves and are trained for that purpose. When wolves are sighted, the dogs are unleashed. Their great speed enables them to overtake the wolf, which they strike with their fore shoulder and knock over; as the wolf rises, another dog strikes it in like manner, until the huntsman following on horseback arrives and kills the wolf with spear or knife. While ferocious in the chase, this great hound is at other times most docile and good-tempered. There are two breeds—the Circassian, or shorter-coated, by some considered the better for deep soft snow; the other having a long, silky, flowing coat, reaching sometimes on the body to a length of 5 inches, while on the

tail it sometimes grows to be 14 inches long. The height of good specimens varies in males from 28 to 33 inches, and in females from 26 to 30, and they should weigh from 75 to 105 pounds for dogs, and 60 to 80 pounds for bitches. The legs are very flat in the bone, giving them an exceedingly slender look from the front, and the feet are long, with a profusion of soft hair. The hind legs are set somewhat forward, which gives the dog, when standing, the appearance of being slightly humpbacked. The chest is deep and not wide, and the sides are flat, where in this dog differs entirely from the English greyhounds. In color the dogs vary, black and white and tan alternating in well-defined patches.

The "brinjaree" is a variety of the rough or long-haired borzoi, used in the Deccan of India and said to be the best hunting dog in the East Indies. It is generally yellow or tan in color.

Italian Greyhound. This is a fancy variety of the true greyhound in miniature, probably first bred as a toy or ladies' pet, which it has remained for many hundred years past. It is only needful to mention that dogs should not exceed 7 to 7½ pounds in weight, and females 5 pounds, to indicate the necessity of daintiness in build, while symmetry of head and neck is essential to perfection. Color is a matter of individual taste; they range from black through the blues to fawn, and even, though rarely, to all white. The last is the most esteemed color at present. The Italian greyhound must be looked at entirely from an artistic and not a utilitarian standpoint. They are prancing, dainty little luxuries, and nothing more.

Whippet. This is the last development from a small greyhound crossed by the terrier. It was originally bred for rabbiting; but it developed such a propensity for racing that whippets are now mainly used for that sport. At the farther end of the proposed course the dogs' handler stands and shakes a rabbit skin or cloth, which excites the dogs to a high pitch. They are then released and will race to that point at a speed exceeding that of any other dog. The form of the greyhound predominates in them; but their eagerness to contest and undying pluck are derived from their terrier blood. As a rule, 15 pounds is taken as handicap weight. Consult authorities cited under the article Dog; and see Plate of HUNTING AND WATCH DOGS.

GREYLAG. See GOOSE.

GREYLOCK, grä'lok, MOUNT. The highest mountain in Massachusetts, situated about 5 miles southwest of the city of North Adams, Berkshire County (Map: Massachusetts, A 2). It is 3505 feet high and commands a remarkably fine view, overlooking the valley of the Hoosac and its villages on the north, beyond which are visible the peaks of the Green Mountains. Mounts Monadnock and Wachusett may be seen toward the east. On the south are the Berkshire Hills, and far away to the southwest, beyond the Hudson, may be seen the Catskills. A large tract of the upper part of the mountain, amounting to about 14,000 acres, has been purchased by the State for a park. Consult Niles, "Greylock Park Reservation," in the *New England Magazine*, vol. xlv (December, 1911).

GREY MOUTH. A seaport of Grey Co., South Island, New Zealand, at the mouth of the Grey River, on the west coast, 105 miles northwest of Christchurch and 190 miles south-southwest of Nelson by rail (Map: New Zealand,

South I., C 3). It has fine harbor accommodation, with extensive wharfage, and is important as the centre of a considerable coal-mining and auriferous district. Saw milling and the preparation of bricks and fire clay are important industries. Pop., 1901, 3800; 1911, 5469.

GREYSON, grā'zōn', EMILE (1823-). A Belgian novelist and educator, born in Brussels. His novels, very popular in Belgium, and his other writings include: *Fiancée Colonna* (1857); *Les récits d'un Flamand* (1859); *Sites ardennais* (1860-62); *Les magots de Téiers* (1863); *Aventures en Flandre* (1882); *Entre bourgeois* (1883); *Les aberrations de Maxime sur l'éducation* (1888); *Hier—aujourd'hui* (1890). In later life he was prominently identified with educational work, as director of higher and intermediate instruction and as a contributor to various reviews, especially the *Revue de l'Instruction Publique*.

GREY TOWN. See SAN JUAN DEL NORTE.

GRIBBLE (of obscure origin; possibly connected with *grub*, *grop*, to grope, AS. *grāpian*, to grasp, from *grip*, grip, from *gripan*, to grasp, or with *grub*, Ger. *grübeln*, to dig; connected with Ger. *graben*, AS. *grafan*, to dig, Eng. *grace*, and probably Gk. γράφειν, *graphein*, to write). A minute boring isopod (*Limnoria lignorum*), which abounds upon the northern sea-coasts, and sometimes does serious damage by perforating piles and submerged woodwork, for the sake of feeding on the wood. Where present, it is extremely numerous, and in America is most destructive in California. Chemical treatment of timber is recommended.

A GRIBBLE.

a, adult isopod (*Limnoria lignorum*); b, a piece of wood perforated by its burrows. Greatly magnified.

GRIBEAUVAL, grē'bō'vāl', JEAN BAPTISTE VAQUETTE DE (1715-89). A French general, born at Amiens and famous for the reforms he inaugurated in the artillery system of his day. In 1732 he joined the Royal Artillery and three years afterward became an officer in the Engineer Corps, devoting himself especially to the study of mines, in which branch of the service he received his captain's rank in 1752. He was the author of a very valuable report to his government concerning the use of light artillery with bodies of infantry (a system then being inaugurated by the Prussian army), together with a complete report concerning Prussian fortifications. In 1757 he entered the Austrian service, serving during the Seven Years' War, in the course of which he directed the siege of Glatz, and held Schweidnitz against Frederick II of Prussia for two months. He was taken prisoner, but afterward was exchanged and was made a lieutenant field marshal. Upon his return to France he began to work for a complete system of reform in the French artillery service. He organized separate corps of artillery for the coast defenses, permanent garrisons, and fortified works, together with mobile units for field service and heavier pieces for siege purposes. Previous to this artillery of varying calibre and design had been indiscriminately scattered throughout the army. Much of Napoleon's success as a tactician and strategist was due to the improvements and reforms rendered possible by

Gribeauval, who not only succeeded in reducing the weight and clumsiness of field artillery, and thus gave to it the mobility which so materially aided Napoleon, but, more important still, brought about a uniformity of design in manufacture, together with many improvements in explosives and projectiles. See ARTILLERY.

GRIBOEDOV, gr'bo-yéd'óf, ALEXANDER SERGÉYEVITCH (1795-1820). A Russian dramatic poet and statesman, born at Moscow. His mother gave him the best obtainable education, preparing him for a diplomatic career. By the time he entered Moscow University he knew French, German, English, and Italian, and had studied music both practically and theoretically. On leaving the university he entered military service when Napoleon invaded Russia, but never got to the fighting line and, becoming tired of inaction, resigned in 1816. In 1815 he translated De Lessert's *Secret du ménage* and in 1817 Barth's *Fausse infidélité*. His comedy, *The Woos of Wit*, was read to his friends in 1824; but the censor, finding the play too pointed, did not permit its publication, with the result that the comedy circulated in thousands of manuscript copies. The only performance of the comedy the author ever saw was at a private theatrical in Brivan in 1825, the first public performance taking place two years after his death. Griboedov was commissioned by General Paskievitch to carry on the peace negotiations with Turkey and Persia, and for this service Emperor Nicholas I made him Minister Plenipotentiary at Tehran. There, with 36 others, he was slain, sword in hand, defending the embassy against an unruly mob during an uprising at the Persian capital.

The singular literary merits of his only original comedy, *The Woos of Wit*, give sufficient ground for believing that death cut short the career of one of Russia's greatest poets. The comedy over which he brooded and worked for some 12 years—and which seems to have been suggested by Molière's *Misanthrope*—is a satirical picture of the struggle between two generations in the third decade of the nineteenth century. The characters are endowed with the bold traits typical of all periods of transition, when one part of society desperately clings to the obsolete forms, while the other, in the enthusiasm of reform, is eager to break with the old. But the great vitalizing spirit of the comedy, apart from its masterly character drawing (its hero Chatsky is as good a type as Molière's Alceste) and its stinging satire, is its remarkable style—a style defiant of all canons of dramatic construction—and its still more remarkable language. Thus, despite the meagreness of his dramatic output, Griboedov may be said to have done for the Russian stage what Pushkin had done for Russian poetry.

The best edition of Griboedov's works is that by I. A. Shliapkin, with exhaustive notes and bibliography (St. Petersburg, 1889). For an analysis of the play, consult Goncharov (q.v.), *A Million of Tortures*, vol. ix of collected works (St. Petersburg, 1899). The comedy has been translated into German (1831 and 1853), Polish (1857), English (1857), French (acts iii and iv, 1858), and Georgian. The best German translation, entitled *Verstand schafft Leidon*, is by Dr. Bertram (Leipzig, 1853). The latest in French is by E. Combes, *L'Esprit nuit* (Paris, 1905); in English, by S. W. Pring (London, 1914).

GRIDLEY, CHARLES VERNON (1845-98). An

American naval officer, born at Logansport, Ind. He graduated at the United States Naval Academy in 1863, served in the West Gulf blockading squadron in the Civil War, participating in the battle of Mobile Bay (1864), and was assigned to various vessels up to 1875, when he was stationed at the Naval Academy for four years. In 1882 he was commissioned commander. He was navigation officer at the Boston Navy Yard from 1882 to 1884, was inspector of the Tenth Lighthouse District from 1887 to 1891, and served as lighthouse inspector from 1895 to 1897, when he was promoted to be captain and given the command of the *Olympia*, the flagship of the Asiatic Station. He directed his vessel in person, though seriously ill, at the battle of Manila (May 1, 1898) and received the commendation of Admiral Dewey for his skill and courage. He was given sick leave immediately after the engagement, but died, while on his way home, at Kobe, Japan.

GRIDLEY, RICHARD (1711-96). An American soldier, born in Boston. He held the rank of lieutenant colonel of engineers at the first capture of Louisburg in 1745, and took part in several Colonial wars. In 1775, as engineer in chief of the Massachusetts troops at Cambridge, he laid out the fortifications on Breed's Hill, and the next day he commanded the American artillery in the action known as the battle of Bunker Hill. Later he fortified Dorchester Heights and, after the British left Boston, directed the erection of works around the harbor. He was commissioned major general by Congress and commanded the Continental Artillery from September 20 till November, 1775, when he was superseded by Colonel Knox.

GRIEBEN, gr'eben, HERMANN (1822-90). A German journalist and author, born at Köslin and educated at Breslau. He founded the *Pommersche Zeitung* at Stettin in 1853 and in 1859 became one of the editors of the *Kölnische Zeitung*. His works include the tragedy *Es ist zu spät* (1848), the comedy *Drei Monate nach Dato* (1858), other dramatic attempts, and some popular collections of songs, as, e.g., *Rheinische Wanderlieder* (3d ed., 1884). The third edition of his collected poems was published in 1884.

GRIEG, grég, EDVARD HAGERUP (1843-1907). The greatest of the Scandinavian composers, born at Bergen, Norway, June 15, 1843. He received his earliest musical education from his mother, an accomplished pianist. From 1858 to 1862 he was a pupil of the Leipzig Conservatory, where his teachers were Hauptmann, Richter, Rietz, Reinecke, and Moscheles. On the completion of his studies at Leipzig, in 1862, he went to Copenhagen for a period of study with Gade, whom he determined to emulate, and immediately plunged into a close study of Norse saga literature, legendary lore, folk music, and national melodic characteristics. It was at this period of his development that Rikard Nordraak (q.v.) entered into his life and by his greater insight made clear to Grieg the path of which the latter was in search. Quite a number of vocal romances, the *Humoresken* (op. 6), the E minor piano sonata (op. 7), and the F minor piano and violin sonata (op. 8), are souvenirs of this friendship. The winter of 1865-66 was spent in Rome, after which he made Christianitya his home for some years. His residence in the latter city was inaugurated by a concert of Norse music which he gave, and at which Mina Hagerup (whom he later married) sang romances written by Nor-

draak, Kjerulf, and himself. A stay of a few months in Rome, in 1870, was made possible by the grant of a government stipend. Here he received much encouragement from Liszt, to whom he dedicated his *Foran Sydens Kloster* (from Björnson's *Arnljot*), a work of magnificent power and conception. In 1871 he established the Philharmonic Society of Christiania, which he conducted till 1880. After that time he lived in Bergen, making occasional concert tours of Germany and England. He died suddenly, Sept. 4, 1907, while boarding a steamer which was to take him to London to fill some concert engagements. Grieg's genius is thoroughly individual and finds its happiest expression in the smaller forms. Fully conscious of his limitations, he never allowed the phantom of ambition to cloud his better judgment. In the days of sensationalism, of dazzling orchestral coloring, of striving for mere effect, and of emancipation from form, he steadfastly clung to his ideals and thus preserved his distinctive character. The beauty of his noble melodies—frequently folk songs or themes patterned after them—is enhanced by rich, distinguished harmonies and piquant, varied rhythms. Through all his works there breathes the spirit of freshness and freedom of the wild northern landscape—a quality that would seem to insure the bloom of perpetual youth to the master's compositions. He wrote for orchestra: a concert overture *Im Herbst* (op. 11), Norwegian dances (op. 35), suite *Aus Holberg's Zeit* (op. 40), two suites *Peer Gynt* (op. 46 and 55), *Sigurd Jorsalfar* (op. 56), symphonic dances (op. 64); the beautiful concerto for piano and orchestra (op. 16); the choral works with orchestra *For der Klosterpforte* (op. 20), *Landerkennung* (op. 31), *Olaf Trygvason* (op. 50); and some exquisite chamber music. His works for pianoforte, mostly in the smaller forms, are veritable gems, while his songs are recognized as among the most beautiful in all song literature. Consult: E. M. Lee, *Grieg* (London, 1908); Schelderup and Niemann, *Edvard Grieg: Biographie und Würdigung seiner Werke* (Leipzig, 1908); H. T. Finck, *Grieg and his Music* (New York, 1909).

GRIEN (GRÜN), HANS BALDUNG. See BALDUNG, HANS.

GRIEPENKERL, grē'pen-kär'l, CHRISTIAN (1839–). A German painter, born in Oldenburg. He studied under Rahl in Vienna and, after the success of his picture "Oedipus Led by Antigone," assisted Rahl in the decoration of the Vienna Opera House and other works he had designed. When Rahl died, Griepengerl and Bitterlich completed some of his undertakings. Then Griepengerl alone did the decorative paintings in various palaces and in the new Houses of Parliament, all in Vienna, and designed the frescoes in the Academy of Science in Athens. Most of these paintings treated mythological scenes, where his rich fancy had much scope. He also painted a number of portraits. In 1874 he was appointed professor at the Vienna Academy.

GRIEPENKERL, WOLFGANG ROBERT (1810–68). A German dramatist and writer on aesthetics, born at Hofwyl, Switzerland. He was professor of German literature at the Cadet School in Brunswick. During his last 20 years he devoted himself entirely to literary work and public readings of his plays, which include the tragedies *Maximilian Robespierre* (2d ed., 1851), *Die Girondisten* (1852), *Auf Sankt Helena* (1862),

and the seriocomedies *Ideal und Welt* (1855) and *Auf der hohen Rast* (1860). These works are distinguished by excellent technique and diction. Consult Sievers, *Robert Griepengerl* (Wolfenbüttel, 1879).

GRIER, grēr, WILLIAM NICHOLSON (1812–85). An American soldier, born in Pennsylvania. He graduated at the United States Military Academy in 1835, served in many Indian campaigns on the Western border, took an active part in the Mexican War, and in 1848 was brevetted major general for gallantry at the battle of Santa Cruz de Rosales. After additional military service on the frontier he came East at the outbreak of the Civil War and served until the end, and was made lieutenant colonel of the First Cavalry early in 1862. He took part in the Peninsular campaign, was wounded at the battle of Williamsburg, acted as chief recruiting officer in Ohio, Iowa, and Pennsylvania, and in 1865 was brevetted brigadier general of the United States army. The next year he was promoted to be colonel of the Third Cavalry, and he retired in 1870.

GRIERSON, grēr'son, BENJAMIN HENRY (1820–1911). An American cavalry officer, born in Pittsburgh, Pa. At the outbreak of the Civil War he was appointed a major in the Sixth Illinois Cavalry, and he rose to the rank of colonel before April 17, 1863, when Grant sent him on a raid from La Grange, Tenn., to Baton Rouge. In 16 days he led his forces 600 miles, tore up railroads and telegraph lines, completely cutting off Vicksburg's communications with the East, destroyed great quantities of arms and supplies, and then brought his men into Baton Rouge so exhausted that many of them fell asleep in their saddles. For his services on this occasion he was brevetted brigadier general on March 2, 1867, and on the same date was brevetted major general for his services during another raid in 1864. He was commissioned major general of volunteers on Feb. 10, 1865, and the next year was appointed colonel of the Tenth United States Cavalry and assigned to duty in the Southwest. He was retired in 1890 with the rank of brigadier general in the regular army.

GRIERSON, SIR GEORGE ABRAHAM (1851–). An Irish Orientalist, born at Glenageary, County Dublin. He was educated at Shrewsbury and Trinity College, Dublin, and received the degree of Ph.D. from the University of Halle in 1894. In 1873 he entered the Indian Civil Service. His many publications contribute largely to the knowledge of the vernacular languages of India. Among the most important of his works are: *Introduction to the Maithili Language of North Bihar* (1882); *Seven Grammars of the Dialects and Sub-Dialects of the Bihari Language* (1883–87); "The Modern Vernacular Literature of Hindustan," in *Journal of Asiatic Society*, vol. lvii (1889); his most important work, the editing of the great *Linguistic Survey of India* (9 vols., 1903–08); "An Ahom Cosmogony, with a Translation and a Vocabulary of the Ahom Language," in the *Journal of the Royal Asiatic Society*, pp. 181–232 (1904); *The Pishāca Languages of Northwestern India* (1906); *Manual of the Kāshmiri Language, Comprising Grammar, Phrase-Book and Vocabularies* (1911).

GRIERSON, SIR ROBERT (c.1655–1733). Laird of Lag and persecutor of the Covenanters. He was a strong supporter of the government, and so loyally did he assist Claverhouse in re-

pressing conventicles that he was made justice of the military court at Kirkeudbright in 1681. He enforced the Test Act with thumb screws and other torture and, in the persecution which followed the act, punished with death refusal to take the oath of abjuration. He was accused of diabolic delight in the torture of his victims. Up to the middle of the nineteenth century his name was preserved in rude country drama, in which his part was that of a bloody monster. On the accession of James II, Grierson was made Baronet and received an annual pension of £200, honors which came close on his condemnation of the "Whigtown martyrs." After the fall of James he was twice seized as a suspect, but was released on bail. For refusing the oath of allegiance (1693) he was frequently arrested and so often fined that he was nearly ruined. He took no active part in "the '15," although his son William was captured at Preston. He was the original of Sir Robert Redgauntlet in Scott's *Redgauntlet*. Consult Fergusson, *Laird of Lag* (Edinburgh, 1885).

GRIES, grēs, JOHANN DIEDERICH (1775-1842). A German poet and translator. He was born at Hamburg and studied law at Jena, but subsequently devoted himself to literary work and became known for his excellent translations of Italian and Spanish authors. His best translations are of the *Gerusalemme liberata* of Tasso, *Das befreite Jerusalem* (14th ed., 1880); of the *Orlando furioso* of Ariosto, *Der rasende Roland* (4th ed., 1851); and the dramatic works of Calderón (3d ed., 1865).

GRIESBACH, grēs-bāg, JOHANN JAKOB (1745-1812). A noted New Testament scholar. He was born at Butzbach in Hesse, Jan. 4, 1745, and received his early training in the schools of Frankfurt-on-the-Main, where his father was for some time a prominent preacher. In his eighteenth year he began his university course, studying at Tübingen, Halle, and Leipzig. At Halle he was greatly influenced by Semler. After an extended visit to seats of learning in Holland, England, and France, he became a docent in theology at Halle in 1771. In 1773 he was made professor. Two years later he was called to Jena, where he remained until his death in 1812. While a university student, Griesbach became interested in the study of the text of the New Testament, and to the task of collecting material for and elucidating the principles of the textual criticism of the New Testament he devoted his life. His labors mark an epoch in the history of this science. His classification of the ancient authorities for the text, i.e., manuscripts, versions, and citations, into three great families, Alexandrine, Western, and Byzantine, is still recognized as substantially correct. His formulation of the principles according to which the evidence for or against variant readings should be weighed was valuable, though his application of the same was too mechanical. He published several critical editions of the Greek New Testament, of which the second (Halle and London, 1796-1808) is the most important. Of his other writings, his *Symbolæ Criticæ ad Supplendas et Corrigenendas Varias Novi Testamenti Lectiones* (1785-93) deserves most attention. Consult S. P. Tregelles, *An Account of the Printed Text of the Greek New Testament* (London, 1854), and Westcott and Hort, *The New Testament in the Original Greek*, introduction and appendix (new ed., ib., 1885).

GRIESINGER, grēs-īng-ēr, KARL THEODOR

(1809-84). A German author. He was born at Kirnbach, Baden, and was educated in the Protestant Theological Seminary at Tübingen. Accused of treasonable utterances published in the *Volkswehr*, a radical journal edited by him during the revolution of 1848, he was imprisoned for two years. From 1852 to 1857 he lived in the United States, and as the fruit of his observations there published the interesting works entitled: *Lebende Bilder aus Amerika* (1858); *Emigrantengeschichten* (1858); *Die alte Brauerei, oder Kriminalmysterien von New York* (3 vols., 1859); *Land und Leute in Amerika* (2d ed., 1863). His descriptions of Swabian life are also popular, while the work entitled *Die Maitressenwirtschaft in Deutschland im 17ten und 18ten Jahrhundert* (1874) is an interesting description of the court life of Germany in former times. His *Samtlichen belletristischen Werke* appeared in six volumes (1843-44).

GRIESINGER, WILHELM (1817-68). A German physician. He was born at Stuttgart and was educated at Tübingen, Zurich, and Paris. In 1847 he was appointed associate professor at Kiel and in 1849 professor of pathology. In 1850 he accepted a call to Cairo, Egypt, where he became physician in ordinary to Abbas Pasha, Viceroy of Egypt, and director of the medical school, which positions he held until 1852. During 1852-53 he traveled on the Continent; subsequently he held professorships in Tübingen (1854-60), Zurich (1860-65), and Berlin (1865-68). At Berlin he founded the *Archiv für Psychiatrie und Nervenkrankheiten*. His chief publications include *Pathologie und Therapie der psychischen Krankheiten* (3d ed., 1871) and *Infektionskrankheiten* (2d ed., 1864).

GRIEUX, grēz. LE CHEVALIER DE. The hero of Prévost's *Manon Lescaut* and the lover of Manon.

GRIFFENFELD, grīf'en-fēld, PEDER SCHUMACHER, COUNT (1635-99). A Danish statesman, born at Copenhagen, son of a wine merchant of German extraction. He was educated by private tutors, then at the University of Copenhagen, and after his father's death (1650) at Leyden (1655-57) and at Oxford (1657-60). He was a profound student of politics, and on his return to Denmark (1662), after travels in France, Italy, and Germany, he gained the favor of King Frederik III and was appointed head of the privy archives and librarian on the new royal foundation. He was a zealous supporter of the King's claim to absolute power and framed the *lex Regia Danica*, was in 1671 rapidly advanced under Christian V, was knighted and became Privy Councilor, and two years later the King made him Chancellor and Count of Denmark. But his position and his foreign policy made him rivals and many enemies. He desired Denmark to make an alliance with both France and Sweden, or, if that was impossible, with France alone, since he saw the danger of being at war with both of these nations at once; but he was repeatedly overruled by his opponents. Future events bore out the wisdom of his policy. In 1676 he was charged with bribery and high treason. The death sentence, though pronounced, was not carried out; but he was imprisoned, and gained his freedom only a year before his death.

GRIFFIN. A city and the county seat of Spalding Co., Ga., 43 miles south of Atlanta, on the Central of Georgia and the Southern railroads (Map: Georgia, B 2). It has several cot-

ton mills and extensive manufactures of Turkish towels. A State agricultural experiment station and a test farm of the Central of Georgia Railroad are situated here. The water works and electric plant are owned by the city. Pop., 1900, 6857; 1910, 7478.

GRIFFIN (from OF. *grifon*, Fr. *griffon*, ML. *grypho*, from Lat. *gryphus*, griffin, variant of *gryps*, from Gk. γρύψ, *gryps*, griffin, from γρυπός, *grypos*, hook-nosed; confused by popular etymology with Gk. γύψ, *gyps*, vulture). A fabulous creature, half animal, half bird, imagined by the ancients. It was usually described in literature and represented in art as having the head, beak, and wings of an eagle and the body and legs of a lion; sometimes it has the head of a leopard or tiger, with horns. This creature was conceived by the peoples of the valley of the Tigris and the Euphrates as one of the chimerical genii or natural forces in the service of the powers of good. Like the bull and the lion, it was either animal-headed or human-headed, but less material than these; and, like them, it was a guardian and protector of man and the treasures of earth. Among the Babylonians its evil counterpart was the dragon Tiamat. In Assyrian sculpture it is represented in colossal size on a slab from Koyunjik in the British Museum and in the embrodered figures on the royal robes. It was even more popular in Persian art, being given as rampant, with high crest, on reliefs from the royal palaces (e.g., Persepolis), and on cylinders and seals.

Thence the myth passed to the Ægean peoples and to the Greeks as well as to the Hittites and the Egyptians. The griffin appears on the battle-axe of King Amasis, in Syrian and Phœnician gems, and on bas-reliefs from Mycenæ. The form of the legend in historic Greek times betrays its Oriental derivation. It appears on the great bronze Phœnician shields from Mount Ida in Crete, on the imported Phœnician and Greek objects in early Italian graves, on Corinthian vases—usually in a long procession of griffins. It is recorded that griffins formed part of the decoration of the bronze patera ordered by the Samians (c.640 B.C. Consult Herodotus, iv, 152). Later it appeared on the helmet of Philidas' famous statue of Athena. It was also connected by the Greeks with other deities, such as Dionysus and Nemesis, but especially with the twin gods Artemis and Apollo. Artemis, in her form as adapted from the Persians, holds in each hand a griffin, on archaic Greek vases and on archaistic sculptures such as the throne in the Dionysus Theatre at Athens. Even more close was the association with the sun god, Apollo, whose chariot the griffin is often represented as drawing, especially in that form of his myth which represents him as withdrawing each year to the regions of the north. The early Greek writers, such as Hesiod and Aristeas, describe the griffins as dwelling in the Rhipæan mountains at the north, near the Hyperboreans and the evil one-eyed Arimaspeans, who, mounted on horses, seek to seize the treasure of gold guarded by the griffins. At a later period the scene of this guarding of the gold was transferred to India. This idea of guardianship was transferred to other spheres, and we find griffins on sarcophagi as keepers of the dead. Many Greek cities of Asia Minor adopted them as types on their coins, as guardian genii of the city, such as Assos, Smyrna, Panticapæum, and Phocæa, evidently under Persian influence.

VOL. X.—25

The Romans lost the poetry and significance of the myth, using the griffin as a mere decorative motif, in friezes, on table legs, altars, and candelabra, as well as in wall paintings. But the symbolism was never entirely lost in the East and reappeared in Christian times in the Bestiaries (q.v.), so called, of St. Basil and St. Ambrose, as part of the peculiar animal symbolism that penetrated the Middle Ages. The heraldic affronted griffins were common in Mohammedan, in Persian, and in Byzantine art—especially in stuffs, ivories, and metal work—passing to the West in the Middle Ages, as is shown, e.g., in many Anglo-Saxon illuminated manuscripts. The legend itself was transformed by Moslem story-tellers, and the form it took is related by those incomparable story-tellers, Marco Polo and Sir John Mandeville, who describe the griffin as a real creature, whose home is in Madagascar, in the form of a powerful and colossal eagle, several times (eight times, says Mandeville) the size of a lion, which it could lift into the air.

The Renaissance rehabilitated the classic form of the griffin, using it, like Roman art, for decorative purposes very freely. It also became popular on family arms and heraldic devices, especially in Great Britain, with the old idea of guardianship; several hundred families (especially in Wales) adopted it as their emblem, but usually replaced the forepaws of the lion by the eagle's claws. (See HERALDRY, *Common Charges*.) In a few instances the griffin ends in a serpent's tail. The attributes of the griffin were swiftness and strength in the service of watchfulness.

GRIFFIN, CHARLES (1826-67). An American soldier, born in Licking Co., Ohio. He graduated at West Point in 1847 and served in the Mexican War, at the close of which he was assigned to duty on the frontier. On the outbreak of the Civil War he joined the Army of the Potomac and commanded the Fifth Artillery at the first battle of Bull Run. He was made a brigadier general of volunteers in 1862 and took part in most of the important battles fought by the Army of the Potomac during the following campaigns. On May 6, 1864, he was brevetted lieutenant colonel for services at the Battle of the Wilderness, and in August of the same year he received the brevet rank of major general of volunteers. Nine months later he was given the actual rank of major general of volunteers. After the surrender at Appomattox he received the arms and colors of the Confederate army and was one of the commission appointed to carry out the conditions agreed to by Grant and Lee. In 1866 he was appointed colonel of the Thirty-fifth Infantry and was assigned to duty in the Southwest, where he died.

GRIFFIN, EDWARD HERRICK (1843-). An American educator, born at Williamstown, Mass. He graduated at Williams College in 1862 and at Union Theological Seminary in 1867. He was professor at Williams College from 1872 to 1889, when he was appointed professor of the history of philosophy and dean of the college faculty in Johns Hopkins University.

GRIFFIN, FRANCIS VIELÉ. See VIELÉ-GRIFFIN, FRANCIS.

GRIFFIN, GERALD (1803-40). An Irish novelist, poet, and dramatist, born in Limerick. He did some newspaper work in Limerick and at the age of 20 went to London. He contributed to periodicals and published novels, some of

which met with success. Among them are: *Holland Tide*, the first of three series of *Tales of the Munster Festivals* (1827); *Tales of Munster Festivals* (2d series, 1829; 3d series, 1832); *The Collegians* (1829), one of the best novels of Irish life, of which an edition, illustrated by Phiz, appeared in 1861 under the title of *Colleen Bawn*; and *Tales of my Neighborhood* (1835). About 1838 he entered the Catholic Society of Christian Brothers, among whom he died. His play *Lisippus*, declined in his lifetime by Charles Kean and others, was produced in 1842 by Macready and Helen Faucit. He has written lyrics of rare tenderness and charm, witness his "Eileen Aroon." An edition of his novels and poems, with a biographical sketch by his brother, was published in eight volumes in 1842-43, and his *Poetical and Dramatic Works* were issued in 1857-59. Consult a sketch in Mitford, *Recollections of a Literary Life* (London, 1859), and H. S. Kraus, *Irish Life in Irish Fiction* (New York, 1903), for critical estimate of his work.

GRIFFIN, MARTIN JOSEPH (1847-). A Canadian journalist and librarian. He was born in St. John's, Newfoundland, but, early removing to Halifax, Nova Scotia, was educated there at St. Mary's College. He practiced law for several years after 1868, then, going into journalism, served first on the *Halifax Chronicle*. In 1868-74 he was editor of the *Halifax Express* and in 1879-81 was editorial representative at Ottawa of the *Toronto Mail*, of which paper he was editor in chief in 1881-85. He became Secretary of the Royal Commission to inquire into the condition of the Canadian civil service (1880) and parliamentary librarian at Ottawa (1885). Besides contributing frequently to the leading magazines of America and Britain, he became known as a literary critic. In 1907 he was made Companion of the Order of St. Michael and St. George.

GRIFFIN, ROBERT STANISLAUS (1857-). An American naval officer, born at Fredericksburg, Va. He entered the United States Naval Academy as a cadet engineer in 1874 and graduated in 1878. During the Spanish War he served on the U.S.S. *Mayflower* in the West Indies and in 1899 was transferred to the line as a lieutenant. In 1903 he was fleet engineer of the European squadron and in 1904-05 fleet engineer of the North Atlantic fleet. His shore duty was chiefly performed in the Bureau of Steam Engineering, Navy Department, and much credit for recent improvements in naval engineering matériel and practice is due to him; he was assistant chief of bureau for several years and in 1913 was appointed chief of the bureau and engineer in chief of the navy with the rank of rear admiral. In 1889, 1894, and 1895 he was secretary of the American Society of Naval Engineers, and in 1908, 1912, and 1913 president. He is the author of numerous articles on technical subjects connected with marine engineering.

GRIFFIN, SIMON GOODALE (1824-1902). An American soldier and legislator, born at Nelson, N. H. He represented his town in the State Legislature and was admitted to the bar in 1860. During the Civil War, as colonel of the First Brigade, Second Division, Ninth Army Corps, he aided Grant in the siege of Vicksburg and participated in Sherman's Mississippi campaign of 1864. He commanded the Second Brigade, Second Division, in the Battle of the Wilderness,

and at Spottsylvania was brevetted brigadier general of volunteers in 1864, on the recommendations of Generals Burnside and Grant. For gallantry at the sieges of Petersburg and around Richmond he was brevetted major general of volunteers in 1865. After the war he lived in Keene, N. H. He was elected five times to a seat in the New Hampshire Legislature and served in the last two terms as Speaker.

GRIFFIN, WALTER BURLEY (1876-). An American landscape architect, born at Maywood, Ill. He graduated as B.S. in Architecture from the University of Illinois in 1899 and thereafter was engaged in the practice of landscape architecture, at first as assistant and junior partner, but independently after 1905. In 1912 he won first prize from the government of Australia in the international competition for the designs for a new federal capital, Canberra, and in 1913 he was placed in charge of the work. He is author of articles on architecture and city planning.

GRIFFIS, WILLIAM ELLIOT (1843-). An American clergyman, educator, and author, born in Philadelphia. He served with the Forty-fourth Pennsylvania Regiment in the Civil War and then entered Rutgers College, where he graduated in 1869. After one year of study at the Dutch Reformed Theological Seminary at New Brunswick, N. J., he accepted an appointment to organize schools on the American model in Japan and was the first American teacher in regions beyond the open ports. On the fall of the feudal system and the unification of the Empire, he was appointed professor of the physical sciences in the Imperial University of Tokyo. He prepared the *New Japan Series* of reading and spelling books and primers for Japanese students in the English language and contributed to the Japanese press and to newspapers and magazines in the United States numerous papers of importance on Japanese affairs. In 1874 he returned to New York, where he finished his theological studies at Union Theological Seminary, and in 1877 was made pastor of the First Reformed Church in Schenectady, N. Y.; in 1886, of the Shawmut Congregational Church in Boston; and in 1893, of the Congregational Church in Ithaca, N. Y. After 1903 he was chiefly engaged in literary work. He wrote: *The Mikado's Empire* (1876); *Japanese Fairy World* (1880); *Asiatic History* (1881); *Corea, the Hermit Nation* (1882); *Sir William Johnson and the Six Nations* (1891); *Matthew Galbraith Perry* (1887); *The Lily among Thorns* (1889); *Honda, the Samurai* (1890); *Japan—in History, Folklore, and Art* (1892); *Brave Little Holland, and What She Taught Us* (1894); *The Religions of Japan* (1895); *Townsend Harris, First American Envoy to Japan* (1895); *The Pilgrims in their Three Homes—England, Holland, and America* (1898); *America in the East* (1899); *The American in Holland* (1899); *Verboek of Japan* (1900); *The Pathfinders of the Revolution* (1900); *Dwa Christus: An Outline Study of Japan* (1904); *China's Story in Myth, Legend, Art, and Annals* (1910); *The Unmannerly Tiger and Other Korean Tales* (1911); *A Modern Pioneer in Korea* (1912); *Hepburn of Japan* (1913).

GRIFFITH, ARTHUR. Irish leader. See IRELAND, HISTORY.

GRIFFITH, FRANCIS LEWELLYN (1862-). An English Egyptologist, born in Brighton and educated at Queen's College, Ox-

ford. Between 1884 and 1888 he worked in Egypt under Naville and Flinders Petrie. In 1888-96 he was an assistant in the British Museum; in 1892-1901 assistant professor of Egyptology at University College, London; in 1896-1908, lecturer at the University of Manchester; and, after 1901, reader in Egyptology at Oxford. In 1910 he took charge of the Oxford excavations in Nubia. He published: *The Inscriptions of Siût and Der Eifeh* (1889); *Hieratic Papyri from Kahun and Gurob* (1898); *Stories of the High Priests of Memphis* (1900); *Demotic Magical Papyri* (1904-09), with Sir Herbert Thompson; *Catalogue of Demotic Papyri in the Rylands Library* (1909); *Meroitic Inscriptions* (1911 et seq.).

GRIFFITH, RALPH THOMAS HOTCHKIN (1826-1906). An English philologist and Sanskrit scholar, born at Corsley, Wiltshire. He was educated at Queen's College, Oxford, and then engaged in educational work in India. From 1863 until 1878 he was principal of the Benares College, and from that year until 1885 he was Director of Public Instruction in the Northwest Provinces. His publications on Oriental literature include: *Specimens of Old Indian Poetry* (1852); *The Birth of the War (Iod)* (1853); *Idylls from the Sanskrit* (London, 1866); *The Rāmāyan of Valmiki* (5 vols., 1870-75; reprinted in 1 vol., 1895); *Yūsuf and Zulaikha* (1882); *The Hymns of the Rig Veda, Metrically Translated into English* (4 vols., 1889-92); *The Nāma Veda* (trans., 1893); *The Atharva Veda* (1895-96); *The Texts of the White Yajur Veda* (trans., 1899).

GRIFFITH, SIR RICHARD JOHN (1784-1878). An Irish geologist and civil engineer, born in Dublin. He studied under William Nicholson in London and under Robert Jameson at Edinburgh. He returned to Ireland in 1809 to examine and report to the government on the bogs of Ireland. In 1812 he became professor of geology and mining engineer for the Royal Dublin Society. Between 1822 and 1830 he supervised the construction or improvement of some 250 miles of roads in Ireland, and from 1827 to 1868 served as commissioner of valuation. He was made Baronet in 1858. He published, besides the first important *Geological Map of Ireland* (1815; rev. eds., 1830 and 1855), *Outline of the Geology of Ireland* (1838); *Fossils of the Mountain Limestone of Ireland* (1842); *A Synopsis of the Characters of the Carboniferous Limestone Fossils of Ireland* (1844), with F. McCoy; *A Synopsis of the Silurian Fossils of Ireland* (1846), with F. McCoy.

GRIFFITH, WILLIAM PETTIT (1815-84). An English architect and archaeologist, born in London. He attained considerable eminence in his profession and designed several hospitals and schools in London. Among his writings are: *The Geometrical Proportion of Architecture* (1843); *The Natural System of Architecture* (1845); *Ancient Gothic Churches* (3 parts, 1847-48-52); *Suggestions for a More Perfect and Beautiful Period of Gothic Architecture* (1855).

GRIFFITH GAUNT, OR JEALOUSY. A novel by Charles Rende, which appeared serially in the *Argosy* and was published in 1866.

GRIFFITHS, DAVID (1867-). An American botanist. He was born at Aberystwith, Wales, and graduated from the Agricultural College, Brookings, S. Dak., in 1892, and from Columbia University (Ph.D.) in 1900. He

taught in the South Dakota schools from 1889 to 1893, was professor of botany at the University of Arizona in 1900-01, and served as assistant agrostologist in 1901-07 and as agriculturist after 1907 in the United States Department of Agriculture. His publications include bulletins of the Department of Agriculture on forage and range conditions in the Western States, and a monograph on the North American *Sordariaceæ*.

GRIFFITHS, ERNEST HOWARD (1851-). A British physicist. He was born in Brecon and was educated at Owens College, Manchester, and at Sidney Sussex College, Cambridge, of which, as of Jesus College, Oxford, he became fellow. In 1901 he was made professor of experimental philosophy and principal of the University College of South Wales and Monmouthshire. He devised an important modification of "Wheatstone's bridge," in 1893 used an electrical method to determine the mechanical equivalent of heat, and in 1907 received the Royal Society's Hughes gold medal for his work on exact physical measurements. His Leeds lectures, *The Thermal Measurement of Energy*, were published in 1901.

GRIFFITHS, JOHN WILLIS (1809-82). An American naval architect, born in New York City. He designed and built many merchant vessels, some war vessels for the United States navy, and introduced many innovations in the art of shipbuilding, his inventions including a timber-bending machine, iron keelsons for wooden ships (1848), bilge keels (1803), and triple screws (1866). He wrote a number of books on naval architecture, the most important of which, *A Treatise on Marine and Naval Architecture* (2 vols., 1850; 4th ed., 1854), was republished in England. His other works were *The Shipbuilder's Manual* (2 vols., 1853) and *The Progressive Shipbuilder* (2 vols., 1875-76).

GRIFFON. A dog. See FIELD DOG.

GRIGGS, EDWARD HOWARD (1808-). An American lecturer and writer. He was born at Owatonna, Minn., and in 1889 graduated from Indiana University (A.M., 1890), where he was instructor in English literature in 1889-91 and professor of literature in 1892-93. He also studied at the University of Berlin. At Leland Stanford he was assistant professor of ethics in 1891-92, professor of ethics in 1893-97, and head of the department of ethics and education in 1897-98. After 1899 he became known as a lecturer. His works include: *The New Humanism* (1900); *A Book of Meditations* (1902); *Moral Education* (1904; 6th ed., 1913); *The Use of the Margin* (1907); *Art and the Human Spirit* (1908); *Human Equipment* (1909); *The Philosophy of Plato* (1910); *Human Progress* (1912); *The Philosophy of Art* (1913); *Self-Culture through the Vocation* (1914).

GRIGGS, JOHN WILLIAM (1849-). An American politician, born in Newton, N. J. He graduated at Lafayette College in 1868, was admitted to the bar in 1871, was appointed city counsel of Paterson, N. J., and became a bank president. He was elected to the General Assembly in 1875 and was a State Senator from 1882 to 1888. During the year 1886 he presided over the New Jersey Senate. In 1895 he was elected Governor of New Jersey, but resigned the office on Jan. 31, 1898, to accept the position of Attorney-General in President McKinley's cabinet, which he held until his resignation in April, 1901. In the latter year he became a member of

the Permanent Court of Arbitration at The Hague.

GRIGNARD, grě'nyár', VICTOR (1871-). A French chemist, born at Cherbourg. He was educated at the lycée of his native city, at the (luny Ecole Normale, and at the University of Lyons, where he became doctor of science in 1901. In his doctor's thesis he demonstrated the discovery of new organometallic compounds of magnesium that were easily obtained and proved to be of great value in synthetic chemistry. These researches earned him half of the Nobel prize in chemistry for 1912. He lectured at Besançon in 1905, taught at Lyons in 1906-09, and took charge, in 1909, of a course at Nancy, where he became full professor in the following year. He is author of a number of memoirs, published in various chemical journals. See GRIGNARD REACTION.

GRIGNARD REACTION. A remarkable synthetic method of organic chemistry, discovered in 1900 by V. Grignard (working at first under the direction of Professor Barbier), and since extensively used for the artificial preparation of a great variety of organic compounds. It is based on the fact that when an organic halogen compound, like methyl iodide (CH_3I), is brought into contact with metallic magnesium in the presence of dry ether, the magnesium combines chemically with the halogen compound, and almost certainly also with the ether, forming a complex substance that is soluble in the excess of ether employed and that readily interacts with compounds of various classes. The union of the halogen compound with magnesium may be undoubtedly represented by formulae like $\text{CH}_3\text{-Mg-I}$, which shows the mode of linking of the atoms in the molecule of methyl-magnesium iodide. How such a metallo-organic compound further unites with ether is less clear; nor is it fully established whether one metallo-organic molecule unites with one or with two molecules of ether. Most chemists assume, with Baeyer, that only one molecule of ether is involved, and that the union takes place through the oxygen of the ether, which becomes quadrivalent ("oxonium oxygen"), as shown by the formula:

In 1904 Baeyer showed that the active complex, whatever its true formula, is formed much more readily if the powdered magnesium employed is previously heated with a small amount of iodine. After the complex—the "Grignard reagent," as it is often called—has interacted with the substance which it is desired to transform, the entire mixture is thrown into cold water acidified with acetic or sulphuric acid, and the product, now free from magnesium, is purified as usual. In formulating the Grignard reagents below, the ether molecule will be omitted, for simplicity's sake. How substances of different classes are prepared by the Grignard reaction may best be illustrated by a set of typical examples.

1. Let the problem be to prepare marsh gas from wood alcohol: the alcohol is changed to methyl iodide, the latter is "grignardized," and the product is brought into contact with acidulated water, the result being an evolution of

all but perfectly pure marsh gas, produced according to the equation:

This may suffice here as an example of the production of *hydrocarbons*.

2. The Grignard reaction may be employed for preparing all kinds of *alcohols* (q.v.)—primary, secondary, and tertiary, monatomic and polyatomic, fatty and aromatic. For instance, ordinary ethyl alcohol, a fatty monatomic *primary alcohol*, might be expected from the action of methyl-magnesium iodide upon formaldehyde:

Benzo-hydrol, an aromatic *secondary alcohol*, has been made from phenyl-magnesium iodide and benzaldehyde, as shown by the following equations:

Secondary alcohols may also be made from the esters of formic acid, the latter being used, for the purpose, in moderate quantities. For instance, secondary amyl alcohol may be prepared according to the equations:

Tertiary alcohols may be prepared either from ketones or from esters of acids other than formic. Thus, phenyl-dimethyl carbinol, a tertiary aromatic alcohol, has been made from acetophenone (a ketone) as follows:

On the other hand, methyl-diethyl carbinol, a tertiary fatty alcohol, may be obtained from ordinary ethyl acetate according to the equations:

As an example of the preparation of a *diamonic alcohol*, or glycol, may be mentioned the synthesis of ordinary pinacolone from ethyl oxalate (the ester of a dibasic acid) and methyl-

magnesium iodide, which may be carried out as follows:

3. The use of the Grignard reaction for the preparation of *aldehydes* may be illustrated by the single example of the transformation of phenyl-magnesium iodide into benzaldehyde. In general, aldehydes are produced when a given Grignard reagent is brought into contact with an *excess* of an ester of formic acid (a *moderate* quantity of ester producing, not an aldehyde, but, as stated above, a secondary alcohol). Benzaldehyde is formed according to the equation:

4. The preparation of aceto-phenone (whose transformation into a tertiary alcohol was mentioned above) may serve as an example of the Grignard synthesis of *ketones* from organic cyanides (nitrils):

5. Finally, it may be shown how an *acid*, e.g., benzoic acid, may be prepared by the Grignard reaction. First, dry carbon dioxide is introduced into the Grignard reagent, and then the resulting intermediate product is decomposed with acidified water, as usual:

The above examples will suffice to indicate the great flexibility of the reaction and its extraordinary possibilities in preparative organic chemistry.

GRIGOROVITCH, gré'gō-rō'vich, DMITRY VAS-SILIEVICH (1822-1900). A Russian novelist of the period of Turgenev, Goncharov, and Dostoevsky (qq.v.). He was born in the Province of Simbirsk. His education was directed by his mother and grandmother and was decidedly French in tone. He studied at the St. Petersburg School of Engineering, tried the stage and painting, but found his true vocation in literature. His first two novels, *The Village* (1846) and *Anton Goremayka* (1847), made his reputation. In both peasant life is depicted very vividly and sympathetically. Especially noteworthy is the attention drawn in them, for the first time in Russian literature, to the heartrending abuses of serfdom. Next to the two works already mentioned, his best novels are *The Fishermen* (1852) and *The Emigrants* (1855). All these novels

have exercised a profound influence on Russian life and literature. After these very successful works the author devoted himself to art, for which he always had a strong predilection. When after a lapse of 30 years he returned to literature, he chose his characters from town-folk, but with little success. Grigorovitch's complete works have been repeatedly published, last in 1896.

GRIJALVA, gré-häl'vā (named in honor of its discoverer, Juan de Grijalva). A river of southeast Mexico, rising in Guatemala, flowing first to the northwest and then to the northeast under various names through the states of Chiapas and Tabasco, and after a course of nearly 300 miles emptying into the Gulf of Campeche (Map: Mexico, M 9). It is navigable for small steamers for about 50 miles up to San Juan Bautista.

GRIJALVA, JUAN DE (c.1489-1527). A Spanish explorer, born at Cuellar (Old Castile). His uncle, Diego Velázquez, Governor of the island of Fernandina (Cuba), sent him to explore Mexico and Yucatan, where he discovered, in 1518, the river now bearing his name. He took possession of all that country in the name of the Emperor Charles V and christened it New Spain. Despite the value of these discoveries, he was not rewarded upon his return to Cuba, but was dismissed from the Governor's service for not founding colonies in the country he had explored, and was killed afterward in Nicaragua. Consult: Juan Diaz, "Itinerario" (the original account of Grijalva's voyage), published in Icazbalceta, *Colección de documentos para la historia de Méjico* (Mexico, 1858); Diaz del Castillo, *True History of the Conquest of New Spain*, issued by the Hakluyt Society (London, 1910-12); Bancroft, *History of Mexico* (San Francisco, 1883).

GRILLAGE BEAMS. See FOUNDATIONS.

GRILLET, gré'yā', JEAN (c.1630-c.1670). A Jesuit missionary and explorer, born in France. In 1660, when the English took Guiana, he was superior of the Jesuit house in Cayenne, but, unlike many of his fellow colonists, did not take refuge among the Indians. A few years later he was sent on a mission to get information concerning the geography of the interior and the customs and civilization of the tribes most distant from the sea. Accompanied by Father François Béchemel, who understood the Galibi language, Father Grillet set out on Jan. 25, 1674. He succeeded in reaching a point about 570 miles southwest of Cayenne, in the country of the Acoquas, a tribe who had never before seen a white man. The two Jesuits returned to Cayenne on June 17, and Grillet sent an account of their journey to France. This account was published afterward under the title *Journal du voyage qu'ont fait les pères Jean Grillet et François Béchemel dans la Guyane, l'an 1674*. It was republished in the second volume of Gomberville's *Relation de la rivière des Amazons* (1679-80) and in Roger's *Voyage around the World* (Amsterdam, 1716). Both of the explorers died soon after their return to Cayenne as a result of the hardships they had undergone.

GRILLPARZER, gril'pär-tsēr, FRANZ (1791-1872). The greatest Austrian dramatist of modern times. He was born in Vienna, Jan. 15, 1791. His conscientious but unfeeling father, a lawyer, died in 1809, leaving the family needy. His mother, an affectionate but eccentric and morbidly sensitive woman, talented in music,

committed suicide in 1810. After an unsympathetic schooling at home Grillparzer studied law in Vienna (1807-11), without making a brilliant success. Afterward he made himself familiar with French, English, Italian, and Spanish. In 1813 he entered government service in the financial department, in 1832 he was put over the archives, in 1847 he became a member of the Academy of Sciences, and in 1856 he retired. If we add to what has been said the fact that Grillparzer was once betrothed to Kathi Fröhlich, whom he first loved, always liked, but never wedded; that he visited Italy in 1810, France and England in 1838, and went to Turkey and Greece in 1843, and finally that he died, honored by all Europe, on the 21st of January, 1872, we know the most striking external incidents in his life.

In German literature he is a link between Goethe, Herder, Schiller, and Lessing, who helped to shape his ideals, and a more modern school. His style is limpid, his verse smooth but virile, his painting of character, especially feminine, masterly. Grillparzer was catholic in his theatrical likings. The suburban theatres pleased him, but he was also a methodical student of Haydn, Mozart, and Beethoven. In 1807-09, under the influence of Schiller's *Don Carlos*, he wrote a drama, *Blanca von Kastilien*; later he turned to Goethe and Shakespeare. *Die Ahnfrau*, a fate tragedy (although Grillparzer denied it), was played first at Vienna (1817) and afterward aroused enthusiasm throughout Germany, but caused the critics to class Grillparzer with Zacharias Werner and Adolph Müllner. This long vexed the poet. His tragedy *Sappho* (1818) made him famous and remains one of his best dramas. In 1822 followed *Das goldne Vlies*, the second greatest trilogy in German literature, which as a stage play, however, fell somewhat flat. This failure Grillparzer laid to the oppressive rule of Metternich. In *König Ottokars Glück und Ende* the dramatist portrayed the rivalry between Rudolph of Hapsburg and Ottokar of Bohemia. For two years the censor kept this play waiting, on the ground that it was unseemly to put the founder of the dynasty on the stage. Thanks to the Empress, the piece was played with great success in 1824. After the cool reception of the tragedy *Ein trauer Diener seines Herrn* (1828) Grillparzer held aloof from the stage for 10 years. On the refusal of *Wehe dem der lügt*, a comedy (1838), Grillparzer was utterly disheartened. *Der Traum ein Leben* (1834), after *La vida es sueño*, by Calderón, a dramatic tale, is played still with success in Germany. *Des Meeres und der Liebe Wellen* (1840) handles the theme of Hero and Leander. In 1850 the public seemed to be eager for the poet's reappearance, but he said "Too late" and would not be persuaded. Consult: Sauer's *Biographical Introduction to Grillparzer's Collected Works* (Stuttgart, 1892); the *Jahrbuch* of the Grillparzer Gesellschaft (Vienna, 1890 et seq.); Traube, *Grillparzer's Lebensgeschichte* (Stuttgart, 1884); Littrow-Bischoff, *Aus dem persönlichen Verkehr mit Franz Grillparzer* (Vienna, 1873); Lange, *Grillparzer, sein Leben, Dichten und Denken* (Gütersloh, 1894); Friedmann, *Il dramma tedesco del nostro secolo*, vol. iii (Milan, 1893); Sittenberger, *Grillparzer, sein Leben und Wirken* (Berlin, 1903); Ehrhard, *Franz Grillparzer; Le théâtre en Autriche* (Paris, 1900); Volkelt, *Grillparzer als Dichter des Tragischen* (München, 1888).

GRILSE, grills (Scot. also *gilse*, cf. *lr. greal sach*, sort of fish). A British name for a young salmon, on its first return from the sea, when it weighs from two to six pounds.

GRIM. The fisherman who, in Arthurian legend, saves the youthful Havelok from a watery grave, rears him as his son, and with the royal reward of his good deed founds the town of Grimsby. The story is told in *The Lay of Havelok the Dane*.

GRIMALDI, grè-mil'dé. A celebrated family of Genoa, members of which were princes of Monaco for several centuries down to 1731. They were staunch supporters of the Guelph interests in Genoa and Italy generally and opposed the Dorias and other Ghibelline families. The most eminent members of the Grimaldi family were: RAINERIO, Admiral of France, who commanded a fleet in the service of Philip the Fair of France in 1304, defeating and making prisoner Guy of Flanders.—ANTONIO, distinguished in naval warfare in the early part of the fourteenth century. He was successful against the Catalans, but in 1353 was completely defeated by Nicolò Pisani, commanding a Venetian and Aragonese fleet off the coast of Sardinia.—DOMENICO, like the others, distinguished at sea, especially in the battle of Lepanto, Oct. 7, 1571. He became Cardinal and Vice-Legate of Avignon and was noted for his efforts to exterminate heresy.—GERONIMO (1579-1685), Cardinal, was celebrated for his attempt to reform the morals of the clergy. He founded a hospital for the poor and distributed great sums in alms. In 1731 the male line of Grimaldi became extinct, and the Principality of Monaco passed to the kindred house of Goyon-Matignon, who assumed the name Grimaldi. Consult: Pierlas, *Monuments inédits sur les Grimaldi de Monaco* (Turin, 1885); Saige, *Monaco, ses origines et son histoire* (Monaco, 1897); De Jolans, *Histoire et généalogie des Grimaldi* (Nîmes, 1900).

GRIMALDI, GIOVANNI FRANCESCO (called IL BOLOGNESE) (1606-80). A Bolognese architect, painter, and etcher. He was a relative and pupil of the Carracci. He practiced in Rome both as an architect and as a painter under the patronage of Paul V, Innocent X, and their successors, and in Paris under that of Cardinal Mazarin. He was twice president of the Academy of St. Luke in Rome. One of the foremost landscape painters of his time, he also executed many etchings and drawings, some of which latter have been mistaken for those of Titian. His works, which are in the manner of the Carracci, include a series of landscapes in the Colonna Gallery, Rome; a series of scenes from the Old Testament in the Quirinal, Rome; several landscapes in the National Library, Paris; two in the Louvre; and a large number of pictures in the Imperial Gallery, Vienna.

GRIMALDI, JOSEPH (1779-1837). The best-known representative of the clown in English pantomime. His father was an actor of Italian parentage, and "little Joe," who was born in London, Dec. 18, 1779, appeared when scarcely two years old at Sadler's Wells Theatre, where he regularly performed (except for one season) down to the date of his retirement from the stage, prematurely worn out by sheer hard work. For several months each year he used to perform nightly at two different playhouses, and once he achieved the feat of acting at three on the same night. At times he played in regular drama, but as a clown he was considered inimitable. His

performance in the pantomime of *Mother Goose* (1806) was many times repeated. At the conclusion of his last appearance, which was as Harlequin Hoax, in his benefit at Drury Lane (1828), he made a pathetic but dignified farewell address. He died in London, May 31, 1837. Consult *Memoirs of Joseph Grimaldi*, edited by Charles Dickens (New York, 1838).

GRIMALKIN, grī-māl'kin (gray + malkin, cat). The quasi-personal name of a cat (properly the female). It is also the name of a familiar of one of the witches in *Macbeth*.

GRIMES, grīnz, BRYAN (1828-80). A Confederate soldier, born in Pitt Co., N. C. He graduated at the University of North Carolina in 1848 and became a planter in his native county. He was a member of the convention at Raleigh which passed the Ordinance of Secession in 1861. When the Civil War began, he entered the Confederate service as major of the Fourth North Carolina Regiment and served until the surrender at Appomattox. In the battle of Fair Oaks Grimes distinguished himself by his gallantry. He took part in the Maryland campaign in the fall of 1862 and at the battle of Fredericksburg commanded the Fifth Brigade in Gen. D. H. Hill's division of "Stonewall" Jackson's corps. Later he fought at the battles of Chancellorsville and Gettysburg. On June 4, 1864, he was assigned to the command of Daniel's old brigade in Rodes's division of the Second Army Corps. In the fall of 1864 he had command of Rodes's old division and accompanied Gen. Jubal A. Early during the Shenandoah valley campaign. He received his commission as major general in February, 1865, and took an active part in the last struggles of Lee's army. At the close of the war Grimes returned to his plantation in North Carolina. He was shot while driving along a country road near his home in Pitt County.

GRIMES, FRANCES (1869-). An American sculptor, born at Braceville, Ohio. She graduated from the normal art department of Pratt Institute in 1894. Selected from her class by Herbert Adams to be his assistant, she worked with him until 1901, and then with Augustus Saint-Gaudens. After the death of Saint-Gaudens, in 1907, she finished the caryatids begun by him for the Albright Gallery (Buffalo, N. Y.). Miss Grimes was elected a member of the National Sculpture Society in 1910 and of the Association of Women Painters and Sculptors in 1911, and exhibited frequently at the National Academy of Design, the Pennsylvania Academy of the Fine Arts, and elsewhere. Her work, after 1908, includes a bust of Bishop Potter (Grace Church, New York), two fountains for the Toledo Art Museum, a bust of Winston Churchill, bas-reliefs of Lucretia Mott and Arthur Whiting, and a lunette for the Washington Irving High School, New York.

GRIMES, JAMES WILSON (1816-72). An American politician and legislator, born at Deering, Hillsboro Co., N. H. He graduated at Dartmouth College in 1836 and in the same year removed to Burlington, Michigan Territory, in what is now the State of Iowa. In this year the Iowa country was added to the newly erected Territory of Wisconsin, and Grimes, who had begun the practice of law, was appointed assistant Territorial librarian. He served also as secretary of a commission at Rock Island appointed to negotiate a transfer of lands with the Sac and Fox Indians, and after the organization of

Iowa Territory in 1838 served several terms in its Legislature. In 1854 he became the nominee of both the Whig party and Free-Soil Democratic party for Governor of Iowa, and after an exciting campaign was elected. His administration, lasting until 1858, saw the birth of the Republican party in Iowa. He was one of the earliest and most active workers in the formation of that party and after leaving the Governor's chair was elected as a Republican to the United States Senate. He was a member of the Peace Convention of 1861. In 1864 he became chairman of the Committee on Naval Affairs, for the duties of which position he had particularly qualified himself. In 1865 he was reelected for another term of six years, but served only until 1869, when, after a stroke of paralysis, he resigned. He was one of the few Republican senators who voted for acquittal at the impeachment trial of President Johnson. The last two years of his life were spent in Europe. Consult Salter, *Life of James W. Grimes* (New York, 1876).

GRIMKÉ, grīm'kă, THOMAS SMITH (1780-1834). An American lawyer and reformer, brother of Angelina and Sarah Grimké. He was born in Charleston, S. C., graduated at Yale in 1807, studied law, and attained eminence at the bar. From 1826 to 1830 he was a member of the State Senate and then and later vigorously opposed South Carolina's nullification projects. He was one of the early advocates of temperance and was an enthusiastic member of the American Peace Society. One of his hobbies was a reform in the spelling of the English language. He published *Addresses on Science, Education, and Literature* (1831).

GRIMKÉ SISTERS, THE, SARAH MOORE (1792-1873) and ANGELINA EMILY (1805-79). American Abolitionists, and advocates of woman's rights; sisters of Thomas Smith Grimké (q.v.). They were born in Charleston, S. C., where their father, John Faucheraud Grimké, was a prominent lawyer and large slaveholder. After his death, in 1819, the two sisters freed their slaves and removed to Philadelphia—Sarah going first, in 1821, and Angelina following, in 1823. Both joined the Society of Friends and devoted themselves for several years to agitating the antislavery question in that city. In 1836 they removed to New York, where they were intimately associated with the leading spirits of the American Antislavery Society, and during the subsequent winter they attracted considerable attention by delivering public lectures on slavery. At this time Sarah wrote an *Epistle to the Clergy of the Southern States* (1836), which, like Angelina's previously published *Appeal to the Christian Women of the South* (1836), was addressed to their old neighbors. In 1837 they went to Boston, where Sarah lectured on woman's rights, a subject which had begun to interest her in New York, and published in the *New England Spectator* a series of letters on *The Province of Woman*. The next year Angelina married Theodore D. Weld (q.v.), one of the leaders of the Antislavery Society, and, accompanied by Sarah, they went to live at Belleville, N. J., where they remained until 1854, when they established a large coeducational institute at Englewood, near Perth Amboy, N. J., which became noted for the independent and enlightened spirit pervading it. Both of the sisters died at Hyde Park, near Boston. Consult Birney, *The Grimké Sisters, Sarah and Angelina Grimké* (Boston, 1885).

GRIMM, grīm, FRIEDRICH MELCHIOR, BARON VON (1723-1807). A noted French journalist and member of the Encyclopedist Circle. He was born in Ratisbon, Germany, of poor parents, and studied at Leipzig. His first production was a tragedy, which was ridiculed at once by the audience and by the critics. Disappointed, he went to Paris as a tutor and remained there as a reader to the Crown Prince of Saxe-Gotha. In 1749 common musical tastes won him the friendship of J. J. Rousseau, and by him he was introduced to the Encyclopedist Circle. Soon afterward he became secretary to Count Friesen, nephew of Marshal Saxe, and so found an entry into the brilliant social circles of Paris, where his intelligence, wit, tact, and good manners soon made him a general favorite. He became wholly French in spirit and was naturalized. His literary reputation was won by a pamphlet, *Le petit prophète de Bochimischbroda* (1753), on the merits of Italian and French opera, a society question of the hour, but his fame dates from the *Correspondance littéraire, philosophique et critique*, begun in 1753 and carried on with various assistants and substitutes until 1759, in the name of Abbé Raynal, who had originated the idea, and then in Grimm's own till 1790. In 1754 Rousseau introduced Grimm to Madame d'Épinay. She soon came to prefer him to the older and intractable lover who left in his *Confessions* a false account of the matter that injured Grimm's reputation for several years. He served as secretary of the Marshal d'Éstrées during the Westphalian campaign (1756-57) and was afterward Minister of Saxe-Gotha at the French court. In 1773 he visited St. Petersburg on a diplomatic mission. The Revolution drove him from France, first to Gotha, then to St. Petersburg. There he resided from 1792 to 1795, enjoying the favor of Catharine II (he was for many years her agent for the purchase of art treasures), and thence he was sent as Russian Minister to Hamburg, his last public office. Grimm's *Correspondance* was not published till 1812. It was sent to several sovereigns and to some minor German courts, and made accessible to them, through a sort of secret official organ, the ideas of the French philosophic movement, shrewdly seasoned to the liking of princes, who were induced to see in the new "philosophy" a means of consolidating their power. Thus Grimm was able to contribute very essentially to the spread of the Encyclopedist movement and to prepare the way for introducing the emancipatory ideas of the French Revolution. And besides this the *Correspondance* is a literary review and chronicle—a record of an important literary period of almost unique value. His collaborators, especially Diderot and Madame d'Épinay, carried on the work in his own delicate, subtle, impartial, and profoundly skeptical spirit. The *Correspondance* was first published in 17 octavo volumes (1812-14), better edited by Taschereau (15 vols., 1820-31, with a supplement of *Correspondance inédite*). M. Tournoux collected his works in 16 volumes (1877-82). Grimm's *Mémoires* on his relations with the Empress Catharine have been published by the Russian Historical Society. For a critical literary appreciation, consult: Sainte-Beuve, *Études sur Grimm* (Paris, 1854); id., *Causeries du lundi*, vol. vii (ib., 1857-62); Schérer, *Melchior Grimm* (ib., 1887); K. A. Georges, *Friedrich Melchior Grimm* (Leipzig, 1904); Ad. Julien, *Amours d'Opéra au 18^e siècle* (Paris, 1908).

GRIMM, HERMANN (1828-1901). A German essayist and critic, a son of Wilhelm Karl Grimm. He was born at Cassel, was educated in Berlin and Bonn, and in 1872 was appointed to the chair of art history at Berlin University. His excellent essays on subjects in art, literature, and history appeared as follows: *Essays* (1859); *Neue Essays* (1865); *Zehn ausgewählte Essays zur Einführung in das Studium der modernen Kunst* (1871); *Fünfzehn Essays, neue Folge* (1875); *Fragmente* (2 vols., 1900-02); *Beiträge zur deutschen Kulturgeschichte* (1897). His principal work is *Das Leben Michelangelos* (2 vols., 1860-63). His biographical-critical lectures on Goethe appeared under the title *Goethe* (2 vols., 1877). His poetical works, *Traum und Erirachen* (1854), *Demetrius* (1854), a tragedy; his fiction, *Überwindliche Mächte* (3 vols., 1867), a novel; and his *Novellen* (1856) are not strong.

GRIMM, JAKOB LUDWIG KARL (1785-1863). An eminent German philologist and antiquary, born Jan. 4, 1785, at Hanau in Hesse-Cassel. He was educated in philology and law at Marburg (1802), and afterward (1805) visited Paris, where he pursued a variety of studies under the direction of Savigny and cultivated his taste for mediæval literature. On his return to Germany at the close of the year, he was employed in the office of the Minister of War at Cassel and became successively librarian to the King of Westphalia (Jerome Bonaparte), and auditor to his Council of State (1808). In 1814 he was secretary to the Ambassador of the Elector of Hesse at Paris, and later on in the same year attended in a similar capacity the Congress of Vienna. While in Paris he claimed, by order of the Prussian government, the restoration of valuable manuscripts and books which had been removed to Paris by the armies of Napoleon I. In 1820 he, jointly with his brother Wilhelm, received the appointment of professor of German literature and librarian of the University of Göttingen. The brothers were among the seven professors who protested in 1837 against the abolition of the constitution by the King of Hanover, for which act they were banished and obliged to retire to Cassel. In 1840 both were invited to Berlin by the King of Prussia, where as members of the Academy they were entitled to give lectures. Jakob was in 1848 elected member of the Frankfurt Parliament. He was, however, with all his interest in political affairs, averse to party strife, and his life was devoted to philological and antiquarian studies. His German *Grammar*, in four volumes, the first volume of which was published in 1810, and the last in 1837 (4th ed., 1870-98), is one of the greatest philological works of the age and may be said to have laid the foundation of the historical investigation of language. His *Deutsche Rechtsaltertümer* (1828; 4th ed., by Heusler and Hübner, 1899) and *Deutsche Mythologie* (1835) are exhaustive works upon the society of the Middle Ages in central Europe and the religious traditions and superstitions from the earliest times. His *Geschichte der deutschen Sprache* (1848; 4th ed., 1880) and *Ueber den Ursprung der Sprache* (1851) are also works of great importance. In company with his brother Wilhelm he published numerous works of a more popular character, the best known of which is *Kinder- und Hausmärchen* (1812-15; 5th ed., 1843; 47th ed., 1906). The greatest joint undertaking of the two brothers

(now carried on by other scholars) is the *Deutsches Wörterbuch*, begun in 1852, of which the latest volume to appear is the fifteenth (1913). *Gammer Grethel's Fairy Tales* was published in 1862. His essays and other articles have been gathered together in the collection entitled *Kleinere Schriften* (8 vols., Berlin and Gütersloh, 1864-90). In vol. i of this series may be found the well-known *Selbstbiographie*, in which his life may be best studied. The following collections of the letters of Jakob and Wilhelm may be noted: *Briefwechsel aus der Jugendzeit*, ed. by H. Grimm and Hinrichs (Weimar, 1881); *Briefwechsel mit nordischen Gelehrten*, ed. by Schmidt (Berlin, 1885); *Briefwechsel*, ed. by Ippel (ib., 1885-86); *Briefe an G. F. Becke*, 1808-29, ed. by Müller (Göttingen, 1889); *Acht Briefe*, ed. by Clausen in *Euphorion* (Vienna, 1907). Consult: Duncker, *Die Brüder Grimm* (Kassel, 1884); Francke, *Die Brüder Grimm: ihr Leben und Wirken in gemeinfasslicher Weise dargestellt* (Dresden, 1899); Scherer, *Jakob Grimm* (Berlin, 1885); Tonnclat, *Les frères Grimm, leur œuvre de jeunesse* (Paris, 1912); *Les contes des frères Grimm, étude sur la composition et le style du recueil des Kinder- und Hausmärchen* (ib., 1912).

GRIMM, WILHELM KARL (1786-1859). A German philologist, brother of Jakob Grimm. He was born at Hanau, Feb. 24, 1786. He was the companion of his elder brother at the Lyceum of Cassel and the University of Marburg. In 1814 he was secretary of the librarian of Cassel, and on removing to Göttingen in 1830 was appointed assistant librarian under his brother, and in 1831 professor extraordinary in the philosophical faculty. He joined his brother in the protest against the King of Hanover, shared his exile, and also his call to Berlin. They labored together on the *Wörterbuch*, the *Märchen*, and many other works, and were commonly known as the Brothers Grimm. Wilhelm died Dec. 16, 1859. Among his works may be mentioned: *Altdänische Heldenlieder* (1811-13), a translation; *Altdeutsche Gespräche* (Berlin, 1851); *Die deutsche Heldensage* (1820; 3d ed., 1889); *Friedank* (1834; 2d ed., 1860); *Ruolandslied* (1838); *Attila und Prohailas* (1846). His *Kleinere Schriften*, a complete collection of essays, were published by Hinrichs (4 vols., 1881-87). See GRIMM, J. L. K., and consult the authorities there referred to. Consult also Steig, *Goethe und die Brüder Grimm* (Berlin, 1892).

GRIMMA, grím'má. A town of Saxony, Germany, situated in a hollow on the left bank of the Mulde, 19 miles southeast of Leipzig (Map: Germany, E 3). The vicinity is very picturesque, and the town is well laid out and attractive. It has a Catholic church of the thirteenth century, an old castle now used for public offices, and a fifteenth-century town hall. The Fürstenschule, consecrated in 1550 and occupying since 1892 a new building, the teachers' seminary, the trade school, and the brewers' school are the chief educational institutions. In the vicinity of the town are found the ruins of the thirteenth-century convent of Nimbschen, to which Katharina von Bora, Luther's wife, once belonged. Grimma was once noted for its textiles. It is in the midst of a busy industrial district which makes machinery, leather, gloves, vehicles, umbrellas, trunks, and paper; it has large bleacheries, dye works, flour mills, and nurseries. Pop., 1900, 10,892; 1910, 11,440. Grimma is first mentioned as a town in 1065.

GRIMME, grím'e, HUBERT (1804-). A German Orientalist, born in Paderborn and educated at the University of Berlin. In 1880 he became professor in the new University of Fribourg and in 1891 professor of Semitic languages at Münster. His published works include the important biographical studies of *Mohammed* (2 vols., 1892-95, 1904) from original sources; *Psalmprobleme* (1902); *Das israelitische Pfingstfest und der Pleiadenkult* (1907); *Die Oden Salomos* (1911).

GRIMMELSHAUSEN, grím'mels-hou'zen, HANS JAKOB CHRISTOFFEL VON (c.1625-76). A German novelist. Little is definitely known of his life. He was apparently a peasant's son, born in Gelnhausen. His important *Simplicissimus* is the only German fiction of the seventeenth century that can still be read with pleasure. He served as a soldier through the later period of the Thirty Years' War, when, able to observe the traits of the common people, he thus collected ample material for his future studies in fiction. From Protestantism he turned late in his life to Catholicism and served for a time the Bishop of Strassburg. For a while, too, he was a magistrate at Renchen in Baden, where he died. *Der abenteuerliche Simplicissimus* (1668) is, as its subtitle states, "The Description of the Life of a Strange Vagabond Named Melchior Sternfels von Fuchshaim, etc." It is a direct imitation of the Spanish picaresque novels, as well as a wonderfully realistic narrative drawn from the author's own experiences. No contemporary writing gives a more vividly realistic picture of the desolation wrought in Germany from 1618 to 1648. Among his other productions may be named the picaresque tales: *Trutz Simplex oder Lebensbeschreibung der Ketzeträgerin und Landstürzerin Courasche* (c.1669), *Der seltsame Springinsfeld* (1670), and *Das wunderbarliche Vogelneest* (1672); the satirical *Schwarz und weiss oder der satyrische Pilgram* (1666); *Der deutsche Nickel* (1673); and the more ambitious *Des vortreflich keuschen Josephs in Aegypten erbauliche Lebensbeschreibung* (1670) and *Dietales und Ameliaden anmutige Liebs- und Loidsbeschreibung* (1670). There are good modern editions of *Simplicissimus* by Keller (Stuttgart, 1852-62) and Tittmann (Leipzig, 1877), and a reprint edited by Kügel (Halle, 1880). Consult Erich Schmidt, *Charakteristiken* (Berlin, 1886), and F. Hoffmann, *Erläuterungen zu Grimmelshausens Simplicissimus* (Leipzig, 1908).

GRIMM'S LAW. A phonetic law stating the changes, commonly termed the first and second sound shiftings, undergone by the mutes or explosives of the Indo-Germanic consonant system in the Low and High Germanic languages respectively. The law, which is one of the most important of all phonetic laws (see PHONETIC LAW), was first developed by Jakob Grimm (q.v.), who outlined it in a letter to Lachmann, Nov. 25, 1820, and in the second edition of his *Deutsche Grammatik* (1822), although the Danish scholar Rask (q.v.) had enunciated its main phenomena in 1819. The law is of much importance in the history of philology (q.v.) as having furnished one of the basal arguments in favor of the theory of the invariability of phonetic law. The fact that there are many words which seem to violate Grimm's law, but which are explained by Verner's law (q.v.) and Grassmann's law (q.v.), is a confirmation of this theory, for it is evident that many linguistic

phenomena which are still obscure are probably due to the action of laws which have not yet been discovered. The law of Grimm concerns the mutes, comprising the *tenues*, *mediae*, and *mediae aspiratae* (the *tenues aspiratae* being rare and in many cases extremely doubtful) of the Indo-Germanic palatal, velar, and labialized velar series (all combined into palatals in Germanic), *k̑, g̑, gh̑, q, g, gh, gʷ, gʷh, gʷh̑*; dentals, *t, d, dh*; and labials, *p, b, bh*. The law in its most general terms may be stated as follows: Indo-Germanic *tenues* become the corresponding *aspiratae* in Low Germanic and remain unchanged in High Germanic; Indo-Germanic *mediae* become the corresponding *tenues* in Low Germanic and *affricatae* in High Germanic; Indo-Germanic *mediae aspiratae* become *mediae* in Low Germanic and *tenues* in High Germanic. Representing, for convenience, the Indo-Germanic palatals, velars, and labialized velars as simple palatals, the following table may be constructed to make the definition clear:

	IG.	LG.	HG.
Tenues.....	$\left\{ \begin{array}{l} k \\ t \\ p \end{array} \right.$	$\left\{ \begin{array}{l} h \\ th \\ f \end{array} \right.$	$\left\{ \begin{array}{l} h \\ th(d) \\ f \end{array} \right.$
Mediae.....	$\left\{ \begin{array}{l} g \\ d \\ b \end{array} \right.$	$\left\{ \begin{array}{l} k \\ t \\ p \end{array} \right.$	$\left\{ \begin{array}{l} ch(k) \\ z \\ pf \end{array} \right.$
Mediae aspiratae.....	$\left\{ \begin{array}{l} gh \\ dh \\ bh \end{array} \right.$	$\left\{ \begin{array}{l} g \\ t \\ b \end{array} \right.$	$\left\{ \begin{array}{l} k(g) \\ t \\ p(b) \end{array} \right.$

It is evident from the table that the changes are more uniform in Low Germanic than in High Germanic. The various Old High German dialects stand in this respect in different stages of development, as is described in GERMAN LANGUAGE. The dialect which has carried out the High Germanic change most thoroughly is the Alemannic, e.g., *thri*, Ger. *drei*, three; *chneo*, Ger. *Knie*, knee; *kot*, Ger. *Gott*, God; *pruuder*, Ger. *Bruder*, brother. As examples of Grimm's law, citations may be made of Indo-Germanic words present in Sanskrit, Greek, Latin, Gothic, English, Old High German, and New High German.

There are certain exceptions in addition to those already indicated in the table. Thus, after *s*, the *tenues* remain unchanged (cf. *stei* and its cognates given below); the Indo-Germanic combination *pt* becomes Germanic *ft*, and *kt*, *qt*, *gkt* become *ht* (Gk. *κλέπτης*, thief, Goth. *hlifus*; Skt. *nakti*, night, Goth. *nakts*), while *gʷ* and *gʷh* have a more complex development than can be outlined here.

	Skt.	Gk.	Lat.	Goth.	Eng.	OHG.	Ger.
k	kampaiś	κῶπη	capere	haffjan	heave	heffan	heben
t	trayas	τρεῖς	tres	breis	three	dri	drei
p	pad	πῶς	pos	fōtus	foot	fuos	Fuss
g	jānu	γῆνυ	genu	kniū	knee	kniū	Knie
d	damayati	δαμῶν	domare	ga-tamjan	tame	zamjan	sāhmen
b	tribus	þairþp	thorp	dorf	Dorf
gh	stighndiś	στειγνῶν	steigan	steig	stigan	steigen
dh	rudhira	ῥυδρός	ruber	rauds	red	rūt	rot
bh	bhrātar	φάτρης	frater	brōþar	brother	bruoder	Bruder

The cause of both sound shiftings has been explained as an increase in the speed of utterance, but this theory is open to many objections. The change seems to be due in reality to an increased force of expiration of the vocal current. Thus, it is evident experimentally that an increased stress on a media or sonant will produce a *tenue* or *surd*, as in the emphatic pronunciation of such a word as "Gad!" and in like manner emphatic aspiration, as in the change of *t* to *th*, is

a recognized phonetic phenomenon. It is noteworthy that changes to some extent analogous to the operation of Grimm's law are found in other languages. Thus, in the Bantu group of South Africa a similar change may be observed, and among the Indo-Germanic dialects the Armenian language (q.v.) is conspicuous for its change of the old *tenues* to *mediae*, and of the old *mediae* to *tenues* (e.g., Old Armenian *p, d, g* = New Armenian *b, t, k*).

Chronologically the first sound shifting seems to have been carried out between 500 and 250 B.C. It began with the change of the *tenues* to *tenues aspiratae*, which then became, as in Greek, voiceless spirants (e.g., *t* became *th*, then *þ*). The second change was that of the Indo-Germanic *mediae aspiratae* to voiced spirants and then to *mediae* (e.g., *dh* became *ð*, then *d*). This was accomplished less uniformly than the first change, so that *g* long retained its spirant value. Verner's law (q.v.) seems to have come into operation at this period. The third change was that of the Indo-Germanic *mediae* to *tenues*. The second or High Germanic sound shifting apparently took place between the fifth and seventh centuries. The earliest was that of the voiceless *p* to the voiced *ð*, whence came *d*. This began in the Oberdeutsch dialects Alemannic and Bavarian, spread to the Middle Frankish, and finally included the Niederdeutsch group of Lower Frankish and Saxon. The other changes of the second sound shifting followed, with the limitations already noted, the same geographical course. See GERMAN LANGUAGE; PHONETIC LAW; PHONETICS; VERNER'S LAW.

GRIMSBY. A village in Lincoln Co., Ontario, Canada, on Lake Ontario, and on the Grand Trunk Railway, 18 miles east of Hamilton and 18 miles west of St. Catharines (Map: Ontario, E 7). Its industrial establishments include canneries, planing mills, and manufacturing of electric fittings and stoves. The village owns its water works. It is situated in a fruit-growing region which is famous for its peaches, grapes, and apples. Pop., 1901, 1001; 1911, 1669.

GRIMSBY, GREAT. A seaport and market town in Lincolnshire, England, on the Humber, 20 miles east-southeast of Hull (Map: England, F 3). The town consists of two portions—the older with irregular streets, and the new, to the east, spacious and regularly laid out. The chief buildings are the fine old parish church, the town hall, customhouse, corn exchange, free

grammar school, mechanics' institute, and the dock warehouses. The town provides a school for technical instruction, owns the market and much remunerative leasehold and real estate. It has an electric-lighting and power plant. It is chiefly famous for its immense fishing trade, having a fleet of over 500 steam trawlers, but has shipbuilding works, breweries, tanneries, flax-dressing and bone-crushing mills, and manure works. Its harbors and docks cover 350 acres.

The Great Central Railway (formerly the Manchester, Sheffield, and Lincolnshire) has played an important part in the development of the town. Many of the docks have been built by this corporation, its latest enterprise being the great docks of Immingham, on the Humber, 5 miles above the town. It exports the manufactures of west Yorkshire and Lancashire. It imports the raw and manufactured products of Russia, Denmark, Norway, and Germany. Grimsby takes its name from Grim, a fisherman of Arthurian legend. It has numerous tumuli and Roman remains and is the traditional spot where the Danes first invaded England. It received its charter of incorporation from King John and further charters from Edward I and Edward III. It sent 11 ships to assist Edward III in his expedition against Calais (1346). The silting of the harbor led to its decline, but prosperity revived with the harbor improvements of 1849-58. Pop., 1901, 63,138; 1911, 74,663. Consult Shaw, *Old Grimsby* (Grimsby, 1897).

GRIMSEL (grimzel) **PASS**. A pass, a little over 7000 feet high, of the Bernese Alps, Switzerland (see **ALPS**), leading from Italy and south Switzerland into the Hasli Thal or Upper Valley of the Aar, and forming the boundary between the cantons of Bern and Valais. The victory of the French, whose advance from the Hasli Thal in 1799 was opposed by the Austrians, is commemorated by the Todtensee (Lake of the Dead).

GRIMSTON, W. H. See **KENDAL**, MR.; **KENDAL**, MRS.

GRINDAL, EDMUND (c.1519-83). An English prelate, born near St. Bees, Cumberland. He graduated at Cambridge in 1538, became private chaplain to Bishop Nicholas Ridley, and in 1541 chaplain to Edward VI, after whose death he went to the Continent and remained till 1559. He succeeded Bonner in 1559 as Bishop of London. His leniency towards the Puritans did not further the establishment of the Anglican system, and he was transferred to the see of York in 1570. On the death of Archbishop Parker Queen Elizabeth favored his accession to the see of Canterbury, to which he was elected in 1575. The Queen had counted on his tractability, but was disappointed to find him rigidly conscientious in his refusal to suppress Puritan activities. He was sequestered in 1577 and was not fully restored for five years. His life was edited by Strype (London, 1710). His writings, and a life by the Rev. William Nicholson, were published by the Parker Society in 1853.

GRINDELIA. A genus of plants of the family Compositæ, named in honor of David Hieronymus Grindel, a Russian botanist. There are about 50 species, which are found from the United States through Mexico into South America. The plants are rather coarse, biennial or perennial, with numerous many-flowered heads of yellowish flowers. Often the plants are viscid from a resinous exudation, on which account they are commonly called gumweeds or tarweeds. Two species have come into some repute in medicine, *Grindelia squarrosa* and *Grindelia robusta*. The first is found in dry soils from Illinois and Minnesota, southward and westward. It has rayless flower heads with a scaly involucre. The other abounds in California and is a more vigorous-growing plant. The plants contain volatile oil, resin, grindeline, etc., and have expectorant, antispasmodic, seda-

tive, tonic, and diuretic properties. The fluid extract is used also as an external application for burns, etc., and it has some reputation as a cure for *Rhus*, or poison ivy, poisoning.

GRINDELWALD, grin'del-vilt. One of the most beautiful valleys of the Bernese Alps, situated in the eastern part of the Canton of Bern, 3402 feet above sea level (Map: Switzerland, C 2). It is celebrated for its glaciers, the Lower Grindelwald descending lower than any other of the Alpine glaciers. Grindelwald is a favorite resort for tourists both in winter and summer. Pop., 1900, 3370; 1910, 3468.

GRINDER (from *grind*, AS. *grindan*; ultimately connected with Lat. *frendere*, to gnash). A small Australian flycatcher (*Neisura inquieta*), which, besides its ordinary whistle, produces a sound resembling that made by a scissors-grinder's machine. This sound is made while the bird hovers in the air (its whole manner of flight is remarkable), but how it is produced is not known.

GRINDING. The operation of shaping or smoothing any hard substance by rubbing away its surface with a rough stone or with a cutting powder. It is similar to filing and is used in cases where, from the hardness of the material or for other reasons, filing is inapplicable. Thus cutting tools and other steel instruments may be filed before hardening and tempering; but after this, if further abrasion is required, they must be ground. Glass lenses and metal specula are ground into shape with emery powder laid upon a metal tool. Ornamental glass is ground into facets or otherwise by means of stones and lap wheels. Diamonds and other gems are ground or cut with diamond dust embedded in soft iron. When large flat surfaces are required, they are obtained by first working two pieces of the substance nearly flat and then laying one upon the other and grinding their surfaces together with sand, emery, or other suitable cutting powder. Plate glass is finished in this manner; also surfaces of cast iron where accurate fitting is required, the iron surface being either prepared with a planing machine or by turning in a lathe. Sockets and other bearings which require to be fitted with great accuracy are usually finished by grinding together. For brass and bell metal powdered pumice stone is best adapted for such purposes, as emery is liable to embed itself in the metal and give it a permanent cutting action upon the bearings. *Dry grinding* is the term applied to the grinding of steel with dry grindstones. Its principal applications are in the grinding of the points of needles and forks, the surfaces of gun barrels, and in finishing steel pens. See **GRINDING**, **CRUSHING**, AND **PULVERIZING MACHINERY**; **CUTLERY**.

GRINDING, CRUSHING, AND PULVERIZING MACHINERY. For the reduction of the size of rock, ores, and other substances, various machines are used, depending upon the size and character of original material and the fineness of the product desired. Naturally there are a large number of these machines in use, but the more important types conveniently can be grouped together. Thus, for reducing the size of rock to about 1 inch *breakers* are used, for reducing the size from 1 inch to about 20 mesh, i.e., so that the fragments will pass a screen with 20 meshes to the inch, *crushers* are used, and for the further reduction to an impalpable powder, *pulverizers* are used. It must be borne in mind that the word

"crushing" is often incorrectly used for breaking. Crushing and pulverizing are often accomplished in one machine, such as the stamp mill; the machine is then known as a pulverizer.

FIG. 1. VERTICAL SECTION OF BLAKE JAW BREAKER.

Breakers. *Jaw Breakers.*—The common practice preceding the invention of jaw breakers was to break rock and ore with a specially designed hammer, known as the *spalling hammer*. In 1858 Eli Whitney Blake, one of the commissioners of roads for the city of New Haven, Conn., designed and patented the Blake jaw breaker for breaking stone for macadamizing Whalley Avenue in that city. This machine consisted of two jaws, one fixed and one movable, so arranged as to form a V-shaped opening between them. In the original design the movable jaw was supported by a cross pin at the bottom. This was quickly improved upon by Mr. Blake by suspending the movable jaw by a cross pin at the top and transmitting a reciprocating motion to the lower portion of the jaw by means of two toggles and a pitman operating on an eccentric. The jaw breaker in common use to-day is of the Blake pattern, with only slight

FIG. 2. VERTICAL SECTION OF GYRATORY BREAKER FOR STONE AND ORE.

mechanical changes, but no change from the original principle. The size product may be regulated by raising or lowering the adjusting wedge at the rear or by inserting longer or shorter toggles. As the eccentric raises the pitman, the toggles approach the horizontal,

thereby moving the movable jaw forward to crush the rock; as the pitman is lowered, the movable jaw is drawn back by its weight and the toggle spring, opening the jaws for the discharge of the broken rock. Only about 40 per cent of the total time is consumed in the forward motion when actual breaking takes place. This led to the invention of the gyratory breaker, a machine which while breaking on one side is discharging on the side diametrically opposite.

Gyratory Breaker.—This machine consists of an annular V-shaped opening to receive the rock or ore similar to the jaw breaker; instead of the movable jaw or head having a reciprocating motion, it has a gyratory motion imparted to it from a vertical shaft or spindle resting in an eccentric at the base; this eccentric cup is revolved by gears connected with a belt-driven pulley. The vertical shaft or spindle to which is attached the crushing head may be either suspended from a spider at the top or supported on a steel step in the eccentric. The gyratory head and the stationary concaves between which the rock is broken are replaceable when worn. To prevent rupture of the machine in case a piece of steel is accidentally fed with the ore, a breaking

FIG. 3. SYMONS DISK BREAKER AND CRUSHER (VERTICAL SECTION).

pin is used to attach the belt-driven pulley to the shaft. The ore is broken between the head and concaves as the head approaches the concaves, and the broken ore is discharged diametrically opposite at the same time. These machines are very heavy and have large capacity as compared with a jaw breaker. They are applicable when large quantities of rock are broken daily over a considerable period of time.

Symons Disk Breakers and Crushers.—These machines are of recent invention, and several large mining companies installed them during 1913 after their efficiency had been tested in an experimental plant. The machine consists of two vertical disks of manganese steel set with their hollow or concave sides facing each other. The disks are supported at an angle to each other, thereby providing a wider opening between the edges of the disks at one part of their circumference. Both disks are rotated in the same direction and at the same speed. The outside disk is supported and revolved by a hollow shaft through which passes an inner solid shaft supporting at one end the inner disk; the other end of the solid shaft rests in an eccentric in the centre of a revolving pulley. To the hollow shaft is keyed a pulley resulting in a positive speed being transmitted to the outer disk. The inner disk receives a gyrating motion from the eccentric and is made to revolve by the friction of the ore fed between the

disks. The inner disk has a gyrating or oscillating motion similar to the crushing head of a gyratory breaker. The ore is fed through the

FIG. 4. CRUSHING ROLLS.

centre of the outer disk and thrown by centrifugal force to where the disks are widest apart; as the disks come closer together, the ore is crushed and the smaller particles discharged or thrown out by centrifugal force.

Crushers. Rolls.—For crushing of ores preliminary to coarse concentration, rolls are generally used. The feed varies in size from 2 inches to about $\frac{1}{2}$ of an inch and the product from 1 inch to about $\frac{1}{10}$ of an inch. There are many types, varying in mechanical details, but the principle on which the ore is crushed is the same with all types. The ore is fed between two revolving steel cylinders and broken by compression. The machine consists of two heavy shafts supported in boxes or bearings. The bearings of one shaft are usually held rigidly in place, and the bearings of the second shaft are movable, for adjustment, and held up to place by heavy car springs; fastened to the shaft is a hub upon which is fastened the crushing surface or shells. The crushing shells vary from 2 to 5 inches in thickness and are easily replaceable when worn.

Pulverizers. Stamp Mills.—Probably the earliest form of machine for pulverizing ores was the gravity stamp. Many improvements have been made in its construction so as to increase its efficiency; the capacity has been greatly increased by increasing the weight of the falling stamp and introducing a solid concrete foundation capped with iron. Only a few years ago stamps weighing from 900 to 1000 pounds were considered heavy, whereas in 1914 stamps on the Rand weighing 2000 pounds were being dropped and in the United States the weight in some of the larger mills had reached about 1400 pounds. The capacity of stamps varies greatly with the character of the ore and size of discharge screen; in the United States the capacity varies from 3 to 10 tons, and in South Africa the capacity reaches 20 tons per stamp. The principle upon which gravity stamps operate is the lifting of the stamp by a cam attached to a cam shaft and allowing it to fall by gravity. The stamp proper consists of a shoe attached to a stem by means of a boss or stamp head; at the upper end of the stamp stem is attached the tappet by means of which the stamp is raised by the cam. The mortar box into which the stamp drops contains shoes upon which the ore is fed by hand, or an automatic feeder operated by mechanism attached to one of the stamps. Water is fed into the mortar box with the ore, and as the stamp drops upon the wet ore the

pulverized ore is splashed through a discharge screen which forms the front of the mortar. As the dies wear, the height of the screen is lowered. Gravity stamps are largely used in gold milling and generally constructed with five stamps to one mortar; this is known as a battery.

Steam stamps are used for crushing the native copper ores of the Lake Superior district and have been developed so as to have enormous capacity as compared with gravity stamps, but the Lake Superior steam stamp has not been successful on gold ores. The Holeman steam stamp, having a capacity about the same as the gravity stamp, has been successfully operated on gold ores in Australia. Small steam stamps, such as the Holeman and Tremain, are sometimes used in connection with the testing of ores from a gold mine preliminary to the installation of a large number of gravity stamps.

FIG. 5. VERTICAL SECTION OF GRAVITY-STAMP MILL FOR CRUSHING GOLD ORE.

Ball Mills.—Before the invention of the tube mill, ball mills were very popular where it was necessary to pulverize ores dry to a required fineness. The mill consists of a revolving cylinder supported by suitable shafting. The interior of the mill contains perforated, spiral-chilled iron plates known as die rings and so arranged that each laps the one following, thereby forming a series of steps. A narrow opening is left between the plates to permit the return of crushed material not fine enough to be discharged through the outside screen. Outside of the die-ring plates are coarse perforated screens to take the wear, and outside of these coarse screens is the fine gauze screen which regulates the size of discharged material. The pulverizing is done by the attrition of steel balls which are added to the mill from time to time as necessary. There are various makes of these machines, such as the Kruppt, Buckner, Gruson, and Janisch.

Tube Mills.—Various metallurgical processes

developed within the past few years require that the size of the tube mill of the ore be reduced below 100 mesh. The rapid development has solved this problem, and to-day it is the standard machine for pulverizing below 100 mesh. It consists of a steel cylinder with heavy cast-iron ends, supported on hollow axial trunnions on which it revolves. The cylinder itself is provided with a suitable lining and is charged with a quantity of flint pebbles or broken quartz rock from the mine. The material to be pulverized, mostly finer than 10 mesh, is charged through one of the hollow trunnions, together with water, mixes with the pebbles and, by the

cently a new discharge has been designed by Chalmers and Williams, resulting in a greatly increased capacity and a granular product suitable for concentration.

Hardinge Conical Mill.—This mill is a modification of the tube mill. It is of recent invention and has found wide application in pulverizing ores where a granular product is desired for concentration. It consists of a short steel cylinder, approximately 10 to 30 inches long and 5 to 8 feet in diameter. The feed end of the cylinder is covered with a heavy, slightly coned cast-iron plate with a hollow axial trunnion for support. Opposite the feed end the cylinder

FIG. 6. TRANSVERSE AND LONGITUDINAL SECTIONS OF BALL MILL FOR FINE GRINDING.

rubbing and pounding action of the pebbles as the cylinder is revolved, is reduced to a fine state of subdivision. The ground pulp is discharged from the cylinder at the opposite end from where the feed enters. The mills as originally designed were approximately 22 feet long by 4 or 5 feet in diameter. These dimensions have gradually changed, and in 1914 the most efficient type appeared to be approximately 14 feet long by 5 or 6 feet in diameter. One plant installed about this time a mill 10 feet long

has attached to it a discharge cone having an angle of about 45°. This discharge cone ends in a hollow trunnion for support. The mill is revolved with a charge of pebbles similar to the tube mill. The ore is continually fed and discharged through the axial hollow trunnions. The effect of the conical discharge is to force the larger pebbles to that portion of the mill having the greater diameter, resulting in a much heavier grinding action on the coarser particles of the feed and less slimes in the discharged pulp.

FIG. 7. TUBE MILL.

and 8 feet in diameter, from which most satisfactory reports were forthcoming. The tendency is to shorten the cylinder and increase the diameter. Many improvements have been made in methods of feeding and discharging. Re-

Edge Runners, or Chile Mills.—Originally designed as a comparatively coarse crushing machine to prepare ores for the arrastra or pulverizer, this machine later was used as a pulverizer, but since the invention of the tube mill it has largely been replaced for this work. In a few mills it is still used as a pulverizer. It consists of two or three heavy vertical rollers revolving in a stationary pan on a horizontal axis and gyrating around a central vertical axis. The pan contains a die ring upon which the rollers gyrate, and screens in the side of the pan through which the ore is discharged. The mills are subdivided into two classes, known as slow-speed and high-speed mills. The rollers used in slow-speed mills are much wider than those used in high-speed mills. These mills are also made when the rollers revolve around a

stationary axis, and the pan containing the die ring is made to revolve.

Huntington Mill.—A pulverizer largely used only a few years ago, but recently replaced by other types of machines. It consists of hori-

FIG. 8. HARDINGE BALL MILL.

zontal rollers differing in this respect from the edge runners, suspended in a pan from a vertical shaft; the vertical shaft is suspended from a horizontal spider, which in turn is connected to a central revolving shaft. The rollers revolve against a die ring in the pan and gyrate around the central vertical shaft. The ore is pulverized between the rollers, which are thrown out by centrifugal force, and the die ring, and discharged through a screen inserted in the side of the pan.

Grinding Pans.—Before the invention of the tube mill and the development of the cyanide process grinding pans were largely used in gold and silver mills for pulverizing and amalgamating. They are still used in Western Australia, but have been almost entirely replaced in America and South Africa by the tube mill. The advantage which the grinding pan has over the

grinding is done. The muller is attached to a revolving vertical shaft by means of a spider and can be raised or lowered. The shaft is revolved by gearing below the pan.

Coffee Mill.—Used for pulverizing ore samples in laboratories, fertilizers, drugs, etc. It consists of a conical head keyed to a vertical revolving shaft, which in turn rests on a movable step so that the head can be raised or lowered, thereby regulating the size of discharge. The upper portion of the head is corrugated. The head revolves in a die consisting of a double cone, the upper portion of which is corrugated. The coarse crushing is done between the corrugated conical surfaces of the head and die, and the pulverizing between the smooth surfaces.

Carr Disintegrator.—Originally invented in England, known in the United States as the Stedman and in Germany as the Brink and Hübner. It is an impact pulverizer for soft or friable material, such as coal. It consists of a nest of revolving cages, made of round bars of iron; adjacent cages revolve in opposite directions. The material, which is fed into the inner cage, is broken, discharged between the bars by centrifugal force, and then receives an impact from the bars of the superimposed cage revolving in the opposite direction; this operation is repeated until the material is finally discharged through the outer cage.

FIG. 10. SYMONS DISK PULVERIZER (VERTICAL SECTION).

Symons Disk Pulverizer.—Although these machines are but recently invented and only three of them were in use in 1913, the success which they have obtained warrants their description. They consist of two revolving disks, set horizontally. The lower disk rests on a sliding wedge which is attached to a vertical shaft revolving in an eccentric. As the eccentric is revolved, the wedge is gyrated, thereby transmitting a circular wave motion to the lower disk, causing a crushing action. Both disks revolve at the same speed. The ore is fed into the hopper, falls between the disks, is thrown out by centrifugal force to where the disks are farthest apart, crushed, and discharged by centrifugal force.

Hammer Pulverizers.—These machines are of the impact type and used for pulverizing soft material, such as coal, bones, drugs, etc. They consist of hinged beater arms revolving at high speed. The beater arms act as hammers thrown out against the material by centrifugal force.

FIG. 9. COFFEE MILL.

tube mill is the possibility of amalgamating during the grinding. It consists of a flat-bottomed pan with a cone in the centre and high vertical sides. In this pan a horizontal muller or circular disk is revolved. The bottom of the pan has a lining, called the die, upon which the

The arms are incased in a suitable hood containing a screen through which the pulverized material is discharged.

Bogardus Eccentric Mill.—For the pulverizing of drugs, fertilizers, bark, oil cake, sugar, etc., the Bogardus eccentric mill, invented in 1832 by James Bogardus, is largely used. It consists of two circular horizontal grinding plates, placed eccentrically with each other so that no two parts come in contact consecutively. The grinding plates may be either smooth or grooved; when grooved, a cutting action takes place upon the material to be crushed.

Buhr Stones, or Gristmills.—Used for pulverizing flour, drugs, etc. It consists of two horizontal stone disks, of which only one revolves. The grinding surfaces of the stones are furrowed, resulting in a grinding and cutting action. The material to be pulverized is fed through the centre of the upper stone, passes between the stones, and is discharged at the circumference. The stones may be a natural quartzose rock, cemented quartz stones, or may be made of emery. See **Flour**.

Woodworth, *Grinding and Lapping Tools, Processes, and Fixtures* (ib., 1907); Darbyshire, *Precision Grinding* (ib., 1907); Colvin and Stanley, *American Machinist Grinding Book* (ib., 1912).

GRINDING SPAR. See **Corundum**.

GRINDLE. One of the many quaint local names, more fully "John A. Grindle," given in the southern Mississippi valley to a strange fish, the mudfish (*Ambloplites calva*), elsewhere described under **Bowfin**.

GRINDLEY, HARRY SANDS (1864—). An American chemist and food specialist, born at Champaign, Ill. He graduated in 1888 from the University of Illinois, where, after gaining the degree of Sc.D. at Harvard (1894), he taught chemistry, becoming professor of general chemistry and director of the chemistry laboratory in 1904 and professor of animal chemistry and chief animal chemist in 1907. He directed investigations of saltpetre in meat in 1907-10, and was a member of the Pellagra Commission of Illinois, and of the University commission for the study of methods relating to human nourishment. He is author of more than 40 bulletins and magazine articles on methods of cooking flesh, on meat preservatives, and on the nutritive value and chemistry of meat.

GRINDSTONE. A flat, circular stone made to revolve upon an axis and used for grinding steel, glass, and other stones, etc. Grindstones are of various degrees of coarseness, according to the purpose for which they are to be used. Grindstones are usually mounted more or less simply, but the large stones employed in cutlery manufacture are turned by machinery at a speed as great as practicable without bursting the stone by the centrifugal force. Grindstones are commonly made of a siliceous sandstone, in which the grains are sharp and there is little cement to bind them together. The surface is thus prevented from wearing smooth. Some of the best grindstones in the United States come from Berea, Ohio, and are obtained from certain layers of the Carboniferous sandstone, or Berea grit. Artificial grindstones of very uniform and perfect texture are made from emery (q.v.); they are much used for work on metal surfaces, dispensing with slow and laborious hand filing.

Emery wheels are made as large as 3 feet in diameter, and so strong that they can be driven at 6000 feet per minute, when they will readily cut tempered steel. Grindstones are now also made of carborundum, which ranks next to the diamond in hardness. These are coming into large use for cutting and polishing precious stones. See **MILLSTONE**; **ABRASIVES**.

GRINDSTONE ISLAND. 1. An islet of Albert Co., New Brunswick, Canada, in Chignecto Bay. It takes its name from its quarries of grindstone, of which large quantities are exported to the United States. 2. One of the Magdalen Islands (q.v.).

GRINGO, grîŋ'gô (Sp., gibberish, possibly a popular variation of *griego*, Greek). A contemptuous term applied to an American or Englishman by Mexicans and South Americans.

GRINGOIRE, grân'gwîr', or GRINGORE, grân'gôr', PIERRE (?1475-1538 or 1539). A French poet and dramatist of the court of Louis XII, born at Caen. As a poet, he began by putting forth moral allegories. He was first to use the stage for contemporaneous political satire. He was a leading member of the theatre company known as *Enfants sans souci*, in Paris, and took a conspicuous part in the production of mysteries. His most noted topical drama, in which King Louis XII himself is said to have taken a hand, is *Le jeu du prince des sots* (1511), directed against Pope Julius II. This and *Le mystère de Saint-Louis* (about 1525) were his most important creations, the former illustrating the full development of the mediæval type of play, with its coarse, farcical morality. Gringoire was distinguished for his dry wit and clever vivacity. He was the most prolific purveyor of farcical dramas for the important festivals of the kingdom. He finally went into the service of the Duke of Lorraine and in his latter days wrote religious or spiritual poetry. His *Burres* were brought out in Paris in 1858-77. Victor Hugo made Gringoire an interesting character in *Notre Dame de Paris*. Banville also made of him a leading figure in a comedy called *Gringoire* (1866). In both cases, however, the authors had little regard for the true character of the poet or the facts in connection with his career. His best-known works are: *Le chasteau de labour* (1499), in which the three allegorical enemies of marriage are named—Need, Care, and Discomfort; *Les folles entrecroisées* (1505); *La chasse du corf des cerfs* (1510), a parody of the Pope's title *seruus servorum*. Consult: Picot, *Gringoire et les comédiens italiens* (Paris, 1878); Badel, *Pierre Gringoire, poète français* (Nancy, 1893); Oulmont, *Étude sur la langue de Pierre Gringore* (Paris, 1911); id., *La Poésie morale, politique et dramatique à la veille de la Renaissance, Pierre Gringore* (ib., 1911).

GRINNELL, grîn-nêl'. A city in Poweshiek Co., Iowa, 55 miles east by north of Des Moines, on the Chicago, Rock Island, and Pacific and the Minneapolis and St. Louis railroads (Map: Iowa, E 3). It has manufactures of gloves, automobiles, washing machines, aeroplanes, liquid soap, leggings, gaiters, and carriages, is the seat of Grinnell College (q.v.), and contains a Carnegie library. Grinnell is governed under the charter of 1882, which provides for a mayor, elected biennially, and a unicameral council. The city owns and operates its water works. Settled in 1854, Grinnell was incorporated in 1865 and in 1882 was chartered as a city of the second class. In that year it suf-

fered from a disastrous cyclone. Pop., 1900, 3860; 1910, 5036.

GRINNELL, HENRY (1799-1874). An American merchant, born in New Bedford, Mass., and educated at the academy in that place. In 1818 he removed to New York, where he began a mercantile career. In 1826 he became a member of the firm of Fish and Grinnell, in which an elder brother was a partner, and in 1828 became head of Grinnell, Minturn & Co., which for over 30 years was one of the most prosperous shipping firms in the country. He retired from active business in 1852, although in later life he was interested in the insurance business. He is best known for his interest in and liberal support of Arctic exploration. Participating in the general anxiety regarding Sir John Franklin and his squadron, and moved by the appeals of Lady Jane Franklin for American assistance, Grinnell furnished the funds for the outfitting of an expedition under officers of the United States navy. Lieut. E. J. De Haven was sent in command, and Elisha Kent Kane served as surgeon. Sailing via Davis Strait, Baffin Bay, and Lancaster Sound, De Haven joined the English searching squadrons at Beechy Island. Sailing up Wellington Channel to lat. 75° 24' N., De Haven discovered hitherto unknown regions, to which he gave the name of Grinnell Land. In 1853, with George Peabody, Grinnell fitted out a second Franklin relief expedition, which, under Dr. Kane (q.v.), discovered Kane Sea and the waterways, as far north as Kennedy Channel, which separate Greenland and Grinnell Land. On the Greenland coast Cape Constitution was reached, lat. 80° 35' N., while the shores of Grinnell Land were traced to Cape Frazer, lat. 79° 43' N. Grinnell also contributed to the Hayes expedition of 1860 and the *Polaris* expedition of Captain Hall in 1871. He was one of the founders and from 1861 to 1864 president of the American Geographical Society.

GRINNELL COLLEGE. An institution of higher learning, founded in 1847, at Grinnell, Iowa. It is coeducational and nonsectarian. It includes a college department and the School of Music. The total number of students in 1914 was 512 in the college and 102 in the School of Music. The faculty numbered 50. The value of the grounds and buildings was about \$545,000, and the total assets were about \$2,000,000. The annual income is about \$130,000. The library contains 50,000 volumes. The president in 1914 was John Hanson Thomas Main, Ph.D.

GRINNELL LAND. A vast region in the Arctic Ocean, known in Europe as Ellesmere Land, situated west of Greenland, from which it is separated by the Kennedy Channel. Its northern part is known as Grant Land, and in the south it is continuous with Ellesmere Land (Map: Arctic Regions, G 6). Its highest point is Mount Arthur (4500 feet). The greater part of the region is covered with ice caps, although the seaward-trending valleys are free from snow in summer and covered with Arctic vegetation. The fauna of the region includes the musk ox, reindeer, wolf, fox, hare, lemming, and ermine. The land was first visited by Dr. I. I. Hayes in 1854 and again in 1861. It was explored by the British expedition under Nares in 1875-76, by Greely in 1882, by Lockwood and Brainard in 1883, and by Peary several times. The glacial-lake system (Lake Hazen), discovered by Greely in 1882, is unique as a habitable region, being in lat. 82°

N. Its snow-free area of 1000 square miles, covered with luxuriant vegetation, affords pasturage for deer and musk oxen. In this region were found remains of the most northerly permanent habitations. Except Greenland, Grinnell Land is the most northerly region of the world. Consult Greely, *Three Years of Arctic Service* (2 vols., New York, 1886), and Sverdrup, *New Land: Four Years in the Arctic Regions* (ib., 1904).

Lieutenant De Haven in 1850 discovered another Grinnell Land, which later proved the northwestern portion of North Devon, and named it after Henry Grinnell (q.v.).

GRIPPE, grip (from gripe, AS., OS. *gripan*, Goth. *greipan*, OHG. *grifan*, Ger. *greifen*, to seize; connected with Lith. *greibti*, to seize). In a wooden ship, a timber bolted to the stem and keel at the place where the two join. A vessel sailing close-hauled gripes when she has a tendency to come up into the wind despite the action of the helm. It is caused by insufficient head sail, too much after sail, or improper trim; if the latter, she is too much down by the head, which may be corrected by shifting ballast from forward aft. A slight tendency to gripe is desirable, as it makes a ship tack easily and surely. Broad bands of plaited rope or canvas used for securing boats at the davits are also called gripes; they pass partly around the boat and have the ends lashed to the rail or strong-back on the davits.

GRIPENBERG, grē'pen-bürg, OSCAR CASIMIROVITCH (1838-). A Russian soldier. He fought in the Crimean War, during the Polish insurrection of 1863, in Turkestan, and as commander of a regiment of Guards in the Russo-Turkish War, rising to be general of infantry. In September, 1904, he received command of the second Manchurian army, organized after the decisive Russian defeat at Liao-Yang. (See RUSSO-JAPANESE WAR.) In January, 1905, with a force estimated at about 80,000 men, he began an attack on the weak Japanese left. He was at first successful, but finally was obliged to retreat with enormous loss. Declaring that he had failed to receive adequate support from General Kuropatkin, he resigned his command a few days after the battle.

GRIPPE, grip (Fr. *la grippe*). An infectious disease characterized by fever, catarrhal affections of the respiratory and digestive systems, and nervous disorders. See INFLUENZA.

GRIQUALAND (grē'kwā-länd) **EAST.** A native territory of the Cape Province, South Africa, bounded northeast by Natal, southeast by Pondoland, south by Tembuland, west by Barkly East, and northwest by Basutoland (Map: Cape of Good Hope, J 8). Area, 7594 square miles. Pop., 1911, 249,038, including 7944 whites. Since 1875 it has been under the jurisdiction of the Cape. Capital, Kokstad, named after Adam Kok, a Griqua chief, who went to the district with 15,000 Griquas, a hybrid race of Dutch and native origin.

GRIQUALAND WEST. A northern district of the Cape Province, South Africa, bounded north and west by Bechuanaland, east by the Orange Free State, and south by the Orange River (Map: Cape of Good Hope, F 7). Area, 15,197 square miles. Pop., 1891, 83,375, including 29,670 whites; 1904, 108,498, including 32,570 whites. Its famous diamond fields were discovered in 1867, when the territory belonged to Waterboer, a native chief. The disturbances

caused by boundary disputes with the Orange Free State and Transvaal Republic resulted in Waterboer's consent to the annexation of Griqualand by Great Britain in 1871. It was incorporated as four of the 77 divisions of Cape Colony on Oct. 1, 1880. The principal towns are Kimberley (capital), De Beers, Griqua Town, Douglas, Belmont, and Barkly.

GRIQUAS, grē'kwāz. Half-caste Dutch-Hottentots of Griqualand East and West, South Africa. Formerly they lived farther south in the Cape Province, but about the middle of the last century they migrated beyond the Orange River under their chiefs Waterboer and Adam Kok. Subsequently the latter, with some followers, moved east to the district now known as Griqualand East. The country of the Western Griquas is a desolate upland 4000 feet in altitude, but contains the richest diamond fields in the world. The Griquas are an interesting example of a racial mixture transplanted to an isolated habitat and thus taking the first step in the formation of a distinct race of mankind.

GRISAR, grē'zār, HARTMANN (1845-). A German Catholic historian, born in Coblenz and educated at Münster and Innsbruck. In 1868 he became a priest and entered the Society of Jesus and in 1871 became professor at Innsbruck. His important works on medieval history and the period immediately after the Middle Ages include: *Galileistudien* (1882); *Geschichte Roms und der Päpste im Mittel-Alter* (1900; Italian, 1899-1907; French, 1906; English, 1911-12); *Das Mittel-Alter einst und jetzt* (1902; 3d ed., 1903); and *Luther* (1911-12; in English, 1913), which roused Protestant biographers to reply.

GRISCOM, CLEMENT AOTON (1841-1912). An American financier, born in Philadelphia. He received an academic education, became clerk in 1857 and partner in 1863 in the firm of Peter Wright and Sons, shipping merchants, a connection in which he began his pioneer work in the exporting of petroleum. In 1871 he started the operation of the American line of steamships, at that time the only line carrying the American flag; later he organized and was supervisor and general manager of the International Navigation Company; and with J. Pierpont Morgan he organized in 1902 the International Mercantile Marine Company, of which he was president until his retirement in 1904, and chairman of the board of directors until 1908. He also held directorates in the Pennsylvania Railroad Company, the United States Steel Corporation, and other companies. He was a president of the American Society of Naval Architects.

GRISCOM, JOHN (1774-1852). An American educator. He was born at Hancock's Bridge, Salem Co., N. J., was educated at the Friends' Academy, Philadelphia, and for 13 years was principal of a Friends' school in the same city. Then for 35 years he taught in New York City, where he projected and, in 1825-31, supervised the New York High School. He was also one of the founders and the secretary of the Society for the Prevention of Pauperism. He helped to establish the medical department of Rutgers College, where in 1812-28 he was professor of chemistry and natural philosophy. He made a tour in Europe to inspect institutions of charity, reform, and education, and published his observations in *A Year in Europe* (1823), one of the most influential educational works of the first half of the nineteenth century. On his return

he became a propagandist of Pestalozzi's doctrines. He also wrote *Monitorial Instruction* (1825). Consult a *Memoir* of Dr. Griscom by his son (New York, 1859), and W. S. Monroe, *History of the Pestalozzian Movement in the United States* (Syracuse, 1907).

GRISCOM, LLOYD CARPENTER (1872-). An American diplomat, born at Riverton, N. J. He graduated in 1891 from the University of Pennsylvania and studied law there and at the New York Law School. In 1893-94 he was in England as secretary to Ambassador Bayard; in 1897 he was deputy district attorney of New York; and during the Spanish-American War he served as captain and assistant quartermaster. After a short period as Secretary of Legation and chargé d'affaires at Constantinople, he became Minister to Persia in 1901. He held the corresponding post in Japan (1902-06) and was Ambassador to Brazil (1906-07) and to Italy (1907-09). In 1911 he became a member of the law firm of Beckman, Menken, and Griscom, New York City, and was thereafter active in local Republican politics. He contributed numerous articles to the Philadelphia *Sunday Press* on travel in Central America.

GRISDALE, JOHN (1845-). A Canadian Anglican bishop. Born in Bolton, England, educated at the Church Missionary College, Islington, and ordained a priest of the Church of England in 1872, he went to India and for a short time was a master in St. John's College, Agra, and also assistant minister in the Old Church, Calcutta. On his return to England he became curate of Broomfield; but, removing to Manitoba in 1873, he was thereafter incumbent in Winnipeg of St. Andrew's, Holy Trinity, and Christ churches until 1882; also professor of systematic theology in St. John's College and canon of St. John's Cathedral; in 1882-96 dean of Rupert's Land and professor of pastoral theology in St. John's College; and after 1896 Bishop of Qu'Appelle. In 1895 he was a delegate to the General Convention of the Protestant Episcopal church of the United States; in 1897, to the Lambeth Conference, London; in 1908, to the Pan-Anglican Congress, London. He became a councillor and an examiner in Manitoba University and a senator of the University of Saskatchewan. In 1906 he was an unsuccessful candidate for the bishopric of Rupert's Land.

GRISEBACH, grē'ze-bāg, AUGUST HEINRICH RUDOLF (1814-79). A German traveler and botanist, born at Hanover, and educated at Göttingen and Berlin. He was appointed extraordinary professor at Göttingen in 1841, regular professor in 1847, and in 1875 director of the botanical garden. Several of his works are devoted to discussions of the flora of the West Indies and of the American tropics. They include: *Spicilegium Florae Rumelicae* (2 vols., 1843-45); *Die Vegetationslinien des nordwestlichen Deutschlands* (1847); *Systematische Untersuchungen über die Vegetation der Karaiiden* (1857); *Flora of the British West Indian Islands* (1859-64); *Die Vegetation der Erde nach ihrer klimatischen Anordnung* (2d ed., 1884).

GRISEBACH, EDUARD (1845-1906). A German diplomat and author, son of the preceding. He was born and educated at Göttingen and was Vice Consul in the German diplomatic service at Smyrna, Bucharest, St. Petersburg, Milan, and Port-au-Prince, Haiti. He first attracted attention by his works *Der neue Tann-*

Lauser (20th ed., 1901), a series of loosely connected poems, and *Tannhäuser in Rom* (7th ed., 1890), a novel in verse, published anonymously. His other works include: *Die deutsche Literatur seit 1770* (4th ed., 1886); *Die tielulose Wittere*, in which the author traces the travels of a Chinese fable through the literature of the world (5th ed., 1886); *Das loethische Zeitalter der deutschen Dichtung* (1891); *Kin-Ku-Ki-Kuan: Neue und alte Novellen der chinesischen Tausendundeine Nacht* (1880); *Chinesische Novellen* (1884). His editions of Bürger and Lichtenberg and his text revisions of Schopenhauer's works, including many posthumous manuscripts of the great philosopher, are important.

GRISELDA, grî-zêl'da, or **GRISELDIS**, grî-zêl'dis. The heroine of one of the most popular mediæval legends, which probably arose in Italy. A poor girl, a shepherdess, by her beauty and virtues wins the love of the Marquis of Saluzzo, who marries her and then puts her humility and obedience to the severest tests, from which she emerges triumphant. The story (said to be founded on fact) is first told in Boccaccio's *Decameron* (the Tenth Novel of the Tenth Day). Petrarch translated Boccaccio's version into Latin in 1373, under the title *De Obedientia et Fide Uxoris*; and in the fourteenth century the story was well known throughout Europe. In the year 1393 it was in Paris elaborated into a "mystery" play, *Le mystère de Griselidis, Marquise de Saluces*, of the original edition of which there remains but one copy, that of the Bibliothèque Nationale, Paris. To about the same time belong several French prose versions, such as *Le meunier de Paris*. In England the story was told by Chaucer in his *Clerke's Tale*, in the version given by Petrarch; there is a reference to *Patient Griselda* by Lydgate in his *Temple of Glass*; there are indications of ballads and stories about *Pacyent Gressell* during the sixteenth century, and some ballads of a later date, still preserved, also deal with the subject, e.g., *Lord Thomas and Fair Anne*; and finally there is the play, *The Pleasant Comedie of Patient Grissill* (1599), of which Thomas Dekker was one of the collaborators. Hans Sachs's *Geduldige und gehorsame Griselda* appeared in Germany in 1546. In 1601 Perrault inserted the tale in the *Contes de ma mère Poye*. Versions of the story are also found in the literatures of Holland, Bohemia, Sweden, Iceland, etc. *Markgraf Walther* has lately been reproduced in Schwab's *Buch der schönsten Geschichten und Sagen*. Consult: Wistenholz, *Die Griseldissage in der Literaturgeschichte* (Heidelberg, 1888); Chaucer Society, *Originals and Analogues of Chaucer*, part ii (London, 1875); Child, *English and Scottish Ballads*, vol. iv (Boston, 1882); Warton, *History of English Poetry*, ed by Hazlitt, vol. iv (London, 1870); *The History of Patient Grisel*, 1619, ed. by Wheatley (ib., 1885); Leroux de Linay, introduction to *La bibliothèque bleue* (Paris, 1847); Widmann, *Griselidis in der deutschen Literatur des XIX. Jahrhunderts* (Tübingen, 1905); Schuster, *Griselidis in der französischen Literatur* (ib., 1900), which contains a bibliography; and the forthcoming catalogue of Petrarch collection at Cornell (ed. by Fowler).

GRISSETTE, grê-zê't' (Fr.). A sort of woolen cloth, so called from its gray color, frequently worn by the French women of the lower class. Hence the name is applied to young women employed as shop girls, sewing girls, chamber-maids, etc. It is also used in a more special

sense by foreigners to designate young women of this class in Paris of doubtful character.

GRISI, grê-zê, GIULLA (1811-69). A famous Italian dramatic soprano. She was born in Milan and was a pupil of Giacomelli, Madame Pasta, and Mariani. She was one of the greatest singers of the nineteenth century and was at the height of her fame during the period of 1834-49, when she was the unquestioned prima donna of the Parisian and London operatic stage. In 1836 she married Count Meley, from whom she was afterward divorced, later marrying her principal operatic support, Mario, the famous tenor, with whom she made a tour of the United States in 1854. She died in Berlin.

GRIS-NEZ, grê-nâ', CAPE. A headland of France, in the Department of Pas-de-Calais, extending into the Strait of Dover, and 21 miles southeast of Dover, England (Map: France, N. G 2). Cape Gris-nez is about equidistant from Calais on the northeast and Boulogne on the south. It has a lighthouse.

GRISON, grî'son (Fr., gray), or **HURON**. A large, plantigrade, mustelinc mammal (*Galictis*, or *Grison*, *citata*) of South and Central America, weasel-like in form, and about 2 feet long without the tail, which is about a foot long. Its coloration is peculiar in that it is light above and dark below—coal black, except on the top of the head, back, and tail, where the hair is long and gray. The sharp contrast between the gray crown and the black face gives the animal a singular and rather vicious aspect. It is savage in disposition and when irritated gives a barking squeal and emits a pungent odor more disgusting than that of a skunk. It lives in hollow trees, clefts in rocks, and holes in the ground, and frequents plantations and the neighborhood of buildings. A larger and less common, but otherwise similar, species is *Allemand's grison* (*Galictis*, or *Grison*, *allemandi*). Cf. **TAYEA**.

GRISONS, grê-zôn' (Ger. *Graubünden*, It. *Grigioni*, Romansh *Grischuns*). The largest, the most easterly, and the most thinly inhabited of the cantons of Switzerland. It is bounded on the north by the cantons of Glarus and Saint-Gall, and by Liechtenstein and Vorarlberg; on the east by Tirol; on the south by Lombardy; and on the west by the cantons of Ticino and Uri (Map: Switzerland, D 2). Its area is 2746.5 square miles (7113.5 square kilometers). The surface of the canton is broken by mountains. The Glarner Alps border on the northwest, and the Bernina on the southeast. The Lepontine Alps enter from the west, the Adula group being in the southwestern part of the canton. In the east is the Rhaetian Range. There are two large valley districts, of which the first and most important lies along the course of the Hither Rhine and occupies the northwestern portion of the canton; and the second, that of the Inn, forming the Engadine (q.v.), extends through the southeastern and eastern parts. In the southern or southeastern sections are the valleys belonging to the basins of the Ticino, Adda, and Adige. Waters rising in the canton find their way ultimately to the North, Adriatic, and Black seas. The lakes are small, the largest being the Silsersee of only 4 square kilometers. The climate is quite varied. In some districts winter reigns for nearly eight months, while the climate in the southern valleys is like that of the northern border of Italy. The upper valleys, particularly the Enga-

dine and Davos, attract invalids from all the civilized world. Among the many famous "air-cure" resorts are Davos-Platz and Saint-Moritz. The village of Juf (6998 feet) is the highest permanently inhabited village in the Alps.

Of the total area of 7113.5 square kilometers, 60.5 per cent, or 4941.7 square kilometers, is reported as productive, and 30.5 per cent, or 2171.8 square kilometers, as unproductive. Of the productive area, 3545.2 square kilometers were agricultural, grazing, etc., 1393.1 in forest, and 3.3 under the vine; of the unproductive area, 11.9 square kilometers comprised lakes of over 10 hectares. In the colder districts crops of barley and rye are raised with difficulty. In the southern valleys, however, wheat, corn, the vine, and almonds are successfully cultivated. The pastures and forests are the chief sources of wealth; in 1911 cattle numbered 78,499. Cattle, skins, timber, and cheese are the principal exports. The rivers abound in salmon and trout, and in the mountains are deer, chamois, bears, and other game. The mineral deposits are nearly exhausted. Rare varieties of marble are quarried, and there are numerous mineral springs. The manufacturing industries are unimportant and are confined chiefly to the production of cotton goods, leather, and beer. The railway mileage is small, but there are many good roads in every part of the canton. The legislative power is in the hands of the *Grosser Rat* (Great Council), consisting of members elected at the rate of one for every 1300 inhabitants. The executive power is vested in a council of five elected members. The obligatory and the facultative referendum and the initiative are in force. The existing constitution of the Grisons was adopted in 1892 and became operative Jan. 1, 1894. There are 14 administrative districts, which are subdivided into 39 circles, and these into 224 communes. The cantonal finances are on a safe and self-adjusting basis, owing to the rather unique fact that the land tax must each year cover any deficit. The de facto population has been as follows: 1850, 89,895; 1870, 91,782; 1888, 96,235; 1900, 105,065; 1910 (census of December 1), 119,698. The legal, or resident, population in 1910 was 117,710. The number of persons returned in 1910 as Protestant was 61,087; Roman Catholic, 57,552. The population having German as the mother tongue numbered 58,465; Romansh (including Ladin), 37,147 (the total for Switzerland was 39,834); Italian, 20,963; French, 838. Emigration is small (152 in 1912). Births (including stillbirths), in 1911, 3014; deaths (excluding stillbirths), 2064; stillbirths, 76. Primary schools, in 1910, 275, with 523 teachers (of whom 467 male) and 15,479 pupils; secondary schools, 44, with 53 teachers (of whom 52 male) and 1190 students. There are no large towns. The Commune of Chur (Coire), the capital and chief town, had in 1910 a population of 14,814; Davos, 11,744; Saint-Moritz, 3310.

The canton constituted a part of the ancient Rætia, which was subdued by the Romans in the reign of Augustus. From the Goths, who overran the country about 400 A.D., it passed into the power of the Frankish kings, and by the Treaty of Verdun (843) was included in the portion of Louis the German, forming a part of the Duchy of Alemannia. During the early Middle Ages the peasantry suffered cruelly from the oppression of their feudal nobles, whose perpetual strife often brought devastation upon

the country. With the rise of free towns some attempt was made to check the feudal anarchy by associations of burghers, acting in alliance with the great ecclesiastical lords, chief of whom was the Bishop of Chur, or Coire. In 1367 the cathedral chapter of Coire and the inhabitants of the diocese formed the *Gotteshausbund*, to check the Bishop and to maintain the independence of the bishopric against the Hapsburgs, to whom the Bishop had sworn allegiance; the latter was soon forced to join the *Bund*. In 1395 the *Oberbund* (also called the *Grauer Bund*) was organized in the upper Rhine valley. A third league, the *Zehngerichtenbund* (League of the Ten Jurisdictions), was formed in 1436, out of the possessions of the house of Toggenburg, whose last representative had just died. In the latter half of the fifteenth century these leagues formed a loose federal union, and between 1497 and 1507 all three had entered into alliance with the Swiss Confederation. In 1512 the inhabitants of Grisons succeeded in conquering Bormio, Chiavenna, and the Valtellina, in north Italy. The Reformation early made its way into Grisons. The bulk of the inhabitants included in the Gray League, however, adhered to the Roman Catholic church, and religious strifes long distracted the region. The claims of Austria to Prättigau and the lower Engadine were bought off in 1649-52. From that time to the end nearly of the eighteenth century the history of the country is one of petty strife between factions. In 1797 its Italian possessions were annexed to the Cisalpine Republic, and during the next two years it was the battlefield of the Russians, the Austrians, and the French. In 1803 it was constituted by Napoleon a member of the Swiss Confederation. Its history during the nineteenth century was principally one of constitutional reform, marked by progress in the direction of a closely centralized form of government.

Consult: Planta, *Geschichte von Graubünden* (Bern, 1892); Plattner, *Die Entstehung des Freistaates der Dreibünde* (Davos, 1895); Heierli, *Urgeschichte Graubündens mit Anschluss der Romerzeit* (Zurich, 1903).

GRISTMILL. See FLOUR.

GRISWOLD, griz'wold. A town in New London Co., Conn., 10 miles northeast of Norwich, on the New York, New Haven, and Hartford Railroad (Map: Connecticut, II 3). It is in an agricultural and dairying region. Pop., 1900, 3490; 1910, 4233.

GRISWOLD, griz'wold, ALEXANDER VIETS (1766-1843). An American Protestant Episcopal bishop, born in Simsbury, Conn. He at first studied law; but in 1795 he was ordained to the ministry, and began preaching in three different towns, besides teaching school. In 1804 he became rector of St. Michael's Church, Bristol, R. I., and in 1811 was consecrated first Bishop of the Eastern Diocese, in which were included the States of Maine, Vermont, New Hampshire, Massachusetts, and Rhode Island. In 1830 he left St. Michael's to accept the rectorship of St. Peter's in Salem, as being more central for his Episcopal labors. His last public act was the consecration of his successor, Dr. Manton Eastburn. He published many sermons and *The Reformation and the Apostolic Office* (1843). Consult Stone, *Life of Bishop Griswold* (Philadelphia, 1844).

GRISWOLD, JOHN AUGUSTUS (1822-72). An American manufacturer and politician. He

was born in Nassau, Rensselaer Co., N. Y., and when 17 years old went to Troy, where he entered the hardware business. After engaging for a number of years in the wholesale and retail drug trade, he became a partner in the Rensselaer Iron Company and was very successful. In March, 1875, he consolidated his works with the Albany Iron Works, to form the Albany and Rensselaer Iron and Steel Company. He was associated with C. H. Delamater in building the *Monitor*, which defeated the *Merrimac* in Hampton Roads, and in conjunction with two other citizens of Troy introduced the manufacture of Bessemer steel into the United States. Griswold was elected mayor of Troy in 1855. Upon the outbreak of the Civil War he aided in raising a number of infantry and cavalry regiments, one of which, the Griswold Light Cavalry, took his name. He was elected to Congress by the Democrats in 1863, but soon after changed his political creed and was twice re-elected by the Republicans. In the House he supported the war measures of the government. He was nominated for Governor of New York in 1868, but was defeated by the Democratic candidate, John T. Hoffman.

GRISWOLD, MATTHEW (1714-99). An American jurist. He was born at Lyme, New London Co., Conn., the son of John Griswold, one of the wealthiest men in New England. He was admitted to the bar in 1743. In 1751 he was elected to the General Assembly, and in 1759 was chosen a member of the Governor's Council, in which he appeared as a champion of the rights of the colonies, and opposed the Stamp Act. He was appointed to the bench of the Supreme Court of Connecticut in 1766, became Chief Justice in 1769, and served until his election as Governor in 1784. He was Deputy Governor from 1771 to 1784 and was chairman of the Connecticut Committee of Safety in 1775. As Governor from 1784 to 1786 he did what he could to foster the national spirit in Connecticut, and was president of the convention that ratified the Constitution of the United States in January, 1788.

GRISWOLD, PUTNAM (1875-1914). An American singer (bass), born in Minneapolis, Minn. Originally he followed a business career. At the age of 22 he discovered his voice and began to study with a local teacher in California. In 1900 he went to London, where he was for two years a pupil of A. Randegger at the Royal College of Music. During the winter of 1902-03 he studied under Bouhy at Paris, the next winter under Stockhausen at Frankfurt; and finally he completed his studies with Emeric at Berlin in 1905. His operatic debut took place at Covent Garden, London, in 1901. During the summer of 1904 he sang at the Royal Opera in Berlin. After having sung the rôle of Gurnemanz in Savage's production of *Parsifal* in America (1904-05), he became in 1906 a regular member of the Berlin Opera. There he remained, appearing also as "guest" in various German cities, until he came to the Metropolitan Opera House in 1911, where through his wonderful interpretation of Wagner's heroes he immediately won public and critics. His sudden death on Feb. 26, 1914—due to an attack of appendicitis—came as a shock to his numerous admirers. He was the first American bass to sing the great Wagner rôles at the Metropolitan, and is to be compared with the most distinguished of his foreign predecessors. He had been a prime favorite in Berlin, where the

critics had praised him as the greatest foreign interpreter of Wotan. He was twice decorated by Emperor William.

GRISWOLD, ROGER (1762-1812). An American politician, born at Lyme, Conn., the son of Matthew Griswold. He graduated at Yale College in 1780, and was admitted to the bar in 1783. He was a member of Congress from 1795 to 1805. In 1801 President Adams appointed him Secretary of War; but he declined the office, and was appointed judge of the Supreme Court of Connecticut in 1807, a position which he held until elected Lieutenant Governor in 1809. At the expiration of his term in 1811 he was elected Governor, and served until his death, in 1812.

GRISWOLD, RUFUS WILMOT (1815-57). An American critic and compiler, born at Benson, Vt. By serving an apprenticeship to a newspaper publisher, he acquired practical knowledge of printing and editing. Wearying of this work, he studied theology and preached acceptably as a Baptist minister, but finally turned to editing and compiling. He was associated from 1841 till his death with various magazines and journals, beginning with *Graham's* in Philadelphia. Besides his editorial work he compiled the once very popular and still useful *Poets and Poetry of America* (1842); *Poets and Poetry of England in the Nineteenth Century* (1845); *Prose Writers of America* (1846); *Female Poets of America* (1848); *Sacred Poets of England and America* (1849). Numerous other works, written singly or in collaboration, are now practically forgotten. He edited the first American edition of *Milton's Prose*, and as literary executor of Poe superintended the first edition of that poet's works (1850), to which he contributed a *Memoir* that was a subject of much controversy. Griswold was industrious and well meaning, but not discriminating in his criticism. Still he did important work in encouraging young writers and stimulating interest in American literature; and his correspondence, published by his son, W. M. Griswold (Cambridge, Mass., 1898), is of great value.

GRISWOLDVILLE, griz'wold-vil. A village in Jones Co., Ga., 10 miles east by north of Macon, on the Central of Georgia Railroad (Map: Georgia, C 3). On Nov. 22, 1864, it was the scene of a stubborn engagement between a brigade of Sherman's army under General Walcott and a division of the Georgia Confederate militia under General Phillips. The latter attacked and retired after several hours of fighting. The Federals lost 84 in killed, wounded, and missing, General Walcott being among the wounded. The Confederates lost 600. Pop., about 100.

GRIT. See SANDSTONE.

GRIV'ET (from Fr. *gris*, gray + *ve-r-t*, green). A small monkey (*Cercopithecus*, or *Lasiopyga, griseoviridis*), one of the guenons inhabiting northeastern Africa. It is olive green in color on the back, while the face and underparts are white, and the root of the tail is gray. A broad white band on the forehead distinguishes it from the vervet. These monkeys go about in small bands, are not numerous, and are docile, good-tempered, and intelligent in captivity. See GREEN MONKEY.

GRIZ'ZLY BEAR. See BEAR.

GROAT (Dutch *groot*, great). A name given in the Middle Ages to all thick coins, as distinguished from the "bracteates" (Lat. *bractea*, a

thin plate or leaf), or thin coins of silver or gold leaf stamped so as to be hollow on one side and raised on the other. Groats differed greatly in value at different times and in different countries. The silver groat once current in England (introduced by Henry III) was equal to fourpence. The coin, though not the name, was revived in the modern fourpenny piece. Groschen were until lately current in Germany. The silver groschen, or *neu-groschen*, of Prussia and the Zollverein, was $\frac{3}{4}$ of a thaler, and was worth two cents, American; the *guler groschen* of Hanover was $\frac{3}{4}$ of a thaler, and was worth three cents, American.

GROAT'S-WORTH OF WIT, A. BOUGHT WITH A MILLION OF REPENTANCE. A tract by Robert Greene (q.v.) discovered after his death, together with a pathetic letter to his wife. It was licensed in 1592, but apparently not published until 1596. The story is in part autobiographical, and contains an allusion to Shakespeare as "an upstart crow."

GRÖBEN, grē'ben, OTTO FRIEDRICH VON DER (1657-1728). A German traveler, born at Pretten, Prussia. In 1675 he went to Italy and Malta and finally to the Orient, where he traveled for many years. In 1682 he was sent by Frederick William of Brandenburg to the western coast of Africa, where, in the following year, he founded Fort Grossfriedrichsburg, named in honor of the Great Elector, on the coast of Guinea. An account of his tours is published in his work entitled *Orientalische Reisebeschreibung des brandenburgischen adelichen Pilgers, nebst der brandenburgischen Schifffahrt nach Guinea und der Verrichtung zu Morca* (1694), the last-mentioned reference bearing upon the author's subsequent experiences in the wars of Poland and Venice against the Turks, during which he was a major general in the Polish service (1686-87). He was known also as a poet. He wrote an account of his travels in Palestine, in verse, in a work entitled *A History of the life and Ione of Bergounen and the Virtuous Areta* (Dantzic, 1700).

GRÖBER, grē'ber, GUSTAV (1844-1911). A German scholar in Romance literature and linguistics. He was born in Leipzig, and was educated there. He was docent and assistant professor at Zurich (1871-74), then became professor at Breslau, and in 1880 went to the University of Strassburg. In 1877 he became editor of the *Zeitschrift für romanische Philologie*, and in 1888 began the publication, as editor in chief, of the *Grundriss der romanischen Philologie* (2d ed., vol. i, Strassburg, 1904-06), to which he contributed articles on Latin literature during the Middle Ages, and on the history of Romance philology. Gröber's other works include: *Die handschriftlichen Gestaltungen der Chanson de geste von Pierabras* (1869); *Die altfranzösischen Romanzen und Pastourelles* (Zurich, 1872); *Carmina Clericorum* (7th ed., 1890); *Zur Volkskunde aus Concilbeschüssen und Kapitularien* (1894); *Abriß der lateinischen Literatur des Mittelalters* (1893); and *Abriß der französischen Literatur des Mittelalters* (1897). In 1899 a *Festgabe*, composed of contributions of pupils and friends, was presented to him, bearing the title *Beiträge zur romanischen Philologie*.

GROCYN, grō'sin, WILLIAM (?1446-1519). An English Hellenist, supposed to have been the first publicly to teach Greek at Oxford. He

was born at Colerne, Wiltshire, and, after studying at Oxford, visited Italy to pursue under Poliziano (q.v.) and Chalcondylas (q.v.) the study of Greek, at that time little cultivated in England. He received his appointment at Oxford about 1492. Grocyn was the friend of Linaere, More, William Latimer, Colet, and of Erasmus, who speaks of him as his *patronus et praeceptor*. With the exception of an epigram on a lady who threw a snowball at him, and his Latin letter to Aldus Manutius, which is prefixed to Linaere's *Proeli Sphæra* (Venice, 1499), no writings by Grocyn are known. Consult Burrows, in *Collectanea*, vol. ii (Oxford, 1890).

GRODEK, grō'dëk. A town of the Austrian Crownland of Galicia, situated on a lake about 20 miles southwest of Lemberg (Map: Austria-Hungary, II 2). Its chief industry is the cultivation of flax and tanning hides, and there is trade in grain and flour. Pop. (town), 1890, 10,742; 1900, 11,845; (district), 1900, 71,482; 1910, 79,592. In the European War of 1914 this town was taken by the Russians during the Galician campaign. See WAR IN EUROPE.

GRODNO. A government in the western part of European Russia, formerly a portion of Lithuania, bounded on the north by the Government of Vilna, on the east by that of Minsk, on the south by Volhynia, and on the west by Poland (Map: Russia, B 4). Area, 14,896 square miles. The land is in general flat, and belongs in the southwest to the basin of the Bug, a tributary of the Vistula, in the north to that of the Niemen, and in the southeast to that of the Dnieper. The extensive morasses in the south have been partly converted into pasture ground by draining; in the north are extensive pine forests. There are still many peat bogs. The soil is light and sandy, and in general fruitful. Over 2,000,000 acres can be cultivated. Rye is the principal agricultural product. Barley, oats, beans, wheat, tobacco, and potatoes are also extensively raised. Horses, cattle, and sheep are exported. The chief branches of industry comprise manufactures of woollen goods, silk, leather, tobacco, flour, and bricks. Pop., 1897, 1,616,630; 1911, 1,997,600. Capital, Grodno (q.v.).

In the eleventh century the Great Russians began to settle in this region, then a marshy plain covered with impenetrable forests, and inhabited by the semisavage Yatviags. In the thirteenth century it became part of Lithuania; in the sixteenth century it was incorporated with Poland, and in the partition of that kingdom was annexed by Russia.

GRODNO. An episcopal city of Russia and the capital of the government of the same name, situated on the Niemen, 160 miles northeast of Warsaw, and 540 miles southwest of St. Petersburg (Map: Russia, B 4). It is divided by the river into two parts; the northern or city proper contains the extensive and handsome palace erected by Augustus II, and is connected with the southern part by an iron bridge. The city is poorly built; it contains among a number of ancient buildings the Bernardine Monastery, erected in 1494, and the parish church, built in seventeenth-century baroque style. The chief articles of trade are grain and timber, the latter being rafted down the Niemen. The principal industries include the manufacture of pottery, tobacco, vehicles, arms, paper boxes, soap, tallow candles, and machinery. It is the seat of the Second Army Corps. Pop., 1886, 39,900; 1901, 41,736; 1911, 66,507, two-thirds Jews.

During the last century of Polish rule Grodno was often the seat of the Diet. It was at Grodno that the second partition of Poland was agreed upon in 1793. The town passed to Russia in 1795. It was occupied by the French in 1812.

GROEN VAN PRINSTERER, grōon vān prin'stēr-ēr, GUILLAUME (1801-76). A Dutch statesman and historian, born at Voorburg. He studied law and letters at Leyden, and took a degree in each course, with dissertations *De Juris Justiniani Præstantia* and *De Prosopographia Platonica* (both, 1823). His earliest historical work, *Verspreide geschriften*, appeared in 1826. Three years afterward he was appointed private secretary to William I, but resigned in 1833 to devote himself more closely to his duties as editor of *Nederlandsche Gedachten* and to historical study. He published at this period *Archives, ou correspondance inédite de la Maison d'Orange-Nassau* (1835-47; continued, 1857-61), and a *Handboek der geschiedenis van het Vaderland* (1841-46). In 1840 he wrote *Bijdrage tot de herziening der grondwet in nederlandschen zin*. He was elected to the House of Deputies in the same year, and was again chosen deputy in 1849, keeping his seat almost continuously until 1865. His works, besides those mentioned, include: *Ongeloof en revolutie* (2d ed., 1868); *De Nederlander* (1850-55); *La Prusse et les Pays-Bas* (1867); and the historical memoir *Maurice et Barnevelt* (1875). Consult Stuart, *In Memoriam: notice biographique* (Utrecht, 1876), and Vos, *Groen van Prinsterer en zijn tijd* (2 vols., Dordrecht, 1886-91).

GROESBECK, grōos'bēk, WILLIAM SLOCOMB (1815-97). An American politician, born in New York City. He graduated at Miami University, Oxford, Ohio, in 1835, and opened a law office in Cincinnati. He was a member of the State Constitutional Convention in 1851, and the next year was appointed a member of the commission to codify the laws of Ohio. He represented his district as a Democrat in Congress from 1857 to 1859; was a member of the Peace Congress in 1861, a delegate to the Union National Convention in Philadelphia in 1866, and one of the counsel for President Johnson during the impeachment trial in 1868, after the retirement of Jeremiah S. Black from the case. In 1872 he was nominated for President by the Liberal Republicans. He received one electoral vote for Vice President. In 1878 he was appointed United States delegate to the International Monetary Congress at Paris.

GROETE. See GROOTE.

GRO'GAN, EWART SCOTT (1874-). A British military officer, scientist, and traveler, born at Winchester and educated at Jesus College, Cambridge. He made trips of exploration in Africa, Australasia, America, and the South Pacific, in 1895-97 was in South Africa and fought against the Matabele, and in 1898-1900, with Arthur Sharp, crossed Africa from south to north by way of the great central lakes and the Nile, a notable achievement, described by the two travelers in *From the Cape to Cairo* (1900). Later he became captain of the Fourth Royal Munster Fusiliers. He wrote also *The Economic Calculus and its Application to Tariff* (1909).

GROINED VAULTING (from *groin*, earlier *grine*, variant of *grain*, from Icel. *grein*, branch of a tree). In architecture, that vaulting in which two barrel vaults intersect each other at

right angles; the arris or salient edge formed at the lines of intersection is called the groin. When the vaults are of equal span and semi-circular section, the groins describe semiellipses; but the intersecting vaults may be of various sections and relative spans. Groined vaulting may be carried on isolated piers or columns, and be thus employed to cover any desired area. It was first so employed by the ancient Romans; in their *thermæ* it appears on a colossal scale. It was used in various forms by the Byzantines, building with brick, and by the Romanesque architects, building in stone; they made it the distinctive feature of their church architecture, and introduced the practice (found in germ, however, in both Roman and Byzantine vaults) of building intersecting groin ribs along the lines of the groins, which with other ribs supported the fillings between them. The Gothic architects, using the pointed arch, further perfected the ribbed groined vault. See VAULTING.

GROLIER (grō'lyā') CLUB. A celebrated society of bibliophiles, founded in New York City in January, 1884. The club is named after Jean Grolier de Servières, Viscount d'Aguisay, Treasurer General of France, whose library was famous. The objects of the club are literary study and the promotion of the arts of typesetting, printing, and binding. The founders of the club, who have also been largely instrumental in its success, were William L. Andrews, Theodore L. De Vinne, A. W. Drake, Albert Gallup, Robert Hoe, Brayton Ives, Samuel W. Martin, E. S. Mead, and Arthur B. Turnure. A clubhouse is maintained in New York, and contains an excellent bibliographical library, a lecture and reading room, and many valuable pictures and prints. By exhibitions, lectures, and the issue of specially prepared books, perfection in the art of bookmaking is encouraged. The club has issued 60 publications since its formation, several having been bronze medallion plaques of Hawthorne, Lowell, Whittier, Poe, and Longfellow, and two etchings, "Grolier in the Printing House of Aldus" and a portrait of Franklin; among the books, an edition of the *Philobiblion* of Richard du Bury, and *Catalogues of Early and Original Editions from Langland to Wither*; *Bookbinding as a Fine Art*, by Robert Hoe; *Modern Book Binding*, by William Matthews; and *Historic Printing Types*, by T. L. De Vinne. An original, otherwise unpublished work is *Washington Irving*, by George William Curtis, a member of the club. Other original works written by members of the club and published by the club are *The Boston Post Bill*, by R. T. H. Halsey; *American Engravers upon Copper and Steel*, by David McN. Stauffer; *Notable Printers of Italy during the Fifteenth Century*, by Theodore L. De Vinne; *Basilieogia a Booke of Kings*, by H. C. Levis, and *Bibliographical Notes on One Hundred Books Famous in English Literature*, compiled by Henry W. Kent. The club's literal reprint in the types of Wynkin de Norde of *The History of Helyas Knight of the Swan*, from the unique copy in the library of the late Robert Hoe; *Researches Concerning Jean Grolier*, by reason of its colored reproduction of bindings; *The Scarlet Letter*, by reason of its colored reproduction, by a new process, of water colors by Boughton, and *The Etched Works of Whistler*, by reason of its completeness, represent the utmost possibilities of bookmaking in their several spheres. See Plate of BOOKPLATES.

GROLIER DE SERVIÈRES, grō'lyā' de

sâr'vyâr', JEAN, VISCOUNT D'AGUISY (1470-1505). A French bibliophile, born in Lyons in 1470. He was the royal French representative in Italy for some time, mostly at Rome and Milan, where he cultivated his taste as a book lover. He was made Treasurer of Francis I in 1537, and was a noted collector of books valuable or curious for subject, material, workmanship, or binding. He was a master of the art of elegant bookbinding, and his volumes are highly prized by bibliophiles. They were usually in brown leather and in Renaissance patterns, with stripes and plant arabesques. His library, which numbered finally about 3000 volumes, was kept in his family until towards the last of the eighteenth century, when it was sold and scattered. At present only some 400 volumes are said to be known, the largest number being in the possession of the National Library in Paris. He died in Paris in 1505. There is to-day in New York City a club of book lovers named after him, the Grolier Club (q.v.). Consult Le Roux de Liney, *Recherches sur Jean Grolier* (Paris, 1866), and Clément de Ris, *Les amateurs d'autrefois* (ib., 1876).

GROLL, ALBERT LOREY (1860-). An American painter, born in New York. He studied under Nicholas Gysis and Loefftz at Munich, and afterward devoted himself to landscape painting in various parts of America. At first he sought for color in the richly glazed effects much employed by his compatriots; later, however, he turned to painting in a higher key with cooler schemes of color. The change was coincident with his selection of the mesa lands of the Southwest as his subject. He likes the big expanse of blue sky, often with masses of rolling clouds, to be seen over the American deserts. Pictures of this type include: "No Man's Land" (Corcoran Gallery, Washington); "California Redwoods" (Brooklyn Institute); "Acoma Valley, New Mexico" (National Gallery, Washington). Groll was elected a member of the National Academy in 1910. He received awards at exhibitions in Munich, St. Louis, Philadelphia (Pennsylvania Academy), and New York (National Academy).

GROLMAN, gröl'mân, KARL WILHELM GEORG VON (1777-1843). A German soldier, born in Berlin. He entered the army at the age of 13. After serving on the Military Commission of 1807 which was appointed to reorganize the Prussian army, he left the Prussian service, which he did not reënter until 1813. He fought in the subsequent campaigns against Napoleon with the Austrian and Spanish armies, and at the battle of Waterloo was quartermaster-general on the staff of Blücher. He did much to promote the extension of German influence in the Province of Posen. His works include: *Geschichte des Feldzugs von 1814* (1842-43) and *Geschichte des Feldzugs von 1815 in den Niederlanden und Frankreich* (1837-38).

GROMMET (OF. *gromet*, *grominet*, *gourmet*, apprentice, diminutive of *gromme*, *gourme*, from leol. *grōn*, Eng. *groom*, man). A grommet is formed from a single strand of rope, which is laid up again to form a circle of three-stranded rope. The stiffener of whalebone or steel which is used to keep the rim of a sailor's flat blue cap in shape is called a grommet, as it was originally made of rope in that form. See KNOTTING AND SPLICING.

GROMWELL (earlier *grommel*, *grummel*, from OF. *gremil*, Fr. *grémil*, *grummel*), *Litho-*

spermum. A genus of plants of the family Boraginaceæ. Extraordinary virtues were formerly ascribed to them, which, however, were wholly imaginary, particularly to the common gromwell (*Lithospermum officinale*), which was formerly used as a cure for stone in the bladder. The common gromwell is a native of dry, gravelly places in Europe, Asia, and North America. It has an erect, much-branched stem, broadly lanceolate leaves, and small flowers. There are about 40 species of *Lithospermum*, which occur throughout the temperate zones of the world. In the United States there are 8 or 10 species. Some have perennial roots that yield a red dye similar to alkanet.

GRONGAR (grön'gär) HILL. A descriptive poem by John Dyer (1727).

GRONINGEN, grō'ning-en. The northeastern province of Holland, bounded on the north by the North Sea, on the east by Germany and the Dollart, on the south by Drenthe, and on the west by Friesland. Area, 790 square miles (Map: Netherlands, E 1). Pop., 1899, 299,602; 1911, 333,217, including 20,305 Roman Catholics and 5686 Jews; 1912, 336,741. There is considerable shipping and industrial activity, but it is chiefly an agricultural province. The northern and northeastern districts produce wheat and oil seeds; the southern fen lands yield peat; potatoes, rye, and buckwheat are cultivated, and cattle are raised. The coastal fisheries are also important. The province was the ancient *Groninga*. Capital, Groningen.

GRONINGEN. The most important town in the north of the Netherlands, and capital of the province of the same name, situated at the confluence of the Hunze and the Aa, and at the convergence of a number of railway lines and canals, 22 miles west of the Dollart Inlet (Map: Netherlands, E 1). It is well built, is crossed by numerous canals, and is surrounded with promenades and walks laid out on the site of the old fortifications. The market place (Groote Markt) is one of the largest in Holland. The most prominent buildings are the Gothic church of St. Martin, surmounted by a tower 323 feet high; the town hall, built in 1810, and containing a collection of coins; the government buildings, the theatre, and the prison. The University of Groningen, founded in 1614, is composed of five faculties, with 52 professors, and has an attendance (1914) of 550. It occupies a fine group of buildings in the Dutch Renaissance style, erected after the fire of 1906 which destroyed the old university. Attached to it are a library of about 160,000 volumes, an observatory, a botanical garden, a museum of natural history, a hospital, and a number of laboratories. Among the other educational institutions of the town may be mentioned the Gymnasium, the academy of architecture and navigation, and the deaf and dumb asylum. In 1912 the state agricultural college was removed from Wageningen to Groningen. The town manufactures sugar, textiles, furniture, mirrors, gold and silver ware, cigars and tobacco, trimmed lumber, ships, machinery, etc. The harbor is accessible to sea-going vessels, and has considerable shipping. The trade of Groningen is chiefly in grain, rape seed, and animal products. Pop., 1899, 66,537; 1912, 78,276.

Groningen was granted by the Emperor Henry III in 1040, when it was known as Villa *Cruninga*, to the Bishop of Utrecht. It was fortified in the thirteenth century, and joined the Han-

seatic League as early as 1282. In 1594 the city was taken by Maurice of Nassau, and annexed to the United Netherlands. In 1672 the town withstood the attack of the Bishop of Münster.

GRONLUND, grön'lund, LAWRENCE (1847-99). An American Socialist, born in Denmark. He received the degree of master of arts in the University of Copenhagen in 1865, and two years afterward came to the United States. He was converted to Socialism by Pascal's *Pensées*, and gave up the practice of law to write and lecture on Socialism. His principal works are: *The Coming Revolution* (1880); the *Coöperative Commonwealth* (1884); *Ca Ira, or Danton in the French Revolution* (1888); *Our Destiny* (1890); *Insufficiency of Henry George's Theory* (1887); and *The New Economy* (1898). He published *Ca Ira* to prove that Danton had been misjudged. He considered the United States more advanced, and therefore better fitted for a socialistic régime, than any other country; that the only obstacle is the negro problem, but that social equality between the black and white races can and will be established. He wrote *Our Destiny* to prove that, instead of being necessarily associated with atheism, socialism would reveal to all the immortality of the soul.

GRONNA, ASLE J. (1858-1922). An American legislator, born at Elkader, Clayton Co., Iowa, and educated in the public schools of Houston Co., Minn., and at Caledonia Academy. He moved to South Dakota in 1879 and subsequently to North Dakota, in which States he engaged in farming and banking. He served in the Territorial Legislature of North Dakota (1899), was chairman of the Republican Central Committee of Nelson County (1902-06), from 1905 to 1911 was a member of Congress, and was then elected United States Senator to fill the unexpired term (1911-15) of Martin N. Johnson. He was reelected in 1914.

GRONOVIVS. The Latinized name of two distinguished Dutch classical scholars of the seventeenth century. 1. JOHANN FRIEDRICH GRONOV (1611-71), born at Hamburg, Sept. 8, 1611. After study at various universities, supplemented by travel in France, Italy, and England, and study of manuscripts in those countries, he became professor of rhetoric and history at Deventer (1642), and then professor of Greek at Leyden (1658), and acquired an international reputation for profound learning. He was a prolific writer, publishing critical and annotated editions of Plautus, Terence, Cicero, Sallust, Livy, Seneca (father and son both), Statius, Tacitus, the elder Pliny, and Aulus Gellius; and edited the works of his friend Hugo Grotius (q.v.). All his work was in Latin, as his *De Iure Belli et Pacis Libri Tres* (Amsterdam, 1642). He died at Leyden, Dec. 28, 1671. 2. JACOBUS GRONOV (1645-1716), son of the preceding, born at Deventer, became a scholar of great renown. He traveled in England, France, and Italy, meeting the greatest classical scholars of those countries. At the invitation of the Grand Duke of Tuscany, he accepted the chair of law in the University of Pisa, but returned to Leyden in 1679 to fill the chair of Greek literature and history in that university. He brought out new editions of his father's works on Tacitus, Gellius, and the tragedies of Seneca, and in addition published annotated editions of Herodotus, the *Cebetis Tabula*, Polybius, Cicero, Minucius Felix, and Ammianus Marcellinus. But his

greatest work was the *Thesaurus Antiquitatum Græcarum*, in 13 folio volumes, published at Leyden, 1698-1702. He engaged in many learned controversies with other scholars, in which his irascible temperament led him to personal abuse and scurrility. Notable were his sarcastic letters to Fabretti (q.v.), *Responsio ad Cavillationes Raphaelis Fabretti* (Leyden, 1685), and to Voss (q.v.), *Epistula de Argutiolis Isaci Vossii* (Leyden, 1687). He died at Leyden. Consult Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

GROOS, grös, KARL (1861-). A German psychologist. He was born in Heidelberg, the son of a publisher, and was educated in the university there. He taught at Giessen (1889-98), Basel (1898-1901), and again at Giessen until 1911, when he became professor at Tübingen. His works, of particular importance in child psychology, especially in his study of play, and in aesthetics, which he relates less to metaphysics than to psychology, include: *Die reine Vernunftwissenschaft* (1889), *Einleitung in die Ästhetik* (1892), *Die Spiele der Tiere* (1896; 2d ed., 1907; English, 1898), *Die Spiele der Menschen* (1899; English, 1901), *Der ästhetische Genuss* (1902), *Das Seelenleben des Kindes* (1903; 4th ed., 1913), *Die Befreiung der Seele* (1909), *Der Lebenswert des Spieles* (1910). Consult Baldwin's preface to the English translations, *The Play of Animals* and *The Play of Man*.

GROOT, grôt, HOFSTEDE DE. See HOFSTEDE DE GROOT.

GROOT, HUIG DE. See GROTIUS.

GROOT, JAN JAKOB MARIA DE (1854-). A Dutch Orientalist, born in Schiedam. He was educated at Leyden, became a Chinese interpreter in the Dutch colonies, and succeeded Schlegel as professor of Chinese in Leyden, refusing a call to Columbia University. In 1911 he took the new chair of Chinese in Berlin. He wrote *The Religious System of China* (1892-1910) and, lectures at Hartford Theological Seminary, *Religion in China* (1913).

GROOTE, grôte, **GROOT**, **GROETE**, GERHARD, called GERARDUS MAGNUS, "Gerard the Great" (1340-84). A mystic and preacher, the founder of the Brothers of the Common Life. He was born at Deventer, Holland, and educated at Paris, where he gained much learning. He became a teacher there and in various other places. He was not in holy orders, but held a number of benefices, living luxuriously until converted by a friend in 1374. He then gave up his benefices and, refusing any higher position than deacon, became a traveling and highly successful preacher (1370). He opposed the scholastics, advocated the reading of the Scriptures, and translated the Psalms into the common language. He gathered a company for the transcribing of books of the Bible, and enforced upon them the practice of community of goods. From this association arose the Brothers of the Common Life (q.v.). The order grew rapidly, and in spite of the opposition of the monastic orders, it was sanctioned by the Pope in 1418. He was influenced by the Carthusians, and later by the Augustinians, whose rule he gave to his order just before his death. Groote's own bishop was at first favorable to him, but the opposition of the clergy and of the civil authorities led to his being silenced in 1383. He died of the plague at Deventer, Aug. 20, 1384. He left numerous writings. His life was originally written by

Thomas à Kempis, who belonged to the Brothers of the Common Life. Consult the English translation by Arthur, *The Founders of the New Devotion* (St. Louis, 1905). Consult also Bonet-Maury (Paris, 1878).

GROS, grô, ANTOINE JEAN, BARON (1771-1835). A French historical painter. He was born in Paris, March 16, 1771. Trained in correct drawing by his father, a miniature painter, at the age of 14 he came under the instruction of David. In 1793 he visited Italy, where he was associated through Josephine with Napoleon Bonaparte, who made him inspector of reviews, thus giving him the opportunity to acquire knowledge for the battle scenes he later executed, and appointed him one of the commissioners to select the works of art which Napoleon took from Italy. In 1796 Gros painted "Bonaparte at the Bridge of Arcole." His "Plague at Jaffa," exhibited in 1805 and purchased by the government, made him famous. Gros was always disposed to struggle against the romantic tendency which is more or less observable in his art, and endeavored to maintain the principles of the Classic school as practiced by David. In 1816 he was made member of the Institute and professor in the Ecole des Beaux-Arts, and in 1828 Officer of the Legion of Honor. For his painting in the cupola of the Pantheon, which represents the four chief dynasties of France offering their deeds as homage to St. Geneviève, he received in 1824 the title of Baron. Gros essayed in the last years of his life to return to the purely classical in his works "Hercules and Diomedes" and "Acis and Galatea," but the result compared so unfavorably with the examples of the Romantic school, then in the ascendancy, that the adverse criticism they evoked affected his mind, and he committed suicide in the Seine on June 27, 1835.

Gros's art represents the transition from the classic art of David to that of the Romantic school. He was the first to abandon classic subjects in favor of historical. To the drawing and composition of David's school he added excellence of color, depth of feeling, and vigor of action. His "Plague at Jaffa" (1805), now in the Louvre, is a masterpiece in this regard. It represents Napoleon ministering to his plague-stricken and dying soldiers in an Oriental courtyard. Other important works are: "Napoleon at Eylau" (1808, Louvre); "Napoleon before the Pyramids" (1810); the "Flight of Louis XVIII from the Tuileries" (1816) and others in the Museum at Versailles; and "Francis I and Charles V at St. Denis" (1808, Louvre), called by the painter his "Bouquet," the best of his works in color. His portraits, of which the Gallery of Versailles contains a large number, are powerful and characteristic. Among the best are those of Generals Masséna, Lasalle, and Fournier-Sarlovèze (Versailles). His works in the classic style are the weakest of his productions. He left a large number of influential pupils.

Consult the biographies of Gros by Delestre (Paris, 1867), Tripiér le Franc (ib., 1880), Dargenty (ib., 1887), and Lemonnier (ib., 1912); also Chesneau, *Les chefs d'école* (ib., 1883), and Delacroix, in the *Revue des Deux Mondes* (1848).

GROS, PIERRE LE. See **LEGROS, PIERRE.**

GROSART, ALEXANDER BALLOCH (1827-99). An English scholar and editor, born at Stirling, Scotland. Ordained as minister in the United

Presbyterian church in 1856, he settled as pastor of St. George's Church, Blackburn, Lancashire, in 1868. Owing to ill health, he resigned in 1892, and passed his last years in Dublin. He wrote hymns and religious works, but is known chiefly for his editions of Elizabethan and post-Elizabethan writers, Spenser, Sidney, Nash, Greene, Barnfield, Donne, Giles Fletcher, Vaughan, Herbert, Herrick, and others, published in the Fuller Worthies' Library, the Chertsey Library, the Huth Library, and elsewhere. Grosart performed a valuable service in collecting a mass of literary material, which, however, needs sifting by more exact scholars.

GROSBEAK, grôsbêk (from *gross* + *beak*, imitated from Fr. *grossbe*, grosbeak). Any of several birds, especially of the family Fringillidae, notable because of the great thickness of the bill, which can be used for breaking the stones of cherries, olives, and the like. The hawfinch (q.v.) and greenfinch (q.v.) are common European examples. In America a number of birds, which have no close association with each other, are so called—prominently the cardinal. (See **CARDINAL BIRD**.) The pine grosbeak (*Pinicola enucleator*) breeds in the Far North, but in winter is found as far south as Washington, though its appearance is very irregular. As it usually appears, the color is slaty gray, with yellowish or reddish olive feathers on the crown and rump. In full plumage, however, the males are beautiful rosy red. The length is about 9 inches. The rose-breasted grosbeak (*Zamelodia ludoviciana*) is one of the handsomest birds of eastern North America. The male is black above and white below, with the breast a beautiful rose red; the female is grayish brown and buffy. The length is 8 inches. This grosbeak breeds as far north as Maine and Manitoba, but it winters in Central and South America. Its song is brilliant though not elaborate. In the Far West it is replaced by the black-headed grosbeak (*Zamelodia melanocephala*), the male of which has the breast orange brown instead of rose. (See **Colored Plate of Eggs of Song Birds**.) In the Southern States the blue grosbeak (*Guiraca caerulea*) is a summer resident. The male is deep blue in color, and about 7 inches long. In the interior of North America from Manitoba northward is found the very handsome evening grosbeak (*Hesperiphona vespertina*), which is black, yellow, olive brown, and white. The length is about 8 inches. This grosbeak is irregularly migratory in winter, and in 1890 large flocks appeared in New England, where they were common for several weeks. It is usually a rare bird in any part of the United States except near Manitoba. It received its name under the impression that it sang only at twilight; but its voice is heard all day as it seeks its food (seeds, buds, and insects) in the forest trees. Three of the species above mentioned are illustrated on the Plate of **BUNTINGS, ETC.**

GROSCHEN. See **GROAT.**

GROSE, grôz, FRANCIS (c.1731-91). An English antiquarian writer, born in Middlesex of a Swiss father and an English mother. He began his career as an architectural draftsman, but his improvident habits made it necessary for him to combine this with other occupations, and he is known principally by his antiquarian researches. Grose's voluminous writings include general discourses upon the antiquities of England and Wales, Scotland, and Ireland, and

special articles, upon armor, for example, while his humor is shown in parodies, dictionaries of slang, and proverbs. His works include: *Antiquities of England and Wales* (1773-87); *Antiquities of Scotland*; *Classical Dictionary of the Vulgar Tongue* (1785; reissued, 1811, as *Lexicon Balatronicum*).

GROSE, GEORGE RICHMOND (1869-). An American Methodist Episcopal clergyman and university president, born in Nicholas Co., W. Va. He graduated from Ohio Wesleyan University in 1894, and from the Boston University School of Theology in 1896. Ordained to the ministry in 1896, he was pastor of churches in Massachusetts, at Leicester (1894-99), Jamaica Plain, Boston (1897-1900), Newton (1900-05), and Lynn (1905-08), and of Grace Church, Baltimore (1908-13). He lectured at Johns Hopkins University in 1910-13. In 1913 he accepted the presidency of De Pauw University. Besides his articles in church magazines he is author of *The Outlook for Religion* (1913).

GROSE, WILLIAM (1812-1900). An American soldier and politician, born in Dayton, Ohio. When he was three years old his family removed to Indiana. He received a common-school education, studied law, and in 1852 was a presidential elector on the Pierce ticket and a candidate for Congress. When the Republican party was organized soon afterward he joined it, and in 1856 was elected to the Legislature. In 1860 he was elected a judge of the Court of Common Pleas, but resigned to recruit the Thirty-sixth Indiana Infantry, of which he was colonel. He commanded a brigade in the battles of Murfreesboro, Chickamauga, and Chattanooga, and was commissioned a brigadier general on July 30, 1864. In 1865 he was brevetted major general of volunteers. From 1866 to 1874 he was collector of internal revenue for the fifth district in Indiana; in 1877 he was sent to the Legislature for the second time; and from 1879 to 1883 was a State Senator. He again ran for Congress in 1878, on the Republican ticket, but was again defeated. From 1884 to 1886 he was one of a commission appointed to build three State hospitals for the insane, and in 1887 was once more elected to the Indiana Legislature.

GROSS, grös (OF. *gros*, from Lat. *grossus*, thick). In law, at large; general; not limited or confined to a particular thing. Thus a right *in gross* is a right generally exercisable by a person, as distinguished from a right *appendant* or *appurtenant* to his land. The term is most commonly employed in connection with the class of rights known as incorporeal hereditaments, as easements and profits *à prendre* in the lands of another. Thus, a right to take ice from a neighbor's pond to supply the domestic uses of the taker is a profit appurtenant to the premises of the latter, whereas a right to take ice *ad libitum* for any purpose is a profit in gross. Such a profit is a true real property right, which may be acquired by grant (q.v.) or prescription (q.v.), and which, when once gained, may be alienated or transmitted, like other real property, to the heir of the owner. Corresponding rights in the nature of easements, sometimes called easements in gross, as a personal right of way over another's land, are, on the other hand, not recognized as property rights at common law, but only as licenses. In the United States, however, certain rights of this sort, as a right to take water from the

grantee's land, or to post bills on his premises, though easements and not appurtenant to any land of the grantee, have been recognized as property rights and, as such, alienable and inheritable like profits in gross. See APPURTENANCE; EASEMENT; LICENSE; PROFIT À PRENDRE.

GROSS, grös, CHARLES (1857-1909). An American historian, born at Troy, N. Y. He graduated at Williams College in 1878, went abroad for historical study, and took his doctorate at Göttingen in 1883. From 1884 to 1888 he continued his historical work in England, confining himself to researches in the constitutional history of that country. He returned to the United States in 1888 to become instructor in history at Harvard University, where in 1901 he became a full professor. His researches in constitutional history, which made him probably better known in Europe, and especially in England, than in America, include: *Gilda Mercatoria* (1883); *The Eschequer of the Jews of England in the Middle Ages* (1887); *The Guild Merchant* (1890); *Select Cases from the Coroner's Rolls* (1896); *Bibliography of British Municipal History* (1897); *Sources and Literature of English History* (1900); *The Court of Piepowder* (1906).

GROSS, grös, FERDINAND (1840-1900). An Austrian author, born and educated at Vienna. He was an editor of the *Frankfurter Zeitung* (1879-81); of the *Wiener Allgemeine Zeitung* (1881-86); of the *Wiener Freudenblatt*; and of the publication entitled *Wiener Mode*, which he conducted for several years. His works consist mostly of collections of short sketches and studies in the *feuilleton* style, of which may be mentioned: *Kleine Münze* (1878); *Oberamergau Passionsbriefe* (1880); *Nichtig und Flüchtig* (1880); *Mit dem Bleistift* (1881); *Aus der Bücherei* (1883); *Blätter im Winde* (1884); *Literarische Modelle* (1887); *Goethes Werther in Frankreich* (1888); *In Lachen und Lächeln* (1898); *Von der leichten Seite* (1900). In his collections of verses he shows the same light, graceful humor. Of his dramas the best are the comedies *Die neuen Journalisten* (1880), in collaboration with Max Nordau, and *Der erste Brief* (1883).

GROSS, grös, SAMUEL D. (1805-84). A celebrated American surgeon, born in Pennsylvania. Graduating from Jefferson Medical College, Philadelphia, in 1828, he practiced his profession in Philadelphia from 1828 to 1833, and in Cincinnati, Ohio, from 1833 to 1840. From 1835 to 1840 he was also professor of pathological anatomy in Cincinnati College. He was professor of surgery in the University of Louisville, Ky., from 1840 to 1850; professor of surgery in the University of New York from 1850 to 1856; and professor of surgery in Jefferson Medical College from 1856 to 1884. He was president of the American Medical Association in 1868, and of the American Surgical Association in 1880. Oxford, Cambridge, and Edinburgh conferred on him honorary degrees. His contributions to literature, besides valuable translations of French and German works, included: *Diseases of the Bones and Joints* (1830); *Elements of Pathological Anatomy* (1839); *System of Surgery* (6th ed., 1884).

GROSS, WILLIAM HICKLEY (1837-98). An American Roman Catholic prelate, born in Baltimore, Md. He studied at St. Joseph's College and joined the Redemptionists in 1857, becoming

superior of the order in 1871. Two years later he was appointed Bishop of Savannah, Ga., and in 1884 became Archbishop of Oregon.

GROSS ADVENTURE. In maritime law, a bottomry loan, so called because of the general character of the risk assumed. Such a loan contributes to the general average in case of loss. See **BOTTOMRY BOND**; **AVERAGE, IN LAW**.

GROSSBEEREN, grōs-bē'ren. A village in the District of Potsdam, Germany, 13 miles south of Berlin. It is noted as the site of the battle in which the allies defeated the French in their advance on Berlin, Aug. 23, 1813.

GROSSCUP, grōs'kūp, PETER STENGER (1852-1921). An American jurist, born at Ashland, Ohio. Graduating from Wittenberg College in 1872 and from Boston University Law School in 1874, he practiced law in his native town, and was city solicitor for six years. In 1882 he removed to Chicago, where he practiced with great success until 1892, then being appointed United States district judge for the northern district of Illinois. It was while serving in this office that he issued the injunction against Eugene V. Debs and other officers of the American Railway Union during the strikes of 1894. From 1899 to 1911 he was a member of the United States Circuit Court of Appeals. In 1908, as one of three members of this court, he wrote the opinion reversing the Landis decision which had fined the Standard Oil Company \$29,240,000. President Roosevelt characterized the reversal as "a gross miscarriage of justice," and in general the decision aroused much criticism. In 1911 he resigned his judicial office and resumed the practice of law in Chicago.

GROSSE, grō'se, JULIUS (1828-1902). A German poet, born at Erfurt and educated at Halle. He studied law, then painting, then turned to poetry, finally succeeding better as a journalist, spending, however, many years as general secretary of the Schiller Foundation. Grosse wrote too rapidly and too much to produce many things that will last, but his best work was done in his *Novellen* and his lyrics. Among his numerous works may be mentioned various editions of lyrics: *Tiberius*, a drama (1875); *Das Mädchen von Capri* (1860) and *Gundel vom Königsee* (1864), both tales in verse; *Das Volkramslied: Ein Sang aus unseren Tagen* (1890), an epic; *Novellen* (3 vols., 1862-63), short stories; *Maria Mancini* (1871), a novel; *Ursachen und Wirkungen: Lebenserinnerungen* (1896), a biographical work.

GROSSE, THEODOB (1829-91). A German historical painter. He was born at Dresden and studied at the Dresden Academy under Bendorff. For his encaustic decorations in the castle of Count Solms Wildenfels on the Mulde, he was awarded the traveling scholarship of the Dresden Academy. After several years in Italy Grosse returned to fresco the eastern loggia of the Leipzig Museum. In 1867 he was made professor at the Dresden Academy. His other works include: "Leda with the Swan" (1852, Dresden Gallery); "Scenes from the Myth of Bacchus" (1877, foyer of the New Theatre, Dresden); "The Visit of the Three Angels to Abraham" (1863, Museum, Leipzig); "Arrival of the Souls in Purgatory," after Dante (1879, Dresden Gallery).

GROSSE (grōs) **ISLE**. An islet of Canada, in the river St. Lawrence, 2½ miles long and 1 mile wide. It lies 29 miles below Quebec and is the provincial quarantine station.

GROSSENHAIN, grō'sen-hin. A town in the Kingdom of Saxony, Germany, on the Röder, 20 miles northwest of Dresden (Map: Germany, E 3). It has a gymnasium, trade and agricultural school, public library, and park. Its extensive manufactures include woollens, silk, machinery, buckskin, leather, cigars, hosiery, safes, fertilizer, cut glass, print goods, copper and zinc wares, soap, lumber, and bricks. The state gardening industry has a rose nursery here. Pop., 1900, 12,064; 1910, 12,217. The town is mentioned as early as the tenth century.

GROSSETESTE, grōs'test, ROBERT (c.1175-1253). A celebrated English prelate. He was born in Suffolk, studied at Oxford and Paris, and, after returning to England, gained great reputation as a divine. He was the first rector of the Franciscan school at Oxford (1224). In 1235 he was elected Bishop of Lincoln and set himself in most vigorous fashion to reform all abuses in his diocese. He was a man of great energy and strong character, but high-tempered and undiplomatic, and became involved in numerous controversies. One of the most famous was with no less a personage than Pope Innocent IV himself. It was not unusual at the time for the Pope to appoint foreigners to vacant benefices in England, many of whom drew their revenues, but never came to the country. Grosseteste set himself against this abuse, and in 1253 refused to induct the Pope's nephew, an Italian youth, into the first canonry that should be vacant in the cathedral of Lincoln. He died Oct. 9, 1253. Grosseteste was a friend of Simon de Montfort (q.v.) and a constitutionalist in politics. His learning was prodigious. Latin, Greek, Hebrew, French, mathematics, medicine, and music were among his attainments, and his knowledge of Scripture is particularly lauded. His influence on English life and thought lasted long beyond his time. He was a most voluminous writer. For his life, consult: Pegge (London, 1793), which contains a list of his works filling 28 closely printed quarto pages; Brewer, *Monumenta Franciscana*, vol. i (ib., 1858); Luard (ed.), *Roberti Grosseteste Episcopi quondam Lincolniensis Epistole*, "Rolls Series" (1862); Stevenson (ib., 1899). For his connection with Oxford, consult Rashdall, *Universities of Europe during the Middle Ages* (Oxford, 1895).

GROSSETO, grōs-sā'tō. An episcopal town, capital of the province of the same name, in Tuscany, Italy, 90 miles south-southeast of Pisa. The cathedral, begun in 1294, was restored in 1855. In the Municipio is a collection of Etruscan antiquities (Map: Italy, C 3). The cathedral is built in the Italian Gothic style, of alternate courses of red and white marble. A few miles to the northeast are the ruins of Rusellæ, one of the 12 cities of the Etruscan Confederation. Grosseto markets cattle, horses, lumber, and grain, and manufactures agricultural machinery. Pop. (commune), 1901, 9599; 1911, 12,442.

GROSSGLOCKNER, grōs'glōk'ner. See **GLOCKNER**.

GROSSGLOGAU, -glō'gou. See **GLOGAU**.

GROSSI, LUDOVICO. See **VIADANA**.

GROSSI, grōs'sè, TOMMASO (1791-1853). An Italian poet and novelist, born at Bellano. He studied law at Pavia, but, owing to his political ideas, never rose in his profession. His heroic poem "I Lombardi alla prima crociata" (1826), in imitation of Tasso, attracted much

attention because of its patriotic sentiment. He dedicated the historical novel *Marco Visconti* (1834) to Manzoni, who had given him encouragement. He has been translated often and is still popular. His other works in addition to his important dialect verses include *Ildegonda* (1814) and *Ulrico e Lida* (1837), which renewed the popularity of the novel in verse—their sentimentality infecting many writers of the period; *Opere* (Milan, 1862); *Opere poetiche* (ib., 1877). Consult Cantù, *Vita ed opere di Tommaso Grossi* (Milan, 1854), and Vicari, *Dell' opera poetica di T. Grossi* (Cagliari, 1901).

GROSS KIKINDA, grōs kik'in-dā. See NAGY-KIKINDA.

GROSSMITH, grōs'smith, GEORGE (1847–1912). An English actor, son of a journalist of the same name. In 1866 he became a reporter for the *London Times*, but soon turned to the stage and about 1870 began his career as an entertainer with comic songs and the like. In 1877 he appeared in *The Sorcerer* at the Opera Comique and became very popular in other Gilbert and Sullivan operas, his best-known part being that of the Admiral in *Pinafore*. Two years later he again set up as an individual entertainer and visited all the chief cities of Great Britain and the United States. He retired from the stage in 1901. Among his writings are: *The Reminiscences of a Society Clown* (London, 1888); *The Diary of a Nobody*, written with Weedon Grossmith (ib., 1894), and numerous songs.

His brother, WEEDON GROSSMITH, the artist, became well known also as an actor, and his son GEORGE (1874–) gained some note as an actor and playwright.

GROSSULARITE, grōs'ū-lar-īt. See GARNET.

GROSSWARDEIN, grōs'vār-din'. See NAGY-VÁRAD.

GROSVENOR, grō've-nēr, EDWIN AUGUSTUS (1845–). An American historian, born in Newburyport, Mass. He graduated at Amherst in 1867 and at Andover Theological Seminary in 1872, after which he took a year of post-graduate work in Paris. He was professor of history in Robert College, Constantinople, in 1873–90; professor of European history at Amherst in 1892–98, of modern government in 1898–1901, and of modern government and international law after 1901. In 1892–94 he was professor of history at Smith College also. He received the Amherst Litt.D. in 1914. His writings include, in addition to much work done for reviews and encyclopædias: *Constantinople* (2 vols., 1895); *The Permanence of the Greek Type* (1897); *The Hippodrome of Constantinople and its Still Existing Monuments* (1899); *Contemporary History of the World* (1898–99). In addition he translated from the French and revised Duruy's *History of Modern Times, General History of the World* (1898), and *Ancient History of the East* (1898–99), and from the modern Greek, *Andronike* (1897).

GROSVENOR, GILBERT HOVEY (1875–). An American geographer. Born in Constantinople, Turkey, he was educated there in the preparatory department of Robert College, and in the United States at the Worcester (Mass.) Academy and at Amherst College (A.B., 1897; A.M., 1901). He taught for a year and after 1899 was connected with the *National Geographic Magazine*, as assistant editor, managing editor, and, after 1903, as editor. In 1909 he became a director of the National Geographic

Society. He was associate editor of the *Proceedings of the Eighth International Geographic Congress* (1905) and of the *Scientific Report of the Zeigler Polar Expedition of 1905–06*, and edited *Scenes from Every Land* (1907; 3d ed., 1912). He became a regular contributor to the *Century*, *The Chautauquan*, and the *Popular Science Monthly*, and wrote *The Explorations of the Nineteenth Century*, in the reports of the Smithsonian Institution (1910).

GROSVENOR, H. L. See WESTMINSTER, DUKE OF.

GROSVENOR GALLERY. A gallery for the exhibition of paintings and sculptures in Bond Street, London. The building was completed in 1877, at a total cost of £120,000. The façade is of stone in the Italian Renaissance manner, and the principal gallery is 104 feet long by 35 feet wide and 36 feet high. The institution was founded by Sir Lindsay Coutts for the purpose of giving unofficial exhibitions of art, under conditions quite different from those usually employed. A jury of selection was dispensed with, and artists of reputation were invited to send any or as many of their works as they desired. The interior of the galleries was so decorated and the pictures so arranged that they might be seen under conditions which prevail in private houses. Many Royal Academicians contributed to these exhibitions, but the method of invitation and selection has attracted to them artists who are at variance with the Academy, with the result that they represent a newer and less conventional character of English art. The exhibition begins May 1st, and is one of the events of the London season.

GROSVENOR HOUSE. The city residence of the Duke of Westminster, on Upper Grosvenor Street, London; formerly Gloucester House, built for the Duke of Gloucester, brother of George III. It contains a famous private collection of paintings.

GROSVENOR SQUARE. A square in London, east of Hyde Park, noted for its literary and aristocratic associations. Bulwer Lytton spent his later years at No. 12, and Chesterfield House is on South Audley Street, which runs out from the Square. It was laid out in 1716.

GROS VENTRES, grō'vūn'tr' (Fr., great bellies). A name applied by French traders to two distinct tribes, the Minitari or Hidatsa, on the Missouri, and the Atsina, an offshoot of the Arapaho. At present the name is applied to the latter, but often qualified as Gros Ventres of the Prairie. See MINITARI.

GROT, grōt, NIKOLAI YAKOVLEVITCH (1852–98). A Russian philosopher, born and educated at St. Petersburg. He successively occupied the chairs of philosophy at Nizhni (1876–83), Odessa (1883–86), and Moscow (after 1886). In his numerous works (written chiefly in Russian) he endeavors to evolve a philosophical system in which the will becomes a primary agent, dominating the external world. In 1894–96 he was editor of the periodical *Voprosy Filosofii* (philosophical questions), the first philosophical publication of its kind in Russia. His works in French include: *Nouvelle classification des sentiments* (1878) and *La causalité et la conservation de l'énergie* (1890). His more important publications in Russian are: *Dreams as a Subject for Scientific Analysis* (1878); *Psychology of the Feelings* (1880); *Philosophy as Art* (1880); *A Criticism on the Conception of Free Will* (1889); *The Mission*

of *Psychology* (1890); *Turning Points in the Development of the New Philosophy* (1894).

GROT, grôt, YAKOV KARLOVITCH (1812-93). A Russian philologist, born at St. Petersburg and educated at Tsarskoye Selo. He held a professorship in Russian history and literature at Helsingfors from 1841 to 1853, and was then appointed to the same position at the Alexander Lyceum at St. Petersburg, where he also was private tutor to the Grand Duke Alexander, afterward Czar Alexander III. His principal works are: the very important *Filologičeskaya razyskanya* (Philological Investigations, 3d ed., 12 vols., 1885); a critical edition of the work of Derzhavin (9 vols., 1864-80); *The Correspondence of Catharine II with Grimm* (1884); a revised edition of the Russian lexicon of the Academy of St. Petersburg (first 2 vols., 1891-92).

GROTE, GEORGE (1794-1871). An English historian of Greece, born in Kent, Nov. 17, 1794. At the age of 16, after acquiring an elementary education in Latin and Greek, he entered the bank in which his father was a partner. He not only continued his classical studies, however, but delved into history, philosophy, and political economy. He sided with the liberal school of thought, to which his creative mind made important contributions. After the passage of the Reform Bill of 1832, in favor of which he had zealously written and spoken, he entered the House of Commons as a representative of London. In the beginning of his public career he commanded a large following, but in time his advanced democratic ideas alienated all supporters with the exception of a few "philosophic radicals." He retired from Parliament in 1841, and two years later from the banking business, to give all his attention to study and writing. Before entering public life he had published (*Westminster Review*, April, 1826) a scathing criticism of Mitford's *History of Greece*, a work from an extreme Tory point of view. It was partly to right the wrong done by Mitford to the spirit of free institutions, and partly to teach his countrymen a lesson in democracy, that Grote conceived and wrote his magnificent *History of Greece*. As early as 1822 he had begun planning the work, but his duties as statesman and banker compelled him to defer it till his retirement into private life. The first two volumes appeared in 1846, the twelfth and last in 1856. The work is pervaded by an intense enthusiasm for Greek democracy, which sometimes leads the author to underrate other forms of government; at the same time it aims to present all the known facts, that the reader may be able to form his own judgment. In 1865 he completed in three volumes a work on *Plato and the Other Companions of Socrates*. A thorough realist, the author could not fully appreciate the idealism of Plato, and yet these volumes have a value in presenting certain aspects of Platonic thought which down to his time had passed unnoticed. Grote began a similar treatise on Aristotle, but did not live to complete it. Meantime he was taking an active interest in education. He was president of University College, vice-chancellor of the University of London—two great nonsectarian institutions—and a trustee of the British Museum. He died June 18, 1871. Consult: Mrs. Grote, *Personal Life of George Grote* (London, 1873); his *Minor Works, with Critical Remarks on his Intellectual Character,*

Writings, and Speeches, ed. by Alexander Bain (ib., 1873); his *Aristotle*, also ed. by Bain (ib., 1872).

GROTEFEND, grô'te-fënt, GEORG FRIEDRICH (1775-1853). A German Orientalist and classical scholar, born at Minden and educated at Göttingen. From 1797 to 1821 he was successively provost and rector of the Gymnasium at Frankfurt, whence he was called to become director of the lyceum at Hanover, which position he held until 1849, when he retired from active life. As a scholar Grotefend was broad, but was prevented by this very quality from becoming a strictly methodical investigator. His first important work was *Anfangsgründe der deutschen Poesie* (1815), which was followed by a revision of Wenck's *Latinitische Grammatik* (2 vols., 1823-24). His contributions to the Old Italic dialects are of considerable importance. They comprise: *Rudimenta Lingua Umbrica* (1835-38); *Rudimenta Lingua Osca* (1839); *Geographie und Geschichte von Altitalien* (1840-42). Grotefend's chief importance, however, lies in his contribution to the decipherment of Old Persian inscriptions. (See CUNEIFORM INSCRIPTIONS.) He held that there were in all three systems of cuneiform writing in the Persian inscriptions, that the Persian characters were alphabetic, that there were 40 letters in all in the alphabet, and that the inscriptions must be read from left to right. He increased the number of certainly known characters from three to 11, and approximated the real value of several more. He published his first study in this subject in 1800, and produced his chief work on it in 1837, *Neue Beiträge zur Erläuterung der persopolitanischen Keilschrift*. In addition to his other studies, he was one of the first to turn his attention to the difficult problem of the interpretation of the Lycian inscriptions.

GROTESQUE, grô-tësk' (Fr., from It. *grottesco*, grotesque, from *grottesca*, style of painting found in ancient crypts, from *grotta*, cavern, from ML. *grupta*, *crupta*, from Lat. *crypta*, crypt). A style of classical ornament, so called in the thirteenth century from its having been rediscovered in the excavations made in the baths of Titus and other ancient Roman buildings. This light, fantastic style was much in favor during the Renaissance. It abounds in all kinds of transformations, from the animal to the vegetable, and mingles all the natural kingdoms in the most fanciful and picturesque confusion. The name "grotesque" thus came by degrees to mean a fanciful combination of natural ideas as applied to ornament.

GROTH, grôt, KLAUS (1819-99). A German poet, and the first writer of prominence to employ "Plattddeutsch," or Low German, as a literary medium. He was born at Heide, in Ditmarsh, the western part of Holstein, Prussia. He studied at the normal school in Tondern and then secured a position as a teacher of girls in his native place, devoting his spare time to the study of philosophy, mathematics, and the natural sciences. Finally, his health giving way, he retired to the island of Fehmarn, in the Baltic, where he remained five years, and where most of his poems were written. In 1853 he went to Kiel, then traveled through Germany and Switzerland on a pension from the King of Denmark, and after a two years' sojourn at Bonn, where he received the doctor's degree in recognition of his services to the Low

German as a literary language, took up his residence in Dresden. In 1857 he returned to Kiel, where the university made him an instructor in German language and literature, then in 1866 professor, which position he held until his death. His fame rests chiefly on his *Quickborn* (1852; 25th ed., 1900), a collection of poems in the Ditmarsh dialect (also translated into High German by Hoffmann in 1856). Besides *Quickborn*, his principal works are: *Vertelln* (2 vols., 1855-59), prose tales from the peasant life of his home; *Hundert Blätter* (1854), High German poems; *Ut min Jungspardies* (1876), tales in Low German. His works have been collected and published in four volumes (Kiel, 1898). For an estimate of his works, consult Eggers, *Klaus Groth und die plattdeutsche Dichtung* (Berlin, 1885), and Siercks, *Klaus Groth, sein Leben und seine Werke* (Kiel, 1899).

GROTH, PAUL VON (1843-). A German mineralogist. He was born at Magdeburg and was educated at the Freiberg Mining School and at Berlin. After lecturing at the former institution and at the University of Berlin, he became professor of mineralogy at Strassburg in 1872 and in 1883 at Munich, where he was appointed custodian of the royal mineralogical collections. In 1877 he founded at Leipzig the important periodical *Zeitschrift für Kristallographie und Mineralogie*. A prolific writer on subjects connected with crystallography, in which he came to be recognized as a foremost authority, he received a title of nobility from the Bavarian government and received many honors from foreign universities and societies. His writings, chiefly on mineralogy and crystallography, include: *Tabellarische Uebersicht der Mineralien nach ihren kristallographisch-chemischen Beziehungen geordnet* (new ed., 1898); *Physikalische Kristallographie* (3d ed., 1895); *Grundriss der Edelsteinkunde* (1887); *Chemische Kristallographie* (1906); *The Optical Properties of Crystals* (trans. by B. H. Jackson, 1910).

GROTIUS, grō'shi-ūs, Hugo, or DE GROOT (1583-1645). A distinguished Dutch publicist and scholar, born at Delft, April 10, 1583. His father, Jan de Groot, was burgomaster of the town and also curator of the University of Leyden. In his eleventh year Hugo entered the University of Leyden, where he studied under Joseph Scaliger, the renowned classical scholar. In his fifteenth year he took his degree. In the following year he accompanied Olden Barneveldt, the Grand Pensionary, on his embassy to France, where Grotius' talents and conduct gained the favor of Henry IV. On his return he began practice as a lawyer and conducted his first case at the bar of The Hague in 1599. In 1607 he was appointed fiscal general, and in 1613 council pensionary, at Rotterdam. The disputes between the two embittered factions into which the dominant Calvinistic party was divided—the Remonstrants (or Arminians) and the Contraremonstrants (the more orthodox party)—were now at their height in Holland; Olden Barneveldt was the protector of the former, and Grotius actively supported them by his writings and by direct political action. These theological strifes had a dire political significance, and in the end both Olden Barneveldt and Grotius were arrested, tried, and condemned by the dominant party under Prince Maurice. (See BARNEVELDT.) Olden Barne-

veldt was beheaded in 1619, and Grotius sentenced to imprisonment for life in the castle of Loevenstein. He escaped, however, by the contrivance of his wife.

For some time Grotius wandered about in destitute circumstances in the Catholic portions of the Netherlands and finally escaped to France. Here his straitened circumstances continued in spite of the fact that Louis XIII bestowed upon him a pension of 3000 livres, since but a part of it was paid, and in 1631 it was withdrawn. A friendly letter from Prince Frederick of Orange induced him to return to his native country: but, by the intrigues of his enemies, sentence of perpetual exile was soon passed upon him. He removed to Hamburg, and while there he received invitations from the kings of Denmark, Poland, and Spain; but the protection promised him by the Chancellor Oxenstiern, and Queen Christina's taste for literature, induced him to enter the Swedish service in 1634. He held the position of Ambassador at the French court (1635-45). His reception by the Queen on his return to Sweden was flattering; but the literary dilettantism of Christina's court did not suit so serious and solid a scholar. Besides, the climate of Sweden did not agree with him, and he was anxious to spend the evening of his life in his native land. In consequence, he sent in his resignation of office to the Queen, who, when she found that nothing could induce him to stay, presented him with a sum of 10,000 crowns and some costly plate, besides placing at his disposal a vessel to conduct him down the Baltic to Lübeck. A storm compelled him to land on the coast of Pomerania. While proceeding towards Lübeck, he fell sick, and died at Rostock, Aug. 28, 1645.

To the talents of a statesman Grotius united deep and extensive learning in various fields of knowledge. He was a profound and enlightened theologian, a brilliant scholar, an acute thinker, and a jurist of rare insight and breadth of vision. His metrical translations from the Greek authors also display superior poetical powers; he was one of the best modern writers of Latin verse and likewise composed poems in Dutch. (See ANTHOLOGY, *Greek*.) In spite of his wandering and checkered career Grotius found time to write a great variety of works, which in themselves would have given him a permanent place in history. The first was the *Mare Liberum*, in which he defended the freedom of the Dutch East India trade and specifically combated the English assumption to the control of the North Sea. His chief work, however, is that entitled *De Jure Belli et Pacis*, which has been translated into all the principal languages of Europe. It may be considered as the basis of international law and has been much used as a textbook on the subject. Among his other works we may mention *Annales et Historia de Rebus Belgicis* (Amsterdam, 1657), written in a style that rivals Tacitus for concise and pointed power; *Annotationes in Vetus Testamentum* (Paris, 1644); *De Satisfactione Christi*; and *De Veritate Religionis Christianæ* (Leyden, 1627), remarkable for its clear arrangement, vigorous logic, and eloquent style. Consult: Butler, *Life of Grotius* (London, 1826); De Vries, *Huig de Groot en Maria van Reigersbergen* (Amsterdam, 1827); Creuzer, *Luther und Hugo Grotius* (Heidelberg, 1846); H. Bertens, *Hugo de Groot en zijn rechtsphilosophie* (Tilburg, 1905); A. D. White,

Seven Great Statesmen in the Warfare of Humanity with Unreason (New York, 1910).

GROTON, grô'tôn. A town in New London Co., Conn., on the Thames River, opposite New London, and on the New York, New Haven, and Hartford Railroad, and on the Chelsea Steamship Line (Map: Connecticut, G 4). It contains the Bill Memorial Library, and has large shipbuilding yards. The government is administered by annual town meetings. The town owns the water works, electric-light plant, and sewer system. Pop., 1900, 5962; 1910, 6495.

Here occurred, on Sept. 6, 1781, what has been called the Massacre of Fort Griswold. One hundred and fifty Americans stubbornly resisted an attack of about 800 Tories under Benedict Arnold, who finally forced their way into the fort and, maddened by the prolonged resistance, butchered the greater part of the survivors after their surrender. Of the 150, 85 were killed and 65 wounded, 35 mortally. The site has been made a state reservation, which contains a monument in commemoration. Consult: *History of New London County* (Philadelphia, 1882) and an article "The Massacre of Fort Griswold," in *Magazine of American History*, vol. vii (New York, 1880); C. F. Burgess, *Historic Groton* (Moosup, Conn., 1909).

GROTTAGLIE, grôt-tā'lyā. A city in the Province of Lecce, Italy, 12 miles northeast of Taranto (Map: Italy, F 4). It has chalk and clay quarries, aparies, manufactures pottery and leather goods, and markets grain, fruit, wine, oil, cotton, and cattle. Pop. (commune), 1901, 11,274; 1911, 11,851.

GROTTE, grôt'tā. A town in the Province of Girgenti, Sicily, 13 miles northeast of the city of Girgenti. Sulphur mining is the principal industry. Pop. (commune), 1901, 11,039; 1911, 10,148.

GROTTGER, grôt'gër, ARTHUR VON (1837-67). A Polish historical painter and draftsman. He was born at Otyniowicz (Galicia), studied at Lemberg and Cracow and in the academy schools at Vienna, chiefly under Karl Blaas. While in Vienna he began to make his reputation with a cycle of crayon drawings of the Polish revolution. About 1865 he went to Italy, and a year afterward to Paris, where he executed his cycle of 12 cartoons, "In the Valley of Tears," exhibited at the Exposition of 1867 and later bought by the Emperor of Austria. His "Warsaw" (seven scenes, 1861), "Poland" (nine scenes, 1863), "Lithuania" (six scenes, 1863), present a history of Poland intensely patriotic and profoundly sad. Grottger is rather a draftsman than a painter; all his work is good in composition. He is represented in the museums of Cracow and Geneva. Consult his biography by Aren (Vienna, 1878) and Kantecky (Lemberg, 1879).

GROTTO OF THE SIBYL. See SIBYL, GROTTO OF THE.

GROUCHY, grô'shë', EMMANUEL, MARQUIS DE (1766-1847). A French marshal. He was born at Vallette in the Department of Seine-et-Oise, Sept. 5, 1766. He entered the French army at the age of 14 and by 1789 had risen to the rank of captain in the royal bodyguards. In spite of birth and training he threw in his lot with the Republicans and left the royal guard for a line regiment. In 1792 he was a colonel of chasseurs and camp marshal. His services in Savoy and in La Vendée (1793)

were rewarded with the rank of brigadier general (1794); but the decree of the Convention against the nobles forced his retirement for a time. He was reinstated in command in 1795 and took part, as second in command to Hoche, in the Irish expedition (1796) and entered Bantry Bay. In 1798 he fought under Joubert in Italy and later distinguished himself under Moreau in Piedmont. His public protest against the coup d'état of the 18th Brumaire did not prevent Napoleon from utilizing his services, and he took part in the campaign on the Danube, distinguishing himself at Hohenlinden (1800). After the Peace of Lunéville Grouchy was made inspector general of cavalry and employed on various important missions, becoming one of Napoleon's most trusted followers. During the Russian expedition he commanded a cavalry division at Borodino and in the retreat led the "sacred squadron" of officers forming the Imperial bodyguard. Nevertheless, he was refused the command of an army corps in 1813, but at the close of the year accepted a lesser post, and, after fighting bravely against odds, was severely wounded at the battle of Craonne (1814). The Bourbon restoration resulted in Grouchy's loss of rank and banishment, and on Napoleon's return from Elba Grouchy was one of the first to offer his services. He suppressed the Royalists under the Duke of Angoulême and received a marshal's baton as his reward. He received command of a division of the French army sent against Wellington and Blücher. With a force of 35,000 men and 100 guns, he was ordered to operate against Blücher and the Prussians after their defeat at Ligny. These orders he obeyed too literally, for, in spite of the entreaties of his generals, he remained before Wavre, assailing Blücher's rear guard of 15,000 men, while the rest of the Prussian army marched to the field of Waterloo. The absence of Grouchy's army resulted in Napoleon's defeat and caused the Emperor to exclaim: "I should have gained the day but for his stupidity." Grouchy did all he could to repair his fatal error; but the cause of the Empire was lost, and he resigned his command under the walls of Paris. Under the Second Restoration he was proscribed, and passed five years in exile in the United States, residing in Philadelphia. Both parties in France reviled him, and an effort was made to condemn him to death. At last, in 1819, he was restored to his titles and estates, though not given the rank of marshal. He lived in retirement near Caen, constantly defending his conduct in 1815 in pamphlets and letters. After the July revolution of 1830 Louis Philippe recognized him as a marshal of France, and he resumed his seat in the Chamber of Peers. He was forced from time to time to defend himself against the attacks of his former generals of staff, and died May 29, 1847, before he was fully rehabilitated. His most important writings appear in the *Fragments historiques relatifs à la campagne et à la bataille de Waterloo* (Paris, 1830). Consult also: *Mémoires du maréchal Marquis de Grouchy*, edited by his grandson (Paris, 1873-74); the histories of the campaign of 1815 by Jomini (ib., 1841), Charras (Brussels, 1857), Quinet (Paris, 1862); E. Perret, *Le Maréchal de Grouchy* (ib., 1895); Houssaye (ib., 1899); J. B. Jourdan, *Mémoires militaires* (ib., 1899); W. H. Kelly, *The Battle of Wavre and Grouchy's Retreat* (London, 1905). See WATERLOO.

GROUND (AS. *grund*, ground, earth, foundation). In painting, the material with which the canvas or panel is covered preparatory to painting, also called *priming*. In panel painting the Italians generally covered the wood with a sort of plaster, called "gesso," upon which the ground, generally a dull red, was painted. Canvases are known as absorbent or nonabsorbent, single-primed or double-primed, and are thus prepared to meet the taste of the artist, both as regards their character and their color. The Dutch and Flemings chose light tints, varying from white to gray. This is also the present practice. The preparation of grounds was formerly considered of great importance, but modern painters attach less importance to priming. A good uniform ground of light tint is generally acceptable, as the covering of the pigments is now, in all competent work, of so great a body and thickness that the ground counts for little or nothing in the final processes of a painting. In etching (q.v.) the term is used to denote the coat of varnish applied to the plate upon which the design is drawn. In relief sculpture it means the flat surface from which the figures project.

GROUND ALMOND. See CHUFA.

GROUND ANNUAL. In the law of Scotland, an annual rent or annuity paid by the owner of land to a creditor or to the unpaid vendor of the land. Thus, when a vendor sells his land and, instead of taking a lump sum for the price, reserves a sum by way of a perpetual annuity or rent, he conveys the land in fee to the disponee or purchaser, subject to this ground annual, which is a burden on the lands forever after. The vendor or creditor is called the ground annualler, and if the ground annual is not paid he is entitled as a remedy to poind the ground, i.e., seize all the goods, whether of the owner or his tenants, which are found on the lands and pay himself, or he may sue the debtor. But he cannot, as a ground landlord can do in England, poind the goods of the debtor's tenants to a greater extent than the current term's rent or arrears due by them. The ground annual is the Scottish equivalent of the rent charge reserved by the vendor of land in England, and of the fee-farm rent of American law, while poinding is the common-law remedy of distress (q.v.).

GROUND BASS. See *basso ostinato* under BASS.

GROUND BEETLE. A beetle of one of the largest and most important families of beetles, Carabidæ, so called because it lives on or beneath the surface of the soil. About 15,000 species have been described in this family, of which over 100 genera and 1200 species occur in North America. Most of them are predaceous and carnivorous, and both adults and larvæ are swift runners. Their colors are dull metallic blue, green, brown, or black, and they are often ornamented by longitudinal ridges and rows of punctures. Both adults and larvæ feed mainly upon insects, slugs, and snails, but also eat dead animal flesh. Some forms eat young growing corn, young seeds, and ripe strawberries. The family is generally useful to agriculture, for its various members feed on such destructive forms as the potato beetle and its larvæ, the June beetle and cutworm. Certain species even ascend trees in search of cankerworms and plum curculios. Seashore forms feed on the beach flea (*Gammarus*). A number

of blind species inhabit caves both in Europe and America (see CAVE ANIMALS), and other small blind forms dwell under large stones. Not one of this last class has ever been found aboveground, so that each colony may have been confined for generations under its respective stone. Certain other species live under stones at the seashore, which are covered at each high tide, and come out only when the tide is low. Still others occur in the nests of termites; these so strongly resemble the termite queens that one may easily mistake the one for the other, and they probably prey upon the termites. Some forms produce a loud noise by raising the tip of the abdomen and rubbing it against a file on the wing cases. These are the "squeakers" that are sold in Covent Garden market, London. Some forms are aquatic, and others live in wet sands of rivers and pools. Certain adult and larval forms lie awaiting their prey in holes in the ground, from which they bound out when the victim is sufficiently near. The overpoweringly fetid odor of a small species (*Nomius pygmaeus*) is described by Barrows (*Proc. Assoc. Econ. Ent.*, Washington, 1897). In the United States the ground beetles can only be confused with the darkling beetles (*Tenebrionidæ*) of California: the ground beetles have five-jointed tarsi, while the darklings have only four joints in the hind tarsi. The "searcher" (*Calosoma scrutator*) is one of our commonest ground beetles. It is violet, blue, and green, with red margins on the wing covers, and sometimes ascends trees in search of caterpillars. Another species (*Lebia grandis*), which closely resembles the bombardiers and is frequently an enemy of the potato beetle, and the genus *Harpalus*, are other common ground beetles. The last named are black and feed to a considerable extent on cutworms. See Plate of INSECTS.

GROUND CHERRY. See *Physalis*.

GROUND CUCKOO. See COUCAL.

GROUND DOVE, or GROUND PIGEON. A pigeon of terrestrial habits. Several genera have short and rounded wings, with much inferior power of flight to pigeons in general; their legs are longer, and their feet rather adapted for walking than for grasping. They are little arboreal in their habits, but live mostly on the ground. Many of them run very quickly. They have not in general much brilliancy of plumage, but among them are the beautiful bronzewings (q.v.) of Australia. In the southern United States, Bermuda, and the West Indies the name "ground dove" is especially applied to the diminutive little dove (*Otamopelia passerina terrestris*), a plain-colored but handsome bird, which is common in these regions. These doves are less than 7 inches long, are almost always on the ground (though they roost at night in trees), and are common in the roads, where they show little fear of man. They are generally seen in pairs and seem greatly attached to each other. See Plate of PIGEONS.

GROUND GAME. In English law, hares and rabbits, which are by statute (the Ground Game Act, 1880, 43 and 44 Vict., c. 47) subject to destruction by the occupiers of lands to protect their crops from injury and loss. The effect of this statute is to remove from game of this description the protection which, in the interests of the sporting classes, the English law throws about wild animals which are hunted

for sport. Ordinarily the possession of land confers no right to kill or snare game found thereon; but the tendency of rabbits to increase and multiply and their destructive character have led Parliament to make an exception of game of this kind. It appears to be not uncommon in England to provide in a lease of agricultural land that the lessor or lessee, as the case may be, shall "keep down" the ground game. See **GAME LAWS; HUNTING**.

GROUND HOG. 1. The name in the Southern United States of the marmot (*Arctomys monax*), better named "woodchuck" (q.v.). 2. In South Africa, the aardvark (q.v.).

GROUND HORNBILL. A hornbill of the African subfamily Bucconinae, characterized by hollow casques and by habits and an organization suited to terrestrial life. Two species are known, a northern (*Bucorax abyssinicus*) and a southern, the "bromvogel" of the Boers (*Bucorax capensis*). Both are large birds, the Abyssinian being 3½ feet long and of stout build, with a casque open in front. The southern species has the casque closed. Both are wholly black, except the wing quills, which are white. They go about in small flocks and are fearless, but when too much alarmed fly into trees for safety. They eat anything they can find—fruits, insects, crayfish, small reptiles, mice, and snakes. They are noted for their antipathy to snakes and their cunning in overcoming them. When a snake is discovered, they approach it, holding their wings stretched out and flapping the reptile with them until it is induced to seize a feather. Then all the birds attack it and peck it to death. If the snake advances, the bird threatened folds its wings as a shield in front of it and by manœuvres and assaults soon overcomes even the death adder. They place their nests in cavities or broken trees. The natives of South Africa hold this bird in superstitious abhorrence, its alleged foretelling of storms being the least of its sins in their sight. See **HORNBILL**.

GROUND IVY, *Nepeta glechoma*. A plant belonging to the family Labiatae, a native of Europe, widely introduced in America, which grows in the dry soils of waste places, hedges, etc. It has a creeping stem, kidney-shaped crenate leaves, and axillary blue flowers in threes. The plant is stimulant, aromatic, and is used in pectoral complaints. A tea prepared from the leaves was formerly in great repute. The leaves were once used in England for clarifying and flavoring ale, which was then called gill ale, from gill-over-the-ground, an old name of this plant; but this use has been discontinued since the introduction of hops.

GROUND LAUREL. See **ARBUTUS, TRAILING**.

GROUND LING. A small loach (*Leuciscus tænia*) of English rivers and ponds, keeping close to the bottom. See **LOACH; Plate of CARPS AND ALLIES**.

GROUND NUT. A term variously employed to denote the seed of the peanut (*Arachis hypogaea*) and the tubers of certain umbelliferous and leguminous plants, especially *Apios tuberosa*, also called earthnut. See **PEANUT**.

GROUND PINE. See **CLUB MOSS**.

GROUND PINK. See **PHLOX**.

GROUND RAT, or GROUND FIG. A burrowing, ratlike rodent (*Aulacodus swinderianus*) of South and West Africa. It is 2 feet long and has very harsh, bristly hair, flattened, grooved, and brown in color. It is a near relative of the spiny rodents of tropical America, such

as the coypu, hutia, and others of the family Octodontidae.

GROUND RENT. In England, the rent reserved on land leased for a long term of years for improvement. The additional value imparted to the land by the erection of buildings and other improvements constitutes this a safe and convenient form of investment. In England and in some parts of the United States the remedy of distress (q.v.) exists in favor of the ground landlord. Unless otherwise provided in the lease, the improvements constitute fixtures and become the property of the owner of the soil.

The practice of hiring ground for building purposes exists in the United States, and the law is similar to that of England on this point. But in most of the States there is no right to distrain the tenant's chattels in case of failure to pay the rent. The landlord will simply have an action for the amount of rent due, or he may, if it be so provided, dispossess the tenant and resume possession of the premises himself.

In Pennsylvania the term "ground rent" is employed for rent charge or fee-farm rent to describe the rent reserved to the grantor of an estate in fee simple.

GROUND ROBIN. See **CHEWINK**.

GROUND SEA. A West Indian name for a roller, especially in the Bay of Campeche and the north coasts of Honduras, Panama, Colombia, and Venezuela. The sea rises in long swells or billows, usually from a northerly direction, which increase in height as the shore is approached, and break there with great force. The ground sea may occur in a calm and otherwise smooth sea and with no indications of a previous or coming gale. It has been suggested that they are due to "northers" blowing farther to the north. In the Gulf of California and other parts of the world, particularly in the tropics, similar phenomena occur.

GROUND SLOTH. See **GANODONTA**.

GROUND SLUICING. See **GOLD**.

GROUND SNAKE. Any of the small, worm-like serpents of the North American genus *Carphophis*, which are the most lowly of Colubridæ and represent the typical forest burrowers of Central and South America. They are harmless little snakes, about the size of a slate pencil, and with no apparent neck, and are likely to be found under stones or beneath or inside of decayed logs. Frequently they also force their way under the bark of trees, an operation in which they exert considerable muscular effort. The species most commonly seen, and to be found in all the south central states, is *Carphophis amoenus*, which is glossy, opalescent, chestnut brown above, and bright salmon color beneath. Another species or subspecies (*Carphophis vermis*), the "ground worm" of the lower Mississippi valley, is large and purplish brown in color above, while below it is broadly flesh-colored.

GROUND SQUIRREL. A group of squirrels, differing from the true squirrels in the possession of cheek pouches, in having a more slender body and shorter legs, and in living chiefly on the ground, and seldom climbing trees to any considerable height. They are of small size, are longitudinally striped on the back and sides, are extremely active and restless, and emit a peculiar chipping sound. The striped spermophile, or gopher (q.v.), so troublesome in the Northwest, and the chipmunk (q.v.) are familiar American examples. See **Plates of GOPHERS AND SQUIRRELS**.

COMMON GAME BIRDS

COPYRIGHT, 1902, BY DODD, MEAD & COMPANY

1 VIRGINIA RAIL - RALLUS VIRGINIANUS
 2 COMMON QUAIL - COLINUS VIRGINIANUS
 3 CALIFORNIA QUAIL - LOPHORTYX CALIFORNICA

4 WILSON'S SNIPES - GALLINAGO DELICATA
 5 RUFFED GROUSE - BONASA UMBELLUS
 6 PHEASANT - PHASIANUS COLCHICUS

GROUND SWELL. A long smooth swell, frequently occurring along a coast where the ocean bed is not far below the surface for a long distance from the land. While often found in fair or calm weather, it is due to deep-water disturbances from heavy winds. Where the water is very shoal, the swell or roller breaks as it rolls in, forming a series of breakers which smooth down again before reaching shore if the flat is of great extent.

GROUND TACKLE. Anchors and chains, and tackles, ropes, etc., used in working the anchors are included by the general expression *ground tackle*. See **ANCHOR**.

GROUND THRUSH. A *pitta* (q.v.).

GROUND WORM. See **GROUND SNAKE**.

GROUP (Fr. *groupe*, from It. *gruppo*, *gruppo*, cluster, knot, borrowed from the Germanic; cf. OHG. *kroppf*, Ger. *Kropf*, AS. *cropp*, Eng. *crop*). In the fine arts, a collection of figures or objects related to each other and to a general design so combined as to produce a harmonious whole. For the principles of grouping, conventional and otherwise, see **COMPOSITION**.

GROUPEE (probably from Sp. *garrupa*, from the American Indian name). A general name for the fishes of the genus *Epinephelus*, typical of the group *Epinephalinae*, a section of the sea-bass family *Serranidae*. It is the largest, most widely distributed, and most important genus of the *Serranidae*. They are mainly of large size and occur frequently in all the tropical seas, where they are valuable for food. About a dozen species are known on the southern coast of the United States and about the West Indies, where various ones are called *cabrilla*, *cherná*, *guasa*, and *mero* by Spanish-speaking fishermen, hind in the British Islands and at the Cape of Good Hope, and *jewfish* (q.v.) in Florida. They have a robust, powerful form, and are usually greenish gray, or orange brown, varied with many blotches and bars, and with dark fins—on the whole, very handsome fishes. The best-known and most common American species is the red grouper (*Epinephelus morio*), which ranges from Virginia to Brazil. It averages about 2 feet in length and is generally gray, but reddish about the mouth, this color deepening and spreading with age. It remains near the bottom, not far from shore, feeds on crabs and small fish, and when caught offers no resistance. It is an important food fish, but not of the first quality in flavor. Another much smaller species (*Epinephelus maculosus*) is the red hind, or *cabrilla*, so constantly seen in the markets of Havana. The common Nassau, or Bermudan, grouper (*Epinephelus striatus*) is larger; and the rock hind, or *cabra mora* (*Epinephelus adscensionis*), which is also known on the African coast, ranks highest of all as a table fish. The black grouper of Key West (*Mycteroperca bonaci*), also called *aguaí*, represents an allied genus, several species of which are called groupers, rockfish, or bonacia, and are large and important food fishes. The great jewfish, or warsaw (*Garrupa nigrita*), is also sometimes denominated black grouper. See **GUASA**; **JEWFISH**; **ROCKFISH**; **SEA BASS**; **SCAMP**; and **Colored Plate of PHILIPPINE FISHES**.

GROUPS, in MATHEMATICS. See **SUBSTITUTION**.

GROUSE (a false singular, after the analogy of *louse*, *mouse*, as singulars of *lice*, *mice*, from *gricu*, *grise*, *greese*, gray, from OF. *griesche*, gray moor hen, variant of *gris*, *gray*, from OHG.

gris, Ger. *greis*, gray). A game bird of that section of the rough-footed gallinaceous family *Tetraonidae* which includes the larger forms; one of the *Tetraoninae*. They are distinguished among birds of their class by their completely feathered shanks (except *Bonasa*), also by the fact that feathers fill the nasal groove and conceal the nostrils. The toes usually are naked, but are feathered to the claws in ptarmigans (q.v.), and they have pectinations of scales along the edges, which are deciduous. The tail feathers are from 16 to 18 and sometimes even 22 in number; and in shape the tail is acute, rounded, or forked. The orbital region usually is somewhat bare, and there is above the upper eyelid a naked stripe, marked by short, fringe-like processes. Many genera have an inflatable air sac on the side of the neck. Often the sides of the neck are further adorned by elongated feathers. The plumage is thick, soft, and handsome, but gay colors and patterns are absent; blacks, purples, and dark greens occur in some forms, but variegated browns, reds, and grays prevail in most species, and there is usually a considerable difference in color and ornamentation between the sexes and some seasonal changes; one genus (*Lagopus*) turns white in winter. (See **PTARMIGAN**.) The grouse, as a rule, are birds of the forest, but some genera are found in open regions only, and the ptarmigans chiefly inhabit mountain tops. All, however, seek their food principally and nest wholly on the ground. The food consists of seeds, berries, buds, leaves, insects, worms, small snails, and so on, varying with region, season, and opportunity. The nest is a rude bed of leaves, twigs, and the like, and from six to fifteen eggs are laid, which are brownish and spotted—among the ptarmigans very heavily. All except the ptarmigans are polygamous, and the cocks indulge in demonstrative courtships (see **CAPERCAILLIE**), make various sounds with their wings (see below), and contest fiercely for the possession of their harems, as is the habit of most gallinaceous birds. They trust mainly to concealment for safety and remain motionless on the ground or perched in a tree until fear overcomes their prudence, when they spring away with a startling *whir* of the wings and astonishing speed. Hence trained dogs are needed to find and flush them, and much skill in shooting is required to bring them down in flight, but some of the forest-haunting species will not leave the supposed safety of a tree perch and are easily killed. They are favorites of sportsmen wherever they occur, and all are most excellent eating, except the few whose flesh is tainted by their bitter or resinous food. Great numbers are shot for the markets in all northern countries. A brief account of the principal species follows:

Capercaillie and Blackcock. The largest of all grouse is the European capercaillie (q.v.). Next in importance to it in Europe ranks the black grouse, or heathcock (*Lyrurus tetrix*), which is the bird to which the name "grouse" primarily applies, although in popular English speech the red grouse, or moor fowl, is meant. On the Continent it occurs both in mountainous and marshy countries, as far south as the Apennines. It abounds in most parts of Scandinavia, Russia, and Siberia, and is abundant in Great Britain wherever there are extensive moors or favorable spaces for it. The male, which is much larger than the female, and

sometimes weighs four pounds, is a shining bluish black, with a conspicuous white bar on the wings, and a mixture of black and white on the legs; there is a piece of bare scarlet skin over the eye; the outer feathers on each side of the tail are elongated and curve outward, giving it a very peculiar appearance. The female, called "gray hen," is of a rust color, darkest on the upper parts, everywhere barred and mottled with a darker color; the tail is straight and even at the end. The young males resemble the females in plumage. It is a gregarious bird, the different sexes, however, in winter generally keeping in flocks by themselves; and, where they are well protected, they often venture into old turnip and stubble fields to feed.

Red Grouse. This, the ordinary "grouse" of Great Britain, the shooting of which, beginning on August 12, is so important a part of the British sportsman's year, is, properly speaking, a ptarmigan and is described under that title.

Ruffed Grouse or Partridge. The best-known American grouse is the bird called "partridge" in the North and "pheasant" in the South, but it is properly the ruffed grouse (*Bonasa umbellus*). This familiar and highly prized game bird, the flesh of which is incomparably superior to that of any other grouse, is found throughout North America from the Atlantic to the Pacific, from Virginia and northern Georgia to Alaska. It is nearly 1½ feet long, and the plumage is handsomely variegated with gray, red brown, and black. The tail is composed of 18 feathers and is crossed near its tip by a broad band of black or brown. On each side of the neck is a tuft of broad, glossy black feathers. These grouse live in woodland, where their nests are made on the ground at the base of a tree or shrub. The eggs are buff-colored, and a dozen, more or less, are laid. (See Colored Plate of GAME BIRDS accompanying this article.) The hazel grouse (*Bonasa detulina*) of Europe and Asia is a nearly allied species.

One characteristic of this species—its "drumming"—is known to almost every one, yet the method of it is widely misunderstood. The sound is produced by the male only and is most frequent and vigorous in the spring, when it may be regarded as a challenge to other cocks and for the entertainment of the hens; but as it is heard also in summer, and especially in autumn, it cannot be wholly a sexual expression. It may be only an expression of vigor. The manner in which the long, muffled roll, resounding to a great distance through the woods, is produced, was long a puzzle or most fancifully explained. It was at first supposed to be a vocal effort, whence comes the generic name "Bonasa" (from *bonus*, a bull). The true explanation is that the bird sits crosswise upon the chosen log, resting upon the back of the tarsi, its tail spread horizontally, and its head drawn back. "The wings are then raised and stiffened, and drumming commences by a slow, hard stroke with both wings downward and forward; but they are stopped before they touch the body. The rapidity of this motion is increased after the first few beats, when the wings move so fast that only a semicircular haze over the bird is visible, the rapid vibration causing the rolling noise with which the sound terminates." So says Henshaw, and Coues and other field ornithologists confirm the statement.

Prairie Chickens. The Eastern prairie chicken, or pinnated grouse (*Tympanuchus americanus*), is a trifle larger than the ruffed grouse. The general color of the plumage is rufous, with bars and crossings of black; the tail is short and rounded. The male has neck tufts of narrow feathers, the largest of which are 5 inches long; he is more remarkably adorned with two loose pendulous wrinkled patches of skin extending along the sides of the neck for two-thirds of its length, capable of inflation with air, and when inflated resembling in bulk, color, and surface middle-sized oranges. This grouse chiefly inhabits dry open districts, from northwestern Ohio, Indiana, and Kentucky westward to central Kansas and the Dakotas. It was at one time abundant on the Western prairies, but has always become rare as a district has become cultivated and populous, notwithstanding laws enacted for its preservation. It has almost disappeared from the State of Kentucky, where it was at one time so extremely abundant that children were constantly employed to prevent its depredations in the cultivated fields, and multitudes were shot and trapped merely to be thrown away. It congregates in flocks in winter, which break up into smaller parties in spring. The males have many combats at the approach of the breeding season. Their voice is a low "tooting," or "booming." They strut, after the manner of turkey cocks, with wings let down to the ground and neck feathers erected. Certain spots, known as "scratching places," seem to be specially appropriated for their displays and combats, and there considerable numbers often meet about daybreak and disperse again after the sun is up. The food of the pinnated grouse consists of seeds, berries, the buds of trees and bushes, insects, and the like.

A very closely allied species, the American heath hen (*Tympanuchus cupido*), formerly dwelt in favorable localities in the Middle States and southern New England. Long Island and Cape Cod were its strongholds. It was long confounded with the more widely distributed prairie chicken, and is now extinct, except a small band on Nantucket Island, which is dwindling away in spite of such protection as can be given them. In 1890 less than 200 were living on Nantucket and Martha's Vineyard, and in 1912 it was thought that less than 50 remained. See EXTINCT ANIMALS.

The "prairie chicken" of the Northwest is more strictly to be called sharp-tailed grouse (*Pedioectes phasianellus*), of which there is a northern and a southern race. It is easily distinguished by the extra long middle pair of tail feathers and the darker plumage—clear dusky black above, with no buff about the head. The back is variegated with transverse zigzags of yellowish brown, and there are many white spots on the wings; below, the plumage is white, thickly marked with triangular spots of drab. The sexes are alike. In the southernmost parts of their range they associate with the prairie chicken and vary their habits northward only as their environment changes. The northern variety extends from the Saskatchewan valley to the borders of the Arctic regions.

Sage Grouse. This species (*Centrocercus urophasianus*), called in old books "cock-of-the-plains," is a very large grouse which inhabits the sagebrush districts of the western United States. See SAGE GROUSE.

GROUSE, ETC.

1. WILLOW PTARMIGAN (*Lagopus albus*); winter plumage.
2. RUFFED GROUSE (*Bonasa umbellus*); male.
3. BLACK GROUSE (*Tetrao tetrix*); male.

4. CRESTED GUAN or CURASSOW (*Crax alexator*); male.
5. CAPERCAILLIE (*Tetrao urogallus*); male.
6. PRAIRIE CHICKEN (*Tympanuchus Americanus*); male.

Wood Grouse. The remaining species of American grouse are denizens of forests. A very widely distributed form is the Canada grouse, or "spruce partridge" (*Canachites canadensis*), a Western variety of which is called Franklin's grouse, or "fool hen." It is plentiful throughout the forests of Canada, from Maine to Alaska, and when disturbed takes refuge in trees, whence a flock may be shot, one by one, without scaring the others away. In winter it feeds mainly on the leaves and young sprouts of the spruce, which taint its flesh. Its plumage is distinctly barred above with plumbeous and black; beneath it is black, with a white border to the throat and white across the breast and on the sides. The females show a duller mixture of yellowish orange, gray, and black. The Eastern and Western (Franklin's) varieties may be distinguished by their tails: that of the former is rounded and tipped with rufous, while that of the latter is nearly even, black to the tip, and has the upper tail coverts (see BIRD) broadly tipped with pure white. A Siberian grouse (*Canachites falcipennis*) is closely allied to this. A still larger Western wood grouse is the "blue," "dusky," or "pine" grouse (*Dendragapus obscurus*). It approaches the capercaillie in size and may be regarded as the American analogue of the blackcock. Its general color is blackish brown; the wings are lighter and the tail large, rounded, and composed of 18 or 20 feathers. They keep in the coniferous forests for the most part and occur throughout the mountain regions from Colorado to central California and northward. For the Arctic grouse (*Lagopus*), see PTARMIGAN.

Bibliography. Standard works of ornithology and field sports. The fullest general account of American grouse is contained in Coues, *Birds of the Northwest* (Washington, 1874). Consult also: Lesflingwell and others, *Shooting on Upland, Marsh, and Stream* (Chicago, 1890); Sandys and others, *Upland Game Birds* (New York, 1902); Lloyd, *Game Birds and Wildfowl of Sweden and Norway* (London, 1867); Morris, *British Game Birds* (ib., 1891); Millais, *Natural History of British Game Birds* (ib., 1909); Malcolm and Maxwell, *Grouse and Grouse Moors* (ib., 1910); A. S. Leslie, *Grouse in Health and Disease* (2 vols., ib., 1911). See PLATE OF GROUSE.

GROUSE'S DAY, SAINT. An English sporting term, used of the 12th of August, when the shooting season opens.

GROUSSET, grō'sā', PASCHAL (1844-1909). A French politician and author, born at Corte in Corsica. He studied medicine in Paris, but immediately took up journalism, wrote scientific articles for *L'Étendard* and *Le Figaro* under the name "Docteur Blasius," and began to write fiction under the pseudonym "Léopold Virey." He joined Henri de Rochefort in the management of *La Marseillaise* in 1869 and in January, 1870, quarreled with Prince Pierre Bonaparte and sent two seconds to answer his challenge. One of these, Victor Noir, was killed by the Prince. This deepened Grousset's opposition to the Empire, and he attacked it bitterly in *La Marseillaise* and was condemned to heavy fines and repeated imprisonments. He took part in the insurrection of March, 1871, was elected a member of the Commune, and took charge of foreign affairs, but on his attempt to leave Paris in June was arrested and deported to New Caledonia. He escaped with Rochefort and

others (1874), went to England, acted as London correspondent of *Le Temps*, under the name "Philippe Daryl," and returned to Paris in 1881. Defeated in the elections of that year, he was chosen deputy in 1893 and reelected in 1898, 1902, and 1906 as a Socialist. He wrote political sketches, *Le bilan de l'année 1868* (1869), *La conspiration du général Malet* (1869), and *Les origines d'une dynastie, le coup d'état de Brumaire an VIII* (1869), as well as the autobiographic *Les condamnés politiques en Nouvelle Calédonie* (with Jourde, 1876); notes of travel and life abroad, *La vie partout* (1884-88); *Scènes de la vie de collège dans tous les pays* (1881-91); translations of Stevenson's *Treasure Island* and of Mayne Reid's novels; and *L'Héritier de Robinson* (1884); *L'Épave du Cynthia*, with Jules Verne (1885); *Le capitaine Trafalgar* (1886); *Le secret du mage* (1890); *Atlantis* (1896). "Tiburce Moray" is another of Grousset's pseudonyms. As editor in chief of *L'Éducation Physique*, he did much to introduce the English idea of athletics in France.

GROUT. See MORTAR.

GROVE, SIR GEORGE (1820-1900). An English engineer and musical critic, born at Clapham. After studying at the grammar school there he was articled to Alexander Gordon, worked at Napier's factory in Glasgow, was employed in the building of Morant Point Lighthouse in Jamaica (1841) and of Gibb's Hill Light in Bermuda (1845), and then worked on the Britannia Tubular Bridge over Menai Strait. In 1850 he was secretary to the Society of Arts, but resigned this post (1852) to become secretary of the Crystal Palace. Here he first made an effort to educate English musical taste, especially for Beethoven and the Romantic German school. In 1867 he traveled to Vienna with Arthur Sullivan and discovered the part books of Schubert's music to *Rosamunde*. His abilities as a critic of music brought him into connection with the Macmillans. He was editor of their magazine from 1868 to 1883 and of the valuable *Dictionary of Music and Musicians* (1879-89; new ed., 1904-09), and wrote *Beethoven and his Nine Symphonies* (1890). For 12 years he was director of the Royal College of Music. He was knighted in 1883 and made Companion of the Bath in 1894. His work in biblical geography was also important. He wrote articles for Smith's *Dictionary of the Bible* (London, 1864), assisted Stanley in his *Sinai and Palestine* (New York, 1865), and was influential in the promotion of the Palestine Exploration Fund. Consult Graves, *The Life of Sir George Grove* (London, 1901).

GROVE, SIR WILLIAM ROBERT (1811-96). An English physicist, born at Swansea. He graduated at Brasenose College, Oxford, in 1832, was called to the bar in 1835, and began the practice of law, but left it for the study of physics. He was professor of experimental philosophy in the London Institution from 1840 to 1847, was a member for some time of the council of the Royal Society, and in 1847 received the Royal medal for a paper on "The Gas Voltaic Battery." Returning to the law, he became prominent in the South Wales and Chester circuits. He became a justice of Common Pleas in 1871 and in the following year was knighted. Afterward he became judge of the High Court of Justice, from which position, however, he retired in 1887 and thereafter until his death devoted himself to scientific investigations. In

1842 he delivered a lecture on "The Progress of Physical Science," in which he propounded for the first time the doctrine that the so-called forces of nature, such as heat, electricity, etc., are not essentially dissimilar; that they are nothing but different modes of motion, different and mutually convertible forms of something which is called *energy*, and of which the most essential characteristic is its indestructibility. Grove was thus one of the first to grasp and enunciate what Faraday has called "the highest law in physical science which our faculties permit us to perceive—the conservation of force." These views were further developed in the famous essay on *The Correlation of Physical Forces* (1846). Grove published several works on subjects connected with electricity, containing the results of his acute experimental investigations. He also made important improvements in electrical apparatus and invented a well-known galvanic battery which bears his name. See **ELECTRICITY**.

GROVE CITY. A borough in Mercer Co., Pa., 70 miles north of Pittsburgh, on the Bessemer and Lake Erie Railroad (Map: Pennsylvania, A 4). It has a Carnegie library, a branch of the George Junior Republic, and an Odd Fellows' Home, and is the seat of Grove City College, opened in 1884. There are manufactures of carriages, gas engines, foundry products, brooms, motor trucks, etc. The borough owns and operates its water works and electric-light plant. Pop., 1900, 1599; 1910, 3674.

GROVER, (VIER (1829-85). An American soldier, born in Bethel, Me. He graduated at West Point in 1850, served on frontier duty at Fort Leavenworth, Kans., until 1853, took part in the Northern Pacific Railroad expedition of 1853-54, and was again stationed at various frontier forts until the outbreak of the Civil War. He was made a brigadier general of United States volunteers in April, 1862, participated in the Peninsular campaign, was brevetted lieutenant colonel on May 5 for his conduct at the battle of Williamsburg, and on May 31 was brevetted colonel for gallantry at Fair Oaks. He took part in the battle of Glendale, and his brigade was especially distinguished for valor at the battle of Manassas. From December, 1862, until July, 1864, he was in command of a division of the Nineteenth Corps, Department of the Gulf, and directed the right wing of the army in the siege of Port Hudson, La. In October, 1864, he was brevetted major general of volunteers for his conduct at the battles of Winchester and Fisher's Hill; and his gallantry at the battle of Cedar Creek and in the Shenandoah campaign earned for him, on March 13, 1865, the brevet of brigadier general in the United States army. He was also brevetted major general on the same day for services during the whole war. He subsequently returned to frontier duty, served as assistant inspector general of the fifth military district in 1869-70, and while on sick leave died at Atlantic City, N. J.

GROVER, LA FAYETTE (1823-1911). An American lawyer and politician. He was born in Bethel, Me., was educated at Bowdoin College, and in 1850 was admitted to the bar in Philadelphia. He moved to Oregon the following year, began practice at Salem, and served as prosecuting attorney of the Territory and auditor of public accounts in 1862. In 1853 he became a member of the Oregon Legislature, in

which he served, in all, three terms, being Speaker in 1856. He fought in the Indian wars of 1853 and 1855-56, and was United States commissioner to settle Indian spoliation claims against the government in 1854-55. He was a member of the Oregon Constitutional Convention in 1857 and was the first representative of the State in Congress. He was chairman of the Democratic State Central Committee from 1866 to 1870 and was Governor from 1870 to 1877, when he resigned to enter the United States Senate, in which he served one term. He took a leading part in urging legislation to exclude Chinese from the United States. He returned to the Oregon House of Representatives in 1886 and served one term.

GROVES, SACRED. Groves associated with worship or religious rites. Such groves are found among many peoples. In the Authorized Version of the English Bible, the word "grove" occurs frequently as the translation of the Hebrew *'ashôrâh*; this is generally admitted to be an error, and in the Revised Version the word is transferred without attempt at translation. (See **ASHURA**.) In two passages (Gen. xxi. 33; 1 Sam. xxii. 6, margin) "grove" represents the Hebrew *'ēshel*, tamarisk (cf. 1 Sam. xxxi. 13). A shrine may have been connected with the tree mentioned in the last passage, and in the first it is stated that Abraham planted a tamarisk in Beersheba "and called there on the name of Yahwe." There is mention of an oak by the sanctuary at Shechem (Josh. xxiv. 26) and at Bethel (Gen. xxxv. 8); certain other passages are by some interpreted as referring to trees (Authorized Version, "plain," Judg. iv. 11; ix. 6, 37). The tree occurs frequently on Assyrian sculptures. One of the Sumerian names of the city of Babylon was DIN-TIR (the grove of life), probably because the earliest religious centre of the place was a grove where rites were performed that were supposed to be life-giving.

Groves played an important part in connection with the religion of the ancient Greeks and Romans. To nature worshipers they seemed peculiarly appropriate sites for temples and oracles. The Greeks placed groves and forests under the protection of the god Pan and tenanted them with nymphs called dryads or hamadryads. Some of the earliest Greek oracles were supposed to be given at Dodona through the rustling of oak leaves. The famous Grove of the Academy was a public garden outside of Athens, where Plato taught. Perhaps the most famous sacred grove of the ancient Hellenic world was Daphne, situated in the environs of Antioch on the Orontes and consecrated by Seleucus Nicator to the worship of Apollo. The Romans derived the foundation of their religion from Numa, as of their political life from Romulus. Numa was believed to have received his religious instruction in a grove from a nymph Egeria. In this spot, thus consecrated by divine presence, he erected, according to tradition, a temple to the Camenæ. Seventeen miles south-east of Rome was a place, Nemi, where a famous temple was erected in a grove to Diana. See **CAMENÆ**; **DAPHNE**; **DODONA**; **DRYADS**; **NEMI**.

GROVETON. See **BULL RUN**, **SECOND BATTLE OF**.

GROW, GALUSHA AARON (1823-1907). An American politician, born at Ashford, Conn. He graduated at Amherst College in 1844 and was admitted to the Pennsylvania bar in 1847. Four years later he was elected to Congress from

Pennsylvania and continued to be a member of that body until 1863—the first half of the time as a Free Soil Democrat, the last as a Republican. From July 4, 1861, to March 3, 1863, he was Speaker of the House of Representatives; during that term he succeeded in passing a homestead law which he had persistently advocated. He was president of the International and Great Northern Railway from 1871 until 1876, a position which made it necessary for him to live in Texas. In the latter year, however, he returned to Pennsylvania. He declined the Russian mission in 1879. In 1894 he was elected Congressman at large by an overwhelming plurality and held that office until 1903. He lost his fortune in railroads and died destitute.

GROWING CROPS. These constitute a peculiar species of property in English and American law, being for some purposes regarded as real and for others as personal property. In general, while still affixed to the soil, they constitute a part of the freehold. The right to gather and use or sell them is an ordinary incident of the lawful possession of land, whether by the owner or by a tenant for life, for years, or at will. For the purpose of determining the rights of other parties than the possessors of the land, growing crops are divided into two classes, viz., those which are the natural growth of the soil, such as grass, timber, the fruit of trees, etc., called *fructus naturales*; and those produced by labor in cultivating, planting, etc., such as corn, oats, vegetables, and the like, which are known as *fructus industriales*. Both classes, on a conveyance of the land, pass with it to the purchaser unless expressly excepted or unless they have been previously sold by the possessor to a third person. But generally the industrial crop is subject to attachment or levy and sale as personal property, and upon the death of the owner of the land they pass to his personal representative and not with the land to his heir; whereas the natural crop is not subject to levy or attachment and descends as real property to the heir. Furthermore, *fructus industriales* are known as emblements, and may, where they are the result of the current year's labor, be taken by a tenant at will or by the personal representative of a tenant for life, even after the termination of the tenancy, where that occurred without the fault of the tenant and between the sowing and the reaping. See EMBLEMENTS.

As growing crops are often made a subject of sale while still standing, but with a view to their removal by the purchaser, it is evident that questions may arise as to their character as real or personal property under such circumstances. In general, it may be said, a present sale of such a crop, whether natural or industrial, with authority to the purchaser to remove it at his pleasure, vests in him the title thereto as personal property. He may, in his turn, assign the crop to a third person and vest in him the right to gather and remove it. From the moment of the original sale the vendor ceases to have any right in the crop, and his conveyance of the soil will not carry with it any right to the same; while, on the other hand, it is, though still attached to the vendor's land, subject to attachment or levy as the personal property of the purchaser. In contracts for the sale of standing crops it has been held that industrial crops are chattels and that, whether the title is to vest in the purchaser before or after sever-

ance, the agreement is not one for the sale of an interest in land and is therefore not governed by the fourth section of the Statute of Frauds (which requires agreements of that character to be in writing); whereas growing crops, if *fructus naturales*, are before severance a part of the soil and an agreement vesting title in them before severance is governed by that section. In either case, however, if the agreement contemplates the severance of the crop before the property vests in the purchaser, it is dealt with as personal property, and the statute has no application. See CHATTEL; FIXTURE; SALE.

GROWING PAINS. These are pains occurring in youth, particularly when growth is unduly rapid, and appearing in the ends of the long bones where bony growth takes place. The pains are neuralgic or rheumatic in character and are sometimes attended with fever and marked constitutional disturbance. The symptoms usually pass off without any bad results, but inflammation of the bone and irregular prominences sometimes are developed. By many authorities the disease is looked upon as a manifestation of rheumatism.

GROWTH (from *grow*, AS. *grōwan*, Icel. *grōa*, OHG. *gruon*; connected with AS. *grane*, Ger. *grün*, Eng. *green*; cf. also Icel. *gröþr*, *gröþi*, growth). Increase in size or volume. It is not to be confounded with development, which follows or accompanies growth and has to do with the unequal growth of parts of the organism, involving an increasing unlikeness of the different parts, i.e., a differentiation or specialization of the body. Hence development is the formation of a complex from what was originally a simple whole, as seen in the development of the flower or the chick, which both grow and unfold or develop.

Inorganic Growth. Growth, whether that of minerals, of our earth, the solar system, or even of the universe, is primarily due to the action of cosmic energy and of motion. Our solar system, the fixed stars and planets, have had a history, have grown, have developed. Geological history is a process of growth; the continents may be said to have gradually grown to their present size and shape. This is illustrated by the growth or simple increase in size of mineral or inorganic bodies. Crystals, under favorable conditions, grow by the addition of particles to the outside. There is a certain limit to their growth, and crystals are of different sizes—they take on a definite shape, related to the physical and chemical characters of the mineral substance. Verworn, however, thinks the contrast made between the crystal and the organism is "unfortunate." He states that "as regards its physical characteristics the living substance of organisms in its essentials ought to be compared with a liquid," and he goes on to state that "liquids grow by intussusception, i.e., if a soluble body be added to a liquid, e.g., salt to water, the latter dissolves the former and stores the molecules of the soluble body by diffusion between its own molecules, that is, there is here exactly the same process as in the growth of the organism." All this goes to show that growth or increase in size, together with some degree of development up to a certain stage (certainly not up to the cessation of power of reproduction), takes place in the inorganic world.

Organic Growth. As living beings funda-

mentally differ from mineral bodies, so growth in plants and animals is inherently different. Even organic growth is defined as increase in volume, but this does not go far enough. Living organisms are compounds or proteids of mineral matter, forming protoplasm, and they grow by adding to the substances forming their bodies similar substances or food, which is taken within the body by interstitial deposit (intussusception), and these are digested and assimilated. This causes an increase in the volume or bulk of the body. Organic growth is fundamentally a physicochemical process plus a form of constructive energy which we are unable to comprehend. In our present ignorance we invoke vital force, "growth force" or "bathmism," words which do not help us to understand what is behind the phenomenon of increase in volume. Besides simple increase in bulk, there is, as Ryder states, a process of rearrangement, further subdivision of and addition to the material basis of the organism. Growth, also, according to Ryder, proceeds everywhere by "adding to its substance at a rate which corresponds exactly with the rate at which the cube of the dimensions of the growing body is everywhere being increased. All growth is accompanied by movement, for as a cell increases in volume it becomes expanded." "Hence," says Verworn, "growth movements are common to all living substance, but they take place so slowly that they can scarcely be followed with the eye." That the phenomena of growth are powerful sources of energy is exemplified by the well-known fact that trees growing out of crevices in the rock are able by their roots to force apart huge masses of stone. See MECHANICS OF DEVELOPMENT.

Correlation of the Volumes and Surfaces of Organisms. It has been pointed out by Leuckart and by Herbert Spencer that, as organized unicellular bodies increase in bulk, their surfaces become proportionately less, and that this elementary rule of growth very probably leads to the necessity for segmentation or subdivision of the original cellular body, "owing to the unfavorable conditions which continuous growth establishes between the organism and its surroundings, thus developing unfavorable conditions for nutrition, respiration, and consequently for metabolism and growth in general." (Ryder.) But, as Ryder claims, there are "supplementary but equally important principles connected with the geometrical ratios with which the forces of growth, reproduction, and metabolism are simultaneously operative during the development, growth, and evolution of organic types"; and he claims that "without resort to another type or set of adjustments which living beings have effected in relation to the outer world, the present development of organized resistance, and even of animal motion and mentality, would in all probability have been an impossibility."

The primary form of living beings, as the lowest plants and animals, is that of a sphere, the spherical shape being due to gravity and surface tension. But Ryder points out that this shape is one "which is itself unfavorable for growth, with a proportionate and concomitant acquisition of new surface, since of all forms of bodies it is the very one which can contain the greatest amount of matter within the least amount of surface." Hence any departure from this primitive spherical form "will increase the proportional amount of enveloping surface in

respect to the volume of enveloped matter." Hence, first, the tendency of organs to extend indefinitely in the form of a cylinder, with rounded or hemispherical ends, which becomes more and more attenuated as its length is increased, as in the nerves or blood vessels; and, secondly, the formation of flattened disklike bodies, such as the blood corpuscles.

Why do the nerves, blood vessels, etc., grow slender and branched? Ryder answers this question by saying that the indefinite stretching or flattening of a mass achieves the same thing "as splitting it up into a great many slender bars and placing these end to end, or, as splitting up the mass into a great many thin slices and joining these edge to edge. In both cases a great gain of surface is accomplished. Now, if a body branches rapidly, it does the same thing as is done when it is split up into a great many slender bars; namely, it increases its surface in a ratio corresponding exactly to the rate at which the splitting or branching takes place." This is what the vascular system has done. The branching of the blood vessels, with their innumerable ramifications, "is nothing more than a physiological response, developed in a geometrical ratio, to a corresponding rapid increase in the volume of the organized matter to be metabolized." So with the nervous system, "the extreme attenuation of the terminal and central interrelative fibres given off by the ganglion cells of the nervous system means a gain of surface in proportion to mass which is nowhere else paralleled by any active constituent tissue of animal bodies." The enormous development of the irritable surface is, he adds, correlated with the extreme irritability of the nervous system. This is exemplified by the tenacity of the nerve terminals of the auditory organs and the other organs of sense; while it is the most attenuated structures known to the histologist which are the most irritable, as cilia, flagella, etc. This subject is further illustrated by the stretching of plasma into threads, as the pseudopods of many protozoans, the branches and filaments or flattened leaflike forms of gills, as well as the roots and branches of plants. Thus, organisms higher than spherical protozoa have, after life began, proceeded, during their growth in volume, to develop surfaces according to this rule of geometrical progression.

Growth as a Function of Cells. As organisms are one or many celled, and as the many-celled plants or animals arise from a single cell (the seed or egg), growth is primarily a function of cells. During growth the cells undergo rapid multiplication, which causes the body to increase in weight, this being determined by the number of cells and their average weight. Increase in age affects the different cells unequally, and hence some cells are dividing while others are not. In the mature body a minority of the cells are in process of division, while the majority are not. (Minot.) Very few observations have been made as to measurement of the growth of animals. Semper measured that of the pond snail; but those of B. A. Gould and of H. P. Bowditch on man are more extensive and reliable. In animals, according to Minot, the rate of growth in weight for man, and for some few other animals, increases for about half the period of growth, then remains approximately constant for a short time, and finally slowly diminishes until it becomes zero.

Factors Concerned in Growth. These are

chiefly external, such as abundance of food and other conditions of existence, as heat, light, etc. Hatschek assumes that in growth the simple molecule of living proteid continually attracts elements to itself from the food. Growth is more rapid in a well-fed animal or plant. Development of the higher organisms is usually introduced by a period of rapid cell division with almost no growth. This is followed by a period of rapid imbibition of water, during which the tissues are stretched, and growth occurs with great rapidity. Later still, the cell walls thicken, intercellular substance is deposited, and the dry weight slowly increases. This is the special period of assimilation and secretion. In the development of the frog the percentage of water rises to 96 when half a month old and then falls slowly. At six weeks from fertilization the human embryo consists of 97.5 per cent water, but at birth the proportion of water has fallen to 75 per cent, and in adult man it is 66 per cent. The growth processes may be classified as "transitory," in which growth is followed by a return to the former size, and "permanent" or developmental, in which there is a persisting enlargement which plays an important part in development. Transitory growth may be illustrated by the enlargement of those cells which cause the leaflets of the sensitive plant to turn; this enlargement is only temporary. Developmental growth is illustrated by the increase of the embryonic plant. Growth phenomena may also be classified as "diffused" or "localized." Diffused growth affects the entire individual or many of its parts, whereas in localized growth the process is confined to a limited region. In early development the whole animal swells by diffused growth; later, the separate organs enlarge as a result of localized growth. Although cell division usually accompanies growth, it is in no way the cause of growth. The curve of growth is obtained by joining with a line the tops of ordinates erected from a horizontal base line at equal time intervals, the height of the ordinates being proportional to the volume of the organism. A study of these growth curves shows that absolute increments of size are at first small, rapidly increase to a maximum, and then decline to zero. This decline to zero is not a necessary property of protoplasm, but it is an adaptation to the limited size which is advantageous to most animals.

Various external agents influence the rate of growth as follows: 1. *Chemical Agents*.—The assimilative and secretory are chemical processes. They require certain materials to work upon. These materials are the food of organisms. The principal elements found in the body are carbon, oxygen, nitrogen, calcium, phosphorus, potassium, sodium, chlorine, magnesium, sulphur, silicon, and iron, which enter the body in various combinations, while each plays a definite rôle. Since phosphorus is especially abundant in embryonic tissue, its peculiar importance for growth is indicated. Potassium is probably of great importance in imbibition. Iron is essential in the early processes of cell division. Besides the inorganic elements organic food is essential to the growth of animals; various chemical agents that are not built up into the organic body may accelerate growth by acting as a stimulus. Certain poisons do this.

2. *Water*.—The imbibition of water is an important growth process. Developing embryos are usually found in moist situations.

3. *Density of the Medium*.—The rapidity with which water is imbibed depends largely upon the osmotic pressure of the medium, and this is determined by its density. Regeneration of marine animals is hastened in dilute sea water, retarded in a concentrated solution. Pond organisms develop with abnormal slowness in a salt solution.

4. *Molar Agents*.—Quiet facilitates growth, and after a wound excessive growth takes place along the cut edge.

5. *Light*.—Light may retard or accelerate growth in different cases. Its effect is usually unfavorable to growth in young plants, and the growing tissue of vegetative plants is usually protected from the sun's rays. So, likewise, among animals the embryo is usually sheltered from the light by being carried in the maternal body, covered by eggshells, or placed in dark places. Acceleration of growth by light, on the other hand, takes place in certain aquatic algæ, especially diatoms, and in certain aquatic embryos (tadpoles, fish embryos, and young pond snails). In these processes of retardation and acceleration not all the component rays of white are equally effective. Thus, in general, the long-waved rays have no more effect than darkness except in forming starch. It is the active rays which retard the growth of aerial organisms, and it is the actinic rays which accelerate the growth of aquatic organisms.

6. *Temperature*.—Heat has a well-known effect on the rate of growth. For every organism there is a temperature to which it is attuned—at which growth takes place faster than at any other. As we lower the temperature, the rate of growth gradually and slowly diminishes; as we raise the temperature, the rate of growth diminishes more rapidly. The temperature of maximum growth (called the optimum) is closely related to the temperature to which the organism is normally subjected. See EVOLUTION.

7. *Extent of the Medium of Volume*.—Among the most remarkable factors determining the extent of growth of an animal is the amount of space it has to move in. It is well known that small trout occur in small brooks and large ones in greater streams. Some years ago Karl Semper reared pond snails in vessels containing different quantities of water. He found that there was a direct relation between the volume of the water and the length of the shell at the end of eight weeks. This experiment has since been repeated with care, and the result confirmed. The explanation of this phenomenon is difficult. It may be that there is a self-adjustment of the size of the snail to the space at its command. In fact, in all the phenomena of growth the phenomena of adaptation are striking.

As to the external factors which influence growth, we are very ignorant. Morgan speaks of a few isolated cases. From experiments in cutting off the tail of a minnow, in which particular regions are held in check while others grow at the maximum rate, the results demonstrate some sort of a formative influence in the new part. "An excellent example of an internal factor," Morgan says, "is found in the interrelations of the parts of the organism to each other." A most important factor in the growth of organisms of the present day is that of heredity (q.v.), for the existing forms of life are the descendants of innumerable generations. Growth, development, and reproduction are now

proceeding in grooves as it were, or along more or less definite paths, in accordance with long-established laws, and heredity undoubtedly affects the mechanism of growth. As Cope has well said: "In bathmism we see the resultant of innumerable antecedent influences, which characterize the life of living beings."

When a worm multiplies by budding or by self-division, the new part grows or begins to form in a zone near the end of the body. This zone is called the "growing zone," or the "zone of proliferation," and here the nuclear substance is abundant in proportion to the enveloping protoplasm. This zone is still more definite in the embryos of all arthropods. It is situated between the penultimate and the last segment of the body, and from this zone the new segments arise and grow. It is also interesting to observe, as Packard states, that in striped or spotted caterpillars, as well as in lizards, the change in the origin and shape of the markings appears to originate at what corresponds to the zone of formative cells and then passes forward towards the head.

Growth is related to *longevity* (q.v.). That men, says Minot, are larger than rabbits because they grow for a longer period, is a common observation; but the facts tabulated by him show the curious result that the average daily increments in growth are nearly the same in man and rabbit. "On the other hand, rabbits attain a larger size than guinea pigs, not because they grow longer, but because they grow much faster. The rate of growth in guinea pigs and rabbits is not very different, as was to be expected in so nearly related animals; but it is sufficient to produce a great inequality in the final size, because the effect of the difference is accumulated, like compound interest on capital. The rate in man (0.02 per cent) is only $\frac{1}{10}$ of the rabbit's (0.5 per cent). This comparison renders it still more strikingly evident that the larger size of man depends on the greater duration of growth." The percentages given by Minot may, he says, be called the specific coefficients of growth. Together with the duration of growth, they determine the ultimate size of the organism. As a rule, the larger an animal, the longer it lives, and this, adds Minot, confirms the idea that in large animals senescence proceeds more slowly than in smaller ones. See *SENESCENCE*.

Growth is related to *great size*. The question why the elephant is so much larger than the mouse, the whale than the porpoise, cannot be answered at present; but from the foregoing statement the causes appear to be connected with nutrition and longevity as well as the conditions of the environment. Why the moa (*Dinornis*) or the apyornis, whose legs were as thick as a man's hat, attained such a colossal size compared with the sparrow, is apparently due to its mode of life and its environment. Birds which have the full use of their wings and are constantly on the wing, live faster than running birds and are of small or moderate size. The ancestors of the running bird, as the ostrich and moa, were undoubtedly flying birds, with keeled sterna; but owing to the isolation of the moa on the New Zealand Islands, and to the absence of mammalian and other enemies, it is evident that by lack of exercise, by food being abundant in the soil, and by not being compelled to fly after their prey, they gradually increased in bulk and weight. Here we see a direct relation between the conditions of life and change of habits and

size. Turtles are slow liver and are known to attain a very great age.

The matter of longevity and also of size may also be dependent on the nature of the cells. Minot states that the most characteristic peculiarity of advancing age, of increasing development, is the growth of protoplasm in proportion to the size of the nucleus. "The possession of a relatively large quantity of protoplasm is a sign of age"; i.e., the amount of protoplasm in the cell is large in maturity and old age as compared with the nucleus. He refers to Bütschli's investigations, which indicate that in bacteria a nucleus is present and very large, while the protoplasm enveloping it is minimal in amount. This fact should be correlated with the extraordinary power of proliferation or reproduction in these organisms, indicating that a small proportion of protoplasm is essential to rapid growth. This presence of a minimum amount of protoplasm is a "young" character, a characteristic of youth. Certain sea fishes, as also starfishes, continue to grow for very long periods, and their cells have the "young" character, containing very little protoplasm. On the other hand, there are certain types which do not grow beyond a definite size, and in these, as, e.g., among the insects, the cells are characterized by having a great deal of protoplasm in proportion to the nucleus. In this connection it should be remembered that May flies and dragon flies in the Carboniferous period were gigantic in size, their wings expanding from 10 to 20 inches, and throughout geological history we have cases of types becoming colossal before becoming extinct. Thus, overweight and oversize may be a sign of weakness and decrepitude—of senescence of the type. As the result of prolonged observation on guinea pigs, weighing them regularly at fixed ages from birth until maturity, Minot shows that even from the time of birth there is a steady loss of vitality; the animal begins, so to speak, to die as soon as it is born. The amount of protoplasm in the cells increases with age. This loss of growth power is equally demonstrated in the case of man and presumably of all mammals. The passage from youth to old age is called "senescence" (q.v.), and the procreation of the young "rejuvenation" (q.v.).

GROWTH, IN PLANTS. Three ideas are involved in the term "growth" as applied to plants: first, increase in size; second, formation of new material; third, attainment of maturity. Of these three, increase in size is the predomi-

nant one; but in special cases of growth no appreciable increase in size occurs, although there may be the formation of new material and even, on attainment of maturity, a rather complex structure. Again, organisms may increase in size and attain mature form without the formation of any new living material, the whole course of development depending merely upon the absorption of water and the rearrangement of material already present. The plant passes through three phases of growth, which are by no means sharply distinguishable from one another and are established merely for convenience.

FIG. 1. Longitudinal section of the growing point of the shoot of horsetail (*Equisetum arvense*). The apex is occupied by a tetrahedral cell, which is continually dividing. Lateral leaves, and just above them the oldest lateral growing points, are forming.

Every plant begins its history as a single cell. The growth and differentiation of this one cell may comprise its whole life history, which will then be correspondingly brief; or, the first cell may divide, and its daughter cells continue dividing, until the plant is constructed of a mass of cells. These may remain practically alike, or they may differentiate into unlike groups of cells, each group constituting a tissue. (See HISTOLOGY.) In this case its life history will be more complex and will proceed as follows: at first the cells are all similar in size and form, and each will show these characteristics: (1) granular protoplasm

FIG. 2. Longitudinal section through the growing point of the shoot of a seedling dicotyl. A group of cells, instead of one as in *Equisetum* (Fig. 1), occupies the apex.

FIG. 3. Longitudinal section of growing point of root from *Selaginella*. The triangular cell near the tip is the apical cell, dividing continually to form (behind) the tissues of the root shaft and (before) the root cap.

while others remain in this stage are to be found at the ends of the axes, at which place they constitute the so-called growing point (Figs. 1, 2, 3). In

of each rootlet and the tip of each branch is occupied by such a region of formative tissue. Even cells which have passed into a later stage of growth may return under certain conditions to the formative stage. This occurs normally in those stems which increase in thickness and form one or more growing zones concentric with the surface. A division of the cells in these zones is mainly in a plane parallel to the surface; the additions increase the diameter of the axes. When a plant is wounded, cells adjacent to those injured may regain their power of division and produce a callus, which closes and heals the wound.

Enlargement. In the second phase of growth, enlargement, division of the cells has practically ceased, and the greater part of the increase in size is due to the rapid absorption of water, which is secreted by the protoplasm in the form of drops in its substance. As these increase in number and volume, they often unite, and usually by the time increase in size has been completed all have united to form one large sap cavity (vacuole), in which the protoplasm constitutes a layer pressed firmly against the cell wall (Fig. 5). Since this mode of growth involves a relative unimportant increase in the

FIG. 4. Longitudinal section of growing point of root of corn (monocotyl). Apex (where cell rows converge) occupied by a group of cells, instead of one as in *Selaginella* (Fig. 3). The root cap is well developed.

FIG. 5. a, several young cells from the cortex of a root of the bean; b, one from the same region after attaining its full size. Drawn to same scale. The volume of b is more than 1700 times that of a, though, as the wrinkling shows, it is not turgid.

amount of living protoplasm, it is extremely economical. In this feature the growth of plants differs most strikingly (in degree at least) from that of animals. During this second phase of growth the volume of the cells may increase

1000 to 1500 fold. Characteristics of the cells in this phase are, therefore, (a) rapid increase in volume, and (b) high percentage of water. The rate of enlargement during this phase is not uniform; nor does it persist indefinitely, even though the conditions may be constantly favorable. The increase in volume, at first relatively slow, becomes more and more rapid until it attains a maximum rate, from which point it rapidly declines and soon ceases altogether. The total period of enlargement is spoken of as the grand period of growth (Fig. 6).

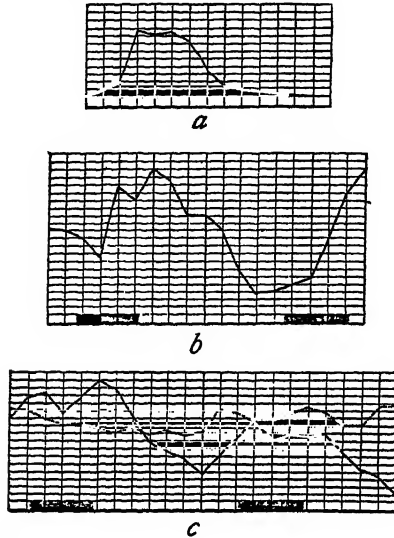

FIG. 6. DIAGRAM SHOWING PERIODIC VARIATIONS IN GROWTH.

The horizontal lines show equal increments of growth; the vertical lines equal intervals of time. a, grand period of growth in root of bean (*Vicia*); b, daily period of growth in stem of barley; c, daily period of stem of mustard (solid line) and of leaf of onion (broken line). In b and c the shaded bars represent hours of darkness.

It lasts in different plants from 5 to 15 days, depending on various factors which influence both duration and rate. Since the formative regions are located at the tips of the axes, the regions of enlargement may be found a short distance from the tip. In roots the elongating region is very short, comprising usually less than 10 millimeters (0.4 inch). In stems, however, the elongating region is usually from 10 to 20 centimeters in length (4 to 8 inches), and in climbers may even reach 50 to 80 centimeters (20 to 30 inches).

The rate of enlargement (especially of elongation) is likely to be different on different sides of a bifacial or radial organ. In that case these organs will be correspondingly curved. The region elongating most rapidly will become convex and the opposite side concave. This curvature, which is determined by unknown, possibly internal, causes, is called *nutations* (q.v.). The curvatures of bifacial organs, which are also dorsiventral, are further distinguished by the terms "epinasty" and "hyponasty." An epinastic curvature is the effect of greater growth upon the dorsal side; a hyponastic curvature, upon the ventral side. Similar variations in growth are induced by the action of external agents; thus, epinasty produced by the action of the light is designated *photoepinasty*, etc. Nutation is exhibited by young leaves of ferns, which are

rolled upon themselves in a coil and straighten as they grow older; by the leaves of buds and flowers, whose closed form (bud) is due to the more rapid growth of the outer faces and their "opening" to the more rapid growth of the inner faces. The rate of enlargement is affected in various ways by external stimuli (see *IRRITABILITY*), which will be considered later. Examples of very rapid growth are furnished by the filaments of the stamens of wheat, which elongate, as the flower opens, at the rate of 1.8 millimeters (0.07 inch) per minute (about the speed of the minute hand of a man's watch); by the leaf sheath of the banana, which grows at the rate of 1.1 millimeters (0.04 inch) per minute; by the flower axis of the century plant, which grows at the rate of 15 centimeters (6 inches) in 24 hours; and by the leaves of *Victoria regia*, which increase in diameter at the rate of 30 centimeters (12 inches) in 24 hours. The rate of growth is studied by means of the auxanometer (q.v.).

Internal Development. The third phase of growth is the phase of internal development. No increase in size occurs during this phase. It is marked by increase in thickness of the cell walls (unequal in different parts), by the death of some cells, and by other less noticeable changes. Since the growth of different groups of cells (tissues) is rarely equal, it follows that the tissues—some compressed, some stretched—firmly united as they are, finally exert strains upon one another in various directions, which serve an important purpose in maintaining the rigidity of the plant.

Factors on which Growth is Dependent. The conditions of growth are four: first, an adequate supply of constructive materials, which are necessary for the formation of a new organic substance, protoplasm, cell wall, etc.; second, an adequate supply of water, which is necessary for the enlargement of the cells; third, access of free oxygen, which is necessary for normal respiration, by which the requisite energy is set free; fourth, a temperature within definite limits, which, however, vary with different plants, the minimum being approximately 0° C. (32° F.), and the maximum 40° C. (104° F.).

The effects of external agents upon growth are numerous and profound. Scarcely any change in external conditions can occur without modifying the growth of the plant. These effects may be unequal in different tissues or in different parts of an organ, or they may be uniform, so that the total growth of the part is retarded or accelerated. The most noticeable effects, naturally, are those which produce curvature and consequent displacement of certain parts. (See under *CHEMOTROPISM*; *ELECTROTROPISM*; *GEOTROPISM IN PLANTS*; *HELIOGRAPHISM*; *HYDROTROPISM*; *RHEOTROPISM*; *THERMOTROPISM*; *THIGMOTROPISM*.) The most important effects upon the general rate of growth are those produced by temperature and light. In general, growth is accelerated by increased temperature up to the optimum point, but further increase beyond the optimum retards it. On the other hand, growth seems to be definitely retarded by light. Growth rate is also modified by turgor. In some forms maximum growth goes with maximum turgor, while in others maximum growth occurs when the turgor is slightly below the maximum. Since under ordinary conditions plants are subject to daily variations in temperature and light, there arises a corresponding daily variation, or "daily

period," in the rate of growth (Fig. 6). Since the temperature rises during the day and diminishes during the night, the general effect will be to accelerate growth during the day and retard it during the night. Turgor is generally lowest during the day, owing to rapid evaporation. In different plants this may give a retardation or acceleration in growth rate. As light, however, retards growth during the day, the final effect will be a resultant between these three interacting factors, the effect of light as a rule predominating. It is also possible that food supply also sometimes enters in as a factor in the daily period. (See PHOTOSYNTHESIS.) The minimum usually occurs in the afternoon and the maximum after midnight, and this variation persists for many days, if plants be kept in continuous darkness.

Correlation. The growth of one part of the plant is directly affected by the activity of another. Thus, the failure of a certain organ to develop may determine the development of another to an unusual extent or in an unusual form. This mutual influence of plant organs, both as to their formation and the course of their development, is termed "correlation." Examples of correlation may be found in the development of the stipules of the pea and the pansy to an extraordinary size when the leaf blades are removed early; in the continued blossoming of plants when fruit is not permitted to form; in the symmetrical or grotesque shaping of a plant made possible by pruning; in the transformation of an underground branch of the potato, which would normally form a potato at its tip, into an aerial shoot bearing leaves and flowers when the aerial parts are cut away.

GRUB (connected with OHG. *grublon*, Ger. *grübbeln*, to dig, and Goth., OHG. *graban*, Ger. *graben*, AS. *grafan*, Eng. *grave*). The name commonly given to the larva of a coleopterous insect. Thus, the larvæ of the May beetles of the genus *Lucinosterna*, found commonly in the soil, are known as white grubs. The larvæ of certain flies (*Diptera*) are also called grubs, although the term "maggot" is now specifically applied to them. Thus, "grubby cattle" means, in the West, cattle affected by the ox bot, or ox warble, the larva of the dipterous insect *Hypoderma lineata*. The grub of sheep is also the larva of a fly (*Oestrus ovis*). See BEETLE; BOT; WARBLE FLY.

GRUBB, SIR HOWARD (1844-). An Irish astronomer and instrument maker. He was born in Dublin, Ireland, July 28, 1844, being the son of Thomas Grubb (q.v.), the famous optician, whose business he succeeded to in 1868. He was educated at Trinity College, Dublin. Under his direction the optical establishment founded by his father achieved increased reputation, and constructed a large number of telescopes, including those for the University of Oxford and the observatory at Potsdam. Sir Howard Grubb was knighted in 1887 and in 1912 received the Boyle medal. He was vice president of the Royal Society of Dublin, honorary secretary of the Royal Dublin Society, president of the Photographic Society of Ireland, and a member of the Board of Irish Lights Commissioners.

GRUBB, THOMAS (1800-78). A distinguished Irish optician. He was born at Kilkenny, Ireland, and in the course of his life constructed the equipment of some of the most important astronomical observatories. At an

early age he gave up business for engineering and soon gained a high reputation as a maker of fine machinery and instruments, many of which were of his own invention. He also exhibited great skill as an optician, particularly in the construction and mounting of reflecting telescopes. He constructed the metallic speculum for the Melbourne Observatory reflector, which had a diameter of 4 feet and was used in making photographs of the moon. Grubb was elected a fellow of the Royal Society in 1864, the Royal Astronomical Society in 1870, and was for many years a member of the Royal Irish Society. To the journals of these societies he contributed papers on astronomical instruments and optics.

GRUBBER. See CULTIVATOR.

GRÜBEL, grü'bel, JOHANN KONRAD (1736-1809). A German folk poet, born at Nuremberg. He became known by his poems in the Nuremberg dialect, which first appeared under the title *Gedichte in Nürnberger Mundart* (3 vols., 1802). These poems reflect the life of the old German city and entitle Grübel to be ranked with such eminent dialect poets as Hebel, Groth, Reuter, and others. Another volume entitled *Korrespondenzen und Briefe in Nürnberger Mundart* appeared in 1808.

GRUBER, HERMANN (1851-). An Austrian Jesuit author, born in Kufstein, Tirol. He was educated at the Stella Matutina in Feldkirch and at other Jesuit schools (Gorheim; Münster; Blyenbeck, Holland; Ditton Hall, near Liverpool; etc.), for a time taught at Mold, Wales, in a school founded by exiled French Jesuits, and in 1899 returned to Feldkirch. He wrote elaborately on various subjects of polemic interest in the publications of the Maria-Laach, in Herder's Catholic *Kirchenlexikon*, in the *Catholic Encyclopædia*, and in *Civiltà Cattolica* (Rome), and published many books including *August Comte* (1889; trans. into French, Italian, and Polish), which was supplemented by *Der Positivismus, 1857-91* (1891), and several revelations of Freemasonry, such as *Mazzini, Freimaurerei und Weltrevolution* (1901; also in Italian).

GRUBER, grō'b'ēr, JOHANN GOTTFRIED (1774-1851). A German scholar, born at Naumburg. He studied at Leipzig, was employed for some time in editorial work on the *Literaturzeitung*, and held professorships of philosophy at Wittenberg and Halle successively. He was the author of a large number of works on historical and critical subjects. With Ersch, after the death of Hufeland, he edited the monumental *Allgemeine Encyclopädie der Wissenschaften und Künste*. Among his independent publications are: *Geschichte des menschlichen Geschlechts aus dem Gesichtspunkte der Humanität* (1806); *Wörterbuch der Aesthetik, der schönen Künste, etc.* (1810); *Wörterbuch der antikklassischen Mythologie* (1810-15). He also edited Wieland's *Sämtliche Werke* (53 vols., 1818-28), to which he added a biography.

GRUB STREET. A London street, described by Dr. Johnson as "originally the name of a street near Moorfields, much inhabited by writers of small histories, dictionaries, and temporary poems, whence any mean production is called *Grub Street*." Employed in a disparaging sense by Andrew Marvell, it was frequently used by Pope, Swift, and other wits. The *Grub Street Journal*, which ended in 1737, was one of the most entertaining of the old newspapers and contained contributions from the partisans

of Pope attacking the Dunces. The locality is now termed Milton Street. Consult F. H. Hadden, *London Street Names: Their Origin, Significance, and Historic Value* (London, 1896), and A. S. Adcock, *A Booklover's London* (New York, 1913).

GRUGRU (native name). The grub or larva of *Rhyncophorus palmarum*, an insect of the weevil family (Curculionidæ), inhabiting Guiana, Cuba, Porto Rico, and other tropical parts of America. The perfect insect is 1½ inches long. The grub is an ugly, inactive creature of a whitish cream color, as long and as thick as a man's thumb, and lives in the soft and spongy central part of the cabbage palm (*Euterpe oleacea*), on which it feeds. It is extremely fat and oily and is esteemed a great delicacy, not only by the Indians, but by many of the European colonists and their descendants, particularly the Dutch. It is cooked by roasting, and eaten with bread and butter, after being sprinkled with cayenne pepper. The fragrance of roasted grugru is said to be most tempting to epicures. A cabbage palm which has been cut down often becomes in a short time almost filled with grugrus; but they are usually obtained from the upper part of the stem of growing palms, near the crown.

GRUGRU PALM NUT. The nut of a number of species of *Acrocomia*, particularly of *Acrocomia lasiopatha* and *Acrocomia sclerocarpa*. These palms are natives of South America and the West Indies, growing 20 to 40 feet in height. The leaves are large and drooping. The fruit is about the size of an apricot, and it consists of a thin edible pulp and a hard nut, the kernel of which contains from 52 to 56 per cent of a white crystalline fat that resembles coconut and palm-nut oils. The trees annually bear 1 to 4 clusters of nuts, the bunches weighing about 10 pounds each. The nuts have been shipped to England for the extraction of the oil, and for several years the oil has been imported under the name "Mocaya oil." A valuable fibre is obtained from the leaves of many of the species of *Acrocomia*.

GRUIC, grū'ich, SAVA (1840-). A Serbian statesman, born at Kolare. He was chief of the artillery division, under General Tchernayeff, in the Serbian army during the war with Turkey in 1876. At the outbreak of the Russo-Turkish War of 1877 he was made Minister of War and afterward was sent to Bulgaria as the first diplomatic representative of Serbia. In 1877 he returned to Belgrade and thereafter was twice Minister of War and three times President of the Ministry. He was Serbian Ambassador at Constantinople from 1889 to 1893 and again from 1900 to 1903, and was Premier again from that year to December, 1904. He was the leader of the radical party, forced King Peter to grant many reforms, and took a prominent part in the formation of the Balkan Alliance.

GRUMBKOW, grump'kō, FRIEDRICH WILHELM VON (1078-1739). A Prussian general and statesman, born in Berlin. He studied at Utrecht and Leyden from 1690 to 1693. He enjoyed the favor of Frederick William I, who employed him in both military and administrative matters. As the head of the War Department of Prussia, he increased and improved the army, and in civil capacity he introduced important tax reforms and considerably improved the administration of the municipalities. In

his foreign policy he was not so fortunate, and his pro-Austrian leanings involved Prussia in numerous difficulties abroad.

GRUMB'LER, THE. A comedy by Sir Charles Sedley, printed in 1702.

GRUMENTUM. An important town in ancient Italy, in Lucania (q.v.), 33 miles south of Potentia. In 215 B.C. Hanno, a Carthaginian general, was defeated near this town; Hannibal made it his headquarters in 207. Later, in Sulla's time, a Roman colony was established there. Ruins of a large amphitheatre, of a Roman theatre, of *therma*, and of a Roman portico have been found about ½ mile south of the modern Saponara. Inscriptions of some importance have also been found on this site. Consult Nissen, *Italische Landeskunden*, vol. ii (Berlin, 1902).

GRÜN, grun, ANASTASIUS. See AUERSPERG, A. A.

GRÜNBERG, grun'běrk. Capital of the district of the same name in the Prussian Province of Silesia, on a tributary of the Oder, 32 miles northwest of Glogau (Map: Germany, F 3). It lies between two vine-clad hills and is noted chiefly for the sparkling wine which it has produced for centuries. Other products are cloth, thread, carpets, twine, glass, rope, yarn, paper, brandy, machinery, bridge materials, and flour. Lignite is mined. Pop., 1900, 20,983; 1910, 23,168.

GRUND, grunt, FRANCIS JOSEPH (1805-63). An American author, born in Bohemia. He came to the United States in 1826 and in 1854 was sent abroad to represent the United States in consular and diplomatic positions. He contributed frequently to the press and wrote a number of books, essays, and addresses, among them: *Americans in their Moral, Religious, and Social Relations* (1837); *Aristocracy in America* (1839); *Thoughts and Reflections on the Present Position of Europe and its Probable Consequences to the United States* (1860); and a campaign *Life of Gen. William Henry Harrison* (1840), written in German.

GRUND, FRANZ FRIEDRICH ALEXANDER (1814-92). A German engineer. He was born at Heinrichau, Silesia, and was educated at Breslau and Berlin. In 1854 he was appointed inspector of hydraulic engineering in the Rhine Province, and in 1862 he became advisory counselor in the Prussian Ministry. Among the hydraulic engineering works executed by him are those on the river Wupper and in Alsace-Lorraine. He also planned the Rhine-Meuse Canal, the harbors at Emmerich and Oberlahnstein (at the junction of the Lahn and Rhine rivers), and the extension of the harbor at Ruhrort, at the junction of the Ruhr and the Rhine. His memorial on the waterways of Alsace-Lorraine became the basis upon which the boundaries, as affecting rivers, canals, and so on, were subsequently determined in the annexed provinces.

GRUNDEMANN, grun'de-mán, REINHOLD (1836-). A German Protestant theologian, born in Bärwald, in the Neumark, Brandenburg. He studied at Tübingen, Halle, and Berlin, after which he occupied himself with pastoral duties from 1861 until 1865, when he devoted himself to the study of missions in England, Holland, and North America, concerning himself especially with their geographical aspects. As the result of his labors, he published *Allgemeiner Missions-Atlas* (1867-71, 1872, with maps), an

amplification of his previous *Missionsweltkarte* (3d ed., 1886). In 1869 he was made pastor in Mörz, near Belgiz. His works include: *Biographie des Missionärs J. F. Riedel* (1873); *Die Entwicklung der evangelischen Mission* (1878-88); *Missions-Studien und Kritiken in Verbindung mit einer Reise nach Indien* (2 vols., 1894-98); *Kleine Missions-Atlas* (1883; 3d ed., 1905).

GRUNDTVIG, grun'tv'ig, NIKOLAI FREDERIK SEVERIN (1783-1872). A Danish theologian, historian, and poet. He was born at Udby, Zealand, was educated at Copenhagen, was appointed pastor of Præstø, Zealand, in 1821, and in 1822 became assistant clergyman of the church of the Saviour at Copenhagen. He first attacked the ruling rationalism in his *Kirkens Gjenmæle* (1825), a work which aroused bitter controversy and caused him to be deprived of ecclesiastical office from 1826 to 1839. In 1861 he was appointed Bishop. He was a champion of religious and civic freedom and advocated the severance of church and state. His views led to the formation of a school which succeeded in getting many important reforms. In addition to his popular ballads and lyrics, he wrote the *Kort Begreb af Verdens Krønike i Sammenhæng* (1812), translations of Saxo Grammaticus, Snorri Sturluson, and of the Old English epic "Beowulf" (1818-22), and many polemical essays. He became a leader of the Danish party in the Diet and vigorously opposed German influence. After 1866 he became more conciliatory towards Prussia. He is best known by his *Northern Mythology* (1832) and *Salmer og aandelige Sange* (5 vols., 1873-81). He was one of the foremost hymnologists in Danish literature. Consult Hansen, *Wesen und Bedeutung des Grundtvigianismus* (Kiel, 1863).

GRUNDTVIG, SYEND HERSLEB (1824-83). A Danish philologist, born in Copenhagen, Sept. 9, 1824, son of the preceding. His early education was conducted wholly by his father, who disapproved of the prevailing methods in Denmark at that time. The study of Greek, Danish, Old Norse, and English preceded that of Latin, and the father's enthusiasm for Danish ballads turned the son's attention at a very early age in that direction. Grundtvig's name is now especially associated with the ballad literature of his native land. His first important publication was his annotated translations of English and Scottish ballads (1842-46). In 1853 the first volume of his *Danmarks gamle Folkeviser* appeared, the fourth and last volume being published soon after his death in 1883. In 1882 he published a selection of these ballads in one volume. Grundtvig's position among Danish philologists is of the highest, in the same class with Raak and Madvig. In 1863 he was appointed docent in Scandinavian philology at the University of Copenhagen, and full professor in 1869. He died July 14, 1883.

GRUNDY, FELIX (1777-1840). An American lawyer and politician, born in Berkeley Co., W. Va. In 1779 his father removed with his family to western Pennsylvania and in the following year to Kentucky, where Felix, one of seven brothers, was brought up amid the perils and privations of a frontier life. He was educated at Dr. Priestley's academy at Bardstown and studied law. In 1799 he became a member of the Kentucky Legislature, where he met Henry Clay in debate, but resigned in 1806 to accept an appointment as judge in the Supreme

Court of Errors and Appeals. The next year he became Chief Justice, but, owing to the insufficiency of the salary, resigned from the bench in 1808 and settled in Nashville, Tenn., where he achieved a wide reputation as a criminal lawyer. In 1811 and 1813 he was elected, as a Democrat, to Congress, and in 1819 was a member of the Tennessee Legislature, where he successfully advocated the establishment of a State bank. In 1829 he was elected to the United States Senate, to fill the unexpired term of James H. Eaton, who had entered Jackson's cabinet as Secretary of War, and in 1832 was reelected for a full term. In the Senate he was chairman of the Judiciary Committee and was a strong advocate of most of Jackson's measures, although he maintained a somewhat neutral position in the Nullification controversy. He was a consistent opponent of Clay's "American policy" and of the United States Bank. In September, 1838, he entered Van Buren's cabinet as Attorney-General, but held office only until December, 1839, when he resigned to enter the Senate again, serving therein until his death, which followed an electioneering tour in behalf of Van Buren's reelection in the fall of 1840.

GRUNDY, MRS. A very censorious person, to whom Dame Ashfield, in Morton's play of *Speed the Plough*, often refers in the expression, "What will Mrs. Grundy say?" but who does not appear among the *dramatis personæ*. Mrs. Grundy is accepted now as the embodiment of that censorious part of society which is governed by narrow, conventional views of morality and propriety.

GRUNDY, SYDNEY (1848-1914). An English dramatist, born in Manchester. He was educated at Owens College and was called to the bar in 1869, but after 1872 devoted himself to the writing of plays and comic operas. Among them are: *A Little Change* (1872); *In Honor Bound* (1880); *A Pair of Spectacles* (1890); *Sowing the Wind* (1893); *The New Woman* (1894); *The Greatest of These* (1895); *A Bunch of Violets* (1894); *The Silver Key* (1897); *The Deycnerates* (1899); *Frocks and Frills* (1902); *The Garden of Lies* (1904); *The Diplomats* (1905); *A Fearful Joy* (1908).

GRUNER, grō'nēr, JUSTUS VON (1777-1820). A Prussian statesman. He was born at Osna-brück and was educated in law at Halle and Göttingen. In 1809 he was appointed president of the police department of Berlin, where he introduced so admirable an organization that two years later he was advanced to the command of the entire police force of Prussia. In this position he displayed great shrewdness in circumventing the French method of espionage at work throughout the kingdom. After the conclusion of the Prussian alliance with France, Gruner, who was an implacable enemy of Napoleon, tendered his resignation and subsequently was intrusted in Prague with the organization of the national defense in Germany, planned by Baron von Stein. He was arrested in 1812, by order of the Austrian cabinet, which had determined on the measure in order to rescue him from capture at the hands of the secret police of France, who had traced his movements. In 1814 he was made Governor-General of Berg and in the following year was appointed chief of the German police in Paris during the occupation of that city by the allies. During the last four years of his life he was Prussian Ambassador to Switzerland. As Governor-General of Berg and

of the Middle Rhine, he organized the patriotic rising against Napoleon, issuing proclamations and traveling from place to place in order to arouse the people. It was he also who succeeded, while chief of the German police in Paris, in obtaining the restoration of the art treasures seized by the French during their occupation of German territory. In 1815, instead of entering the State Department at home, he accepted the position of Ambassador to Switzerland.

GRUNER, (WILHELM HEINRICH) LUDWIG (1801-82). A German line engraver, born in Dresden. He was a pupil of Klingens and Krüger in Dresden, and he also studied under Longhi and Anderloni in Milan. From 1837 till 1841 he resided in Rome, where he engraved the mosaics of the Chigi Chapel, published in 1839. In 1842 he went to England, where he remained until 1856. While in England he engraved *Decorations of the Garden Pavilion of Buckingham Palace* (1846) and *Specimens of Ornamental Art* (1850), ordered by the British government. His sight being for a time affected, he devoted himself to fresco painting, and he had a share in the decorations of the Crystal Palace, London, Osborne House, and Buckingham Palace. In 1850 Gruner was called to be director of the Cabinet of Engraving in Dresden, where he remained until his death. While there, he published a series on the *Cathedral of Orvieto* (1858); *Luini's Decorations of Santa Maria delle Grazie, Milan* (1859-60); *Das Grüne Gewölbe zu Dresden* (1862); and his *Terra-Cotta Architecture of Northern Italy* (1867). He also engraved a number of special plates, especially after Raphael and Overbeck.

GRUNERT, grü'něrt, JULIUS THEODOR (1809-80). A German forester, born and educated at Halle. He was appointed assessor of forests for the Prussian government at Königsberg in 1839, and thereafter held important positions under the government at Danzig and other cities of Prussia, and was also in 1859-66 director of the Academy of Forestry at Eberswalde. His last appointment was at Treves, where he was chief forester from 1866 until his retirement in 1878. He was founder and editor of the *Forstliche Blätter* (established 1861) and wrote the works entitled *Der preussische Förster* (1869; 2d ed., 1883), *Forstlehre* (1875; 4th ed., 1884), and *Die Jagdgesetzgebung preussens* (1880).

GRÜNEWALD, grü'ne-vălt, MATTHIAS (?-c.1529). A German painter of the Renaissance, one of its most important masters. The date of his birth cannot be established; but he was born probably at Aschaffenburg, where a painter by this name is recorded in the public documents. Our meagre knowledge of his life is due chiefly to Sandraart (the German Vasari), who relates that Grünewald practiced at Mainz, where he lived a retired and melancholy life and was unhappily married. From him we know also that he was patronized by Cardinal Albrecht of Brandenburg, Archbishop of Mainz, and important paintings by him were in Mainz Cathedral. It is not known from whom he derived his artistic training; but he belonged to the Franconian school of the middle Rhine, and was certainly influenced by the work of Schongauer. His art is strikingly original and unlike anything that preceded. A very marked characteristic is the heavy contrast of light and shade, for which Sandraart long ago called him "the German Correggio"; another is his powerful and poignant realism. His point of view is pictorial, and his

works show lack of anatomical study and deficiency in line. The color is powerful, sometimes harsh. In emotional expression he is second to no painter of the century.

Among Grünewald's earliest-known paintings are "Christ Mocked" (Pinakothek, Munich), recognized as his work in 1909, and a "Crucifixion" (Basel Museum). He painted also, in gray monochrome, the exterior of Dürer's well-known "Heller Altarpiece," with "Saints Cyriacus and Laurence," now preserved in Städel Institute, Frankfurt. By far his most important achievement is the remarkable Isenheim altar, painted before 1519 for the priory of the Antonites in that town. It was one of those richly decorated late German altars, the effect of which depends largely upon the Gothic architectural surroundings, and in its original condition it was the most imposing work of the kind in Germany. All of its painted parts and much of the sculpture survive in the museum of Colmar. When closed, the altar presented a panel of the "Crucifixion, with the Virgin, the Magdalen, and the Baptist," of grandiose and almost repellent naturalism; on either side were the figures of "Saints Antonius and Sebastian." When the first pair of wings was opened, the central panel depicted the "Madonna and Child" in a wondrous landscape, adored by angels singing and making music; the left wing was an "Annunciation," the right a very original "Ascension of Christ." The interior of the altar revealed a series of polychrome wooden sculptures, dominated by "St. Anthony," and flanked by painted wings representing, with grotesque originality, "Saints Anthony and Paul" and the "Temptation of St. Anthony." On the predella was a "Bewailing of the Body of Christ." Soon after 1510 he painted for the church at Aschaffenburg the altar of "Our Lady of the Snow," recently discovered in the church of Stuppach, together with the "Founding of Santa Maria Maggiore." Another "Crucifixion" of powerful realism is in the Karlsruhe Gallery—on the obverse Christ sinks beneath the cross; and in the Pinakothek, Munich, is the central panel of an altarpiece representing Saints Erasmus and Mauritius.

Bibliography. A descriptive bibliography of the literature on Grünewald appeared in *Repertorium für Kunstwissenschaft*, vol. xxiii (Berlin, 1910). The two principal monographs are Boeh, *Die Werke des Matthias Grünewald* (Strassburg, 1904), and Josten, in *Künstler Monographien* (Bielefeld, 1913).

GRÜNHAGEN, grun'hä-gen, KOELMAR (1828-1911). A German historian, born in Trebnitz, near Breslau, and educated at Jena, Berlin, and Breslau, where in 1855 he was made instructor in history and from 1860 to 1901 was professor. He edited the *Zeitschrift des Vereins für Geschichte und Altertum Schlesiens* (1862 et seq.) and was long head of the governmental archives in Breslau. He wrote much on the history of Silesia: *Breslau unter den Piasten als deutsches Gemeinwesen* (1861); *Friedrich der Grosse und die Breslauer, 1740-41* (1864); *Die Hussiten-Kämpfe der Schlesier* (1872); *Geschichte Schlesiens* (1884-86); *Schlesien unter Friedrich dem Grossen* (1890-92). Grünhagen published many valuable documents, especially from the Middle Ages, bearing on the history of this province.

GRÜNINGER, grü'ning-ēr, JOHANN, also known as JOHANN REINHART VON GRÜNINGEN (c.1450-?). A German printer. He became a

master in Basel in 1480 and in 1482 was made a burgher of Strassburg, where between 1483 and 1529 he printed about 250 works, many of them illustrated with wood engravings, but full of errors. At the beginning of the Reformation in Strassburg he published a number of Catholic polemic treatises.

GRUNT. A name commonly used by fishermen for various species of the drum (q.v.), especially the fresh-water species (*Haplodimotus grunniens*). It refers, like "croaker" and other names, to the vibratory "grunting" sounds made by these fishes.

GRUPPE, grōp'pe, OTTO (1851-). A German classical scholar, son of Otto Friedrich Gruppe. He was born in Berlin, was educated there, and in 1876 became teacher in a Gymnasium there. He wrote reviews of books on classical mythology in Bursian's *Jahresbericht*, and published the valuable "Griechische Kulte und Mythologie," in *Beziehung zu den orientalischen Religionen* (1887), and *Griechische Mythologie und Religionsgeschichte* (1902-06).

GRUPPE, OTTO FRIEDRICH (1804-76). A German scholar and author, born at Danzig and educated at Berlin. His opposition to the then prevailing Hegelian philosophy was so strong that he was not allowed to qualify as a docent. He became a journalist, wrote for the *Preussische Staatszeitung*, and became its editor in 1835. Seven years later he was appointed to a position in the Ministry of Education and in 1844 he became professor of the philosophic faculty in Berlin. His philosophic work is contained in *Antus* (1831), *Wendepunkt der Philosophie im 19. Jahrhundert* (1834), and *Gegenwart und Zukunft der Philosophie in Deutschland* (1855), all anti-Hegelian. He was a classical scholar of much ability and wrote: *Die kosmischen Systeme der Griechen* (1851); *Ariadne*, on Greek tragedy (1834); the valuable work *Die römische Elegie* (1838); and *Minos* (1859) and *Eakus* (1872), in which he discussed interpolation in the Roman poets of the Augustan age. His other works include epics, lyrics, and dramas, now little read, two or three anthologies, and the critical works *Leben und Werke deutscher Dichter* (5 vols., 1864-72) and *Reinhold Lenz, Leben und Werke* (1861).

GRUSCHA, grō'shā, ANTON JOSEPH (1820-1911). A Roman Catholic prelate. He was born in Vienna and in 1843 was made a priest. In 1851 he was appointed professor of religion in the Theresianum and in 1855 preacher in the cathedral of St. Stephen in Vienna. After that his rise was rapid, and he was appointed in succession to the offices of Privy Chamberlain of the Pope (1858), professor in the University of Vienna (1863), canon of St. Stephen's (1871), Apostolic Field Vicar of the Army, and Bishop of Karth in partibus (1878); Archbishop of Vienna (1890), and Cardinal (1891). He contributed frequently to Catholic periodicals and published a *Handbuch der katholischen Religionslehre für höhere Lehranstalten* (1851).

GRUSIA. See GEORGIA.

GRUSIN'IAN. A name used by some ethnologists to designate the Georgian peoples of the Caucasus. It is derived from *Grusia*, the Russian name of Georgia. See GEORGIAN.

GRUSON, grō'sōn, HERMANN (1821-95). A German inventor and ironmaster, born at Magdeburg and educated at Berlin. After working in the Borsig locomotive works, he was mechanic on the Berlin-Hamburg road (1845);

then was chief engineer of the Wöhlert machine shop in Berlin (1851), and in 1855, after serving for a year as manager of a steamship company at Buckau, set up a shipyard of his own and an iron foundry. The result of his experiments here was the invention of a process for chilled cast iron (see ARMOR PLATE), which found many uses in industrial machinery as well as for armor and shells. The metal, sometimes called "Gruson metal," is used also in the manufacture of the Gruson rapid-fire gun and the Gruson anchor. In 1886 his establishment was incorporated with Gruson as manager. He retired in 1891, and in 1893 the works were bought by the firm of Krupp (q.v.). Gruson wrote studies in physics under the title *Im Reiche des Lichts* (2d ed., 1895).

GRUTER, grū'tēr, or **GRUYTÈRE**, grū-ē-tār', JAN (1560-1627). A Belgian classical scholar, born at Antwerp. After studying at the universities of Cambridge and Leyden he held various professorships until 1592, when he was made professor of history at the University of Heidelberg. In 1602 he became librarian of that university, but during the siege by Tilly in 1622 the valuable Palatine collection of books, of which he was keeper, was sent to Rome, together with his own private library. He published editions of many of the Latin classics, but is remembered chiefly for his *Lampas sive Fæ Artium Liberalium* (7 vols., 1602-34), a collection of the best critical and antiquarian treatises of the sixteenth century, and his masterpiece, *Inscriptiones Antiquæ Totius Orbis Romanorum* (2 vols., 1603; ed. by Gudius, Grævius, and Burmann, 4 vols., 1707), to which Joseph Scaliger (1540-1609) wrote a valuable index. Consult Hulst, *Jean Gruytere* (Liège, 1847), and Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

GRÜTLI, grū'tlé, or **RÜTLI**. A meadow in the Canton of Uri, Switzerland, occupying the western shore of the Lake of Uri, the southern portion of the Lake of Lucerne. It is regarded as the cradle of Swiss liberty, tradition designating it as the place where on Nov. 8, 1307, Erny Anderhalden of Melchthal, Fürst, and Stauffacher planned the revolt against Austria which resulted in the independence of Switzerland. The tract was purchased in 1859 by the school children of Switzerland to be preserved as national property. A monument commemorating the event was erected there in 1884.

GRÜTZMACHER, grūts'māk-ēr, FRIEDRICH (1832-1903). A celebrated German violoncellist, born at Dessau. He received his first musical instruction from his father and then studied the cello under K. Drechsler and composition under F. Schneider. While a member of a small orchestra in Leipzig, he attracted the attention of Ferdinand David, who brought about his appointment in 1849 as first cellist of the famous Gewandhaus Orchestra. From 1860 till his death he filled the same position in the Royal Court Orchestra in Dresden. He was one of the most renowned teachers of his time, and not only a very prolific, but also a much esteemed, composer for his instrument.

GRÜTZNER, grūts'nēr, EDUARD (1846-). A German genre painter. He was born at Gross-Karlowitz and was a pupil at the Munich Academy and afterward of Piloty, whom he assisted in teaching. He is principally known through his pictures of humorous scenes from

Shakespeare and his humorous genre subjects from monastic life. Among the former are scenes from *Henry IV, The Merry Wives of Windsor, As You Like It, The Taming of the Shrew*; such pictures as "Falstaff at the Inn" (1869), "Falstaff and his Companions in the Wood" (1870), "Falstaff in the Dirty Linen." His monastic subjects include "In the Convent Cellar," "Testing Wine," "Convent Brewery," "Capuchin Mending his Cowl," "Monastic Hospitality," "Siesta in the Convent." He is represented in the Pinakothek by "The Silesian Drinker and the Devil," "Convent Peace," and "Don Quixote"; at Dresden by "The Convent Library"; at Königsberg by "The Convent Kitchen": at Breslau by a series of cartoons entitled "Falstaffiade," and in other German museums. Grützner's art is literary rather than pictorial. He characterizes well, and his humor is contagious.

GRUYÈRES, grū'vâr'. A town of Switzerland, situated 16 miles southwest of Fribourg (Map: Switzerland, B 2). It has an old tenth-century castle of the former counts of Gruyères and is a centre for the celebrated Gruyère, or Swiss, cheese. Pop., 1900, 1375; 1910, 1389.

GRUYÈRE, grū-é-târ', JAN. See GRUTER.

GRYLIDÆ (Neo-Lat., nom. pl., from Lat. *gryllus*, *gryllus*, cricket). A family of insects of the order Orthoptera, including those forms known as crickets. It comprises three distinct groups—the true crickets, typified by the common field cricket, the tree cricket, and the mole crickets. See CRICKET.

GRYPHÆA (Neo-Lat., from Lat. *gryphus*, *gryps*, Gk. γρῦψ, griffin, from γρῦρός, *grypos*, hook-nosed). A pelecypod genus of the family Ostreidæ, found fossil in, and very characteristic of, Mesozoic rocks. The shell has little resemblance in form to the majority of pelecypods, for it is very unsymmetrical, the left valve being much enlarged and strongly arcuate with underturned beak, while the right valve is small, flat, and lidlike. The best-known species are *Gryphæa arcuata* of the European Lias and *Gryphæa vesicularis* of the Cretaceous of both North America and Europe. At some Cretaceous localities in the United States *Gryphæa* shells have been washed out of the soft deposits in which they were entombed and now lie scattered on the surface of the ground in great numbers. See EXOGRYA.

GRYPHIUS, grīf'i-ūs, Ger. pron. grē'tē-ūs, ANDREAS (1616-64). A German dramatic poet, whose real name was Greif. He was born at Grossglogau and passed a sad youth. He studied at Leyden, where he also lectured on a multitude of subjects, traveled in France and Italy, and, after refusing calls to professorships in Frankfurt-on-the-Oder, Upsala, and Heidelberg, was appointed Syndic of the Principality of Glogau. The struggles of his youth and the envy of later years, as well as physical weakness, made his lyrics sombre and his epigrams sharp. But his dramatic work, which is more important, suffers little from his own experience of the tragedy of life; and the tragedies *Leo Armerius* (1646), *Katharina von Georgien* (1647), *Cardenio und Oelinde*, and *Papinianus*, though marred by imitations of Seneca and of his own contemporary, Vondel, and though veritable cabinets of horror, show considerable power, though little action. His comedies are much better. *Peter Squents*, or *Absurda Comica*

(c.1650), is based on the main episodes of the *Midsummer Night's Dream*; *Horribilicribrifax*, of about the same date, has much the same motive as Plautus's *Miles Gloriosus*, save that it adds a pedantic scholar, besides a braggart captain; and *Das verliebte Gespenste* (1660) and *Die geliebte Dornrose* (the best German comedy before Lessing), written in the dialect of Silesia, are full of humor. The latter play is curiously incorporated in the former. Several of his plays and lyrics have been reprinted in recent times. His hymn *Vanitas vanitatum*, *vanitas* is widely known. Gryphius also translated many Dutch, Italian, and French plays; wrote an epic in Latin, and was considered a marvel of learning, as he knew 11 languages and lectured on logic, anatomy, geography, history, mathematics, astronomy, and Roman antiquities. A fairly complete edition of his works is that published at Breslau (1657-63); also an edition of his dramas and lyrics, edited by H. Palm, in three volumes, in the publications of the *Stuttgarter litterarischen Vereins* (1879-85). Consult Hermann, *Ueber Andreas Gryphius* (Leipzig, 1851); Klopp, *Andreas Gryphius als Dramatiker* (Osna-brück, 1852); Wysocki, *Andreas Gryphius et la tragédie allemande au XVIIème siècle* (Paris, 1893); Manheimer, *Die Lyrik des Andreas Gryphius* (Berlin, 1904).

GREYFIUS (properly GREYFF), SEBASTIAN (1493-1556). A German printer, born at Reutlingen, and a brother of Franz Greyff, who published at Paris a *Lexicon Græco-Latinum*. Sebastian went to Lyons before 1524 and printed there more than 300 titles in Hebrew, Greek, and Latin, but very few in French. The best known among his books are a Latin Bible of 1550, in unusually large type, and a *Thesaurus Linguae Sanctæ*, by Sanctus Pagninus (1529). His son ANTOINE carried on his father's business for a time in Lyons.

GRYPHON, grī'fŏn (archaic form of *griffin*). A fabled monster with the head of an eagle and the lower part of a lion. See GRIFFIN.

GRYSBOK, grīs'bŏk (Dutch *grijsbok*, from *grijs*, gray + *bok*, buck). A small chocolate-colored antelope (*Namotragus*, or *Raphioceros*, *melanotis*), one of the steinboks (q.v.), now met with only in the hilly country north and west of the Limpopo River. Cf. ORIBE.

GUACA, gwā'kà, or **HUACA**, lwā'kà. See PERUVIAN ARCHAEOLOGY.

GUACAMAIA, gwā'kà-mī'ā. A West Indian parrot fish (q.v.).

GUACHARO, gwā-chā'rŏ, OIL BIRD, or FAT BIRD. A curious bird of northern South America, which has many resemblances to the nightjar, but is now regarded as constituting a separate family, the *Steatornithide*. Its specific name is *Steatornis caripensis*, in allusion to the valley of Caripe (q.v.), where it was first obtained by Humboldt and Bonpland. It is the sole representative not only of its genus and family, but of the suborder *Steatornithes*. It is about the size of a crow, much resembles a nightjar in form and plumage, and is wholly nocturnal, spending the day in vast numbers in deep and dark caverns. At night the birds come forth, chattering with a queer clicking note, and search the forests for food, which consists of oily nuts and fruits. The hard, indigestible seeds swallowed by the guacharos accumulate on the floor of their caves in great quantities, and many of them sprout and grow in pale, colorless forms of plants, which form a most singular part of

the scenery of the caverns. The bird is said to make a bowl-like nest of clay, in which are laid two to four white eggs. The young are extremely fat and are gathered by the Indians and used by many white persons as food, but more extensively as the source of a clear and very useful oil, which is tried out of their bodies. The guacharo inhabits Trinidad and neighboring islands and various inland parts of Venezuela and Ecuador. Consult Newton, *Dictionary of Birds* (New York, 1893-96), where many further references will be found. See Plate of NIGHTJARS, ETC.

GUACHOS, gwā'chōz. See GAUCHOS.

GUACO, gwā'kō (South American name). A Peruvian medicinal plant. See EUPATORIUM.

GUADALAJARA, gwā'dā-lā-nā'rā (Lat. *Arriaca*). Capital of the Spanish province of the same name, situated 2100 feet above sea level, on the left bank of the Henares, 35 miles by rail northeast of Madrid (Map: Spain, D 2). It is an ill-built town, and many of its old buildings have fallen into ruin. The chief of these are the palace of the Mendozas, the feudal lords of Guadalajara; the *Panteón*, or mausoleum, in which they are buried; the cloister of San Francisco, now a fort; the Gothic-Arabian palace of the dukes of the Infantado; and the Roman bridge and aqueduct across the Henares. There are also several notable churches, a school of military engineering, the provincial institute, museum, and library, installed in an old cloth factory. A military aerodrome was established in 1911. Soap, leather, woolen goods, and bricks are manufactured, and there is a good trade in farm products. Guadalajara fell into the hands of the Moors in 714, but became a possession of Castile in 1081. Pop., 1900, 10,944; 1910, 12,170. The province has an area of 4076 square miles and its population in 1910 was 208,447.

GUADALAJARA. The capital of the State of Jalisco, Mexico, situated near the Rto Grande de Santiago, 3600 feet above sea level (Map: Mexico, G 7). The surrounding district is fertile and rich in silver mines, and the city itself is well built, with straight, well-paved streets, and many large squares, being the second city in the country in size and importance. The chief buildings are the cathedral, dating from 1618, which has a magnificent interior and contains a beautiful painting by Murillo; the university, the government building, episcopal palace, theological seminary, high school, and art academy. The city has also a public library of 24,000 volumes, a botanical garden, and a number of scientific and literary institutions, as well as several fine theatres. The numerous convents rent their arcades to shopkeepers. The water supply is derived from the many springs near the city and is brought by an aqueduct 8 miles long. The city has electric lights and street railways. It also has cotton and flour mills, tile works, a tannery, and a shoe factory, and carries on an active trade in machinery. It is the residence of a United States consul, and imports large quantities of manufactured goods from the United States. Pop., 1910, 118,799. Guadalajara was founded in 1530. On July 30, 1912, an earthquake visited the district, and 10,000 people were rendered homeless. The city was captured from the Federals by the Constitutionalist forces in July, 1914.

GUADALAVIAR, gwā'dā-lā'vā-ār' (Ar. *wād al-abyad*, white river). A river of east Spain, rising in the Sierra de Gúdar, in the Province

of Teruel, and flowing in a south and southeast direction through the Province of Valencia (Map: Spain, E 3). It falls into the Mediterranean at the town of Valencia. Length, about 150 miles. In one place the river passes through a defile or cañon, only 50 feet wide, with perpendicular rocky sides 450 feet high, and the romantic scenery along its banks has been celebrated by many poets. Near its mouth the waters of the Guadalaviar are led off into numerous canals, irrigating the plain around Valencia, and a large part of it serves as the water supply of the city.

GUADALCÁZAR, gwā'dāl-kā'sār. A town in the Province of San Luis Potosí, Mexico, situated in an arid region about 40 miles northeast of the city of San Luis Potosí (Map: Mexico, J 6). It is important because of its mines of quicksilver. Pop., about 8000.

GUADALCÁZAR, MARQUIS OF. See FERNÁNDEZ DE CORDOBA.

GUADALQUIVIR, gā'dāl-kwiv'ēr, *Sp. pron.* gwā'dāl-kā-vēr' (Ar. *wād al-kebir*, great river). Next to the Ebro, the most important river of Spain. It rises in the Sierra de Pozo, in the eastern part of the Province of Jaén, and, after pursuing for a short distance a northeasterly course between that range and the Sierra de Cazorla, makes an abrupt bend and flows in a generally west and southwest direction through the provinces of Jaén, Cordova, and Seville, emptying into the Atlantic Ocean 20 miles northwest of Cadiz, after a course of 350 miles (Map: Spain, C 4). Its upper valley is irregular and mountainous, but through the greater part of its course it flows through a wide and level plain, somewhat resembling the pampas of Argentina. Here the river runs sluggishly, and for the last 70 miles of its course, as far as Seville, it is a tidal stream. Below Seville it divides twice, forming two large islands, called Isla Mayor and Isla Menor. At high water it often overflows its banks, and the whole region around its mouth is known as *Las Marismas*, or tidal marshes. The principal tributary is the Jénil, from the south. The middle valley is very fertile and contains, besides the cities of Cordova and Seville, on the banks of the river, numerous towns and villages. The river flows at all seasons with a full stream, being fed by the winter rains and the melting snow from the Sierra Nevada in summer. The river, though navigable to Seville for ships of 1200 tons, is not much used as a waterway, and the channel is not kept free from silt. The Guadalquivir figures largely in the legends, poetry, and history of Spain. It is the *Bætis* of the Romans. Consult E. Slater, *Along Spain's River of Romance* (New York, 1912), and P. Gwynne, *The Guadalquivir: Its Personality, its People, and its Associations* (London, 1912).

GUADALQUIVIR, MARQUIS DE LAS MARISMAS DEL. See AGUADO, ALEJANDRO MARÍA.

GUADALUPE HIDALGO, gā'dā-loop' hā-dāl'gō or ā-nāl'gō, TREATY OF. A treaty made between the United States and Mexico, at Guadalupe Hidalgo, a small place in the outskirts of the city of Mexico, Feb. 2, 1848, at the close of the Mexican War. The American negotiator was Nicholas P. Trist, of Virginia, chief clerk of the Department of State, who had been sent by President Polk, in the spring of 1847, to the headquarters of General Scott for the purpose of entering into negotiations with the Mexican

government. At that time Trist was instructed to demand, among other things, the cession of New Mexico and the Californias and the recognition of the Rio Grande as the international boundary. During an armistice, in the month of August, commissioners of the Mexican government met Trist and offered radically different counterpropositions, insisting also upon the Nueces as the correct boundary. Nothing came of these negotiations, and, upon the termination of the armistice, hostilities were resumed, and Trist was recalled. Nevertheless, he remained on the ground, and, upon a suitable change in the military situation, negotiations were resumed in January, 1848, and on February 2 an agreement was reached in the Treaty of Guadalupe Hidalgo. Trist promptly returned to Washington, and President Polk submitted the treaty to the Senate on February 23. After vigorous opposition on the part of some of the senators, resulting in modifications which were accepted by Mexico, the treaty was ratified by the Senate on March 10; ratifications were exchanged on May 30, and the treaty was proclaimed on July 4, 1848. By the terms of the treaty in its final form the Rio Grande was established as the boundary for the eastern portion of the cession, and in the west the lines of the Gila and Colorado were so followed as to give to the United States all the territory then known as New Mexico and Upper California. The United States agreed to pay to Mexico \$15,000,000 and to assume the payment of all claims adjudged against Mexico under the conventions of 1839 and 1843. Furthermore, the United States assumed the payment of all claims, not exceeding in the aggregate \$3,250,000, held by citizens of the United States against Mexico, which originated prior to the date of the treaty. On July 29, 1848, Congress passed an act providing for the payment of the claims already liquidated, and on March 3, 1849, a commission was created to pass upon claims against Mexico held by citizens of the United States. By this commission 182 claims were allowed and 70 were rejected. For a map illustrating the cession, consult Channing, *United States of America*, (New York, 1896).

GUADALUPE (gá'dá-lóop') **MOUNTAINS.**

A mountain range between the Rio Grande and the Pecos River in Texas and New Mexico. It has a northwesterly trend and may be considered as a southern continuation of the Rocky Mountains. The range has a maximum elevation of 5000 to 6000 feet above sea level.

GUADALUPE (gá'dá-lóop') **RIVER.** A river of Texas. It rises in Kerr County, in the southwest-central part of the State, and flows southeast through pleasantly undulating prairie and forest regions past the towns of New Braunfels, Seguin, Gonzales, Cuero, and Victoria (Map: Texas, D 5). About 20 miles from its mouth it divides into two branches, the south branch uniting with San Antonio River, and both emptying into San Antonio Bay, 140 miles southwest of Galveston. The length of the Guadalupe is about 250 miles, and steamers can ascend it to Victoria.

GUADELOUPE, gá'de-lóop', *Fr. pron.* gwá'dlóop'. A French West Indian island colony situated between the British islands of Montserrat to the north and Dominica to the south (Map: West Indies, G 3). The colony consists of: Guadeloupe, 582.8 square miles, pop., 183,001 according to the census of 1911; Marie-

Galante, 57.7 square miles, pop., 19,422; part of Saint-Martin, 20.4 square miles, pop., 4174; Saint-Barthélemy, 9.5 square miles, pop., 2545; La Désirade, 10.6 square miles, pop., 1579; Les Saintes, 5.5 square miles, pop., 1709; Petite-Terre, 1.3 square miles; total, 687.3 square miles, pop., 212,430. Guadeloupe Island is in reality two islands, Basse-Terre and Grande-Terre, separated by an arm of the sea (Rivière Salée) about 4 miles long and varying in width from 100 to 400 feet. Basse-Terre, called Guadeloupe proper, has an area of 364.2 square miles, with 83,386 inhabitants; Grande-Terre, 218.6 square miles, with 99,615 inhabitants. Basse-Terre and Grande-Terre differ radically: the former is volcanic and mountainous, intersected by many streams; the latter is calcareous (superimposed upon an igneous base) and low-lying, few elevations being over 100 feet, while the water supply consists almost wholly of ponds and cisterns. In Basse-Terre, in the northwest part, is Grosse-Montagne (2370 feet); near the middle of the west coast are Les Deux Mamelles (2536 and 2368 feet); farther south are Sans Toucher (4856 feet) and the semiactive volcano La Soufrière (4869 feet), the highest point in Guadeloupe. Near La Soufrière is L'Echelle (4484 feet). Basse-Terre is famous for its scenic beauty; Grande-Terre for its plantations, especially sugar. The climate of Guadeloupe is hot and moist and not unhealthful in the more elevated parts of the island. The islands are subject to cyclones. The mean annual temperature is 78°. Guadeloupe, like most of the West Indies, has a fertile soil and produces chiefly sugar, coffee, cacao, vanilla, rice, bananas, etc. Over 30 per cent of the total area is under cultivation, and of that nearly 50 per cent is under sugar. The sugar industry of the island, which had greatly declined with the abolition of slavery, has again revived as a result of the importation of coolies, and the annual output amounts at present to about 70,000 tons. Cotton, rubber, and tobacco are also cultivated to some extent. The forests of Guadeloupe, confined largely to Basse-Terre, are quite extensive, abounding in campeachy or logwood, but, being difficult of access, they are little exploited. The commerce of the colony, while showing marked fluctuations, appears about stationary when the average of one term of years is compared with another. In the general trade imports and exports in 1890 amounted to 23,249,000 and 21,370,000 francs respectively; in 1900, 20,283,000 and 14,813,000; 1910, 16,804,000 and 24,053,000; 1911, 19,383,000 and 20,245,000 (12,362,000 francs from France and 19,420,000 francs to France); 1912, 19,524,000 and 26,084,000 francs. The colony of Guadeloupe is administered by a governor, an executive council of six, and a legislative council of 30 members. It is represented in the French Parliament by a senator and two deputies. The colonial budget for 1911 balanced at 4,560,000 francs; a subvention from the French government of about 300,000 francs is required. The population of the colony increased from 190,273 in 1906 to 212,430 in 1911; of the latter, 3641 were born in France and 12,306 were foreigners (mostly East Indian coolies); the great mass of the population is mulatto and negro. There are about 13,000 pupils in the elementary schools, mostly public. The capital is Basse-Terre (q.v.), with 8134 inhabitants in 1911. The commune of Pointe-à-Pitre, in Grande-Terre, at the south

entrance of the Rivière Salée, is the chief commercial town and has a fine harbor; pop., 22,664.

Guadeloupe was discovered by Columbus on Sunday, Nov. 3, 1493, and settled by the French in 1635. During the latter half of the seventeenth century the colonists resisted several attacks by the British, who finally captured the island in 1759 and retained it until 1763. The island was again captured by the British in 1794 and 1810. In 1813 it was transferred to Sweden and in 1816 was formally restored to France. Slavery was abolished in 1848. Consult: *Annuaire de la Guadeloupe et dépendances* (Basse-Terre); Boumais, *Guadeloupe physique, politique, économique, avec une notice historique* (Paris, 1881); Stoddard, *Cruising among the Caribbees* (London, 1896); Ballet, *La Guadeloupe* (Basse-Terre, 1890-96); Guesde, *La Guadeloupe et dépendances* (Paris, 1900); André Blancan, *La crise de la Guadeloupe* (ib., 1904); Hermann Koerfer, *Der Guadeloupe-archipel und seiner wirtschaftliche Bedeutung* (Bonn, 1910). See DÉSTRADE; MARIE GALANTE; SAINT MARTIN.

GUADÉT, gwá'dé', MARGUERITE ELIE (1758-94). A French orator and statesman, born at Saint-Emilion. Already known as a lawyer, he was elected in 1791 to the Legislative Assembly and became one of the leaders of the Girondists. He was a very strong advocate of the constitution of 1791, and was President of the Assembly when the famous 10th of August uprising occurred. Although anxious for every curtailment of the power of the King, he attacked his enemies, Marat and Robespierre, quite as violently when reflected to the Convention in 1792. The proceedings he demanded against Marat ended in the latter's acquittal, and Guadet took refuge in Saint-Emilion with his family, where he was discovered and shortly afterward guillotined at Bordeaux. Consult J. Guadet, *Les Girondins* (Paris, 1889).

GUADIANA, gwá'dé-á'ná (Lat. *Anas*). One of the longest, but at the same time the narrowest and poorest in volume, of the five great Spanish rivers (Map: Portugal, B 3). The little river which has commonly been regarded as its head stream, and which bears the name of Guadiana Alto, rises on the west boundary of the Province of Albacete, about 8 miles northwest of the town of Alcaez. From its source it flows northwest for about 30 miles, after which it disappears among swamps, and, according to latest investigations, finds its way by a subterranean passage to the Záncara, a river which rises in the Province of Cuenca, and which should be considered the head stream of the Guadiana. A short distance from the Záncara are situated a number of lakes, called Los Ojos (eyes) de la Guadiana, which were formerly believed to indicate the subterranean course of the Guadiana. The Guadiana pursues a westward course through La Mancha and the Province of Estremadura, until, passing the town of Badajoz, it bends southward and flows in that direction through Portuguese territory, partly forming the boundary between Spain and Portugal, until by many channels it enters the Atlantic below the town of Ayamonte. It is about 520 miles in length, but is navigable for only 40 miles; it is, moreover, extremely difficult to enter from the sea, on account of the rapid changes which take place in the channels and bars of its delta. Its chief affluents are the Giguela on the right and the Jabalón and Ardilla on the left.

GUADIX, gwá-déx'. A city of Spain, situated in the Province of Granada. It is situated on the river Guadix, about 35 miles east-northeast of the city of Granada (Map: Spain, D 4). Said to have been the first bishop's see in Spain, it contains the ruins of a Moorish castle and a cathedral. It has brandy distilleries and manufactures building materials, pottery, hemp goods, and hats; it carries on an extensive trade in cotton, flax, and corn. In the neighborhood are iron and copper mines and the popular mineral springs of Graena. Pop., 1900, 12,616; 1910, 13,820.

GUADUAS, gwá-doo'ás. A city in the Department of Cundinamarca, Colombia, situated in the fertile valley on the road between Bogotá and Honda, at 3100 feet above sea level. The town lies in a district producing coffee and sugar and abounding in asphalt deposits; its chief manufactures are leather and hats. Pop., 9000. It was founded by a monk, who built a convent there in 1614.

GUAGUA, gwá'gwá. A town of Luzon, Philippines, in the Province of Pampanga (Map: Luzon, D 7). It is situated on Pampanga Delta about 3 miles southwest of Bacolor, and has water connection with Manila. Pop., 1903, 11,028.

GUAGUANCHE, gwá-gwán'chá (Sp.-Amer., probably from the native name). A small barracuda (*Sphyræna guancha*), occasionally taken in the southern United States.

GUAHIBAN, gwá-é'ban. A tribe of western Venezuela and northeastern Colombia, South America. They occupy the territory between the Orinoco and the Meta. Consult Fernández and Barolomé, *Ensayo de gramática hispano-guahiva* (Bogotá, 1895), and B. Taverro-Acosta, *En el Sur* (Ciudad-Bolivar, 1907).

GUAHIBO. See GUAHIBAN.

GUAIACOL, gwá'-kól (from *guaiac*, from Sp. *guayaco*, *guayacan*, from the Haitian or South American name), or METHYL PYROCATECHIN, C₈H₆.OH.OCH₃. A preparation obtained by distillation of beechwood creosote, of which it contains from 60 to 90 per cent. It is a colorless, oily liquid, soluble in 85 parts of water and much more freely in alcohol, ether, glycerin, and oils. Its taste and odor strongly resemble those of creosote, but it is less disagreeable. Of its compounds, guaiacol carbonate is best known. This is a tasteless, odorless, white powder, insoluble in water. Both guaiacol and its carbonate are employed as substitutes for creosote in the treatment of tuberculosis, being in many cases less irritating to the stomach. Guaiacol benzoate, a colorless, odorless powder, and guaiacol salicylate, a similar powder, have been used for the same purposes as the carbonate.

GUAIAACUM, gwá'-kūm (Neo-Lat., from Sp. *guayaco*, *guayacan*). A genus of trees of the family Zygophyllaceæ, natives of the tropical parts of America. The trees are remarkable for the hardness and heaviness of their wood, generally known as lignum vitae, but also as guaiacum wood, and sometimes as brazilwood, as well as for their peculiar resinous product, guaiacum, often but incorrectly called gum guaiacum. The species to which the commercial lignum vitae and guaiacum are commonly referred are *Guaiacum officinale* and *Guaiacum sanctum*, natives of the West India Islands and of some of the continental parts of America. *Guaiacum officinale* is a tree sometimes 60 feet high, with two or three pairs of ovate, obtuse,

and perfectly smooth leaflets, pale-blue flowers, a furrowed bark, and generally a crooked stem and knotted branches. Some species have been grown as ornamentals in Florida and southern California. It seems probable that other species supply part of the guaiacum wood and resin of commerce. At present the supplies are obtained chiefly from Cuba, Jamaica, and San Domingo. The wood is exported in billets about 3 feet long and 1 foot in diameter, of a greenish-brown color. This is the color of the heartwood; the sapwood is pale yellow. Guaiacum wood sinks in water and is remarkable for the direction of its fibres, each layer of which crosses the preceding diagonally; annual rings are scarcely to be observed, and the pith is extremely small. It is much valued, chiefly by turners. Ship's blocks, rulers, pestles, and tennis balls or bowls (q.v.) are among the articles most commonly made of it. When rubbed or heated, it emits a faint disagreeable aromatic smell; its taste is also pungent and aromatic. Shavings and raspings of the wood are bought by apothecaries for medicinal use. The bark is also used in medicine on the continent of Europe, but not in Great Britain or America. The virtues of both wood and bark depend chiefly on the resin which they contain, and which is itself used in powder, pill, and tincture. It has stimulant, diaphoretic, and alterative properties, and has been employed with advantage in chronic rheumatism, skin diseases, and catarrh. It has also been highly praised as a preventive of gout. The resin sometimes flows spontaneously from the stem of the guaiacum tree; it is sometimes obtained artificially. It is of a greenish-brown color and has a brilliant resinous fracture. It has scarcely any taste, but leaves a burning sensation in the mouth. One of its most striking characteristics is that it is colored blue by its oxidizing agents and is used as a test for such substances. It contains guaiacic acid, which closely resembles benzoic acid and yields on distillation certain definite compounds known as guaiacin, pyroguaiacin, and guaiacol.

GUAICURUAN, gwí-koo'-roo-án'. A distinct stock of South American Indians living in the Gran Chaco. There are about 20 tribes of them, all of the same warlike, roving, equestrian habit. The best known of the tribes are the Abipone (q.v.), Guaicuru, Mataguayo (q.v.), and Toba (q.v.). The Guaicuru originally lived farther south upon the Paraguay River. They have a system of hereditary castes, distinguished by different colors used in painting the body, the ruling family painting with black. The men go naked, but the women wear a short skirt. They place large wooden labrets in the lower lip. They tend immense herds of cattle and horses, but refuse to cultivate the ground. Consult: Brinton, *The Linguistic Cartography of the Chaco Region* (Philadelphia, 1898); Kersten in *Internationales Archiv für Ethnographie*, vol. xvii (Leipzig, 1904); Koch-Grünberg in *Globus*, vol. lxxxi (Brunswick, 1902); Schüller, *Sobre el origen de los Charruas* (Santiago, 1906).

GUAJACON, gwá'-há-kón'. The Cuban name for the various top minnows of the genus *Gambusia*, exceedingly abundant in Cuba. See Plate of KILLIFISHES AND TOP MINNOWS.

GUAJÁN, gwá'-hán'. See GUAM.

GUAL, gŭo'-ál', Pedro (1784-1862). A South American patriot, born in Caracas, Venezuela, and educated at the university in that city. He took part in the revolution of 1810, was a mem-

ber of the Legislature, and secretary to Miranda. After an exile of several years he returned, was made Governor of Cartagena, and then Ambassador to the United States. In 1816 he joined Bolívar's revolt and for some time acted as Minister of Finance and Foreign Affairs in the newly established government. For many years he lived in retirement, which was broken only by a mission to Europe for Ecuador in 1837, resulting in the final acknowledgment of that state's independence by Spain. In 1858, while living quietly at Caracas, he was chosen President of a provisional government, established in opposition to that of Monagas; and again entered actively into political affairs, serving as President of the Council of State under the government of Julian Castro. In 1859 he was elected Vice President of the Republic of Venezuela, and succeeded, in the following year, to the presidency, from which he was removed when General Páez assumed the dictatorship in 1861.

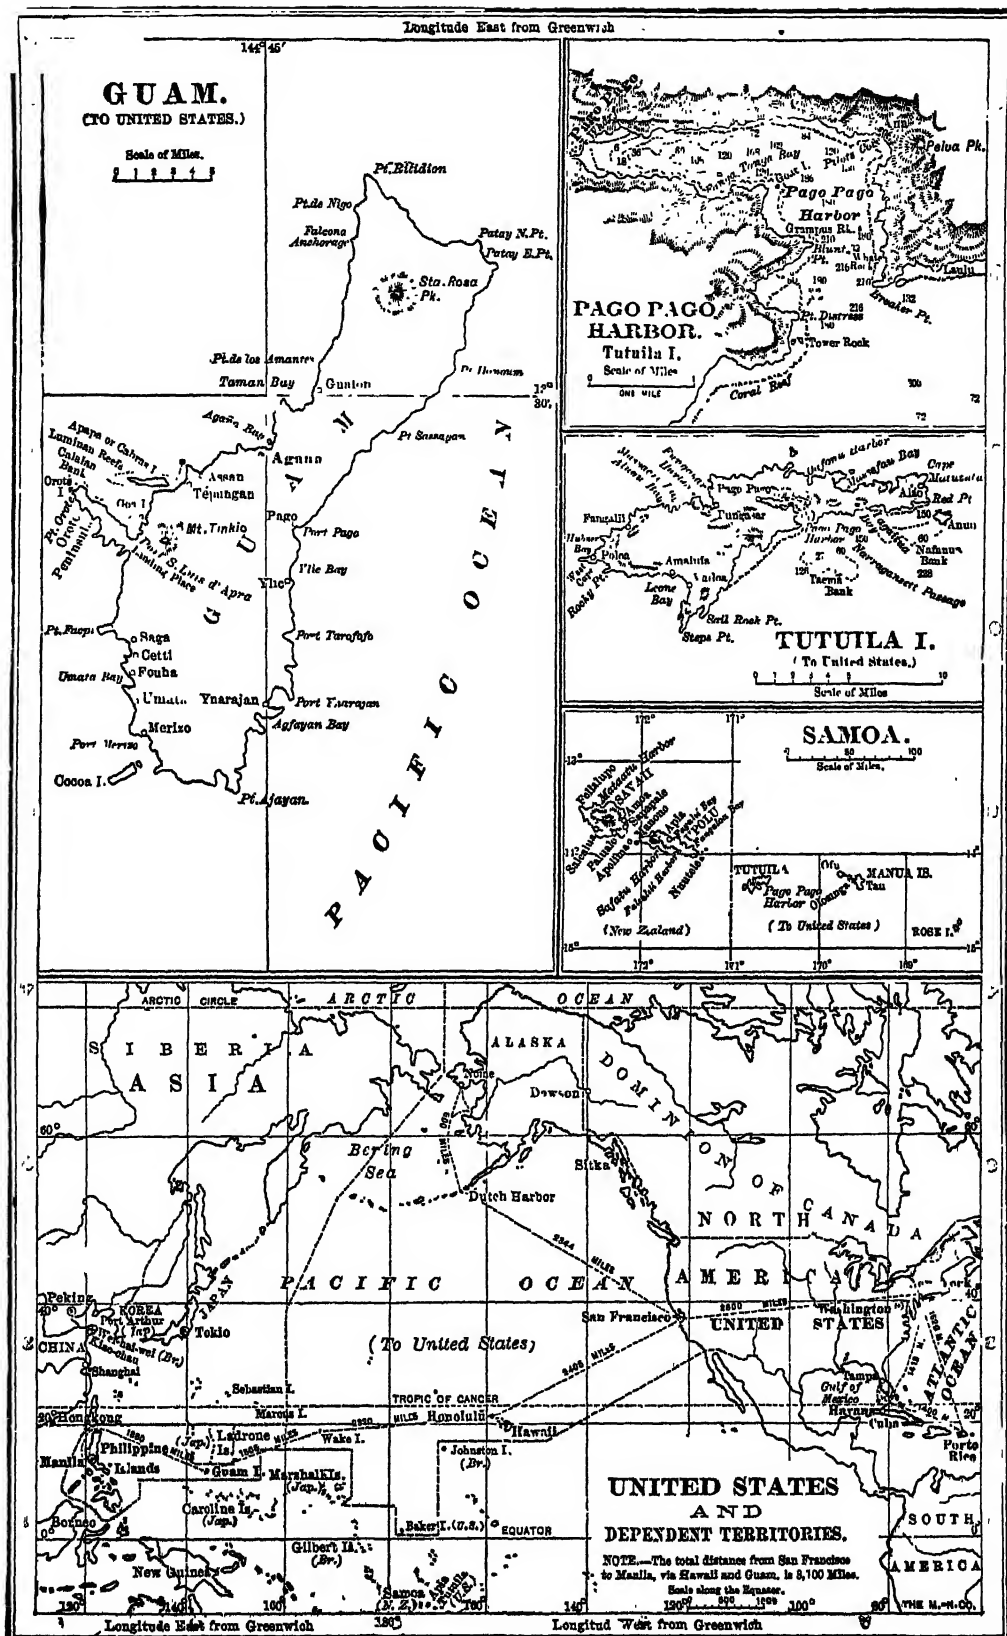

GUALBERT, gwál'bár', or **GALBERT**, JOHN. See VALLOMBROSA, CONGREGATION OF.

GUALDO TADINO, gwál'dó tà-dě'nò. An episcopal city in the Province of Perugia, Umbria, Italy, 22 miles north of Foligno. In the cathedral and in the city hall are paintings by Niccolò da Foligno. Near the city are the ruins of the ancient Tagnæ, where Narses in 552 defeated and slew Totila, the Ostrogothic King. It produces pottery, silk, and oil, and has a good trade in oil, grain, and millstones. Pop. (commune), 1901, 10,055; 1911, 10,448.

GUALEGUAY, gwí'lá-gwí'. A city in the Province of Entre Ríos, Argentina, situated on a small tributary of the Paraná, 120 miles northwest of Buenos Aires. It has tanneries and flour mills and in its vicinity are situated extensive slaughterhouses. It has railway communication with the more important towns of the province, and through Puerto Ruiz, 7 miles below, it exports a considerable quantity of animal products. It contains a theatre, a library, and a branch of the National Bank. Pop., 1903 about 9000.

GUALEGUAYCHÚ, gwí'lá-gwí-choo'. A city in the Province of Entre Ríos, Argentina, situated on the Guauguaychú River, 12 miles from its junction with the Uruguay (Map: Argentina, H 4). The town has a library and a school, various milling establishments, important manufactures of beef extracts, and an active river trade. Pop., 1903, about 15,000.

GUAM, gwām, or **GUAJÁN**, gwá'-hán'. The largest, most populous, and most southerly in position of the Marianas, or Ladrone, Islands, a group which trends almost north and south along the one hundred and forty-fifth meridian east from Greenwich; and between the thirteenth and twentieth parallels of latitude, a distance of about 450 miles (Map: Asia, Q 7). The group forms a linear system of islands the south end of which has long been free from volcanic action. Such action appears more recent towards the north, active volcanoes being found on the extreme northern islands. Guam is 30 miles in extreme length and averages about 6 miles in width. It lies almost north and south, with the south half set slightly to the west of the northern. Its area is approximately 226 square miles. The geographical position of Fort Santa Cruz, in the Bay of San Luis de Apra, is long. 144° 15' 33" E., and lat. 13° 26' 22" N. The south-

ern part of the island is high and mountainous. A chain or ridge of hills ranging in altitude from 700 to 1300 feet begins near the Bay of Pago and, crossing to the west coast near Agaña, follows the coast to the extreme southern part. The highest peak is Mount Jumullong Mang-gloc (1320 feet), just east of the town of Umatac. The topography of the northern half is entirely different, inasmuch as it is one large plateau, ranging in elevation from 200 to 500 feet, sloping generally from the interior to the sea, where it terminates in abrupt headlands and steep bluffs. This part is not watered by any perennial stream, and the only elevation of any prominence is Mount Santa Rosa (870 feet). The whole of the island is surrounded by a coral reef, with here and there a break permitting entrance to the harbors.

The climate of Guam is healthful and, on the whole, pleasant. The northeast trades prevail for six months of the year, during which there is little rain. From June to the middle of December the monsoon blows. Its warm winds strike the tops of the hills and cause precipitation, giving rise to the rainy season. The mean annual temperature is 81° F., and it is almost constant. Earthquakes are of common occurrence, but except for the severe shock of September, 1902, they have not been serious.

Copra is the most important product of Guam. Cacao of excellent quality has been raised and commands good prices in the Manila market. Coffee of good quality grows all over the island in groves of fair size. Sugar cane has been grown in Guam, but has never proved a success in manufacture on account of the shallowness of the soil. Three varieties of cotton grow uncultivated. The commonest is tree cotton, growing to a height of 60 or 70 feet. Produce which is raised for local markets comprises rice, corn, garden vegetables, mangoes, oranges, limes, papayas, tobacco, etc. Poultry raising is done on a small scale, but is difficult on account of rats and iguanas, which overrun the entire island.

The public lands of Guam are about 67,200 acres in extent, of which about 33,600 are leased and under more or less cultivation. It is mostly timberland and savannah, and a fair portion of it is fertile. The capital and most important city is Agaña (q.v.). Other towns on the island are Sumay, Agat, Merizo, and Inarajan. The original inhabitants were Chamorros, but long-continued wars in the seventeenth century nearly destroyed the male population, and it is probable that there are no people on the island to-day who are pure-blooded descendants of the Chamorros. They are intermixed with Tagalos and Malays. The men are of short stature, but well formed and strong.

Guam was discovered on March 6, 1521, by Fernando de Magallanes, then on his historic voyage around the world. It was not, however, until 1565 that anything like a formal occupation was attempted. In that year Miguel López de Legaspi, with three ships, took possession in the name of the crown of Spain. Missionaries came in 1668, and in the following year a church, called the Dulce Nombre de María, was erected in Agaña. Guam remained in the possession of Spain until June 21, 1898, when it was taken possession of in the name of the United States by the cruiser *Charleston*. Under American rule the administration is officially called the Naval Government of the Island of

Guam, and the chief executive is an officer of the navy who holds the title of Governor by appointment of the President. The island is expected to become an important naval station for vessels sailing to and from the Philippines. The total imports for the fiscal year 1913 amounted to \$160,249. Of these \$75,165 was from the United States and most of the remainder from Japan. Exports amounted to \$37,373, all of which was copra sent to Japan. The population on June 30, 1913, was 12,693, of whom 12,448 were natives; 1920, 13,275. Consult: Griffis, *List of Books* [with reference to periodicals] on *Samoa and Guam* (Washington, 1901); Wheeler, *Report on the Island of Guam* (ib., 1900); Forbes-Lindsay, *America's Insular Possessions* (2 vols., Philadelphia, 1906); Guam (ib., 1905); Cox and Dorn, *The Island of Guam* (Washington, 1911).

GUAN, gwān (South American name). A gallinaceous bird of Central and South America, often domesticated. It belongs to the same family (Cracidae) as the curassow, the guans constituting the subfamily Penelopinae. They have been separated into a number of genera, of which *Penelope* (16 species) and *Ortalis* (19 species) are the largest. All are rather large, varying from the body size of a grouse to that of a goose. Their plumage is mainly black, glossed with green, and varied with white and brown; nearly all have the throat bare, and many have pendent gular wattles. Their heads are often crested, and their tails are long and gracefully carried. They go about in large flocks, but separate into pairs during the breeding season and spend most of their time in the high forest trees, descending to the ground in search of fallen fruits, insects, and the like. Their nests are placed in trees, on bushes, or on the ground. Only one species ranges sufficiently far north to enter the United States. This is the Texan guan, or "chachalaca" (*Ortalis vetula macalli*), which is a dark, glossy, olivaceous-green bird nearly 2 feet long; but one-half of the length is due to the graduated tail of 12 feathers. It is noisy in the breeding season (April), the name "chachalaca" being imitative of its notes, which are as harsh and loud as those of a guinea fowl; and all the guans of a neighborhood join in a stentorian chorus at sunrise each morning. These birds may be easily tamed and to a certain extent are domesticated about the rural villages; but there seems little probability of their becoming a really widespread and useful fowl. See Plate of GROUSE, etc.

GUANABACOA, gwā'nā-bā-kō'ā. A town of Cuba, situated a few miles east of Havana (Map: Cuba, C 3). It is built chiefly on a range of hills and is surrounded by groves of trees, watered by numerous springs. It has a theatre, a lyceum, and a hospital. It was formerly an ancient Indian town, but the Indians were supplanted by Spaniards before the end of the sixteenth century. It received its town charter on Aug. 14, 1743. In 1762 it was sacked by the English. Pop., in 1907, 14,367.

GUANACO, gwā'nā'kō (Sp., from the South American name *huanaco*, *huanaca*). The larger of the two wild species of the camel family inhabiting South America, of which the llama and alpaca are domesticated varieties. This animal (*Lama*, or *Huanacus*, *guanaco*) has more the appearance of a hornless goat antelope than of a camel. Its back is flat and straight, its legs in fair proportion, its head small and neat, with

long, pointed, expressive ears, and its tail reduced to a bushy stump. A full-grown male stands about 4 feet high at the shoulder and is covered with a thick coat of long, almost woolly hair, pale reddish in color, and longest and palest on the underparts. Domestication and artificial breeding with reference to the improvement of this coat have produced the alpaca (q.v.).

The guanaco is distributed throughout South America wherever a temperate climate exists. It inhabits the valleys of the Andes as far north as Bolivia and Ecuador, in company with the vicuñas (the other species of the genus, *Lama vicunia*), and there has habits very similar to its mountain-keeping relatives; but on the plains of Patagonia it ranges to the shores of the Atlantic and of Magellan's Strait and moves about in herds. The pairing season comes in August and September, and the young are born in May and June. They feed upon the pungent herbage of the Patagonian deserts as well as upon the bitter grasses of the pampas and furnish to the wandering natives their principal flesh food and the only skins useful for clothing or tent making, except those of the rheas. The Gauchos hunt them extensively also, and they form the principal prey of the puma, so that they take the place in South America of the antelopes of other plains regions. The guanaco also occurs on Tierra del Fuego and neighboring islands and swims readily from one to the other. Over a large part of its habitat none but salt water is to be had, and this it drinks readily. One very curious circumstance in its history is its habit of resorting to certain places in river valleys when it feels ill, so that nearly all which die a natural death seem to do so at these spots. This has been plausibly explained as due to the influence of an instinct inherited from the time when the country was much colder, and whenever storms or other distress afflicted the animals they were accustomed to seek a covert in the bushes which grew only alongside the sunken streams. Consult: Tschudi, *Reisen durch Süd-Amerika* (Leipzig, 1866-69); Darwin, *A Naturalist's Voyage* (London, 1860); Cunningham, *Natural History of the Straits of Magellan* (ib., 1871); Hudson, *The Naturalist in La Plata* (4th ed., ib., 1903); Spears, *Gold Diggings of Cape Horn* (New York, 1895). See LLAMA; VICUÑA; Plate of CAMELS and LLAMAS.

GUANAHANI, gwá'ná-há'né. The name given by the natives to the island on which Columbus is supposed to have first landed, and which he called San Salvador. It is identified by some with Cat Island, one of the Bahamas, while others believe it to be the present Watling's Island, belonging to the same group. Consult Markham, *Life of Columbus* (London, 1892).

GUANAJAY, gwá'ná-hí'. The second town, in size, of the Province of Pinar del Río, Cuba (Map: Cuba, C 4). It is situated a short distance from the Puerto del Mariel, 20 miles west of Havana, and is the terminus of the Havana and Guanajay Railroad. It is surrounded by hills and is one of the best health resorts in the province. Pop., about 6400.

GUANAJUATO, gwá'ná-hwá'tó. An inland state of Mexico, bounded on the north by the State of San Luis Potosí, on the east by Querétaro, on the south by Michoacán, and on the west by Jalisco (Map: Mexico, H 7). Area, 11,376 square miles. The state lies entirely within the great central plateau of Mexico, Anahuac (q.v.), whose average elevation is 6000 feet

above the sea. The surface is mountainous in the northern half, where it is traversed by the Sierra Gorda and Sierra de Guanajuato, while the southern half is more level. The chief rivers are the Lerma and its two tributaries, the Laja and the Turbio. There are a number of lakes in the southern part of the state, and mineral springs abound. The climate is semitropical in the plains and somewhat cold in the mountains. In the valleys and plains the chief industries are agriculture and stock raising, while in the mountainous regions mining ranks first. The chief agricultural products are corn, wheat, barley, tropical fruits, and red pepper. The mineral wealth of the state is very large, silver, gold, mercury, tin, lead, and copper being represented. The annual output of the mines is valued at about \$14,000,000. Guanajuato has a large number of small cotton and woolen mills, flour mills, potteries, breweries, distilleries, etc. The state is traversed in several directions by the National Railways of Mexico. Guanajuato is one of the most densely populated states of the country; its population in 1910 was 1,081,651, or over 98 inhabitants per square mile. The capital is Guanajuato (q.v.). Consult Martin, *Mexico's Treasure House* (New York, 1906).

GUANAJUATO, or **SANTA FE DE GUANAJUATO**, sán'tá fá' dá gwá'ná-nwá'tó. The capital of the State of Guanajuato, Mexico, situated in the Cañada de Marfil, 6200 feet above sea level and 165 miles northwest of Mexico (Map: Mexico, H 7). Its streets are deep and tortuous, but the houses are well built, and its fine public buildings include the cathedral, the monasteries, the college, the gymnasium, the theatre, and the mint. The silver mines of the vicinity were the richest of all Mexico, but became unprofitable because of their great depth. New methods and use of electricity have revived the mining industry. It has woolen, cotton, and flour mills, and manufactures soap, chemicals, pottery and some silverware. It is a distributing centre for imported machinery and hardware. It has a fine system of water works. A United States consular agent resides here. Pop., 1910, 35,682. Guanajuato was founded in 1554, and under Spanish rule numbered over 100,000 inhabitants, receiving the title of city in 1741. It is one of the most historic spots in Mexico, having been originally distinguished by the heroic struggle of the natives of the region against Spanish conquest. In the war for independence the city was the scene of the first great battle at the storming of the Alhóndiga de Granaditas (q.v.) in 1810. It was repeatedly sacked during the long war.

GUANARE, gwá'ná-rá. Capital of the State of Zamora, Venezuela, situated near the river Guanarito (Map: Venezuela, D 2). It is a place of great importance in the cattle trade of the country. Its population is estimated at 11,000. Guanare was founded in 1593.

GUANCHOS, gwán'chóz (native *Guanachinet*, from *guan*, man + *Chinet*, Tenerife). A Hamitic people, formerly numerous in the Canary Islands, associated with the ancient Canarii and Kamnuriëh. Their subjugation by the Spaniards was completed about 1496, and they are now almost extinct. In craniological characters they approach the Cro-Magnon race of France, with subdolichocephalous skull, low forehead, and projecting jaws. Those who first described them say that they were a handsome people, tall, well built, athletic, and agile. Their complexion and

hair were blond, but mixture with Arabs changed these characteristics in different islands. By their language and inscriptions they ally themselves with the Berbers of North Africa and the ancient Numidians. Consult Wallach, in *Journal of the Anthropological Institute*, vol. xviii (London, 1887-88).

GUANE, gwá'ná, or **GUANES**, gwá'nás. An inland town of Cuba, in the Province of Pinar del Río, and judicial seat of its district, about 20 miles southwest of Pinar del Río (Map: Cuba, A 4). It is the terminal of the Western Railway of Havana, and is a centre of tobacco production, cattle raising, and cedar lumbering. Pop., 1907, 1369.

GUANIDINE, gwá'ni-din (from *guano*), CH_5N_3 . An organic substance obtained in small quantities by the direct oxidation of proteids and readily converted into urea; it is therefore possibly one of the intermediate products of the gradual disintegration of proteids in the animal body. Guanidine is a crystalline solid substance soluble in water and alcohol; it acts as a powerful base, forming crystalline salts by combination with one molecule of acid. If boiled in aqueous solution in the presence of a little sulphuric acid or barium hydroxide, guanidine changes into urea and ammonia. If heated with concentrated acids or alkalis, it breaks up into ammonia and carbon dioxide. Just as the hydrochloride of urea changes on heating into biuret, so the hydrochloride of guanidine changes into biguanide, whose formula is

Guanidine itself is chemically an imino-urea, its constitution being represented by the following structural formula:

It may be prepared synthetically by the action of ammonium chloride on cyanamide in alcoholic solution. The best-known way of preparing guanidine, especially on a moderately large scale, consists in heating a mixture of ammonium sulphocyanate with charcoal and an oxide (like that of zinc) in a current of ammonia, the resulting product containing guanidine sulphocyanate:

The most important derivatives of guanidine are kreatine and kreatinine (qq.v.), the former being methyl-guanidine-acetic acid, the latter an anhydride of kreatine. Guanidine is a strongly poisonous substance.

GUANINE, gwá'nín, $\text{C}_5\text{H}_7\text{N}_5\text{O}$. A yellowish-white amorphous substance, which derives its name from its being a constituent of guano. It also forms, however, the chief constituent of the excrement of spiders, has been found attached to the scales of fishes, and seems to occur normally in the mammalian liver and pancreas.

With regard to its occurrence in guano, as it has not been found in the recent excrement of sea birds, there is every reason to believe that it is formed by slow oxidation (from atmospheric action) of uric acid, much as uric acid can be made to yield urea and oxalic acid. In the pancreas and liver it probably represents one of those transitory stages of disintegrated ni-

trogenous tissues which are finally excreted by the kidneys in the more highly oxidized form of urea.

Guanine may be best prepared from Peruvian guano, which is for this purpose finely powdered and boiled with dilute sulphuric acid; on cooling and filtering, the solution is made alkaline with caustic soda and again filtered, whereupon the guanine contained in the solution may be precipitated with an ammoniacal solution of silver oxide. The guanine thus obtained being contaminated with considerable amounts of uric acid, it is washed with water, treated with dilute hydrochloric acid, and the resulting solution, after being filtered and decolorized with bone-black, is precipitated with ammonia; finally some urea in hot nitric acid is added, and guanine nitrate allowed to crystallize at ordinary temperatures; the crystals are dissolved in dilute sodium hydroxide, and then addition of ammonium chloride to the solution produces a precipitate of pure guanine.

Guanine is insoluble in water, ether, alcohol, and ammonia. By the action of oxidizing agents it is converted into guanidine (q.v.), parabanic acid, and carbon dioxide. The presence of guanine may be analytically detected with the aid of concentrated solutions of potassium chromate and potassium ferrocyanide, the former reagent producing an orange-colored, the latter a yellowish-brown, crystalline precipitate, in solutions of guanine. When treated with nitrous acid, guanine is transformed into xanthine. The chemical constitution of guanine has been determined by Emil Fischer, and at present guanine can be prepared synthetically by several different methods. The structural formula of guanine is as follows:

GUANO, gwá'nó (Sp. *guano*, *huano*, from Peruvian *huano*, dung). A name applied to the excrementitious deposits of sea fowl, such as pelicans, cormorants, gannets, penguins, and petrels, which are found especially on certain coasts and islands where the climate is dry and the rainfall slight. The deposits sometimes contain, in addition to excrementitious matter, the remains of the birds themselves as well as of seals, walrus, and various other animals. Although the use of guano as a manure is comparatively recent, dating from about the middle of the nineteenth century, its value in agriculture was well known to the Peruvians long before they were visited by the Spaniards, probably as early as the twelfth century, and its collection and use were carefully regulated by the Incas. Alexander von Humboldt first brought specimens of guano to Europe in 1804 and had them analyzed. The most noted deposits of guano are those of the Chincha and other islands off the coast of Peru, but valuable beds have been discovered in many other parts of the world. The deposits, however, occur mainly within 10° to 20° north and south of the equator. The quality and value of the guano commercially depend almost wholly upon the amount of decomposition which it has undergone. The guano consists essentially of nitrogenous and phosphatic compounds, the former being chiefly ammonium salts and nitrates derived from the decomposition of the uric acid and urates which exist in the fresh

excrements of the birds, as well as of undecomposed or partially decomposed uric acid and urates and other organic compounds. The ammoniacal salts and nitrates, and some of the phosphates, are soluble in water and are readily washed away by rain. In regions where very little rain falls the deposits of excreta suffer very little from leaching, and therefore retain nearly the whole of the nitrogenous and phosphatic compounds. On the other hand, guanos found in regions where rain falls freely lose a great part of their soluble constituents, but remain rich in the less soluble phosphates.

Aikman classes guanos as nitrogenous and phosphatic and gives the following data as to the composition of the deposits which were reported as still being worked in 1894:

COMPOSITION OF GUANOS

KIND OF GUANO	Nitrogen	Phosphoric acid
	Per cent	Per cent
NITROGENOUS GUANOS		
Saldanha Bay.....	9	9
Ichaboe.....	8	9
Pabellón de Pica.....	7	14
Punta de Lobos.....	4	15
Huanillos.....	6	13
PHOSPHATIC GUANOS		
Baker Island.....	39
Enderbury.....	37
Aves and Sidney Island.....	34
Malden Island.....	32
Browse Island.....	31
Huon Island.....	28

Until 1874 most of the so-called Peruvian guano was obtained from the Chincha Islands, situated about 12 miles off the coast of Peru, between lat. 13° and 14° S. Each of these islands is from 5 to 6 miles in circumference and is of granite, formerly covered with guano, in places to a height of nearly 200 feet, in successive horizontal strata, varying in thickness from 3 inches to 1 foot, and in color from a light to a dark brown. Sometimes, however, a vertical surface of upward of 100 feet of a perfectly uniform appearance was found.

Certain of the Peruvian guanos originally contained as high as 14 per cent of nitrogen, but the quality greatly deteriorated as the deposits became worked out. To make good this deficiency, it was at one time a common practice to "equalize" or "rectify" the guano by the addition of ammonium sulphate.

Guano was the first artificial fertilizer to be used in large quantities, and the remarkable benefits derived from its application led to a rapid extension of its employment and prepared the way for the general use of commercial manures and intensive culture. Guano is therefore of special importance historically, because of its influence on agricultural practice. As shown above, it is essentially a nitrogenous and phosphatic fertilizer, usually containing only a small percentage of potash. When used continuously, therefore, and not supplemented by potash fertilizers, there result an undue exhaustion of the soil as regards potash, and a consequent refusal of the soil to respond to further applications of the guano. This was, in fact, the experience of some of the earlier users of guano and unjustly brought the fertilizer into a certain measure of disrepute. The practice, formerly common, of applying salt with guano tended to hasten this exhaustion of potash in the soil.

The guano industry was at its height about the middle of the last century. Since then it has greatly declined in relative importance, due both to the exhaustion of deposits and to the utilization of cheaper sources of commercial fertilizers, such as the immense phosphate beds in different parts of the world, but especially in the United States, the nitrate deposits of Chile, and the potash deposits of Germany. Peru now scarcely furnishes enough guano for home consumption and has had to restrict exportation, resorting to the old Inca rule of a closed season for protection of the guano birds and rotation of digging, in order to conserve the supply.

The term "guano" is commonly applied to various other manures, such as fish guano and bat guano. The latter is the more or less altered accumulation of bat manure, found in certain caves where bats have been allowed to congregate undisturbed for many years. It sometimes contains as high as 9 per cent of nitrogen and 25 per cent of phosphoric acid, but is very variable in composition and is found in too limited quantities to be of much commercial importance. See MANURES and MANURING. Consult also Gardner, *Essay on the History, Character, and Value of Guano* (New York, 1844); Lee, *Treatise on the Relation of Peruvian Guano to American Agriculture* (in reports to United States House of Representatives, July, 1854); Nesbit, *On Agricultural Chemistry and the Nature and Properties of Peruvian Guano* (London, 1856); Aikman, *Manures and Manuring* (Edinburgh, 1894); Storer, *Agriculture* (New York, 1897); R. E. Coker, "Fisheries and Guano Industry of Peru," *United States Department of Commerce and Labor, Bureau of Fisheries, Bulletin* 3, part 1 (Washington, 1908).

GUANOALCA, gwā'nō-ŭ'kā (1530-91). An Araucanian cacique, born in the valley of Puren, Chile. Renowned for his victories over the Spaniards, he was elected commander in chief of the forces of the allied tribes in 1588 and was killed in the assault upon Mariguenu.

GUANO ISLANDS. A general term applied to the Chincha, Lobos, and minor groups of islands, off the coast of Peru, South America. They were so named from their large deposits of guano.

GUANTÁNAMO, gwān-tān'ā-mō (also called Santa Catalina del Saladero, from the name of the mountains which surround it). An inland town in the Province of Santiago de Cuba, Cuba, situated about 10 miles north of the Bay of Guantánamo (Map: Cuba, K 6). It is connected by rail with Caimanera, its port. It exports coffee, sugar, and lumber. It was founded at the end of the eighteenth century, largely by families of French descent from Santo Domingo. Pop., 1907, 14,559. In 1903 the United States leased from the Cuban government the land on both sides of the entrance of Guantánamo Bay, about 20 miles from the town, for a naval and coaling station. Its position on the trade route from New York to Colon (about equidistant) and its proximity to routes from Europe to the entrance of the Panama Canal make it valuable as a naval base. It is the principal naval base of the United States in the West Indies, is well fortified, and its harbor can safely hold a large number of war vessels of all types.

GUAPORÉ, gwā'pō-rā', or ITENEZ, ã-tā'nās. A river of South America, rising in Matto Grosso, Brazil, and flowing northwest between

Brazil and Bolivia, to its confluence with the Mamoré (q.v.), an affluent of the Madeira (Map: Brazil, E 6). Its entire length is about 950 miles, and it is navigable for light-draft vessels to the town of Matto Grosso, which is less than 100 miles from the source of the river.

GUAQUE, gwá'ká. A wild Carib tribe on the Caqueta River, on the border between Colombia and Ecuador. They are intelligent, and skillful in gathering wax and in other occupations. The couvade is in force among them. No woman must be seen by men during her monthly period, and at the birth of a child she must withdraw from the household for three months, during all which time her husband observes strict seclusion. See COUVADE.

GUARÁ, gwá-rá'. A corrupt form of *aguará* (q.v.).

GUARANA, gwá-rá'ná (Brazilian name), or BRAZILIAN COCOA. A dried paste, made from the seeds of the *Paullinia sorbilis*. The dried seeds are reduced to powder, mixed with water to a stiff paste, and rolled into cylinders, which are then dried, forming a hard brownish mass. The substance has an astringent, bitterish, but not unpleasant taste, and is largely used as a stimulant by South American Indians. It is sometimes of the greatest service as a remedy for sick headache. The essential crystallizable principle of guarana is caffeine; of this, guarana usually contains between 4 and 5 per cent.

GUARANÍ, gwá'rá-né'. One of the most important of all the groups of Indian tribes in America. The term has two meanings, applying (1) to the Guaraní proper (warriors), living between the Paraná River and the Atlantic, and (2) to the immense linguistic family called Tupí-Guaraní, spread formerly over Uruguay, Paraguay, and Brazil, with ramifications in Bolivia and Peru. Their numbers have been greatly exaggerated, running up into the millions. The population of Paraguay and Uruguay is largely Guaraní, or has the blood of that people in its veins. They are not tall (average height, 63½ inches). They are dolichocephalic and are also said to be light in color and to lack the coarse features of the average American tribes. The Guaraní were not, at the time of the discovery, altogether dependent upon hunting, but had developed peaceful arts and sedentary life. In one sense this made them an easy prey to both Spaniards and Portuguese, but it saved their lives and taught them new industries. The more vigorous, after enduring their oppressors for a century, moved up the branches of the Paraná into Bolivia, where they mingled with the Spaniards, learned their language, and developed a fine-looking breed. The Guaraní of Brazil, under the Portuguese government, were settled on reservations and have married with the whites, the mixed progeny being called Mamelucos. These are industrious and progressive in agriculture and arts. The manioc is their staple vegetable food, along with many wild roots and fruits. They hunt also a great variety of wild animals and catch fish. Poultry is reared, and besides dogs they have tamed parrots, swine, and ostriches. The villages are surrounded with a double line of palisades and consist of a number of large communal clan houses, in which each family has its fire; in many of these houses there are no partitions.

Some of the tribes wear skin or network cloaks, and others a waist garment of feathers

like a Scottish kilt. Their weapons are the bow and arrow and clubs. The bow when straightened is also used as a lance. The tribes on the wide streams make dugout canoes 20 or 30 feet long, capable of carrying 30 persons. They have a simple upright loom and make netted hammocks. For bodily decoration they apply colored juice or clay, on which rude patterns are drawn; feathers of tropical birds are also used as ornaments. Drums, trumpets, and flageoles are their musical instruments.

The Tupí-Guaraní, scattered over the immense drainage area of the Río de la Plata and the southern affluents of the lower Amazon, had no political solidarity. They are most of them now either distinct tribes or groups, or settled down under different conditions with the white populations. Consult Martius, *Ethnographie und Sprachenkunde Amerikas* (Leipzig, 1867), and Brinton, *The American Race* (New York, 1891). See TUPÍ; TUPÍAN STOCK.

GUAR'ANTY, or **GUAR'ANTEE** (OF., Fr. *garantie*, from *garantir*, to warrant, from *garant*, *guarant*, *warant*, warrant, from OHG. *giverēn*, Ger. *gewähren*, to grant). In its broadest sense, a contract by which one becomes legally liable for the debt, default, or miscarriage of another. In this sense it is used interchangeably with *suretyship* (q.v.). Frequently it bears a narrower signification, denoting a contract to pay money or do an act upon the failure of another to pay or to do. In the former case the principal debtor and the guarantor or surety are bound, ordinarily by a single contract, to the third person. In the latter case the guarantor's contract with the third person is separate and distinct from his principal's contract. A promissory note signed by A and B for A's debt is an example of a guaranty of the first class. A promissory note by A for his debt to which B adds a separate contract, by which he guarantees the payment of the note, illustrates the second class. There is some authority for the use of guaranty in a third and still narrower sense—as an undertaking, by the guarantor, to pay if the principal cannot; i.e., to pay only upon proof of the principal's insolvency. If the guarantor's agreement is made at the same time with that of the principal, the same consideration will answer for both; but a guaranty of an existing debt or liability requires a new and distinct consideration.

At common law, a guaranty was equally enforceable whether written or oral. By sec. 4, c. 3, 29 Car. II (see FRAUDS, STATUTE OF), it is provided that the contract of guaranty must be in writing and signed by the party to be charged or by his authorized agent, if it is "a special promise to answer for the debt, default, or miscarriage of another person." Ordinarily a guaranty is such a promise, and thus within the statute; but it often happens that a transaction which partakes of the nature of a guaranty does not fall within the statute. The rules governing the construction of guaranties, the discharge of guarantors, and their rights against their principals will be considered under SURETYSHIP. Consult: Brandt, *Suretyship and Guaranty* (3d ed., Chicago, 1905); De Colyar, *Law of Guaranties and of Principal and Surety* (3d ed., London, 1897); D. H. Pingrey, *Treatise on the Law of Suretyship and Guaranty* (2d ed., Albany, 1913); and the authorities referred to under CONTRACT.

GUARAUNAN, gwá'rá-ŏ'nan. A tribe in

British Guiana, South America. Consult E. F. Im Thurn, *Among the Indians of Guiana* (London, 1883), and Tavera-Acosta, *En el Sur* (Ciudad-Bolívar, 1907).

GUARAUNO, gwá-rou'nó. A tribe of South American Indians, known to the English as Warraus, living in the delta of the Orinoco River, Venezuela. They are dark in color and well shaped in body. They are also industrious farmers and skillful laborers, building their houses upon piles to guard against the overflowing of the river. It is said, however, that they prefer the uplands, having been driven to the swamps by the inroads of the Caribs. They are estimated to be from 8000 to 15,000 in number and appear to constitute a distinct linguistic stock.

GUARD (OF., Fr. *garde*, from OF., Fr. *garder*, to guard, from OHG. *wartēn*, Ger. *warten*, AS. *weardian*, Eng. *ward*; connected ultimately with Gk. *ḡpān*, *horan*, to look). Guards may be divided into four classes—exterior guards, interior guards, military police, and provost guards. Exterior guards are used only in time of war. They belong to the domain of tactics, and their purpose is to prevent surprise, to delay attack, and otherwise to provide for the security of the main body. On the march they take the form of advance guards, rear guards, and flank guards. At a halt they consist of outposts. Interior guards are used in camp or garrison to preserve order, protect property, and enforce public regulations. In time of war such sentinels of an interior guard as may be necessary are placed close in or about a camp, and normally there is an exterior guard farther on, consisting of outposts. In time of peace the interior guard is the only guard in a camp or garrison. *Military police* differ somewhat from either of these classes. They are used in time of war to guard prisoners, to arrest stragglers and deserters, and to maintain order and enforce police regulations in the rear of armies, along lines of communications, and in the vicinity of large camps. *Provost guards* are used in the absence of military police, generally in conjunction with the civil authorities at or near large posts or encampments, to preserve order among soldiers beyond the interior guard.

The various elements of an interior guard, classified according to their particular purposes and the manner in which they perform their duties, are as follows: (a) the main guard; (b) special guards—stable guards, park guards, prisoner guards, herd guards, train guards, boat guards, watchmen, etc. At every military post, and in every regiment or separate command in the field, an interior guard is detailed and duly mounted. It consists of such number of officers and enlisted men as the commanding officer may deem necessary and is commanded by the senior officer or noncommissioned officer therewith, under the supervision of the officer of the day or other officer detailed by the commanding officer. In order that guard duty may not be needlessly irksome and interfere with tactical instruction, the number of men detailed for guard is the smallest possible. In time of peace sentinels on fixed posts are replaced, as far as practicable, by watchmen. When more than one guard is required for a command, a field officer of the day is detailed, who receives his orders from the brigade or division commander as the latter may direct. The strength of guards and the number of consecutive days for which an organi-

zation furnishes the guard are so regulated as to insure privates of the main guard an interval of not less than five days between tours. The members of the main guards and stable and park guards are habitually relieved every 24 hours; sentinels are relieved every two hours.

The commanding officer exacts a faithful, vigilant, and correct performance of guard duty in all of its details, giving his orders to the officer of the day, who is responsible for the proper performance of duty by the guard with which he marches on and for the enforcement of all police regulations. The commander of the guard is responsible for the instruction and discipline of the guard, while the sergeant of the guard is the senior noncommissioned officer of the guard and, if no officer is present, performs the duties of the commander of the guard. The corporals of the guard post and relieve sentinels and instruct the privates in their orders and duties. Musicians of the guard sound the camp and garrison calls prescribed by the commanding officer.

Orderlies and color sentinels are privates of the guard selected for correct performance of duty, military bearing, neatness of person and clothing, smartness of arms and equipments. One orderly is detailed as orderly to the commanding officer. Color sentinels are placed on the color line, when established, to guard the colors and stacks of rifles. Privates of the guard are assigned to reliefs by the commander of the guard, and to posts, usually, by the corporal of their relief.

Orders for sentinels are of two classes, general orders and special orders. Guard orders apply to all sentinels, special orders to particular posts and duties. The members of a guard are given the countersign and parole. The countersign is a word given daily from the principal headquarters of a command to aid guards and sentinels in identifying persons who may be authorized to pass at night. The parole is a word used as a check on the countersign in order to obtain more accurate identification of persons. The countersign is usually the name of a battle; the parole, that of a general or other distinguished person. Watchmen are enlisted men detailed as watchmen or overseers over prisoners, and as such receive their orders and perform their duties as the commanding officer may direct. Compliments from a guard consists in the guard turning out and presenting arms. The guard takes charge of all prisoners in camp and garrison and has charge of the post flag, which is hoisted at the first note of reveille and lowered at the last note of retreat. The reveille and retreat gun is fixed by the members of the guard.

Guard mounting is formal or informal, as the commanding officer may direct. It will be held as prescribed in the drill regulations of the arm of the service to which the guard belongs; if none is prescribed, then as for infantry. In case the guard is composed wholly of mounted organizations, guard mounting may be held mounted. Formal guard mounting is ordinarily held only in posts or camps where a band is present. The purpose of guard mounting is to give an opportunity carefully to inspect the individual men, their arms and equipments, before assigning them to their posts and duties, and formally to relieve the old guard marching off. Consult *Manual of Guard Duty, United States Army* (Washington, 1914) and *Field Service Regulations, United States Army* (ib., 1914).

For detailed description of formal ceremony of guard mounting and inspection of guards, see the *Drill Regulations* of the different arms of the service. See **ADVANCE GUARD**; **REAR GUARD**.

GUARD, NATIONAL. The organized militia of the United States. The term is generally used to designate a body of citizens organized for home defense. In this sense used during the French Revolution, and later with respect to local forces in Italy and Spain. See **MILITIA**; **NATIONAL GUARD**.

GUARDAFUI, gwär'dá-fwé', CAPE (Lat. *Aromatum promontorium*). Next to Ras Hafun, the most eastern point of the African continent, situated in lat. 11° 50' N. and long. 51° 16' E. (Map: Africa, K 3). It forms the extremity of an immense promontory, the northern part of Italian Somaliland, stretching seaward in a northeast direction, and washed on the northwest by the Gulf of Aden and on the southeast by the Indian Ocean.

GUARD BOAT. A picket or patrol boat. Also a boat sent by the guard ship of a fleet or squadron to carry the orders, mail, etc., between the flagship (or ship of the senior officer) and the other vessels.

GUARD CELLS. See **STOMATA**.

GUARD/FISH'. See **NEEDLEFISH**.

GUARDI, gwär'dé, FRANCESCO (1712-93). One of the foremost Venetian landscape painters. He was born in Venice, was a pupil of Canaletto, and like him painted Venetian scenes. Their works are sometimes confused, but Guardi's paintings are less finished than those of his master; his whole style is sketchier, more sparkling, and more picturesque, though architecturally less exact. He introduced processions of figures in brilliant colors, and peopled his pictures with animated groups in gay costume, all treated with unflinching spirit, and with every advantage of beautiful and harmonious color. Of his numerous works Simonson, the chief modern authority on the subject, enumerates 282 examples, scattered throughout Europe and America. Of these 51 are in London—9 in the Wallace collection, 7 in the collection of J. P. Richter, and 3 in the National Gallery; 38 in Paris—9 in the Louvre and 22 in the collection of Baroness Leonino; 13 in Philadelphia, all in the J. P. Johnson collection; 10 in Vienna, mostly in the Academy; 8 in New York—5 in the Hearn collection and 2 in the Metropolitan Museum ("Santa Maria della Salute" and "The Rialto"); 7 in Venice; 6 in the Berlin Museum; and 3 in Boston. Consult Simonson, *Francesco Guardi* (London, 1907).

GUARDIA, gwär'dyá, TOMÁS (1832-82). A Central American politician, President of Costa Rica, born in Bagaces, Guanacaste. He adopted a military career, and participated in the defeat of the Walker filibustering expedition in 1855. He was made colonel, and was Governor of Alajuela from 1866 to 1869, when he led a revolt against Jimenez, which resulted in his overthrow in 1870 and the establishment of Carranza as provisional President and Guardia as commander in chief of the army. Six months afterward he succeeded Carranza as provisional President, and towards the end of the year was elected President. From that time until his death he was virtually dictator of Costa Rica, resigning and reassuming the presidency a number of times, and finally dying in office despite his waning popularity. The interior of the Republic was much improved under his iron-handed

administration, although he saddled the country with an enormous debt by attempting to construct an interoceanic railway.

GUARDIAGRELE, gwär'dé-a-grá'la. A city in the Province of Chieti, Italy, 18 miles from the Adriatic and from Ortona, the nearest railway station. It markets grain, olives, and vegetables, and has numerous fairs. Four miles from the town is a mineral spring, rich in bicarbonate of iron and magnesia. Pop. (commune), 1901, 9493; 1911, 9971.

GUARDIAN, gür'dí-an. One having lawful custody and control of the person or property, or both, of an individual who cannot take care of himself. In this sense the term includes guardians of lunatics, idiots, habitual drunkards, spendthrifts, etc., though such a guardian is usually in the United States styled a "committee." It also embraces a guardian or overseer of the poor and many other custodians. But in its more usual acceptation the word guardian is employed to denote one who has the custody and control of the person or property, or both, of an infant, i.e., of a person under 21 years of age, during the whole or some part of his minority. Such guardians exist either by virtue and operation of law or by special appointment by parents or courts.

I. In the first class are (1) guardians *by nature*; (2) guardians *for nurture*; (3) guardians *in socage*; and (4) guardians *by estoppel*. (1) A guardian by nature is, in England, one who has the care and charge of the person but not of the property of the heir apparent. The guardianship continues until the ward reaches the age of 21. (2) In English law also a guardian for nurture is one who has the management of the persons only of all the children other than the heir apparent, until they are 14 years of age. Both of these species of guardianship represent the natural right of parents to the custody and control of their children. They vest, therefore, in the father or, upon his death or disability, in the mother. In the case of illegitimate children the mother has the sole right of guardianship. In the United States, where all the children inherit equally, these two forms of guardianship are substantially the same, and are governed by the laws covering the relation of parent and child. (3) Guardianship in socage, now of rare occurrence, was the usual form of guardianship where lands held by socage tenure descended to an infant under the age of 14. It extended to the inherited estate as well as to the person of the ward and later to any other property, real or personal, that he might have. The person entitled to guardianship was the infant's next of kin who could not possibly inherit the property. It ceased when the ward reached the age of 14 if the infant elected to appoint another guardian. Otherwise it might continue. This form of guardianship is obsolete in most of the United States, and in those States where it is retained it is no longer necessary that the guardian shall be incapable of inheriting from the infant. (4) A person who officiously meddles with the property of an infant may be required by the court to account to the infant, the same as if he were in fact guardian. He is then said to be a guardian *by estoppel*. See **ESTOPPEL**.

II. Guardians appointed by parents or courts are now the most common. They include: (1) testamentary guardians and (2) judicial guardians, and within the second class are embraced

(a) guardians in Chancery, (b) guardians *ad litem*, and (c) guardians appointed by courts, by virtue of some statutory authority. (1) The English statute 12 Car. II, c. 24, first gave to a father power to appoint by will a guardian of his minor children, born or unborn, and vested in such testamentary guardian control of both the person and the estate of the ward until he became 21 years of age. That statute has been generally reenacted in the United States. Such a guardian is under the jurisdiction of the courts of equity, must account strictly for his acts, and is the recipient of a personal trust which cannot be delegated to another. (2) (a) The King of England early delegated his power, as *parens patriæ*, to appoint guardians for infants and other incompetent persons to the Court of Chancery, and that authority still exists in the Chancery Division. In the United States the same right is exercised by courts of equity, though frequently regulated and modified by statute. The guardianship lasts until the infant is 21 years old, but after he is 14 his wishes will be taken into consideration by the court in making the appointment. (b) It is also an inherent power of a court, before which an infant comes as a defendant in an action, to appoint a guardian *ad litem* or special guardian for that particular suit. The appointee is usually a relative or friend of the infant defendant. His authority is confined to the representation of his ward in the legal proceeding for which he is appointed. (c) It was only by force of statute that the English ecclesiastical courts acquired the power to appoint guardians for infants. And the same is true of probate and surrogate courts in America. That power is generally conferred on such courts in the United States, and in some States other designated courts are given the same authority, by special statutory enactment.

The authority of a guardian closely resembles that of a parent. He has in general the custody of the ward's person, the right to change his domicile, or bind him out as an apprentice, the direction of his education, secular and religious, and the power to deal generally with his personal property, and to sell and dispose of the same. But he cannot sell the real estate of the ward, though it is his duty to manage and lease it, and to receive the rents and profits for the ward's benefit.

The duties of a guardian are summarized in the statement that, since he is in effect a trustee, he must act exclusively in the ward's interest, and must take no profit to himself by virtue of his position. He must keep the property productive, and invest in such securities only as are directly authorized by law or by the court. He is not obliged to support the ward, except out of the ward's property. His acts are closely scrutinized by the courts and he may be required, from time to time, to give an account of his dealing with the ward's property. The ward has generally one year after becoming of age in which to call the guardian to account. The guardian's compensation is usually statutory and by way of commissions on the sums disbursed by him on his ward's account.

The guardianship of the person terminates when the ward marries, and the better authorities hold the same to be true as to the property. The court which appoints a guardian may remove him for good cause. Guardians not judicially appointed cannot be removed by a court

in England, but in the United States such power is generally vested in the courts by statute. For the guardianship once vested in lords of lands held in chivalry or by knight's service under the feudal system, see TENURE; WARDSHIP. Consult Woerner, *The American Law of Guardianship* (Boston, 1897); H. S. Kelley, *Treatise on the Law Relating to Executors, Administrators, and Guardians* (4th ed., Kansas City, Mo., 1913). See also PARENT AND CHILD.

GUARDIAN, THE. 1. A play by Massinger, licensed 1633, produced at court with success, 1634, and published in 1655. 2. A comedy by Abraham Cowley hastily written on the occasion of Prince Charles's passage through Cambridge, where the poet was a fellow (1641), and printed in 1650. In 1658 it was revised under the title of *The Outlier of Coleman Street*, and published in 1663. 3. A periodical founded in 1713, in London, by Richard Steele. It was the successor of the *Spectator*, but was issued only from March to October. Of the 176 papers, 53 were written by Addison.

GUARDIAN ANGEL, THE. A novel by Oliver Wendell Holmes (1867).

GUARD SHIP. In a fleet or squadron, the duty ship of the day. She must provide a guard boat which makes the rounds of the fleet or squadron one or more times a day carrying mail, orders, etc., to and from the flagship. She must also furnish additional special boats for this sort of service if called upon. She must furnish the patrol boats, if such are necessary, and are not supplied by other vessels of the fleet. An officer from the guard ship boards all vessels entering port if so required by the senior officer present, and makes a report to him in regard to them. The guard ship, during the 24 hours of the duty, hoists the guard flag at the fore, and at night is distinguished by a red lantern carried at the truck.

GUARINI, gwa-ré-né, GIAMBATTISTA (1538-1612). An Italian pastoral poet, born at Ferrara of a noble family long renowned in the world of letters, and especially made famous by Giambattista himself. He early showed literary ability and, gaining admission to court, was often intrusted by Alfonso II with important diplomatic missions, such as that to Warsaw to procure the Duke's election to the throne of Poland. But by nature haughty, restless, and ambitious, in 1588 he suddenly left Ferrara, thus arousing the anger of the Duke, who for some time made it impossible for him to obtain employment at any other court. Finally becoming reconciled in 1595, he returned to thank the Duke, and later passed to the courts of Florence and Urbino. His last public mission was one of congratulation from the people of Ferrara to Pope Paul V on the latter's election in 1605. His last years, though gladdened by his reputation as a poet, were filled with domestic misfortunes and family quarrels. He died in Venice.

Guarini wrote numerous love and encomiastic lyrics, a comedy, *L'idropica*, a *Trattato della politica libertà*, many letters, and critical works in defense of his literary principles, *Compendio della poesia tragicomica*, *Il segretario*. He principally owes his fame, however, to *Il pastor fido*, to which is invariably coupled the *Aminta* of Tasso, whom he there simulates. The two are certainly the finest pastoral poems in Italian literature, and while *Il pastor fido* is more perfect in construction and technical execution, and is unsurpassed in elegance of language and

wealth of delicate images, easy-flowing phrases, and ingenious witticisms, the *Aminta* is the more truly poetic. For, as De Sanctis says, "Guarini lacks the inspiration, the melancholy, the fantastic concentration, the profound sentiment of Tasso. . . . He is always speaking of love, but does not feel it. Nor does he feel pastoral life, that inclination to solitude and idyllic peace. . . . He has imagination but not fancy, *esprit* but not sentiment, a musical ear but not the harmony which in the soul is felt." He is only a consummate artist. *Il pastor fido* (begun about 1580, presented to Charles Emmanuel I, Duke of Savoy, in 1585, published in 1590, and first played in Crema in 1596) was intended to be a tragedy-comedy. As a matter of fact it is a tragedy only in so far as in accordance with Greek tragedy the action is governed by Fate, and is a comedy only in that, following Latin comedy, the play ends happily. Again like the *Aminta*, it is in reality a beautiful lyric poem, a courtier's conception of ideal life. Happiness, in contrast with the highly conventional and artificial life led especially at court, was then identified with simple rustic life in the midst of beautiful Nature with its simple pleasures and free expression of one's feelings. Naturalism was the philosophy then popular, and *Il pastor fido*, an apotheosis of pastoral life and of the golden age, represents the triumph of Nature over Destiny. Becoming immensely popular, and influencing, among others, Calderón and Shelley, *Il pastor fido* has gone through about 170 editions, of which many are in the various languages into which it was soon translated, French, German, English, Dutch, Spanish, and Greek. Consult: V. Rossi, *B. Guarini e Il pastor fido* (Turin, 1886); F. De Sanctis, *Storia della letteratura italiana*, vol. ii (Naples, 1903); A. Saviotti, *Guariniana*, ecc. (Pesaro, 1888); A. L. Stiefel, in *Litteraturblatt für germanische und romanische Philologie*, vol. xii (Leipzig, 1891); M. W. Shelley, *Lives of the Most Eminent Literary and Scientific Men of Italy*, vol. ii (London, 1835); W. Everett, *Italian Poets since Dante* (New York, 1904).

GUARINI, GUARINO (1624-c.1683). An Italian monk, mathematician, and architect, born in Modena. He was appointed architect to the Duke of Savoy, Carlo Emanuele II, and designed many public and private structures in Turin. These include the palace of the Duke of Savoy; the church of San Lorenzo of the Theatins; the sanctuary of the Madonna della Consolata; the mortuary chapel of the house of Savoy in the church of San Giovanni; and the church of St. Philip Neri. He also designed the churches of Santa Maria d'Etting, Prague, and Santa Maria della Provvidenza, Lisbon. All these are in the fantastic style of Bernini, which Guarini carried to the extreme of the baroque. Among his writings are *Disegni d'architettura civile ed ecclesiastica* (1668) and *Leges temporum et planetarum* (1678). Consult: Cicognara, *Storia della scultura* (3 vols., Venice, 1813-18); Milizia, *Lives of the Celebrated Architects, Ancient and Modern*, trans. by Cressy (2 vols., London, 1826); Quatremère de Quincy, *Histoire de la vie des plus célèbres architectes* (2 vols., Paris, 1830).

GUARINO (Lat. *Varinus*) **DA VERONA**, gwá-ré'nó dá vā-rō'ná (1370-1460). A learned Italian of the Renaissance, especially influential in reviving the study of Greek. He studied under Chrysoloras at Constantinople, and, after his re-

turn to Italy, taught in many places, including Venice, Verona, Padua, Bologna, and Florence. At one period he was tutor to Prince Lionello of Ferrara, and acted as interpreter for the Council of Ferrara. He translated the first 10 books of Strabo and a portion of Plutarch; wrote a Greek as well as a Latin grammar, and commented on Aristotle, Cicero, Persius, Juvenal, and Martial. Consult: Rosmini, *Vita e disciplina di Guarino* (Brescia, 1805-06); Sabbadini, *Guarino Teronese e il suo epistolario* (Salerno, 1885); Sabbadini, *La scuola e gli studi di Guarino* (Catania, 1896); Woodward, *Vittorino da Feltre and other Humanist Educators* (Cambridge, 1897); Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

GUARNERI, gwār-nā'rē, or **GUARNERIUS**. A noted family of violin makers of Cremona, Italy. The head of the family, **ANDREA** (c.1630-98), learned his art of Nicolò Amati, for whom he worked from 1650 to 1665.—**GIUSEPPE** (1666-c.1739), son and successor of Andrea, was as much an imitator of Stradivarius as was his father of Amati.—Another son, **PIETRO** (1695-?), was also a violin maker, but a much inferior workman to his father and brother.—The most famous member of the family was **GIUSEPPE ANTONIO** (1687-c.1745), who was a nephew of Andrea and a pupil of the famous Stradivarius. The letters "I. H. S." were written on many of his labels, in consequence of which he was popularly known as Guarneri del Gesù. Many reasons have been given by historians for the variable character of his work; the violins of his later days being of very inferior workmanship, while those of his medium period are regarded by connoisseurs as equal to those of Stradivarius. See **VIOLIN**. Consult Horace Fetherick, *Joseph Guarnerius, his Work and his Master* (London, 1906).

GUARNERIUS. An Italian jurist of the eleventh century. See **INNEBUS**.

GUASA, gwá'sá. One of the huge sea bass or groupers of the tropical Atlantic, especially *Promicrops guttatus*. (See **JEWFISH**.) The word "guasa" or "guaza," often corrupted in Florida into "warsaw," is the Spanish name of a similar fish first known in the Mediterranean, where it is called "merou" by French fishermen; and both these names are given in the West Indies to various groupers (q.v.).

GUAST, PIERRE DU. See **MONTS, SIEUR DE**.

GUASTALLA, gwá-stál'lá. An episcopal city in north Italy, in the Province of Reggio nell'Emilia, about 18 miles north of Reggio, on the right bank of the Po, in the marshy, fertile plain which is cut up by canals (Map: Italy, C 2). It markets rice, silk, cheese, and wine, and has ancient fortifications, a tenth-century cathedral, a Gymnasium, a school of music, a municipal theatre, a public library, and a bronze equestrian statue of Ferdinand I of Gonzaga (died 1559) by Leone Leoni. Guastalla was founded in the seventh century by the Lombards. Paschal II held a council here in 1106. The Duchy of Guastalla, of which this city was the capital, came into the possession of the Gonzaga family in 1539. After 1746 the territory was annexed by the Empress Maria Theresa; in 1748 it was handed over to the Duke of Parma. In 1796 it was captured by the French, and the next year became part of the Cisalpine Republic. In 1805 it was given to Napoleon's sister Pauline, and in 1814 assigned by the Congress of Vienna to Napoleon's wife, Marie Louise. Shortly after

her death in 1847 it was annexed to Modena (q.v.). Pop. (commune), 1901, 11,091; 1911, 11,881.

GUASTAVINO, gwás'tá-vē'nó. A system of vault construction introduced about 1883 by an Italo-American, R. Guastavino. Guastavino vaults are built of any form of two or more layers of thin, hard-burned tiles, laid in strong cement, breaking joints in each course. The idea was derived from the Roman use of flat tiles for centrings and linings of vaults. Guastavino vaults are remarkably light and strong and exercise very little thrust.

GUATEMALA, gá'te-má'lá, *Sp. pron.* gwá'tá-má'lá. The largest and most important of the five Central American republics, containing nearly one-half of their collective population and leading them in the extent of its domestic and foreign commerce. It has a frontage of 200 miles on the Pacific and of 70 miles on the Caribbean Sea (Gulf of Honduras). It extends from lat. 13° 54' to 17° 48' N., and is bounded on the northwest and north by Mexico, on the east by British Honduras and the Gulf of Honduras, on the southeast by Honduras and Salvador, and on the south by the Pacific Ocean (Map: Central America, B 3). Its area (estimated) is 48,300 square miles.

Topography. The Pacific coastal plain is somewhat broad in the west and quite narrow in the east near the coast of Salvador. At the foot of the mountains its slope is very noticeable, but nearing the sea it is almost level. It is also so low that in the rainy season lakes form which connect with the sea by channel, thus rendering their waters brackish (esteros). The Pacific ports, San José, Champerico, and Ocos, are merely open roadsteads. The Atlantic ports are Livingston and Puerto Barrios, the latter having a good natural harbor.

Three distinct topographic features mark the interior, crossing the country east and west. In the north is the broad, low, hilly plain of Petén, of tertiary and cretaceous formation, covered with forests and grasses, and still largely unexplored. In the centre the plain rises to a high plateau surmounted by the sedimentary ranges of the Sierra Madre system, which in their highest point attains an elevation of about 11,000 feet. The plateau is continued to the south, and is bordered along its south edge by the volcanic mountains which skirt the Pacific coastal plain and are roughly parallel with the Pacific shore line. This southern part of the plateau is covered deep with the debris of eruptive rocks and ash, forming plains of very rich and productive soil among the mountains. Accordingly, the most important agricultural districts are among the uplands of the south, and much nearer the Pacific than the Atlantic. Most of the volcanoes are extinct; but there have been recorded within the historic period severe eruptions of Tacaná, Cerroquemado, Fuego, and Pacaya. Other volcanic summits are Agua, Atitlán, Tajumulco (seemingly the loftiest elevation of the land), Acatenango, and Santa María. Earthquakes are very frequent in the neighborhood of the volcanic belt, and some of them have destroyed many towns. The effects of a very destructive earthquake on April 18, 1902, which resulted in the partial destruction of the important city Quezaltenango, were recorded by seismographs all over the world; and the volcanic eruptions from the Santa María group that followed in late October buried a

large area of coffee lands under several feet of the same volcanic ash that has contributed to make this southern portion of Guatemala one of the large coffee producers.

The volcanic belt forms the water parting between the Atlantic and the Pacific river systems. On the Pacific side the rivers descend the steep slopes as torrents to the narrow coastal plain, and are unsuitable for navigation. The Atlantic rivers, on the other hand, have a long and gentle slope; but they are of little consequence as water highways, though the Motagua, the most southern and important of the Atlantic group, is navigable for 100 miles. Other streams are the Polochic and the Usumacinta (on the Mexican frontier). There are many lakes without visible outlet in the Cretaceous rocks of north Guatemala, the largest of which is Lake Petén, and among the eruptive rocks farther south are many beautiful mountain lakes. The largest lake of the Atlantic slope is Yzabal (the Golfo Dulce). It is shallow, considering its large area, but is navigated by steamers.

Climate, Flora, and Fauna. Lying wholly within the tropics, Guatemala would have a uniformly warm, moist climate if it were not for the great diversity of its surface in the central and southern parts. Here the differences in topography reach their maximum, with important effect upon climate, while the comparatively level areas of north Guatemala and the Pacific coastal plain have uniform tropical weather conditions. In the lower-lying hot lands (*tierra caliente*), up to 2000 feet above the sea, the mean temperature is from 77° F. to 82° F. The population here is very small. Fevers are prevalent, and most of the hot lands are unsuitable for settlement by the white races. These are the regions of cacao and banana culture, of the coco palm, and of rubber and mahogany forests. The healthful temperate regions (*tierra templada*), forming the central and southern plateaus and plains among the mountains, are from 2000 to 6000 feet above sea level. The zone between 2000 and 4000 feet, with a mean temperature of 68° F. to about 73° F., is the chief region of coffee culture. Less coffee is grown in the higher parts of the temperate lands, where the temperature has been known to fall to the freezing point. The cold lands (*tierra fría*), above 6000 feet, where the mean temperature is 50° F. to 63° F., are adapted to the cultivation of wheat, the potato, and apple; and in particularly favored spots, well exposed to the sun, even oranges and bananas, which, with sugar cane and cotton, are characteristic products of the lower altitudes, are successfully grown. Above 10,600 feet, among the highest mountains, where the mean annual temperature is under 50° F., there is no agriculture. Here are found alpine conifers, and there is more or less mountain grazing. The tops of the highest mountains are treeless and are sometimes covered with a little snow.

The Atlantic slope, swept to a considerable extent by east or northeast trade winds, has a larger rainfall than the Pacific slope, where the heaviest precipitation is on the southern slopes of the mountains. The driest regions are the plains among the mountains. These plains are partly screened by the elevations around them from rain coming from either ocean. Thus, the inland district of central Guatemala has only about 27 inches of rain in a year, which is sufficient for agriculture, while the city of

Guatemala, on the coast of the southern Cordillera, has 57 inches, and Tual, high on the Atlantic slope, 195 inches. The temperate lands, covering a large collective area in central Guatemala, are the great source of the country's agricultural wealth. Among the wild plants the bamboo grows in thickets on the low-lying Pacific seaboard, and the dense forests of the northern hot land are famous for their magnificent orchids. Animal life is more abundant in the moist than in the dry regions. A number of mammals, including the tapir and peccary, inhabit the forests. The alligator, and 30 species of fish previously unknown, were found in Lake Petén. Some of the most dangerous snakes find a home in the forest undergrowth. There are very many species of birds, the most notable of which is the quetzal, or long-tailed trogon, "with an emerald-green silky plumage, dashed with a golden lustre above, with a lovely purple blue below, and a tail 3 feet long." This bird has been chosen as the national emblem of the Republic. Horses, mules, cattle, sheep, swine, and goats are important factors in the industrial life of the drier and cooler agricultural districts.

Agriculture and Minerals. The principal industry is agriculture, for which the country is well adapted on account of its fertile and well-watered soil, as well as its favorable climate. Good lands may still be purchased for prices ranging from \$18 up per acre, or leased on favorable terms. The total value of agricultural products in 1913 is given at \$540,189,111 paper currency, as against \$533,000,000 in 1912, and \$186,000,000 in 1906. These sums represent the local value of coffee, sugar, cereals, vegetables, fruits, rubber, tobacco, wood, and cattle products. The most important product is coffee, Guatemala producing half the crop of Central America and being surpassed only by Brazil and the East Indies in the quantity harvested. Coffee is cultivated by German and United States planters on large plantations and is also grown on a smaller scale by a number of Guatemalans. The coffee exports in 1912 were 76,219,800 pounds, valued at \$10,988,521 gold. In the lower regions where coffee is raised, the trees are shaded by the banana plant, which also yields good crops. Cane sugar yielded in 1913 about 79,705,000 pounds of sugar, distillers taking most of the crop. Tobacco, rubber, chicle, and beans are also important. The cultivation of cacao and vanilla, for which the country seems well suited, has fallen off; no exports were shown either in 1911 or 1912. The output of cereals, confined to narrow areas in the higher lands, is insufficient for the domestic demand. Cattle on the plateaus yield hides for export, and the cotton fields and high, dry sheep pastures provide fibres for the spinners and weavers who ply their trades in the homes. The mineral deposits have received little attention, although the mining code encourages the industry. They include gold, silver, salt, iron, lead, and coal, of which only placer gold is obtained, to some extent, in the valley of the Motagua River. In 1912 only 30,840 pounds of mineral products were exported, valued at \$2737. The limited mining now being carried on is for the most part near the frontiers of Mexico, Honduras, and Salvador.

Manufactures and Commerce. The manufacturing industries are only slightly developed and are confined chiefly to the production of

blankets, coarse cloth, straw hats, ponchos or cloaks, wooden and earthen wares, tobacco products, and leather goods. There is a large cotton mill at Cantel, established in 1885, with a capital of \$600,000 gold. The transportation facilities are far from adequate. In many parts of the country there are merely paths on which trains of pack mules furnish the only means of transportation. The railway lines, all owned by American and German companies, have at present a total length of 502 miles. The Guatemala Central Railroad, connecting the capital, Guatemala, with the Pacific seaport of San José and with a branch line connecting Santa María with Patulul, is 141 miles long. The Northern, or Guatemala, Railroad, connecting the Atlantic port of Puerto Barrios and Guatemala City, and with the Quirigua branch, has a length of 220 miles. These two lines, as well as that of Ocos and the Occidental Railway, are managed by one company, the International Railways of Central America. The companies are assisted by annual subventions as well as by land grants. Puerto Barrios, the chief Atlantic seaport, is connected by steamers with New York and New Orleans. The Pacific ports have direct steam communication with San Francisco and Europe.

The chief article of export is coffee, which goes mainly to Germany, the United States (24 per cent of the total export in 1912), and Great Britain. Besides coffee, there are shipped hides and skins, bananas, rubber, sugar, and chicle. The imports consist chiefly of cotton goods supplied by Great Britain, the United States, Germany, and France; railway materials and telegraph and electrical supplies, chiefly from the United States; and building materials and iron manufactures, which are also supplied to a large extent by the United States. The value of the exports of Guatemala for 1912 amounted to \$12,955,587 gold, as against \$10,981,724 in 1911. The imports for 1912 amounted to \$7,781,985 gold, as against \$6,514,422 in 1911. The commerce with the United States, which was for a long time greatly handicapped by the lack of direct steamship lines between the Pacific ports of the two countries, increased with the establishment of a direct steamship line between San Francisco and Guatemala in 1900. The exports to the United States in 1912 were valued at \$2,855,468 gold, about two-thirds being coffee. The United States sold to Guatemala in 1914 goods to the value of \$3,601,813, of which flour and manufactures of cotton were the most important items.

Government and Finances. Guatemala has a democratic form of government and is governed under the constitution proclaimed in 1879. The executive power is vested in a President, who is elected directly for six years and is assisted by a cabinet of six ministers, and by a Council of State consisting of 13 members partly elected by the Assembly and partly appointed by the President. The legislative authority is vested in the National Assembly of 60 members, elected directly for a period of four years, at the rate of one deputy for every 20,000 inhabitants. For the administration of justice Guatemala has a Supreme Court, consisting of a Chief Justice and four associate justices, elected by the people; six courts of appeals, consisting each of a Chief Justice and two associate justices, all elected by the people;

and minor courts whose judges are appointed by the President at the recommendation of the Chief Justice of the Supreme Court. For governmental purposes the country is divided into 21 departments, which are subdivided into municipal districts. Each department is administered by an official called *Jefe Político*. He is appointed by the President. The municipal districts are administered by one or more *alcaldes* each, and by municipal councils, all elected by the people.

The regular army of Guatemala numbers about 7000 officers and men. The effective army is estimated at 56,900 men, and the reserve at 30,000. Availability for service is from 18 to 50 years of age. The metric system of weights and measures is in use.

Customs duties supply about three-fourths of the revenues, and about one-ninth to one-seventh of the governmental resources comes from internal taxes on spirits, tobacco, and other articles. The ordinary revenues increased from \$9,139,872 paper currency in 1900 to \$71,014,726 paper currency in 1912 (the paper dollar was worth only about 5.6 cents in 1912). In 1913 the revenues increased to \$83,644,025 paper. The ordinary expenditures in 1900 amounted to \$11,870,067 paper, and increased in 1912 to \$76,682,017 paper. The interest on the public debt, schools, and the army consume about two-thirds of the government receipts. The total amount of the foreign debt (4 per cent interest), including arrears of interest, was \$11,583,783 gold at the end of 1912; the internal currency debt amounted to \$107,884,042 paper; and the total debt was about \$17,577,000 gold. Most of the foreign debt is held in Great Britain and Germany. At present the payment of interest on the debt is about 17 years in arrears. This, however, is not likely to result in complete default, as the attitude of the later United States administrations has been, that the Monroe Doctrine should in no wise be interpreted to allow any country to escape its just obligations. Guatemala has six banks of issue, whose notes are legal tender even in case of debts contracted to be paid in silver. Guatemala is practically on a paper basis, gold and silver coins being little circulated. The value of the silver peso in United States currency fell from nearly \$1 in 1874 to about 43.4 cents in 1913, while the paper peso is subject to fluctuations, and in 1913 was as low as 5.2 cents, and as 4.8 cents in the first quarter of 1914, in United States currency.

Population. The inhabitants numbered about 2,119,000 at the end of 1912; 1918, 2,123,091. The density of population is greatest on the high, cool plateaus. About 65 per cent are Indians and negroes, and 35 per cent are Spanish Americans and mixed breeds, the last slightly exceeding the whites in number. The foreign population is only about 12,000, Guatemala being unable as yet, in spite of favorable legislation, to attract many immigrants. Nearly the entire population adheres to the Roman Catholic faith. There is no state religion. Perfect liberty of worship is granted. Education is free and nominally compulsory. In 1912, 59,631 children were enrolled in 1837 schools; in 1913 the number of pupils was 61,163. There were also numerous private primary and secondary schools, rural schools, 6 normal schools, a medical school, a law school, military school, and, in 1913, a college of agriculture was opened in Guatemala

City. The educational system is the best in the Central American states.

History. Extensive ruins of cities, temples, and aqueducts found in all parts of Guatemala testify to the existence of a highly developed people before the advent of Europeans. The most careful study of these ancient remains, however, has as yet failed to reveal anything of the history of this prehistoric race, which was probably allied to, if not identical with, the Toltecs of Mexico. The country was conquered by the Spaniards, under Alvarado, between 1522 and 1524, and in no province of Spanish America were the natives so mercilessly oppressed as in Guatemala. *Las Casas* claimed that in the first 15 or 16 years of Spanish misrule between four and five millions of Indians perished. The province was governed as a captaincy general under the viceroyalty of New Spain down to the declaration of independence in 1821. In 1822 Guatemala was declared annexed to Iturbide's Mexican empire, a status which lasted for 15 months and was followed by the creation of the Confederation of Central America, consisting of the five states of Guatemala, Honduras, Nicaragua, Salvador, and Costa Rica, which adopted a federal constitution in 1825. Before the final dissolution of the confederation, in 1839, the State of Guatemala became independent (1833), adopting a liberal constitution, and then plunged into a condition of chronic warfare with its neighbors. Under the firm guidance of Rafael Carrera the country successfully withstood an attempt made by General Morazán in 1842 to establish an autocratic government in Central America. In 1850 the republics of Honduras, Salvador, and Nicaragua endeavored to force Guatemala into a new confederation, but were decisively defeated at Arada. Since that time there has been an ever-present tendency to resolve the office of president into that of dictator, from the attempt of Carrera, who was made President for life in 1854 and maintained himself in office until his death in 1865, to José María Regna Barrios, who installed himself as dictator in 1897 and was assassinated in the following year. Nor has Guatemala been able to resist the temptation of effecting by force of arms a new union of the Central American states, and in 1885 Rufino Barrios, who had come into power in 1873, fell in battle against the republics of Nicaragua, Costa Rica, and Salvador, which had formed an alliance for the preservation of their independent existence. The movement towards federation by peaceful means, instituted in 1895, came to naught after two years of negotiations. In 1898 Manuel Estrada Cabrera was elected President. He did much to promote education, commerce, and improvement of means of transportation. Upon his reelection in 1905 he was accused of trying to become dictator and of ruthlessly oppressing his opponents. A revolt, organized in 1906 by General Barillas aided by some San Franciscan adventurers, involved all Central America in war. Presidents Roosevelt and Díaz intervened and arranged an armistice, known as the Marblehead Pact (July 19, 1906), later incorporated into a treaty, which provided for improvements of commerce and navigation of the area involved in the war. In 1907 Guatemala joined in the Central American Peace Conference at Washington, which provided for a Central American Court of Justice. Estrada Cabrera was chosen President for a third term in 1910. In 1913

Great Britain demanded a settlement of claims, sending a warship to Guatemala. The latter appealed to the United States, after which an adjustment of the debt was made. For national coat of arms, see Colored Plate in article HERALDRY.

GUATEMALA, or **SANTIAGO DE GUATEMALA**, sūn'tē-ā'gō dā gwā'tā-mā'lā. The capital of the Republic of Guatemala, situated 85 miles from the Pacific coast on a plateau 5000 feet above sea level. The city is regularly built, is well supplied with water by an aqueduct, and has electric lights, street cars, and all modern conveniences (Map: Central America, B 3). Its principal buildings are the cathedral, the episcopal residence, the government palace, and the university building, in which the law school and the national library are installed. The city has also schools of art, medicine, engineering, and agriculture, a conservatory of music, and several technical evening schools. The International Bureau for promoting industries, commerce, and agriculture of the Central American republics is located here. Guatemala is the commercial centre of the country. It manufactures cotton and woolen goods, earthenware, gold and silver articles, cigars, and leather, and is the seat of a United States consul. Pop., 1910, 90,000. Guatemala is the third capital of the country to bear that name. The first was founded in 1524 and was overwhelmed in 1558 by a volcanic eruption. It is now called Ciudad Vieja, or Almalonga. The second capital, now known as Guatemala la Antigua, lies 25 miles west of the present capital and was almost entirely destroyed by an earthquake in 1773, the date of the settlement of the present Guatemala.

GUATEMOTZIN, gwā'tā-mō-tsēn', **GUATEMOC**, or **CUAUHTEMOC** (1502-25). The last Aztec Emperor of Mexico. He was only 18 years old when he assumed charge of the operations against the invaders under Cortés, in November, 1520. He was a nephew of Motecuhzoma (Montezuma) and had been a leader of the party opposed to the latter's temporizing policy from the first arrival of the Spaniards. He organized the attack of the *Noche Triste* and after the return of Cortés, Guatemotzin, who had succeeded Cuiclahuatzin as Emperor, carried on the defense of the city of

Mexico throughout the spring and summer of 1521. When further efforts became vain, he tried to escape from Mexico with his remaining followers, but was captured. Cortés at first treated him with much respect, but, failing to secure from him any information regarding hidden stores of gold, which probably existed only in the minds of the Spaniards, put him to the torture of a slow fire. When Cortés started on his difficult march across Honduras, he took the most important of his native prisoners with him as hostages for the good behavior of their people. During the journey Cortés was informed that the Mexicans were planning a rising against the white conquerors. A summary trial was forthwith arranged, and Guatemotzin, together with the other prisoners, who had been a serious hindrance during the march, was executed in February, 1525. Consult Díaz del Castillo, *True History of the Conquest of New Spain*, edition of Hakluyt Society (London, 1910-12), and Prescott, *Conquest of Mexico* (Philadelphia, 1863).

GUATIVERE, gwā'tē-vā'rā. The name in the Spanish West Indies of a genus (*Bodianus*) of small, brightly colored, much-spotted fishes, which abound in tropical seas and are good food. Two or three species occur along the Florida reefs, where they are called "negro fish" from their blackish-olive hue. See JACOB EVERTZEN.

GUATOAN, gwā-tō'an. A tribe in southwestern Brazil, South America. They inhabit the region about the confluence of the Paraguay and the São Lourenço. Consult: Max Schmidt in *Verhandlung der Berliner Gesellschaft für Anthropologie* (Berlin, 1902); id., *Indianer-Studien in Zentralbrasilien* (ib., 1905); Chamberlain in *Science*, vol. xxxvii (Lancaster, Pa., 1913).

GUATUSO, gwā-tū'sō. A wild tribe on the Río Frío, in the northern part of Costa Rica. They are a robust and athletic people, cultivating corn, bananas, and other crops, knitting hammocks and nets from agave fibre, but steadfastly rejecting the Spanish civilization, preferring to lead a free life. In consequence of the cruelties of the rubber gatherers they are rapidly dying out.

GUAVA, gwā'vā (Sp., Portug. *guayaba*, from Brazilian *guayaba*, *guaiva*, the native name). A shrub or small tree of the genus *Psidium*, native

GUAVA.

a, *Psidium cattleianum*; b, *Psidium guajava*.

of the tropics of Asia and America, most common in the New World, and cultivated in suitable climates for its edible fruit. The lemon guava (*Psidium guajava*) is most commonly grown in Florida and the two Indies, attains a

height of 20 feet, has numerous branches, obtuse, smooth leaves, 2 or 3 inches long, white fragrant flowers on solitary axillary stalks, and roundish or oblong smooth yellow fruit about the size of a hen's egg. The rind is thin and brittle; the pulp firm, flesh-colored, full of horny seeds, aromatic, sweet, and rather astringent. They, and the jelly made from them, are exported. The red guava, also referred to the same species, a plant common to both the Indies, bears a beautiful red fruit, with red flesh. Since it is acid and less agreeable than the lemon guava, it is less in cultivation. Besides these, the strawberry guava (*Psidium cattleianum*) produces a small claret-colored fruit of excellent flavor and good preserving qualities.

GUAVIARE, gwá'vè-á'rá. One of the largest tributaries of the Orinoco, rising in the Andes not far from Bogotá, Colombia, and flowing eastward (Map: Colombia, C 3). It forms the boundary in Colombia between the departments of Cundinamarca and Cauca. The region through which it flows is mostly level and very sparsely populated. Length, over 700 miles; navigable through the greater part. In the present undeveloped state of the country it is of little economic value.

GUAVINA, gwá-vè'ná (Sp.-Amer., probably from the native term). A name for sundry fishes of the goby family, common in the tropical rivers and useful as food.

GUAYAMA, gwá-yá'má. A town of Porto Rico, in the Department of Guayama, situated at the southeast end of the island, about 4 miles inland (Map: Porto Rico, E 4). It has a good harbor and is surrounded by a sugar-growing region. Pop., 1899, 5334; 1910, 8321.

GUAYAQUIL, gwá'yá-kel', or **SANTIAGO DE GUAYAQUIL**. A city, the chief seaport of Ecuador, situated on the west shore of the estuary of Guayas River, at the head of the Gulf of Guayaquil and connected by railroad (opened in 1908) with Quito (Map: Ecuador, A 4). The town lies in a low plain and is divided into two parts, the old and the new. In the old town the streets are crooked and ill-paved; in the new town they are well laid out, and lined by the residences of the richer class. The climate is unhealthful, and the water supply is bad—conditions which will be remedied when sanitary improvements, started in 1913, shall have been installed. The chief buildings and educational institutions are the cathedral, town hall, the college and technical school, and the hospitals. The town has a good harbor, protected by a breakwater, and the chief occupation is trade, both foreign and domestic. The city is the seat of the United States Consul General to Ecuador. Its chief exports are cacao, rubber, coffee, quinine, gold, silver, and hides. The town has a number of shipyards, ranking among the best on the Pacific coast of South America. Pop., about 80,000. Guayaquil was founded in 1535. Consult C. R. Enock, *Ecuador: Its Ancient and Modern History* (New York, 1914).

GUAYAQUIL, GULF OF. One of the largest inlets of the Pacific Ocean, on the west coast of South America, in the southwestern part of Ecuador (Map: Brazil). It is over 100 miles wide at its mouth and narrows into an estuary of Guayas River, the entrance to the narrower part being divided by the island of Puná. Vessels drawing 22 feet can ascend to

Guayaquil, while larger ones must anchor at Puná and transship their cargo.

GUAYAS, gwá'yás. A river of Ecuador, South America, rising in the west chain of the Andes, and flowing in a southwesterly direction into the Gulf of Guayaquil (Map: Ecuador, B 4). Its basin is estimated at 14,000 square miles. It is navigable for small steamers as far as Bodegas.

GUAYMAS, gwá'más. A seaport of the State of Sonora, Mexico, situated on the Gulf of California (Map: Mexico, C 4). It has a good harbor, admitting large vessels, and is a leading Pacific port. It is an important trading centre, having railway and steamship connection with the United States. It exports gold, silver, pearls, and hides, and is the residence of a United States consular agent. Pop., 1900, 8648.

GUAYMI, gwá'mé. A tribe, probably of Chilchcan stock, inhabiting the Verague and Chiriquí districts of Colombia, extending across the Isthmus of Panama, from ocean to ocean.

GUAYRA, gwá'rá, LA. See LA GUAYRA.

GUAYULE, gwá-yóo'lá; *colloq. or dial. pron. wá-yóo'lá, or HUAYULE*, wá-yóo'lá (probably from the Spanish "hay" and Indian "hule," rubber). A name given a kind of rubber produced in Mexico. It is obtained from *Parthenium argenteum*, a spreading shrub of the family Compositae. The plants grow 1 to 3 feet high, with spreading crown; the bark of the trunks and twigs is light gray; the leaves are lanceolate or spatulate and variously dentate; and the flowers are yellow, appearing in September or October. The plant occurs from western Texas and New Mexico through Mexico, but is commercially abundant only in parts of Chihuahua, Zacatecas, San Luis Potosí, eastern Durango, and southern Coahuila. The rubber is obtained from the dried plant by several patented processes, the bark yielding about three times as much as the wood, and the leafy shoots giving hardly any. The dried plant yields from 8 to 12 per cent rubber. Guayule rubber may be substituted for African rubber in many articles, and it is said to be well adapted to the manufacture of boots, shoes, etc. Attention was called to this plant as a valuable source of rubber by the exhibition from Durango at the Centennial Exposition at Philadelphia in 1876. Such a valuable source of crude rubber attracted attention, and this resulted in developing large business enterprises. At present extracting plants are established at several Mexican centres. The natural supply of guayule is limited, so that much investigation has been undertaken to grow the plant artificially. The problem was a difficult one, but seems to have been solved. From 1905 to 1909 over 40,000,000 pounds of crude rubber were shipped from Mexico, and since that time the amount has increased. For a complete account of the plant as a source of rubber, consult Lloyd, *Guayule, a Rubber Plant of the Chihuahuan Desert*, published by Carnegie Institution (Washington, 1911).

GUAZU, gwá'son. The word in the vernacular of eastern South America for any of several deer. Cf. GUEMAL.

GUBAT, góo-bát'. A town of Luzon, Philippines, in the Province of Sorsogón. It is situated near the east coast, about 28 miles south-east of Albay. Pop., about 16,000.

GUBBIO, góob'bè-ò (Lat. *Iguvium*, mediæval *Eugubium*). An episcopal city in the Province of Perugia, Umbria, Italy, 70 miles east-south-

east of Arezzo (Map: Italy, D 3). It is mediaval in appearance and is picturesquely situated on the southern slopes of the Apennines, 1735 feet above sea level. The most conspicuous building is the Palazzo dei Consoli, a huge Gothic structure with pinnacles and tower, erected in the fourteenth century. In the twelfth-century cathedral are fine sculptures, Umbrian paintings, a finely carved throne, and a famous cope. The Residenza Municipale contains ancient and modern majolica and the Euginine tables that were discovered in 1444 near the ancient theatre. (See EUGUBINE TABLES.) Gubbio has a municipal theatre. It markets cattle, grain, wine, oil, linen, and lumber, spins silk, and manufactures majolica, for which it has been famous since Giorgio Andreoli discovered his carmine finish. An interesting procession is that of the Ceri, on May 15. Pop. (commune), 1901, 26,320; 1911, 27,397.

GUBEN, gō'ben. The capital of a circle in the Prussian Province of Brandenburg, situated at the confluence of the Lubis with the Neisse, 30 miles south-southeast of Frankfort-on-the-Oder (Map: Germany, F 3). Situated in a picturesque rolling country devoted to the culture of the vine, it has wine presses, lignite mines, and mineral springs, and manufactures hats, woolen goods, machinery, paper, cardboard, gold leaf, lumber, and spirits. Guben passed, with Lower Lusatia, from the possession of Saxony to that of Prussia in 1815. Pop., 1900, 33,122; 1910, 38,593.

GUBERNATIS, gō'ber-nā'tēs, ANGELO DE, COUNT (1840-1913). An eminent Italian man of letters, born at Turin. He studied at the University of Turin and in 1862 was sent by the government to Berlin to perfect himself in philology. In 1863 he was appointed professor of Sanskrit in the Istituto degli Studi Superiori at Florence. But, attracted by the Socialistic theories of Bakunin, he soon resigned, only to discard his views later, and, after some hesitation, to be reappointed in 1867. He was called to the University at Rome in 1891. De Gubernatis was active as a dramatist, lyric poet, journalist, critic, Orientalist, and mythologist. His early works were contributions to Sanskrit scholarship. The *Zoological Mythology*, published in London (1872), gave him a European reputation. Among his scientific and literary works may also be mentioned his dramas, such as the trilogy *Il re Nala* (1859), the *Don Rodrigo* (1861), the *Drammi indiani* (1872), the *Savitri* (1877); his works dealing with Oriental studies, such as the *Piccola enciclopedia indiana* (1867), the *Fonti vediche dell' epopea* (1868), the *Mitologia vedica* (1874), the *Manuale di storia della letteratura indiana* (1882); his investigations into mythology, such as the *Manuale di mitologia comparata* (1880); his important biographical compilations, the *Dizionario biografico degli scrittori contemporanei* (1879-80), and the continuations since 1888 (cf. the *Dictionnaire international des écrivains du jour*, 1888), the *Ricordi biografici* (1873), the *Dizionario degli artisti italiani viventi* (1889-92); and the great history of literature and anthology entitled *Storia universale della letteratura dai primi tempi e presso tutti i popoli civili fino ai nostri giorni, con florilegi da ogni letteratura* (1882-85). He founded and carried on many periodicals and reviews; e.g., *La letteratura civile* (1859); *Italia letteraria* (1862); *La civiltà italiana* (1865); *Rivista orientale*

(1867-68); *Rivista europea* (1869-76); *Bollettino italiano degli studi orientali* (1876 et seq.); *Revue internationale* (1883-87). A contributor to many reviews, he also directed the *Giornale della società asiatica italiana* after 1887.

GUDDEN, gōd'd'en, BERNHARD VON (1824-86). A German physician, born at Cleves, and educated at Bonn, Berlin, and Halle. He specialized in the care of the insane, became assistant physician at the asylums in Siegburg and Illenau, then director of an establishment near Würzburg, and in 1869 professor of psychiatry at Zurich. From this position he went in 1872 to a like chair at Munich, where he also had charge of the district insane asylum of Upper Bavaria. Ennobled in 1875, he became physician to Prince Otho of Bavaria and had charge of the mad King Louis II, with whom he died in the attempt to keep the King from suicide by drowning in the Starnbergersee. His works include: *Beiträge zur Lehre von der Scabies* (2d ed., 1863); *Experimentaluntersuchungen über Schädelwachstum* (1874); and the posthumous papers collected by Grashey (1889). With Westphal he edited *Archiv für Psychiatrie und Nervenkrankheiten* (1868 et seq.).

GUDE, gō'd'e, HANS (1825-1903). A Norwegian landscape painter. He was born at Christiania and studied at the Düsseldorf Academy, especially with Schirmer and Achenbach. In 1854 he was appointed a professor at Düsseldorf, in 1864 at Karlsruhe, and in 1889 at Berlin. His subjects are taken from the scenery of his native land, and he excels especially in coast scenes with highly individual light effects. His pictures are good in composition, detailed in drawing, and not deficient in color, but, by reason of their rather bald realism and lack of emotional qualities, they are often tedious. He is best represented in the Museum of Christiania by seven landscapes and nine water colors; in Stockholm by three marines and one landscape; at Berlin by two good examples; also at Copenhagen, Helsingfors, Breslau, Hamburg, Leipzig, and in other German museums. Consult his biography by Dietrichson (Christiania, 1899).

GUDEHUS, gō'd'e-hūs, HEINRICH (1845-). A celebrated German tenor, born at Celle, near Hanover. He began life as a schoolmaster and organist. While he was studying singing with Madame Schnorr von Carolsfeld (q.v.), she recognized his talent and brought him to the notice of Von Hülsen, who at once engaged him for the Berlin Opera. After a successful début in 1871 he withdrew for further study with Luise Ress, and reappeared in 1875. From 1880 to 1890 he was a member of the Dresden Opera. During the season of 1890-91 he sang the principal Wagnerian rôles at the Metropolitan Opera House in New York. Wagner selected him to create the title rôle in *Parsifal* in 1882, after which time he was prominently identified with Bayreuth. He retired from the stage in 1900.

GUDEMAN, gō'd'e-mān, ALFRED (1862-). An American classical scholar, born at Atlanta, Ga. He graduated from Columbia University in 1883, and later studied at Berlin. He held appointments at Johns Hopkins (1890-93), Pennsylvania (1893-1902), and Cornell (1902-04). In 1904 he removed to Munich, Germany, to take an active part in the preparation of the great *Thesaurus Lingua Latinae*. (See DICTIONARY, *History*.) He contributed many articles to

learned periodicals in America and in Europe, and to Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*. His most important work is a very elaborate edition of the *Dialogus* of Tacitus (1894; a less elaborate edition followed in 1898). He edited also Tacitus' *Agricola* (1899; published, in revised editions, in German, 1902 and 1914), Tacitus' *Germania* (1900), and Sallust's *Catilina* (1903). He compiled also a *History of Classical Philology* (3d ed., 1902), published later, in revised and enlarged form, as *Grundriss der Geschichte der Klassischen Philologie* (1907 and 1909). In 1910 he published *Imagines Philologorum*, 160 portraits of classical scholars from the Renaissance to the present time.

GUDGEON, gū'jŏn (Fr. *goujon*, It. *gobione*, from Lat. *gobio*, from Gk. *κόβιος*, *kóbios*, *gud-geon*). A fish (*Gobio fluviatilis*) of the carp family, Cyprinidae, resembling the chub. It is very common in the streams of Europe, particularly such as have gravelly bottoms and occasional pools and rapids. It is about 8 inches long, has large scales, a barbule at the angle of the mouth, and a forked tail. The upper parts are brown spotted with black, and white below. The gudgeons swim in shoals, feed on worms, mollusks, and other small animals, are ready biters, and are easily caught. Many are taken with the casting net in shallow water and kept alive in the markets until sold. They are excellent food. There are other species in Europe. Nearly related species occur in America, but they are not known by this name.

GUDIN, gu'dān', THÉODORE (1802-80). A French landscape and marine painter. He was born in Paris and studied for some time under Girodet-Trioson. Under Louis Philippe and Napoleon III he was marine painter to the court. In 1838 he was commissioned by the government to paint a cycle of pictures glorifying the French navy, 90 in all, of which 63 are in the Gallery of Versailles. His first works were at first good in color and spirited in execution, but he afterward lapsed into inferior work. His chief paintings are the "Burning of the *Kent* in the Bay of Biscay" and the "Hurricane of Wind in the Roadstead of Algiers, Jan. 7, 1831," both in the Louvre. Gudin was Commander of the Legion of Honor and received many foreign decorations.

GUDEUN, gŭd-rŭn'. The chief of the Low German epic sagas, taking the place of the Nibelungen saga in High German. The legend is preserved only in a High German poem by an unknown Austrian author. There is but one manuscript copy, of the early sixteenth century, now in Vienna. It tells how King Hagen of Ireland had a daughter, Hilde, whose suitors he was wont to kill. Undiscouraged, King Hetel of Denmark sends a secret embassy, who persuade the willing maid to flee with them to him over sea. Hetel meets the bride on the shore, but the father is in hot pursuit. There is a fight on the beach. Hetel saves Hagen's life, and there is a happy reconciliation. This is the prelude. Hilde has a daughter, Gudrun. She, too, loves a foreign prince, Herwig of Seeland; but while her father is away "fighting the Moors," a rival, Hartmut of Normandy, carries her away. As before, the father pursues on his return and with him Herwig. There is another fine battle scene. Hetel is killed; and Hartmut carries away Gudrun for 14 years' hard captivity, soothed by Hartmut's sister, Ortrun, and

terminated by a rescue through her lover and her brother Ortwin, all ending as before in a reconciliation. We have a higher stage of moral evolution, a more Christian standard than in the *Nibelungenlied*, and so, naturally, in the course of the epic there is a more thoughtful insight into the complex aspects of human nature. There is also a more delicate humor, though not the effeminate sentimentality of some other epics in this cycle. The time of the Gudrun saga is evidently that of the Danish raids on the English and Irish coasts, although its present form dates from the beginning of the thirteenth century. The subject is as old as the stories of Europa and Helen, but it was essentially a story of the seaside. Hence, though it was the more artistic, it appealed less to popular taste, and was not, like the *Nibelungenlied*, subjected to popular revision and extension. It had its origin, like the other, in epic songs, but it had an original poet for its author, and shows a constructive development by a more or less conscious plan. Thus it stands between the true popular epic and the studied epic of the court. It has 32 cantos, and its form is the four-line stanza with end rhyme, the last half line having two extra beats, one more than the *Nibelungenlied*. This gives it an unpleasant dragging effect. The saga has been treated dramatically by Julius Grosse and in an opera by Klughardt and Niemann. The best modern edition of the *Gudrun* is by Martin (Halle, 1901). There are translations into modern German by Simrock (1843), Klee (1878), Weibrecht (1884, a paraphrase), L. Freytag (1888), Lemmermayer (1890), and Legerlotz (1900). Consult: Wilmanns, *Die Entwicklung der Kudrundichtung* (Halle, 1873); Albert Fécamp, *Le poème de Gudrun, ses origines, sa formation et son histoire* (Paris, 1892); Siegmund Benedict, *Die Gudrunsaage in der neueren deutschen Literatur* (Rostock, 1902); F. E. Sandbach, *The Nibelungenlied and Gudrun in England and America* (London, 1904).

GUEBERS, gē'bērz or gā'bērz. See GIEBERS.

GUÉBRIANT, gā'b'rē'ān', JEAN BAPTISTE BUDES, COUNT DE (1602-43). A French marshal, born at Plessis-Budes, in Brittany. He fought first in Holland, then held a command in the French troops that formed a portion of the German army in the campaign in the Lower Palatinate, and conducted the passage of the Rhine (1639). After the death of Duke Bernhard of Saxe-Weimar, its leader (1639), the army fought under the French banners with Guébriant in command. He defeated the Imperial troops at Wolfenbüttel (1641), and at Kempen (1642), where he was made marshal. At the siege of Rottweil, in Swabia, he was mortally wounded and died in the surrendered city (1643).

GUEBWILLER, gā'b'vē'lār'. A town in Upper Alsace, Germany. See GERWEILER.

GUELDER (gēl'dēr) ROSE, or SNOWBALL (from *Gelderland*, *Gelderen*, a Dutch province where this rose was supposed to have originated). A cultivated variety of the high-bush cranberry (*Viburnum opulus*; see VIBURNUM), in which the flowers are all barren and instead of forming flat cymes, as in the wild plant, form much larger globose corymbs. When abounding in flowers, it is a very ornamental shrub and is therefore often planted.

GUELDERS. See GELDERLAND.

GÜELL Y RENTÉ, gū-ál'á rān-tá', **JUAN** (1815-75). A Cuban author, born and educated in Havana. When 20 years old, he went to Spain and enlisted in the army, where he served for a number of years. When he returned to Cuba, he was for several terms sent as a representative of the island in the Spanish Cortes. He published several volumes of poems, including *Hojas del alma* (1846); *Ultimos cantos* (1859); *Noches de estío* (1861).—His brother **José** (1818-84) was born in Havana and was sent to Barcelona to be educated. After several years spent in practicing law in Cuba, he returned to Spain in 1848 and married Doña Josefa Fernanda, the sister of the King consort, in spite of royal opposition. This resulted in his banishment, and for several years he lived in Paris, where he was active in the liberal and republican conspiracies in connection with Spain. He published: *Anarguras del corazón* (1843); *Lágrimas del corazón* (1846); *Leyendas americanas* (1856); also several novels in French, and an historical work, *Philippe II et Don Carlos devant l'histoire* (1878).

GUELPH, gwēlf. The chief city and an inland port of entry of Wellington Co., Ontario, Canada, on the river Speed, 48 miles west by south of Toronto, and 28 miles northwest of Hamilton, on the Grand Trunk and the Canadian Pacific railways (Map: Ontario, D 6). It has fine public buildings and is the seat of the Ontario Agricultural College and Macdonald Institute of Domestic Science. The industrial establishments include manufactories of pianos, organs, sewing machines, carpets, clothing, steel and wire goods, woodenware, ironware, carriages, boots and shoes; also meat-packing plants, breweries, etc. The value of the products of manufactures in 1910 was \$7,392,336, as compared with \$3,689,183 in 1900, being an increase of 100.37 per cent. Guelph is an important centre for stock raising and has an annual winter fat-stock exhibition. The city owns its eight parks, its electric-light, water, and sewerage systems, street railway, and the Guelph Junction Railway (15 miles). Besides the water power supplied by the Speed River, which falls here 30 feet, electric power is supplied from Niagara Falls. A United States consul resides here. Guelph was founded by John Galt, the Scottish novelist (q.v.). Pop., 1901, 11,496; 1911, 15,175.

GUELPH FUND. The name given to the sum granted by the Prussian government, in 1867, to the deposed King of Hanover, George V, but withdrawn in 1868, on the latter's continued refusal to renounce his right to the throne. It amounted to about \$12,000,000, and the income of it was kept by Prussia till 1879, when part of it was given to the widow and daughters of the King. The Duke of Cumberland, son of George V, acquired the entire income in 1892, on renouncing explicitly any intention of intriguing against Prussia. While Prussia administered the fund, the income was said to have been used in combating the Guelph intrigues; and the suspicion that Bismarck employed it for corrupt purposes, such as bribing the press, won for it the nickname of the "Reptile Fund."

GUELPHIC (gwēlf'ik) **ORDER.** An order of knighthood for Hanover, instituted by George IV, when Prince Regent, on Aug. 12, 1815. It became extinct in 1866. It was both a military and civil order, unlimited in membership, com-

prising five classes—Grand Cross, Commander of the first and of the second class, Knight, and simple member. The grandmastership was vested in the crown of Hanover. The badge of the order was an eight-pointed cross of gold, with lions between the arms and surmounted by a crown; in the centre was the white horse of Hanover surrounded by a blue circle, and the motto *Nec Aspera Terrent*.

GUELPHS, gwēlfs, **AND Ghibellines**, gib'ē-līnz. The names of two great political parties, whose contentions and wars distracted northern and central Italy in the latter part of the Middle Ages. The designation "Guelph" (Ital. *Guelfo*, pl. *Guelfi*) is commonly supposed to be derived from Welf, the name of a princely family of Germany, which rose to great power in the twelfth century, when it was the rival of the house of Hohenstaufen, which occupied the Imperial throne. The most famous of the rulers of the house of Guelph was Henry the Lion, Duke of Saxony and Bavaria, who defied the power of the Emperor Frederick Barbarossa, and who was deprived of most of his possessions in 1180-81. The origin of the designation "Ghibelline" (It. *Ghibellino*) is altogether uncertain. A theory which has been widely accepted, but which rests on an insufficient basis, is that it became current as a modification of Waiblingen ("men of Waiblingen," one of the possessions of the Hohenstaufen in South Germany), the name, used as a battle cry, under which the followers of Conrad III (the first of the Hohenstaufen emperors) are said to have figured in the battle of Weinsberg, in which Welf VI, uncle of Henry the Lion, was defeated in 1140. About the beginning of the thirteenth century we find the names "Ghibellines" and "Guelphs" in use in Italy. The former may, in general, be described as the upholders of the Imperial authority in Italy (or, at the beginning, the supporters of the Hohenstaufen), the latter as the opponents of the Emperors. The opposition to Imperial authority in Italy arose from two distinct parties, which for the most part made common cause with each other—from the Church, which sought to assert its independence of the emperors, and from the principalities and city republics, which contended for their provincial or municipal rights and liberties. The Guelphs may therefore, in a measure, be said to have represented the National party. Florence, Bologna, and Milan took, as a general rule, the side of the Guelphs; while Pisa, Verona, and Arezzo were Ghibelline. Florence, especially, was the great stronghold of the Guelphs. The great Italian families in like manner took opposite sides, but the policy of each family frequently varied. As a rule, the nobles of the more northern districts of Italy inclined to the Ghibelline side, while those of the central districts were Guelphs. By degrees, however, and especially after the downfall of the preponderance of the German emperors in Italy, the contest ceased to be a strife of principles, and degenerated into a mere struggle of rival factions availing themselves of the prestige of ancient names and traditional or hereditary prejudices. In 1334 Benedict XII practically disallowed altogether the reality of the grounds of division between the parties, by proscribing, under pain of the censures of the Church, the further use of those once stirring names, which had long been the rallying words of a sanguinary warfare. After the fourteenth century we read lit-

tle more of Guelphs or Ghibellines as actually existing parties, although the names were used in the sixteenth century for the partisans of Louis XII or of Maximilian. Consult: Browning, *Guelphs and Ghibellines* (London, 1893); Symonds, *Renaissance in Italy* (ib., 1904); E. Hutton, *Malatesta, Lord of Rimini* (New York, 1906); Villari, *Medieval Italy* (London, 1910); Sedgwick, *Italy in the Thirteenth Century* (2 vols., Boston, 1912); also the general works on mediæval history referred to under ITALY and GERMANY. See FLORENCE; HOHENSTAUFEN; ITALY.

GUEMAL, gá-míl' (South American name). Either of two species of small deer confined to the Andes. They are distinguished from other

HEAD OF GUEMAL.

deer (as the subgenus *Furcifer* or *Xenelaphus*) by their antlers, which have but a single forking, of which the front prong is the longer and projects straight forward, by the tusks in the upper jaws of both sexes, and also by the uniform coloration of the fawns. One species (*Mazama bisulca*, or *Cervus chilensis*) inhabits southern Chile, and the other (*Mazama*, or *Cervus, antisianensis*) the highlands of Peru. See PAMPAS DEER.

GUÉMEZ DE HORCASITAS, gwá'máth dá ór'ká-sé'tás, JUAN FRANCISCO, CONDE DE REVILLA GIGEDO (1682-1708). A Spanish soldier and provincial governor, born in Oviedo. Entering the army, he served with distinction in the siege of Gibraltar and in the conquest of Oran, rising to the rank of field marshal. In 1734 he was appointed captain general and Governor of Cuba, where he introduced many reforms in the government and was active in the defense of the colony against the attacks of the English. Appointed Viceroy of New Spain in 1746, he reformed the administration of the finances, fostered new settlements, fortified Vera Cruz and Acapulco, and drew up regulations for the militia of Cuba and Florida. He was superseded in 1755 and in the following year returned to Spain, where he was promoted to the rank of captain general of the army and was made president of the council of war. His "Memoria á su sucesor" is published in *Instrucciones que los Virreyes de Nueva España dejaron á sus sucesores* . . . (Mexico, 1867).

GUÉMEZ PACHECO DE PADILLA HORCASITAS, gwá'máth pá-chá'kó dá pá-dé'lyá ór'ká-sé'tás, JUAN VICENTE, CONDE DE REVILLA GIGEDO (1740-99). A Spanish administrator,

born at Havana, Cuba. He was captain of the Viceroyal Guard in Mexico, under his father, and won military distinction as lieutenant colonel of the Spanish Guards at the siege of Gibraltar. In 1789 he was appointed Viceroy of New Spain, where he served till 1794. During his administration, which was one of the most beneficent in the history of Spanish rule in Mexico, he made many public improvements and did much in developing commerce and industries. Notwithstanding his able rule, he suffered a severe *residencia*. Afterward he was director general of the artillery of the Spanish army. Consult Revilla Gigedo, *Instrucción reservada que dió á su sucesor* (Mexico, 1831-32), and Bancroft, *History of Mexico* (San Francisco, 1883-88).

GUENDAR. See GONDAR.

GUENON, ge-nón' (Fr., ape, monkey). A term for a group of African monkeys, forming the large genus *Cercopithecus* and including the malbrouk, vervet, grivet, green, patas, mona, diana, and various other species, elsewhere mentioned. All are small, slender, arboreal in habit, gregarious, strikingly colored, and so hardy and docile in captivity that they furnish the most familiar forms to menageries. They are the servants of organ grinders, and pets all over the world. These are the monkeys best known by the ancients of Egypt, Greece, and Rome. Anatomically they more closely resemble the langurs than any other group.

GUÉRARD, gá'rúr', ADOLPHE (1841-). A French engineer. He was born in Vosges, at Raon-l'Étape, France, and was educated at the Ecole des Ponts et Chaussées. Entering the engineer department of the army, his first important maritime engineering was in connection with the canal connecting the mouth of the Rhone with the port of St. Louis. He was then in charge of extensive river and harbor improvements connected with the deltas of the Rhone, and installed the mechanical facilities which have made Marseilles one of the best-equipped ports in the world. In 1892 he was appointed the French representative of the International Commission to study the improvements of the sanitary conditions of Cairo. He became inspector general of the first class in the Corps of the Ponts et Chaussées; in 1899 took charge of the inspection of all the important French ports; and in 1895 was made a member of the International Consulting Commission of the Suez Canal Company. Upon the nomination of the French government, President Roosevelt appointed Guérard a member of the Consulting Board of Engineers of the Isthmian Canal Commission, which reported early in 1906.

GUERCINO, gwër-chē'nō (It., squint-eyed), a nickname of GIOVANNI FRANCESCO BARBIERI (1591-1666). A Bolognese painter of the Eclectic school. He was born at Cento, near Bologna, studied under local masters, and then at Bologna under the influence of Ludovico Carracci (q.v.). His earliest works show the influence of Caravaggio (q.v.), whose pictures he certainly saw, and are marked by strong contrasts of light and shade and by the naturalism of that master. In 1616 Guercino founded a popular school of painting at Cento; in 1619 and 1620 he visited Ferrara and Venice, and in 1621-23 he was at Rome. To this period belong the "Raising of St. Petronella," in the museum of the Capitol at Rome; his fresco of "Aurora,"

in the Villa Ludovisi, Rome; and his "St. William of Aquitaine Assuming the Monk's Garb," in the Gallery of Bologna. Upon the death of his patron, Gregory XV, in 1623, Guercino returned to Cento, where he made his home until 1642. In 1619 he painted the frescoes of the cupola of the cathedral of Piacenza with subjects representing prophets and angels, sibyls, and scenes from the New Testament.

Upon the death of Guido Reni (q.v.), in 1642, Guercino attempted to fill his place at Bologna. He imitated Guido's manner, but without success, losing his own strength and vigor. His house at Cento, with its fine paintings and fresco decorations, is still preserved.

Guercino left 250 large pictures, besides frescoes and smaller works, and a number of drawings. Among his chief paintings, besides those mentioned above, are: "St. Bruno and his Companions in the Desert," in the Gallery of Bologna, and the "Capture of St. Roch" (1618), a fresco in San Rocco, Bologna; "St. Peter Raising Tabitha," in the Pitti Palace, Florence; the "Death of Dido," in the Spada Palace, Rome; "Abraham Casting off Hagar," in the Brera, Milan; the "Prodigal Son," in the Museum of Turin—the last two belonging to his later period; "Cephalos and Procris," at Dresden; the "Ecstasy of St. Francis," in the Louvre; the "Assumption of the Virgin," at St. Petersburg. Consult: Calvi, *Notizie della vita di Barbieri* (Bologna, 1842); Malvasia, *Felsina pittrice* (ib., 1678); Dolme, *Kunst und Künstler Italiens*, vol. iii (Leipzig, 1887); G. Cantalamessa, *Lo stile del Guercino* (Bologna, 1891).

GUEREBA, gá-rá'bá (South American name). The black howler monkey. See **HOWLER**.

GUEREZA, gé-ré'zà (African name). A strikingly adorned monkey (*Colobus guereza*, or *abyssinicus*) of eastern Central Africa, found in forests from southern Abyssinia to Mount Kilimanjaro and westward beyond Lake Albert Nyanza. The head, body, and limbs are covered with black hair of moderate length; but a line of long hair, which hangs below the flanks, rises on both sides of the back and forms a white mantle. The dark face is also surrounded by a white fringe, so that long whiskers lie flat on the cheeks. The long tail terminates in a white tuft. The local variety on Mount Kilimanjaro exhibits these features in their highest perfection, the tail being "feathered" throughout its whole length with hair described by Abbott as glistening like spun glass. This long black and white fur so closely harmonizes with the moss on the trees that the monkeys are unrecognizable at a very short distance. This species is nowhere very numerous, since it has been persistently sought by the natives for the sake of its skin, with which the Abyssinian soldiers adorned their shields, while the Masai warriors used the white mantle and tail as a part of their battle costume. No specimen has thus far been taken to Europe alive. The genus *Colobus* contains about 30 species. Consult books of exploration in East Africa, especially those of Thomson, Johnston, Abbott, and Gregory; also Elliot, *A Review of the Primates* (New York, 1913). See **KING MONKEY**, and **PLATE of MONKEYS of the OLD WORLD**.

GUERICKE, gá'rik-s, OTTO VON (1602-86). A celebrated German physicist, known chiefly by his discoveries regarding the nature and effects of air. He was born at Magdeburg and studied in Germany and Holland, subsequently traveling

in England and France, and becoming later an engineer in the army of Gustavus Adolphus. In 1646 he was made Burgomaster of Magdeburg and became greatly interested in the philosophical discussions over the vacuum which were in progress. The experiments of Galileo and Pascal on the weight of air led Guericke to attempt the creation of a vacuum. His first experiment was made by filling a stout barrel with water and then pumping out the water, but it was found that no sooner was a vacuum produced in the barrel than the air forced its way through. He next took a globe of copper provided with a stopcock and having an opening at the bottom, into which a pump was fitted. To his astonishment he found that the pump extracted the air quite as well as the water, and when he opened the cock the air rushed in with a whistling noise. This, the first air pump, was invented about 1650. (See **AIR PUMP**.) Guericke's invention soon became famous, and in 1654 he was summoned to the presence of the Emperor Ferdinand III of Germany at Ratisbon, at which time he made the famous experiment commonly known as the "Magdeburg Hemispheres" (q.v.). Guericke's *De Vacuo Spatio*, a work in seven books, written in 1663, was published in 1672, and the third book, which contains an account of his experiments, was translated into German and published in Ostwald's *Klassiker*, No. 59 (Leipzig, 1854). Guericke's name is also associated with the beginnings of scientific investigation in the field of electricity. In his experiments he applied friction to a sphere of sulphur. Consult F. W. Hoffmann, *Otto von Guericke* (Magdeburg, 1894).

GUÉRIN, gá'rán', GEORGES MAURICE DE (1810-39). A French poet. He was born in Languedoc, entered the Church, and became a member of the religious community of Lamennais (q.v.) at La Chesnaye. In 1838 he was appointed an instructor in the Collège Stanislas, Paris. His poems were collected in 1860 as *Reliquies*, edited by Trébutien, with a critique by Sainte-Beuve. His genius was exceptional, its most distinctive characteristic being its comprehensive view of nature.—His sister **EU-GENIE** (1805-48) was remarkable for her brilliancy and for her devotion in caring for him. Her *Journals and Letters* (1862) are charming in style and reveal her saintly spirit. Consult: Matthew Arnold, *Essays in Criticism*, vol. i (London, 1902); Harriet Parr, *Maurice and Eugénie de Guérin* (ib., 1870); A. Lefranc, *Maurice de Guérin* (Paris, 1910).

GUÉRIN, JULES (1866-). An American painter and illustrator, born in St. Louis, Mo. He studied under Jean Paul Laurens and Benjamin Constant in Paris, and his work shows distinct traces of their schooling. His pictures are usually of architecture or landscape—frequently a combination of the two—his method being to diminish as much as possible effects of chiaroscuro and render his subject in very flat masses of color, producing a decorative effect somewhat analogous to that of the later Japanese artists. The result is well suited to the reproductive processes of the magazines, for which much of his work was done. He was elected a member of the National Institute of Arts and Letters and received awards at the expositions of Chicago, Paris, Buffalo (1901), and St. Louis (1904). In 1914 he had charge of the decorations of the Panama-Pacific Exposition (San

Francisco), for which he made an elaborate color scheme.

GUÉRIN, PIERRE NARCISSE, BARON (1774-1833). A French historical painter. He was born in Paris, was a pupil of Jean Baptiste Regnault (q.v.), and painted in the classical manner of David. His works are good in line, but cold in color and sentiment. The best of them, the "Return of Marcus Sextus" (1799), in the Louvre, is of unusual pathos. Others are: the "Offering to Esculapius" (1802); "Pyrrhus and Andromache"; "Aeneas and Dido" (1813); "Clytemnestra" (1817)—all in the Louvre; and "Napoleon Pardoning the Rebels in Cairo," at Versailles. Guérin was named member of the Institute and of the Order of St. Michel in 1819, director of the French Academy at Rome in 1822, Baron in 1829, and Officer of the Legion of Honor in 1832. Among his pupils were Gérault and Delacroix (qq.v.).

GUÉRIN DE TENCIN. See TENCIN.

GUÉRIN-MENEVILLE, mǎ'n'-vêl', FÉLIX EDOUARD (1799-1874). A French naturalist, born at Toulon. A pupil of Cuvier, Geoffroy Saint-Hilaire, and Latreille, he became professor of entomology in the College of France in 1850 and was specially famed for his scientific investigations into the proper methods for raising silkworms. He wrote largely upon the subject for the different societies to which he belonged, and published, besides: *Iconographie du règne animal de Cuvier* (7 vols., 1830-44); *Généra des insectes* (1835), with Percheron; *Guide de l'éleveur de vers à soie* (1856); *Production de la soie, situation, maladies et amélioration des races du ver à soie* (1857); *Notes sur les éducations pour graine qu'il conviendrait de faire pour atténuer les désastreux effets de l'épizootie des vers à soie* (1857).

GUERNSEY, gĕrn'zĭ. The second in size of the Channel Islands (q.v.), distant 69 miles southeast from Start Point, Devonshire—the nearest point of the English coast and about 46 miles southwest of Cherbourg, France (Map: France, N., C 3). Its length is 9 miles, its greatest breadth 5, and its area 19 square miles. The northern part of the island is flat, the southern more elevated, intersected by deep valleys and glens, and with a lofty, picturesque coast. The interior is generally rolling and fertile; about two-thirds of the soil is arable. St. Peter Port and St. Sampson, connected by the first-built English electric trolley line, are the chief towns. St. Sampson is an important quarrying centre for blue granite. The island is famous for its cattle. There is a United States consular agency on the island. Pop. (including outlying small islands), 1901, 43,042; 1911, 44,997.

GUERNSEY, EGBERT (1823-1903). An American homeopathic physician, born at Litchfield, Conn. He entered Yale College in 1842, but came to New York and graduated in medicine from New York University in 1846. He then began practice in Williamsburg (now a part of New York City) and was soon appointed city physician. In 1848 he started the Brooklyn *Daily Times* and was for two years its editor in chief. The teaching of Hahnemann was then exciting great interest in this country, and Guernsey became a convert to, and prominent exponent of, the homeopathic system of practice. He began to practice in New York City in 1850 and was identified with the New York Homeopathic Medical College as professor first

of materia medica and then of practice. His book on *Domestic Practice* (1855) has passed through several editions and was translated into French, Spanish, and Danish. In 1852 he edited, with Dr. A. Gerald Hall, *Jahr's Manual*, and in 1872 he established the New York *Medical Times* and was its editor in chief till his death. In 1870 he organized the Western Dispensary, since united with the Hahnemann Hospital as the "Guernsey Maternity." In 1877, through his efforts, the inebriate asylum on Ward's Island, New York City, was converted into a general hospital (the Metropolitan) and placed in the hands of the homeopathic school of practice, Guernsey being its president until his death. Besides the writings mentioned above, Guernsey was a voluminous writer and the author of an elementary history of the United States widely used in public schools.

GUERNSEY CATTLE. See CATTLE.

GUERNSEY LILY. See AMARYLLIS.

GUÉROULT, gǎ'rǔr', ADOLPHE (1810-72). A French publicist, born at Radepond (Eure). He became known as an exponent of Saint-Simonist principles and wrote articles on economic subjects for the *Journal des Débats* and other periodicals. Subsequently he was correspondent of the *Débats* in Italy, in 1842 was appointed French Consul at Mazatlan, Mexico, and in 1847 at Jassy, Rumania. He was variously active as a journalist in Paris from 1848 to 1857, when he became editor in chief of *La Presse*. In 1859 he founded *L'Opinion Nationale*, which under his direction attained conspicuous influence as the advocate of Democratic measures under Imperial rule. From 1863 to 1870 he was a member of the Corps Législatif, in which he acted with the Left Centre, or Democratic opposition. After Sept. 4, 1870, he declared for the Republic. His publications include the *Lettres sur l'Espagne* (1838), originally contributed as a series to the *Débats* during a residence in Spain; *De la question coloniale* (1842); *Etudes de politique et de philosophie religieuse* (1862); *La politique de la Prusse* (1866); *Discours prononcés au Corps législatif* (1866); *La République en France* (1871).

GUERRAZZI, gwĕr-răt'sé, FRANCESCO DOMENICO (1804-73). An Italian statesman and writer, born at Leghorn and educated for the legal profession. He early came under the Byronie influence. For the liberal opinions enunciated in his *Elogio di Cosimo del Fante* he was sent to Montepulciano (1828). There he wrote *La serpicina*, a little essay delightful in style, intended to prove that man is in every way inferior to the brutes. In 1829 he was associated with Mazzini and Bini in the establishment of the *Indicator Livornese*, a liberal organ which was soon suppressed. He was imprisoned in 1831 and again in 1834, when he was taken to Portoferraio. At this place he employed his time in writing the *Assedio di Firenze*, an historical novel, his best-known work, alive with patriotic fervor. This book exercised a deep influence on the generation which fought the battles of 1848. In January of this year he was again incarcerated for a few months. On the eve of the definite breach between the people and the Grand Duke of Tuscany, in 1849, Guerrazzi was induced to accept office in the ministry. On the flight of the Grand Duke he was proclaimed member of the provisional government and subsequently dictator. During this crisis of the state he preserved

the strict autonomy of Tuscany until the return of the grand-ducal rule, when he was immediately seized and imprisoned on the ground of having neglected due measures of repression when the revolution first gathered strength during his ministry. His defense, entitled *Apologia della vita politica di F. D. Guerrazzi*, published at Florence (1852), is a masterpiece. After an imprisonment of three years he was condemned to the galleys, but was subsequently permitted to select Corsica as the refuge of his perpetual banishment. Restored to liberty and action by later events, Guerrazzi sat in the Parliament of Turin in 1862 and 1865. His language is of the purest Italian, but his style is often bitterly intemperate—Byronic in its impulsiveness and frequently bombastic. Among his novels are: *La battaglia di Benevento*, his first important production, praiseworthy for its narrative style; *Veronica Cylio*; *Isabella Orsini* (1844); *Marchese di Santa Prassede* (1853); *Beatrice Cenci* (1854); *La torre di Nonca* (1857); *Pasquale Paoli* (1860), a work excellent in tone and treatment, dealing with the fall of Corsica. The later novels, like the *Assedio di Roma* (1864), show decline in power. Conspicuous among his other writings are the *Scritti*, published at Florence (1847), containing the mordant satire, *I nuovi Tartufi*; the *Discorso al principe e al popolo* (1847), in which he demanded a constitution for the country; the *Asino* (1857), with a subject like that of *Serpicina*; and the *Vita di Andrea Doria* (1863). In 1844 he collected and published, at Florence, four *Orazioni funebri d'illustri Italiani*, and in 1848 printed his *Memorie*. Consult the editions of Guerrazzi's *Lettere*, by Carducci (Leghorn, 1880-83) and by Martini (Turin, 1891); Bosio, *Opere, Vita di Guerrazzi* (Milan, 1877); Vismara, *Bibliografia di Guerrazzi* (ib., 1880); Fenini, *Guerrazzi, studi critici* (ib., 1873); Ricucci, *Guerrazzi, Leopardo, Mazzini: Studi* (Naples, 1899).

GUERRERO, gá-rí-ró. One of the Pacific states of Mexico, bounded by the states of Michoacan, Morelos, Mexico, and Puebla on the north, Oaxaca on the east, and the Pacific on the southwest. Its area is 24,996 square miles (Map: Mexico, J 9). With the exception of the coastal zone, about 20 miles wide, where the land rises gently, the surface is rough and mountainous. The Sierra Madre del Sur, rising to an altitude of over 9000 feet, traverses the whole length of the state parallel with the coast. It sends out numerous lateral spurs, inclosing narrow valleys through which small streams run south into the Pacific and north into the Río de las Balsas, also called Río Mexcala, the only large river of Guerrero. Its valley, separating the Sierra Madre del Sur from the main range of the Sierras, occupies the north half of the state. The climate is very hot and unhealthy in the coast lands, where fevers and leprosy prevail to a great extent; but the uplands enjoy a temperate, dry, and healthful climate. There is an extensive region of agricultural land, but its cultivation is greatly impeded by the sparseness of population. The chief agricultural products are cereals, fruits, tobacco, coffee, cacao, vanilla, and cotton. The mineral deposits are believed to be extensive, but thus far relatively little has been done towards their exploitation, although considerable quantities of silver have been mined. There is direct steamship communication between the port of Acapulco (q.v.) and foreign countries, and the Cuernavaca branch

of the National Railways has been extended through the state as far as Balsas. The population in 1910 was 504,278, largely aboriginal Indians. The capital is Chilpancingo, a small town in the centre of the state, situated about 200 miles from the city of Mexico and about 110 miles from the coast. It is well built and lighted by electricity and had in 1910 a population of 7094.

GUERRERO, VICENTE (1782-1831). A Mexican revolutionary leader. He was born at Tixtla and spent his youth upon a farm. In October, 1810, he joined the revolutionary army under Morelos and distinguished himself by his energy and valor. In 1818, when all opposition to the Spanish power seemed extinct, he won two victories over the viceregal troops and reorganized the republican movement. He became the recognized head of the Independents and established himself in the south, but was induced by Iturbide, in January, 1821, to join in the *Plan de Iguala*, by which Mexico was to become independent under a king of the Spanish royal family. Iturbide's assumption of the Imperial title alienated Guerrero, who became the leader of the opposition, and was in command at the battle of Almolonga, in January, 1823, in which he was severely wounded. When Iturbide left the country, Guerrero was made a member of the Executive Council of four, but his lack of education and his inexperience in politics prevented his exercising much influence in the government. From 1824 to 1828 he was Vice President of the republic. He was a candidate for the presidency in 1828 and was defeated. Thereupon his partisans rose in revolt and succeeded in forcing the legally elected candidate (Pedraza) to leave the country. The Congress elected Guerrero to the vacant office (March, 1829). The most important measure of his administration was the decree abolishing slavery (Sept. 15, 1829). The Spanish invasion of that year was repelled with ease, but the extraordinary powers conferred upon the President afforded a pretense for the formation of a revolutionary coalition, under the veteran intriguer Bustamante. Revolution broke out in December and gained ground with great rapidity. Bustamante assumed the office of President. Guerrero fled to the south and with Acapulco for a base of operations kept up an armed resistance until January, 1831, when he was betrayed into the hands of his enemies by a Genoese shipping captain. He was shot on Feb. 14, 1831, after a brief military trial.

GUERRILLAS (gér-rí-láz), or **GUERILLAS** (Sp., predatory war, dim. of *guerra*, war, from OHG. *icerra*, strife, confusion). Bands of persons or individuals acting singly, who commit acts of hostility without the sanction or authority of their own government. They are not a part of the organized army, but intermittently return to their homes and vocations, thereby divesting themselves temporarily of the character and appearance of soldiers. If captured, they are not entitled to the privileges of prisoners of war, but are treated summarily as murderers and robbers. They should be distinguished from *partisans*, which are organized bands operating under a commission from their own government, and who, so long as they conform to the laws of war, enjoy the privileges and rights which those laws guarantee belligerents. Consult: *The International Peace Conferences* of 1899 and 1907 at The Hague; *In-*

structions for the Government of the Armies of the United States in the Field (Washington, 1863, 1898); *Rules for Land Warfare, United States Army* (ib., 1914).

The term "guerrilla" originally was applied to armed bands of Spanish peasantry who, favored by local conditions and the terrain generally, proved very effective against the French invasion which began in 1808. In the American Civil War the name was applied to various irregular bodies of Confederate troops. Similarly the francs-tireurs (q.v.) of the Franco-German War were practically guerrillas. The Spanish employed some few guerrillas against the United States in Cuba in 1898, and the closing stages of the British-Boer War were devoted, on the Boer side, to guerrilla tactics, carried out by small bands of armed Boers. Filipino and Moro guerrillas were active for several years during the pacification of the Philippine Islands by the United States forces. The marauding bands of murderers and robbers operating all over Mexico in the vicinity of the Federal and Constitutionalist forces during the revolution (1911-15) are further typical examples of guerrillas.

GUERRINI, gwër-ré-né, OLINDO (pseudonym, Lorenzo Stecchetti) (1845-). An Italian poet and miscellaneous writer, born at Sant' Alberto (Province of Ravenna). He studied law at the universities of Turin and Bologna, but never practiced. In 1868 he began to occupy himself with literature and research and was appointed librarian of the University Library at Bologna. His publications include: *Postuma: Canzoniere di Lorenzo Stecchetti* (1877); *Polemica* (1878); *Studi e polemiche Dantesche* (1880); *Canti popolari romagnoli* (1880); *Rime di tre gentildonne del secolo XVI* (1882); *Brandelli* (1884); *Il libro dei colori* (with Ricci, 1887). He wrote many humorous poems in Venetian dialect, among the best of which is *Bepi*. In 1903 appeared *Rime di Lorenzo Stecchetti*. He is the chief representative of "verism" in modern Italian lyric poetry, which is shown in his *Rime di Argia Stolenfi*.

GUESCLIN, gá'klín', BÉTRAND DU. See DU GUESCLIN, BÉTRAND.

GUESDE, géd, JULES BASILE (1845-). A noted French Socialist leader, born in Paris, Nov. 11, 1845. Like many other French politicians, he began his career as a journalist. In 1870 he founded a radical paper called *Les Droits de l'Homme*, in which he vigorously espoused the Commune. For this he suffered imprisonment and exile, and for five years he led the life of a wandering agitator. While in Germany, his radical opinions became definitely socialistic, and he returned to France, not only a strict adherent of Karl Marx, but full of admiration for the unity and discipline of the German Social Democratic party. It now became his great ambition to organize in France a powerful, united, and well-disciplined Socialist party unswervingly committed to the Marxian programme. With this object in view, he founded the weekly *Egalité*, in which he advocated his principles with great ability and singleness of purpose. Guesde's first struggle was with the semianarchistic followers of Blanqui, who favored insurrection and violence as a means of overthrowing present society. In 1878, the year of the Universal Exposition, the Socialists attempted to hold a convention in Paris, but the police broke up the meeting, and Guesde, who was the leader in this movement, was arrested.

He aroused so much enthusiasm that the French workmen rallied to his side, and in the following year the great Labor Congress of Marseilles indorsed the Marxian programme drawn up by Guesde and Paul Lafargue, son-in-law of Karl Marx.

French Socialists in the latter part of the nineteenth century were split up into numerous groups that were constantly quarreling with each other. Some were strictly Marxian and followers of Guesde, others called themselves "possibilists" or those who desired an opportunist policy which meant emphasizing Socialist doctrines less and progressive social reform more. Between the two there was constant war. Opportunism to Guesde spelled treason to Socialism for the sake of petty reforms. At the time of the Dreyfus affair many Socialists, led by Jean Jaurès (q.v.), became supporters of the radical ministry. A Socialist, Millerand (q.v.), even became a member of the cabinet. Guesde determined to bring the matter before the International Socialist Congress of Amsterdam in 1904. This he did, and the congress after a great debate officially supported Guesde's resolution that a Socialistic party must be independent of all other parties and not participate in a capitalist government. All true Socialists in France were told to unite in one party. In this way was born the Unified Socialist party, a powerful cohesive organization definitely committed to the Marxian programme, which elected in 1914 about 100 members to the Chamber of Deputies. Jaurès bowed to the decision of the Amsterdam Congress and continued as leader of the party; but the "possibilists," Millerand, Briand, and Viviani, refused, and they were consequently expelled from the organization.

After 1893 Guesde was almost regularly elected a member of the Chamber, where he exercised considerable influence. There is a touch of fanaticism in his intellectual rigidity, for he is a stern unbending Marxist and believes firmly in the coming of a Socialist régime. The great European War of 1914, which threatened the existence of France, alone had the effect of changing the uncompromising attitude of Guesde. In a public statement he declared that Germany was a traitor to the peace of Europe and had endangered the existence of civilization; he also denounced the German Socialists as "traitor workmen." He entered the cabinet of M. Viviani (as Minister without portfolio). Consult: R. Hunter, *Socialists at Work* (New York, 1908); S. P. Orth, *Socialism and Democracy in Europe* (London, 1913); J. S. Schapiro, "The Drift in French Politics," in *American Political Science Review* (Baltimore, August, 1913).

GUESS, gés, GEORGE. See SQUOYA.

GUESS WARP. A hawser paid from a ship by rough estimate of its sufficiency. In carrying out a hawser in a boat from a ship to a distant object, if the boat is small, or if in haste, only part of the hawser is put in the boat, which drags the hawser from the ship until, in the judgment ("guess") of the officer or petty officer in charge of the boat, he can reach his destination with what he has in the boat.

GUEST, gést, EDWIN (1800-80). An English scholar. He graduated at Cambridge, where he became fellow of Caius College in 1824 and vice chancellor in 1854. He was one of the founders of the Philological Society (1842), to which he contributed numerous papers. His work in phi-

lology has been largely superseded, but his *History of English Rhythms* (2 vols., 1838; ed. by Skeat, 1882) is still valuable. He was a pioneer in the study of ancient Britain. Some of his investigations in the field were collected by W. Stubbs under the title *Origines Celticae* (1883).

GUEST, JOHN (1821-79). An American naval officer, born in Missouri. He entered the navy in 1837 and in 1866 rose to be captain. During the Mexican War he served along the west coast of Mexico and the California coast, and in 1854, while at Shanghai in command of the seamen and marines of the steamer *Plymouth*, won a decisive victory over a force of Chinese rebels who were seeking to plunder foreign residents. In the Civil War he commanded the *Ocasco* in the passage of Forts Jackson and St. Philip, and the *Lehigh* and *Itasca* in the battles of Fort Fisher. He was promoted in 1873 to be commodore and was in command of the Portsmouth Navy Yard at the time of his death.

GUEUX, Les, là gē (Fr., beggars). The name assumed by the confederated nobles who opposed the tyrannical policy of Philip II of Spain in the Low Countries and brought about the revolt which separated the Northern Provinces from Spain. Philip having followed up his previous policy of severity and persecution by sending inquisitors to the Low Countries to put into execution the decrees of the Council of Trent, provoked by this act the bitter resentment of the patriotic party, who saw in it an attempt to curtail their ancient liberties. An opposition was thus formed, which, headed by Count Louis of Nassau and Count Hendrik van Brederode, declared in an act called the "Compromise" (April 5, 1566) their fixed determination to ignore the authority of the inquisitors. On one occasion, after listening to a deputation from the liberal party, the Regent, Margaret of Parma, it is said, seemed inclined to yield to their demands, when one of her council approached her and whispered that she "need not be afraid of these gatherings of beggars." The remark having been overheard by some of the deputation, the epithet was soon afterward assumed as the title of the patriotic league. The "beggars" maintained a long and vigorous contest against the despotic proceedings of Philip and his advisers. A branch of them, the "sea beggars," under the bold leadership of Count de la Marck, initiated the long struggle for independence by the capture of Brill, April 1, 1572. The record of their struggles is a glorious one. After many reverses and few successes the tide turned in their favor. From the date of the Union of Ghent (1576) the history of the Gueux is merged in that of the Netherlands. Consult: Kervyn de Lettenhove, *Les huguenots et les gueux* (6 vols., Brussels, 1882-85); Renon de France, *Histoire des causes de la désunion . . . des Pays-Bas* (3 vols., Brussels, 1886-91); Jurien de la Gravière, "Les gueux de mer," in *Revue des Deux Mondes* (Paris, 1891-92); also the general works of Motley, Blok, and others, mentioned in the article on the NETHERLANDS.

GUEVARA, gā-vā'rā, ANTONIO DE (c.1490-1545). A Spanish writer, born in Treceño, Santander. As a boy, he was taken to the court of Ferdinand and Isabella, and after the Queen's death he entered the Franciscan Order. He served as guardian at Arévalo and Avila, and in 1518 was made court preacher and histori-

ographer by Charles V. After visiting England and Germany, he was appointed inquisitor in 1523 and took part in the forcible conversion of the Moors. In 1527 he was named Bishop of Guadix. He accompanied Charles V on his expedition to Tunis (1535), and on other travels in Europe. Returning to Spain, he died at Mondoñedo. He enjoyed great favor in his own time, both at home and abroad, for the peculiarly artificial style of his didactic and political treatises, which are marked also by decidedly moralizing tendencies. This rhetorical manner of Guevara prevailed in his *Marco Aurelio con el reloj de principios* (1529), which, translated into English—*The Golden Book of Marcus Aurelius, Emperor and Eloquent Orator*, translated from the French by Lord Berners (London, 1532); and again, *The Diall of Princes, Englysshed oute of the Frenche*, by Thomas North (London, 1557; cf. a later ed., London, 1619)—first made known in England the literary mannerisms and affectation which in Lyly's hands became euphuism. Like the other productions of Guevara, this work was frequently translated into French, and from it, through an interesting French translation, La Fontaine derived the subject matter for his fable *Le paysan du Danube* (libre xi, fable 7). When publishing the *Reloj*, Guevara pretended that it was a genuine autobiography of Marcus Aurelius, and that the original manuscript was to be found at Florence. This fraud was detected and made known in 1540, by Pedro de Rúa, a professor at Soria, and Guevara had to admit his authorship. The proceeding was the occasion of undue strictures upon him on the part of several critics. His other productions comprise a volume (Valladolid, 1530) containing *Década de las vidas de los X. Césares, emperadores romanos, De menoscprecio de la corte, Aviso de privados y doctrina de cortesanos, and De los inventores del marear*; *Epistolas familiares* (Valladolid, 1539); and two devout treatises, *Monte Calvario* (1542) and *Oratorio de reliquias* (1543). Of these the *Epistolas familiares* became the most famous, and were widely read for the sake of their refined diction, which for us is overwrought and absurdly pompous. Among the English translations of the *Epistolas*—called generally the "Golden Epistles," so great was their vogue—may be noted that of E. Hellowes (London, 1574) and that of G. Fenton (ib., 1575).

Bibliography. *Biblioteca de autores españoles*, vol. xiii (Madrid, 1850), contains his "Epistolas familiares," and vol. lxx (ib., 1873) a number of philosophical writings; consult also Gálvez, *Guevara in England* (Weimar, 1910).

GUEVARA, Luis Vélez de. See VÉLEZ DE GUEVARA, LUIS.

GUEVI, gwā'vé (South African name). The pigny antelope. See BLUEBUCK; DIKKE; ANTELOPE.

GUGGENHEIM, gug'en-him, BENJAMIN (1855-1912). An American capitalist, son of Meyer Guggenheim. When only 20 years old, he was sent to Denver, Colo., to take charge of the mining interests of his father in that city. He had charge of the first smelter built by his family at Pueblo, Colo., and subsequently took charge of the smelting plant at Perth Amboy, N. J. In 1903 he erected at Milwaukee a plant for making machinery, later merged in the International Steam Pump Company, of which he became president in 1909. With his brothers Benjamin Guggenheim was in control of the

American Smelting and Refining Company. He was one of those lost in the *Titanic* disaster.

GUIANA, gè-á'ná. A territory in the north-east part of South America, bounded by the Atlantic on the north, by Brazil and the Atlantic on the east, and by Brazil and Venezuela on the west (see accompanying map). Its area is estimated at 166,800 square miles. (Brazilian Guiana, lying on the south, is sometimes embraced under this general heading.) Guiana has not been thoroughly explored. Its surface may be described, on the whole, as a plateau rising towards the west and north, with an average elevation of about 3200 feet. The mountains have nowhere been found to rise higher than the peak Roraima (8600 feet). This mountain is on the west boundary and belongs to the Pacaraima Range. Along the southern border of Guiana is the low Tumuc Humac Range. The coast is level and low, and dikes keep back the ocean at many points.

Guiana is well watered, numerous rivers coursing through it northward to the sea. The most important of them are the Essequibo (600 miles in length, the longest river in Guiana), Mazaruni, Berbice, Corentyn, and Maroni (400 miles). Owing to numerous rapids and falls, they are navigable only for comparatively short distances. Of the many fertile valleys, none has any considerable extent except the depression lying between the Essequibo and the Corentyn. Little is known of the geology of Guiana, except in the southern part, near the Brazilian boundary, where valuable deposits of gold have given an impetus lately to geological exploration. In this region gneisses and granites are found to underlie heavy beds of sandstone and other stratified rocks of undetermined age.

The climate is tropical. Owing to the intense heat and humidity along the coast, the northern portion of Guiana is particularly unhealthy. Both here and up along the rivers fevers have greatly interfered with the development of the country by Europeans. The climate of the upland interior is naturally more moderate and inviting. The rainy period extends from the last of April until the middle of August, during which time there is a very heavy precipitation. Along the coast there is a second and lighter rainy season from November to February. In the short dry periods of the year east winds prevail. Guiana is free from hurricanes. The vegetation is wholly equatorial. In the lower and northern sections heavy forests cover the land. They usually extend well up towards the higher parts. The forests, like the fauna, are similar to those of the Amazon region, possessing valuable medicinal and dye woods and the typical wild fruits of the torrid zone. The magnificent *Victoria regia* was first made known from the Berbice River. The plateau itself, so far as explored, is practically barren. The low, forest-covered lands are very fertile, but are surpassed in richness by the tide-irrigated coast strip. The cultivated land produces the usual tropical crops as well as some of a less torrid region. Among the larger animals may be mentioned the jaguar, sloth, tapir, ant eaters, capybara, and numerous monkeys (howlers, capuchins, marmosets). The boa, anaconda, and a number of venomous species represent the serpents.

Politically Guiana is divided into three countries—British, Dutch, and French Guiana.

British Guiana. This colony, a possession of

Great Britain, forms the western part of Guiana. It is bounded on the west by Venezuela and Brazil, on the northeast by the Atlantic, and on the east by Dutch Guiana, being separated from the latter by the river Corentyn. It extends from east to west about 270 miles and from north to south about 340 miles. Its area is estimated at 90,277 square miles, being more than half that of all Guiana. Of British Guiana (quite the most important of the three colonies), only the alluvial stretch along the coast has been really developed. There are three settlements—Demerara, Essequibo, and Berbice—with Georgetown as the capital of the colony. Wood cutting is a leading industry. Gold production, which has declined in recent years, amounted in the fiscal year 1897 to 127,479 ounces, valued at £464,768; in 1900, 112,780 ounces, £411,211; in 1910, 64,830 ounces, £236,359; in 1912, 51,190 ounces, £190,733. Diamonds are also found, chiefly along the Mazaruni River. In 1913 there were under cultivation about 145,000 acres, of which about 68,400 acres were under sugar cane and about 41,900 acres under rice. Grazing has not become important; in 1913 cattle numbered 72,000. In the general trade imports and exports were valued in 1902-03 at £1,444,084 and £1,829,749 respectively; in 1911-12, £1,703,356 and £1,978,597 (£898,459 from, and £725,626 to, the United Kingdom). The principal export is sugar, valued in 1912 at £1,019,500. Other exports were: gold, about £177,000; rum, £149,000; balata, £101,500; rice, £38,700. About 40 per cent of the sugar goes to Great Britain and the United States. The imports consist principally of tissues, flour, manures, machinery, implements, etc. North America supplies the colony with fish. In 1911-12 the total tonnage entered and cleared was 988,663. The colonial fleet at the end of 1910 consisted of 58 vessels, of 3228 tons. Georgetown (q.v.) is the chief port; next in commercial importance is New Amsterdam, at the mouth of the Berbice. There is a railway from Georgetown to Rosignol, 60½ miles; from Vreeden Hoop to Greenwich Park, 15 miles; and from a point on the upper Demerara to the upper Essequibo, 18¾ miles. There are 450 miles of river navigation, 12 miles of canal, 264 miles of good roads, about 575 miles of telegraph line, and 74 post offices.

The colony is administered by a governor appointed by the crown. The governor is assisted by an executive council and by a court of policy, consisting of seven appointed and eight elected members, chosen by the registered voters (4050). Revenue and expenditure in 1902-03 amounted to £557,351 and £501,704 respectively; in 1911-12, £593,498 and £588,625; in 1912-13, £580,446 and £590,744. Public debt in 1913, £884,615. There are 49 post-office savings banks. British sterling and American gold coin are current and legal tender, as well as Spanish and Mexican gold. The population of British Guiana increased from 98,154 in 1841 to 135,994 in 1851; in 1871, 193,491; in 1891, 278,328; there was no census in 1901; in 1911, 296,041. These figures are exclusive of aborigines living in the inaccessible parts of the colony; they perhaps number about 10,000. Of the censused population in 1911, there were 126,517 East Indians, 115,486 negroes, 10,084 Portuguese and 3937 other Europeans, 6910 aborigines, and 2622 Chinese. Most of the remaining inhabitants were of mixed race. Males numbered 153,-

717, females 142,324, and natives of the colony 218,705. In 1912-13 there were 224 schools receiving government aid, with 36,148 pupils, and an average attendance of 22,624. The common language is English.

Dutch Guiana, or Surinam. This colony, belonging to the Netherlands, lies east of British Guiana and is bordered on the east by the Maroni River. Its estimated area is 49,845 square miles. Only the sea region is developed, the interior having been little explored. The coast is generally rather swampy. Its inhabited portions are protected and drained by dams and canals and are nowhere wider than 25 miles. Along the coast are fine mangrove forests. Among the plants exploited by the natives here and farther inland are manioc and several varieties of palms. Agriculture is almost the sole industry of the Europeans, sugar being the principal product. Cacao, bananas, rice, maize, and coffee are grown. In 1910 there were produced 121,791 metric quintals of sugar, 16,830 of cacao, 2023 of coffee, 13,233 of maize; 19,937 of rice, 10,898 hectoliters of molasses, and 8729 hectoliters of rum. There were under cultivation, in 1910, 11,994 hectares, of which 2411 were under sugar cane. In 1876 gold was discovered in the eastern part of the colony. Mining was not a little impeded by the dispute with France over the boundary. The question was finally settled in 1905. The gold output in 1910 was 1,081,476 grams, valued at 1,481,622 gulden. The export of gold in 1901 was valued at 901,562 gulden; in 1905, 1,402,176; in 1910, 1,440,073; in 1911, 1,271,437; in the period 1876-1911, 39,395,989. The development of commerce is shown in the following figures for imports and exports respectively: in 1870, 4,042,111 and 2,657,871 gulden; in 1880, 3,914,458 and 3,000,535; in 1890, 5,366,258 and 4,272,692; in 1900, 6,166,608 and 5,540,855; in 1910, 7,424,698 and 8,345,447; in 1912, 7,494,042 and 8,435,447. In 1910 imports from and exports to the Netherlands were valued at about 4,433,000 and 3,843,000 gulden respectively; United States, 1,666,000 and 2,381,000; other countries, 1,326,000 and 2,122,000. There entered at the ports, in 1910, 240 vessels, of 210,998 tons; in 1912, 237, of 211,214 tons. There are no railways and only a few miles of telegraph.

The colony has a governor, with a council of four members nominated by the Queen. The legislative body is the colonial assembly, or "states," the members of which are chosen for six years by electors in proportion of one in 200 electors. For 1914 the estimated revenue and expenditure were 7,051,799 and 6,261,533 gulden; subvention, 790,266 gulden. The population in 1906, exclusive of negroes and Indians living in the forests, was reported at 78,124; in 1910, 86,233. The latter figure included 52,369 aborigines, 19,183 British Indians, 7894 Dutch East Indians, 913 Europeans, and 5374 others. Population of 1921, 113,181. There were 46,037 males and 40,196 females. Paramaribo, with 35,346 inhabitants in 1910, is the capital and only important town. In 1911 there were 26 public schools, with 2965 pupils, and 40 private schools, with 6311 pupils. The official language is Dutch, but English is much used.

French Guiana. This colony and penal settlement of France lies between Dutch Guiana and Brazil, the river Oyapok being on the eastern border. Its area is estimated at 30,463 square miles. The surface rises quite gradually

from the unhealthy coast to the mountain border on the south, where the highest point, however, does not reach above 2700 feet. The coast is not so low as that of British and Dutch Guiana. There are several rivers, but none of importance. Only a small part of the country is known. Fevers, particularly yellow fever, decimate the region and proved so fatal to French convicts that white prisoners have long been sent elsewhere. Less than 10,000 acres of land are under cultivation. The crops include rice, maize, coffee, sugar cane, tobacco, etc. The industrial growth of the colony is very slow and discouraging. There are but a few thousand head of live stock in the colony.

Gold mining is the leading industry, and gold is the chief article of export. Gold was discovered in 1853. In 1904 the product was 114,758 ounces; in 1912, 127,809 ounces. The development of this industry is much affected by the high rate of mortality. There is a little production of phosphate, silver, and iron. Some marble and balata and rosewood oil also figure in the list of exports. In 1890 imports and exports were valued at 7,890,000 and 4,309,000 francs respectively; in 1900, 8,953,000 and 6,497,000; in 1910, 12,223,000 and 11,567,000; in 1912, 10,905,000 and 12,117,000. Of the latter figure the gold export accounted for 10,457,000 francs. About three-fourths of the import trade and about one-half of the export trade are with France. A cable connects Cayenne with Brest.

The colony is administered by a governor, assisted by a privy council of five members appointed at Paris. The colony has a council general of 16 members, and sends one deputy to the French Chamber. The local budget for 1912 balanced at 3,592,000 francs; but a subvention from the home government is necessary. In 1901 there were 32,908 inhabitants, among whom were 4097 hard-labor convicts and 1885 native Indians; in 1911, 49,000. The convicts (about 4400 in 1912) are restricted to four localities. The Ile du Diable off the coast, northwest of Cayenne, became famous through the imprisonment there of Alfred Dreyfus. Cayenne, the capital and the only important town, had 13,527 inhabitants in 1911. The group of islands called the Iles du Salut (of which the Ile du Diable is one) form a desirable harbor. In 1912 there were 26 schools, with 2796 pupils. There is a college at Cayenne.

History. The coast of Guiana was first visited in 1499 and 1500 by Ojeda, Vespucci, and Pinzon. The Spaniards planted a few settlements in the region, none of which seem to have had any long existence. Missionaries visited the interior during the sixteenth century. The tales of El Dorado aroused interest in this corner of South America, but the main current of settlement and exploration was along the Orinoco and to the westward of modern Guiana. Raleigh, who first made the name widely known in 1595, confined his operations almost entirely to the river, although his sailing masters in 1594 and succeeding years carefully explored the coast to the east. After the formation of the Dutch West India Company in 1621, the Dutch, who had established trade on the Pomeroon River as early as 1581 and had explored the Guiana coast more fully in 1597 and 1598, gained a permanent foothold at the head of the Essequibo Delta, where a settlement had been existing since 1613. In 1648 the Treaty of

Westphalia confirmed the Dutch West India Company in possession of the territory. Meanwhile the French had settled near Cape Orange, and the English near the mouth of the Surinam. In 1667 this English colony was exchanged with Holland for New Netherlands or New York. Things remained in much the same condition until 1803, when England captured Demerara, Berbice, and Essequibo from the Dutch, who formally surrendered them by treaty in 1814. The three colonies, comprising some 76,000 square miles, were consolidated in 1831. The boundary between British Guiana and Venezuela (q.v.) ceased to be a subject of dispute after the arbitration Treaty of 1897. The boundary between French Guiana and Brazil was determined in 1900, between British Guiana and Brazil in 1904, and between French and Dutch Guiana in 1905. In the latter year negro riots occurred at Georgetown, due to strikes for higher wages. These were quickly suppressed by the government, but showed the desperate character of the easily excited low-class colored population.

GUIANGA, gē-ān'gā, **GUANGA**, gūō-ān'gā. See BAGOBO.

GUIB, gwīb (African name). One of the "harnessed" antelopes, or bush bucks (*Tragelaphus scriptus*), of southeastern Africa, which formerly were extremely numerous and are still scattered from Abyssinia to the Cape. It is the smallest of the genus, not larger than a goat in size, and shows a great variety of coloration, which varies from dark brown to pale rufous, irregularly streaked and spotted with white. It keeps near the watercourses, hiding in dense thickets. See Plate of GAZELLES.

GUIBERT DE NOGENT, gē'bār' de nōzhān' (1053-c.1124). A French historian and prominent churchman of his day, born near Clermont (Oise). He is said to have been instructed by St. Anselm and became abbot of Notre Dame de Nogent in 1104. His principal work is the history of the First Crusade, written probably

about 1108-12. He wrote also an autobiography and several other works, among which the most prominent are *De Vita Sua, sive Monodiarum* and *De Pignoribus Sanctorum*, a satire on saints and relic worship. A complete edition of these was issued in 1651. Consult P. Bourgin, *Guibert de Nogent: Histoire de sa vie* (Paris, 1907).

GUIBERT, gē'bār', or **WIBERT**, vē'bērt, OF **RAVENNA** (c.1020-1100). Antipope with the name Clement III (1080-99). He was born between 1020 and 1030 and in 1073 became Archbishop of Ravenna. He quarreled with Gregory VII (q.v.), by whom he was suspended in 1075 and excommunicated in 1078. In 1080 the Emperor Henry IV (q.v.) had him chosen Pope in opposition to Gregory at Bixie, and he was enthroned at Rome four years later, after the Emperor had captured the city. After the death of Gregory Guibert contested the papal see with Victor III and Urban II. In 1099 he made his submission to Paschal II. Consult his life by Kühnke (Leipzig, 1888).

GUICCIARDINI, gwē'chār-dē'nē, **FRANCESCO** (1483-1540). An Italian statesman and historian, born of noble parentage at Florence. The studies of law and literature engrossed his earliest attention, and before he reached the age of 23 he was elected professor of law by the signoria of Florence. His knowledge of international law and his tact in the conduct of public affairs caused him to be selected in 1512 by the signoria as Ambassador to the court of Ferdinand, King of Aragon. During a period of two years he discharged his diplomatic duties with ability. In 1515 he was dispatched by the Republic of Florence to receive at Cortona Pope Leo X. This pontiff at once secured Guicciardini's services and committed to him the government of Modena and Reggio and finally of Parma. Under Clement VIII he was for some years Governor of the Romagna and finally of Bologna. On the accession of Paul III (1534), Guicciardini resigned all his dignities and returned to Florence, where Alexander de' Medici had been made sovereign by Charles V. On the assassination of Alexander, Guicciardini promoted the elevation of Cosimo de' Medici; but, meeting with no special favor from that prince, he withdrew to his villa at Arcetri, where he began his famous work *La storia d'Italia*, the greatest historical work of the sixteenth century. He died before its completion. In 1561 the first 16 books of his history were published at Florence, and three years later, at Venice, four additional books appeared. The work is a standard of classical historical writing, aside from its value as a minute and faithful record of the period it embraces (1490-1534). A magnificent Italian edition was published at Freiburg (1775-76), and another at Pisa in 1819, edited by Rosini. An earlier work was the *Storia fiorentina* (1509), dealing with the history of Florence from 1378 to 1509; it is marked by an impartial and keenly searching spirit, although written at the age of 26. Between 1523 and 1527 he wrote *Del reggimento di Firenze*, a most interesting discussion of city government. Guicciardini is always remarkable for the exactness of his observation and his unflinching common sense. He codified the political ideas of the sixteenth century. From 1857 to 1867 there appeared at Florence *Opere inedite di Francesco Guicciardini*. Consult: Benoist, *Guichardin, historien et homme d'état* (Paris, 1862); Gioda, *Guicciardini e le sue opere inedite* (Bologna, 1880);

Rossi, *Francesco Guicciardini e il governo fiorentino dal 1527 al 1540* (ib., 1896); Zanoni, *Vita pubblica di Francesco Guicciardini* (ib., 1890).

GUICCIARDINI, FRANCESCO, COUNT (1851-1915). An Italian statesman, descended from the sixteenth-century historian of the same name. He was educated at the University of Pisa and in 1882 was elected to the Lower House. In 1884 he became General Secretary for Agriculture, Commerce, and Trade; in 1896-97 was Minister of Agriculture in Rudini's cabinet; and in 1906 and 1909-10 was Minister of Foreign Affairs in Sonnino's cabinet. For many years he was vice president of the House of Deputies, of which he was a member uninterruptedly after 1892.

GUICCIOLI, gwé-chō'lè, TERESA, COUNTESS (1801-73). The daughter of Count Gamba of Ravenna, married when 16 to Count Guiccioli, who was over 60. She is known to fame from her intimacy with Lord Byron in 1819-22. In 1851 she married the Marquis de Boissy. She wrote a defense of Byron, entitled *Lord Byron jugé par les témoins de sa vie* (1868), known in its English translation as *My Recollections of Lord Byron* (1869). See also BYRON, G. G.

GUICHARD, gē'shūr, KARL GOTTLIEB, better known as **QUINTUS ICIILIUS** (1724-75). A German soldier and writer on military affairs, born in Magdeburg. He studied for the ministry, but his mind turned to military affairs and ancient history. In 1757 he published his *Mémoires militaires sur les Grecs et les Romains*. At the outbreak of the Seven Years' War he enlisted in the army of Duke Ferdinand of Brunswick, and in 1758 was presented to Frederick the Great, to whose personal service he was forthwith attached. It was at Landshut in May, 1759, that Frederick referred to a certain centurion mentioned in Polybius' account of the battle of Pharsalus as Quintus Icilius. Guichard ventured that the name was Quintus Cæcilius, persevered in his correction, and next day appeared with the text of Polybius in confirmation. "So?" retorted the King. "Well, then, Quintus Icilius shall be *your* name!" From that time Guichard appeared as Quintus Icilius in all lists and reports. He became major in 1758 and after the conclusion of the war was retained at Potsdam, where he was promoted to be colonel. He published further, *Mémoires critiques et historiques sur plusieurs points d'antiquités militaires* (1773). Consult Carlyle, *History of Frederick the Great* (London, 1858-65).

GUICHE, gēsh, DIANE D'ANDOUINS, COUNTESS OF (1554-1620). A mistress of Henry IV of France, daughter of Paul d'Andouins. She studied under the same tutors as the famous King and was his favorite playmate in their early youth. In 1567 she married Phillibert de Gramont, Count of Guiche. About 1580 Montaigne dedicated some sonnets to her, and about that date the *belle Corisande*, as she was called, again met the King, who wished to marry her after her husband's death at La Fère (1580). During Henry's bitter war against the Liguers, led by the Duke of Guise, she was his most sagacious and trustworthy adviser. Henry's letters to her are included in his published correspondence, *Recueil des lettres missives de Henri IV* (9 vols., Paris, 1843-76).

GUIDE (OF. *guis*, Fr. *guide*, from OF. *guier*, *guider*, Fr. *guider*, to guide, probably from Goth., AS. *witan*, OHG. *wissan*, Ger. *wissen*, to know,

Lat. *videre*, to see, Gk. *εἰδέναι*, *eidenai*, Skt. *vid*, to know). A military term, denoting the non-commissioned officer detailed to regulate the pace and direction of bodies of troops during parade, drill, or evolutions. It also describes the person, civil or military, intrusted with the responsibility or duty of leading troops through a strange country or during night operations. In the French army the Guide Corps of cavalry and infantry form an important branch. The corps of guides of the British Indian Punjab frontier force consists of six troops of cavalry and eight companies of infantry, composed of native rank and file, and also, with the exception of 14 Europeans, of native commissioned officers. The French Guide Corps was first formed in 1744 as a small company of messengers on active service, but the number increased rapidly, until Napoleon finally formed them into a corps 10,000 strong.

GUIDERIUS, gwi-dē'ri-ūs. A long-lost son of Cymbeline, in Shakespeare's romantic comedy of that name.

GUIDGUID, gwīd'gwīd, or **GUITGUIT**. An imitative name given in tropical America to almost any small bird having a quickly repeated cry, especially the creepers of the genera *Cacaba*, *Dacnis*, and the like. It is also used of members of the family Pteroptochidae, which consists of many species of small, plainly colored, wren-like birds which spend their time and seek their insect food on the ground in the forest. A Chilean species (*Hylactes megapodius*) is very well known as "elturco."

GUIDI, gwē'dē, CARLO ALESSANDRO (1650-1712). An Italian poet, born at Pavia. Literature, especially poetry, engrossed his earliest attention; and he strove to imitate Pindar. To his first pieces he owed the notice of the Duke of Parma, whose favor he further secured by his talent in setting his verses to airs of his own composition. In 1685 he went to Rome, where he won the friendship of Christina, Queen of Sweden, and composed at her request the pastoral drama *Endimione*; he was one of the first members of the Arcadia. His subject matter is always conventional, and his treatment of it usually artificial, but the workmanship of his verse is admirable. Guidi adopted a free form of canzone, later developed by Leopardi. His *Rime* appeared at Parma in 1681. Consult: Martelli, in *Vite degli Arcadi*, vol. iii (Rome, 1714); Crescimbeni, in *Poesie di A. Guidi, non più raccolte* (Verona, 1726); G. Capsoni, *Alessandro Guidi* (Pavia, 1897).

GUIDI, IGNAZIO (1844-). An Italian Orientalist. He was born in Rome, was educated there in the Liceo San Apollinare, and in 1878 became professor of Semitic languages in the University of Rome. He edited and translated Arabic, Syriac, Ethiopic, and Coptic texts, notably the earliest fragments of Amharic (q.v.); and is particularly known for his theory that the original home of the Semites was on the lower Euphrates. He received an honorary doctor's degree from Berlin.

GUIDI, TOMMASO. See MASACCIO.

GUIDICCIONI, gwē'dē-chō'nē, GIOVANNI (1500-41). An Italian prelate and poet, born at Lucca. His integrity and force of character played an important part in the diplomatic relations of his country. As President of the Romagna and Governor of the Marches, he freed these regions from the bandits infesting them. His love poems are of little value, but where

his strong feeling for his country is shown, as in the sonnet beginning "The Arne, and the Tiber, and the Po," his verse is very noble. His complete works were published in 1718, and his *Lettere inedite* in 1865. The *Lettere di negozi* are particularly interesting historical documents. Consult C. Minutoli, *Opere di Mons. G. Guidiccioni* (Florence, 1867), and Fornaciari, *Una fenice fra i letterati del cinquecento* (ib., 1873).

GUIDO, gwé'dó (?-894), DUKE OF SPOLETO. He contested the Italian crown with Berengar I (q.v.), with the result that he was crowned King at Pavia (889). In 891 the Pope placed the Imperial crown on his head. See SPOLETO.

GUIDO D'AREZZO, dā-rét'só, or **GUIDO ARETINO** (c.995-c.1050). A famous reformer of music and a monk of the Benedictine Order. It had been generally believed that he was born at Arezzo, until Dom Germain Morin discovered evidence that he had been educated in the monastery of St. Maur des Fossés, near Paris; so that it seems probable that he was born near Paris. He has the reputation of being the inventor of musical notation and has been styled "The Regenerator of Music." But the circumstances which led to this invention are differently stated by nearly every narrator. The most plausible and possibly the most reliable account is that on one occasion, while chanting with the monastery choir a hymn in honor of St. John, he was struck with the gradual and regularly ascending tones of the opening syllable sounds of each hemistich in the first three verses:

"Ut queant laxis
Mī-ra gestorum
Sol-ve polluti

Re-sonare fibris
Fa-muli tuorum
La-bii reatum," etc.

Comprehending the fitness of these sounds to his proposed system of solfeggio, he promptly systematized the idea. The fame of Guido's musical invention, and the success he achieved with it, particularly among the youthful choristers of his own monastery, while gaining for him considerable ill will and subjecting him to much jealousy in his own and neighboring monasteries, finally brought him to the attention of the Pope (John XIX), who invited him to Rome. Guido immediately accepted the invitation and met with a very gratifying reception. The Pope became a student of the new system and did much to help the cause. In 1029 Guido became prior of the monastery of Avellano, where he probably died.

Research and tradition are united in ascribing to him the introduction of the four-line staff, which was a combination of the former red *f* line and yellow *c* line, with the addition of a black *a* line between them, and a black *e* line above them; the mensural notes being written on the lines and spaces. Extra lines were added either above or below, whenever necessary. By this invention a uniformity of pitch was obtained, which in itself marks one of the most important steps in the history of music. He left many interesting writings explanatory of his musical doctrines, among which may be mentioned the *Micrologus* and the *Argumentum Novi Cantus Invenendi*. See MUSICAL NOTATION; GUIDONIAN HAND.

GUIDO DELLE COLONNE, dē'lā kō-lōn'nā. An Italian poet of the thirteenth century, probably a Sicilian by birth. For a long time he was a judge at Messina. He wrote Italian

poems patterned after Provençal models, and in Latin a *Historia Trojana*, based on Dictys and Dares and on the *Roman de Troie* of Benoît de Sainte-Maure. The *Historia* was very popular in the Middle Ages and, translated into nearly all the tongues of western Europe, had a great effect on the literature of Italy, France, and England. Chaucer obtained from it the plot of *Troilus and Cressida*. Caxton's English version of the French translation by Raoul de Fevre was the first printed English book. Consult the announced edition of poems edited by Ernest Langley, and Hamilton, *Chaucer's Indebtedness to Guido delle Colonne* (New York, 1903).

GUIDO GUINICELLI, gwé'né-chél'lē. An Italian poet. See GUINICELLI, GUIDO.

GUIDON, g'дон (older form *guydon*, from Fr. *guidon*, from *guider*, to guide). A color or pennon carried by troops of cavalry, batteries of field artillery, mounted sections of engineers, and mounted companies of the signal corps. The guidon for cavalry, field artillery, and signal corps is cut swallow-tailed; for engineers is triangular shape. Colors: cavalry, red and white; field artillery, scarlet; signal corps, orange; engineers, scarlet. (Consult *United States Army Regulations*, Washington, 1913.) It aids in maintaining alignments, being placed on the flank on which the guide is indicated. In column formations it is placed at the head of the columns. See COLORS, MILITARY.

GUIDON DE LA MER, g'é'dōn' de là mār (Fr., banner of the sea). A French treatise on maritime law, which appeared at Rouen between 1556 and 1584. Notwithstanding the fact that it was of unknown authorship, it rapidly gained a position of great authority, comparable to that of the *Consolato del Mare* (q.v.), and the *Ordonnance de la Marine* (q.v.), promulgated by Louis XIV of France in 1681. The first known edition is dated 1607. See also MARITIME LAW; OLÉRON, LAWS OF; RHODES, LAW OF; WISBY, LAWS OF. Consult also Cleirac, *Us et coutumes de la mer* (Bordeaux, 1661), and Kaltenborn, *Grundsätze des praktischen europäischen Seerechts* (Berlin, 1851). The best edition is that contained in Pardessus, *Collection de lois maritimes antérieures au XVIIIe siècle* (Paris, 1828-45).

GUIDONIAN (gwé'dō'nī-an) **HAND**. A mechanical device for teaching the syllables of solmization (q.v.). Guido of Arezzo distributed the 20 tones of his scale over the finger tips and joints of the left hand. But as the hand has only 10 tips and joints, the twentieth tone (which was very seldom used) was assigned to a point above the tip of the middle finger. After the position of the different tones on the hand was once committed to memory, the pupil was enabled to tell any interval or scale by merely glancing at his left hand.

GUIDO (gwé'dó) **OF LUSIGNAN**, lū'zé'-nyān'. See GUY OF LUSIGNAN.

GUIDO OF SIENA. A painter of the thirteenth century, about whose work there is much controversy. He is important mainly as an immediate predecessor of Cimabue and Giotto and seems to have been slightly superior to his contemporaries, such as Margaritone and the Berlinghieri, and the equal of Giunta Pisano. This assumption is based upon a large painting of the Virgin and Child enthroned, with six angels, formerly in San Domenico, now in Palazzo Pubblico, Siena. It is signed "Guido de Senis" and dated "1221." Siennese writers therefore

claim for him, rather than for Cimabue, the honor of first reviving painting in Italy. But on account of existing spaces between the numerals, Milanesi, and following him Crowe and Cavalcaselle, read "1281," and identify the painter with Guido Graziani, a Siennese of the later fourteenth century. It seems more likely, however, that, as Douglas maintains, the entire panel has been repainted, so that no conclusions from its style are warranted. But the inscription seems unchanged; for such spaces between numerals of 10 occur, and there is no reason for assuming that the date 1221 has been tampered with and changed to 1281. The whole question must therefore be regarded as unsettled. Consult Milanesi, *Della vera età di Guido* (Siena, 1859), and Crowe and Cavalcaselle, *History of Painting in Italy*, vol. i, edited by Douglas (London, 1893).

GUIDO RENT, rä'nä. An Italian painter of the Bolognese school. See RENT, GUIDO.

GUIENNE, gé'nä. An ancient province of France. It comprised the territory now included in the departments of Gironde, Lot, Lot-et-Garonne, Dordogne, Aveyron, and the most important part of Tarn-et-Garonne and Landes, and formed with Gascony what was originally Aquitania, of which name Guienne is a corruption. It became separated in 1259 from Gascony. For its earlier history, see AQUITANIA.

GUIEYSSÉ, gé'äs', PIERRE PAUL (1841-1914). A French mathematician, Egyptologist, and public official, born at Lorient. After studying in the college of his native town he entered in 1860 the Ecole Polytechnique. In 1863 he became a member of the marine hydrographical engineering corps, and during the siege of Paris in 1870 he was awarded the cross of a Chevalier of the Legion of Honor. From 1874 to 1893 Guieysse was an instructor in mechanics at the Ecole Polytechnique, and from 1877 to 1890 he was also actuary of a life-insurance company. In addition he was greatly interested in the language and civilization of ancient Egypt, lecturing on that subject at the Ecole des Hautes Etudes, supplying the chair of Egyptology at the Collège de France in 1886-87, and writing several valuable memoirs, which include: *Le rituel funéraire égyptien* (1876); *Le papyrus funéraire de Soutimes* (1878); *Les inscriptions historiques du grand temple d'Ipsamboul*. He also took an active part in the political life of the nation, as deputy (1890-1910), as Minister of the Colonies (1895-96), and as a member of the Superior Council of the colonies (1903-06), representing New Caledonia.

GUIGNES, gé'ny', JOSEPH DE (1721-1800). A noted French Orientalist and Chinese scholar. He was born at Pontoise in the Department of Seine-et-Oise. In 1752 he was elected to the Royal Society of London and in 1754 to the French Academy of Inscriptions. He became professor of Syriac at the Collège de France in 1857. His great work, *L'Histoire générale des Huns, Turcs, Mongols, et autres Tartares occidentaux avant et depuis J. C. jusqu'à présent* (1756-58), is a rare specimen of industry and research.—His son, CHÉRIEN LOUIS JOSEPH (1759-1845), also a very distinguished Oriental scholar, was Consul at Canton and published a Chinese dictionary (1813).

GUIGNIAUT, gé'nyô', JOSEPH DANIEL (1794-1876). A French Hellenist and archaeologist, born at Paray-le-Monial. He was appointed director of the normal school in 1830, afterward

was made professor of Greek, and then professor of geography in the faculty (1835). In 1860 he was made perpetual secretary of the Academy of Inscriptions. His principal work, *Religions d'antiquité considérées principalement dans leur formes symboliques et mythologiques* (1825-51), is founded upon the *Symbolik* of G. F. Creuzer (q.v.). Other works include: *Dissertation sur la Vénus de Paphos* (1827); *Dissertation sur le dieu Serapis et son origine* (1838); *Théogonie d'Hésiode* (1835). He also contributed articles on archaeology to the *Globe*, the *Revue Archéologique*, and other publications.

GUIGNOL, gé'nyôl'. A French puppet show, the equivalent of the English Punch and Judy. It was developed from the Italian *pupazzi* by Laurent Mourgnet, who in 1795 established a theatre for the Guignol in Lyons, which was kept up for many years by his descendants. The drama is said to be derived from Guignol, or Chignol, a silk weaver of Lyons, where, as also in Paris, the performance is one of the most popular street shows. See PUNCH.

GUIJA, gé'nä. A lake of Central America, situated in the republics of Salvador and Guatemala, at an altitude of over 3000 feet (Map: Central America, C 3). It is about 15 miles long and about 6 miles wide and is surrounded by mountains. It contains two volcanic islets.

GUIKOWAR, gi'ko-wär. See GAIKWAR.

GUILBERT, gél'bär', YVETTE (1869-). A Parisian singer, noted for her performances at cafés-concerts, like the Eldorado and the Ambassadeurs, and such theatres as the Nouveautés and the Variétés. She visited the United States in the season of 1895-96 and again in 1896-97 and also appeared with some success in Germany and England. In 1897 she became Madame Schiller. In 1902 she published two novels, *La vedette* and *Les demi-vieilles*.

GUILD, gild (AS. *gegild*, *gildscipe*, Icel. *gildi*, Ger. *Gilde*, guild, from AS. *gild*, Icel. *gjald*, payment, OHG. *geld*, Ger. *Geld*, money, from AS. *gildan*, Icel. *gjaldan*, OHG. *gelten*, Ger. *gelten*, to pay, Eng. *yield*). A medieval association whose members were pledged to assist each other in the pursuit of common ends. They have been classified as (1) ecclesiastical, (2) social-religious, and (3) trade guilds. The trade guilds may be subdivided into the guild merchant and the craft guilds. The aim of the ecclesiastical guilds was to promote piety and encourage good works; while the aim of the social-religious guilds was to perform certain social and religious functions, such as the holding of feasts, psalm singing, and escorting the dead to the grave. These guilds also endeavored to secure protection for members from personal injury. The trade guilds were mainly designed to protect the economic interests of their members, but social and religious functions were also performed by them.

Origin of Guilds. The origin of the guilds is still a matter of dispute. They first became prominent after the ninth century, when the original tribal organization of the Teutonic races had broken down and in some cases succeeded to the functions of the tribe. The spread of Christianity had a great influence upon their development. It is possible that on the Continent the trade corporations of the Roman Empire had not wholly disappeared and formed the nucleus of some of the later guilds.

Guilds are first mentioned in the Carolingian capitularies of 779 A.D. The first authentic

notice of guilds in England dates from the ninth century. These early guilds were social-religious in their nature. In England evidence of trade guilds does not appear before the Norman Conquest, when the great increase in trade made associations for mutual protection necessary. They had probably appeared somewhat earlier in Flanders and North France.

Social-Religious and Ecclesiastical Guilds. The history and organization of the social-religious guilds are involved in much obscurity. They were presumably local organizations. In some cases they became powerful and were vested with manorial jurisdiction. In England they lost their importance after the Norman Conquest. The ecclesiastical or religious guilds, on the other hand, grew in wealth and power down to the beginning of modern times. In London there were a large number of them. In the reign of Richard II a guild in honor of St. George the Martyr, consisting of an alderman, master, brothers, and sisters, was established in Norwich. King Henry V confirmed it by letters patent under the great seal, made it perpetual, and granted it certain privileges and immunities (*Madox, Firma Burgi*). In like manner guilds were formed in Bristol, Exeter, and other large towns. These guilds, through the munificence of individuals, by degrees amassed considerable wealth. By Henry VIII the property and revenues of these religious guilds were seized and perpetually vested in the crown. See BROTHERHOODS, RELIGIOUS.

The Guild Merchant. In its early stages the guild merchant was doubtless a private institution, designed solely to protect the interests of its members. By the twelfth century it had become in England and in some continental cities a semipublic body, possessing by charter a monopoly of all trade carried on within the town. Those who were not of the guild might, indeed, sell their wares, but not at retail. They were, moreover, subjected to all sorts of petty exactions from which guild members were exempt. Entrance to the guild merchant was free to all burgesses who would share in the "scot and lot"—the general burden of taxation. Citizens of distant towns might be given the privileges of the guild. (See LAW MERCHANT.) This was, however, less generally the case on the Continent. In continental countries the guild merchant never attained the influence that it attained in England. In many cities it remained practically a private institution parallel with the craft guilds.

The Craft Guilds. With the growth of industry the members of different trades began to associate themselves for the defense of their own special interests. These associations were known as the craft guilds in England, as the *corporations de métiers* in France, and the *Zünfte*, or *Innungen*, in Germany. In England we may regard them as the outgrowth of the guild merchant. Supervision in the various trades, regulations as to membership, and like functions were consigned to these guilds. Members might still belong to the guild merchant. As one craft after another was organized, the guild merchant lost its functions as a regulator of trade and finally lost its individuality, becoming an integral part of the municipal constitution.

In their inception the craft guilds admitted to their ranks all who could exercise their trades with sufficient skill. They sought to insure good workmanship and therefore required that each

craftsman should have served an apprenticeship. Officials of the guild supervised the entire process of production, to see that no deception was practiced. Night work was for this reason forbidden. In so far, therefore, the interests of the consumer were protected. They sought to protect their own interests by preventing all competition, both from without and within. Nonmembers were not permitted to practice the trade within the towns; and the members were required to sell at the same rates and to pay equal prices for raw materials. During the flourishing period of their existence (from the twelfth to the fifteenth century) the craft guilds did much to advance the standard of workmanship and to procure a satisfactory existence for their members.

The membership of the guilds consisted in master workmen, journeymen, and apprentices. The master workman alone bought materials and sold the finished product: the journeymen lived in the master's household and received a fixed wage for their work. The apprentices also lived with the master, but as a rule they received for their labor nothing but their board and training. In the period of greatest prosperity each apprentice looked forward to becoming a journeyman, and each journeyman could become a master. In France and Germany, and less generally in England, it was the custom in some trades for each craftsman who had completed his apprenticeship to travel from place to place, learning new methods of work. It was also customary to require from the journeyman who wished to become a master the performance of a piece of work as evidence of his capacity—a chef d'œuvre or masterpiece. These customs obviously exerted a very beneficial influence upon mediæval industry.

Prominent examples of the trade guild in England were the weavers' and goldsmiths' guilds. The weavers' guild was the earliest and most important of the craft guilds. Weaving was the first important industry to break away from the house system, hence the early development of the guild. In 1130 we find mention of an influential weavers' guild in London, Lincoln, and Oxford. At the height of its powers the guild claimed full jurisdiction over its members in pleas of debt, contract, and petty agreements. It held a monopoly of the cloth industry and regulated the quality and prices of the goods produced. Later it split into several branches, of which one, the drapers, became an association of great importance, developing into the merchant class which later won for England her commercial supremacy. In the fifteenth century the influence of the weavers' guild was broken by the introduction of the domestic system of industry in the cloth trade, under which the craftsman, originally an independent worker owning his own tools and purchasing his own materials, became a mere wage earner. The guild continued to exist until the eighteenth century, but without vitality or influence.

The earliest mention of a goldsmiths' guild dates from 1180. At that time the guild was "adulterine," i.e., unauthorized by the crown. Later, however, the goldsmiths constituted one of the more powerful guilds of London and are regularly mentioned near the head of the list of the "twelve great companies." By a statute of 1300 the guild received the office of establishing a standard of fineness for gold and silver used in the arts. The standard was established in London, and officers of the guild were to visit other

cities, establishing in each place the London standard. Throughout the Middle Ages the goldsmiths' guild seems to have played an important part in determining the standards adopted in the coinage. At the beginning of modern times we find the goldsmiths a wealthy and powerful body, who undertook, in addition to the work of their craft, the functions of deposit and lending of money.

In England the craft guilds did not generally aim at political power. On the Continent, on the other hand, prolonged struggles were carried on between the guilds and the aristocracy. In some parts of Germany the contest for political power culminated in civil war. During a part of the thirteenth and fourteenth centuries the guilds succeeded in securing political supremacy in some of the cities of Germany.

Journeyman Guilds, Compagnonnage. The movement of population to the towns, which characterized the later Middle Ages, created in the guilds a tendency towards exclusiveness. The period of apprenticeship was lengthened for those who were not the children of guild members, and certain classes were excluded from membership altogether. The period of journeying from place to place was also lengthened, and the fees for admission to the guilds were increased. The "masterpiece" became a very onerous and costly piece of work, sometimes requiring several months of labor and heavy expenditures for materials. The chance of the journeyman's becoming a master workman was accordingly greatly reduced. A cleft appeared between the interests of the master and those of the journeymen. The latter associated themselves in the so-called journeyman or yeoman guilds of England and the *compagnonnage* of France. These organizations sought to secure better wages from the masters and to assist members in distress. The *compagnonnage* in particular developed into a powerful organization. Its members were bound by oaths to carry out the policies of the organization. The masters naturally opposed it in every way, as did also the clergy and the state. It continued, however, to thrive. In 1791 it was formally proscribed by the Revolutionary government, but it was beyond the reach of the police power. During the nineteenth century, however, its significance dwindled away. Only vestiges of it remain at present.

Decline of the Guilds. The guilds were strictly local institutions, working for a local market, and their monopoly was a local monopoly. The commercial progress which followed the era of discovery reacted upon the industrial organization. It offered a wider market than had heretofore been known and encouraged production upon a large scale, to which the guild system was inherently antagonistic. It was necessary that either the guilds should abandon their policy of exclusiveness and restriction, or that industry should be transferred to new centres, where guild regulations had no force. In England these things occurred. In some of the older towns great inroads were made in the industrial privileges of the organized masters. Where custom and tradition stubbornly resisted such innovations, towns gradually sank in importance. On the other hand, in the north of England, even before the utilization of coal in modern production, new towns and industrial centres arose where the guilds had no sway. On the Continent of Europe the system lost its

vigor in the latter half of the eighteenth and first half of the nineteenth century, owing to the general development of modern industry.

Guilds, Musical. With the decline of the troubadours and the passing of music from the aristocratic minnesingers to the civic meistersingers, a corresponding change took place in the attitude of the general public towards musicians. Instead of being fêted and praised they were now looked upon as mere hirelings, whose morals were doubtful, and who deserved little consideration and no civil privileges. In self-defense, therefore, the minstrels, jongleurs, and itinerant musicians banded themselves together into guilds. These organizations, which differed little from the commercial guilds, were recognized by the King or by the local authorities, and the members admitted to certain privileges within the territory governed by their guild. Authority was vested in a king or warden, and a board of control, who arbitrated any disputes between the members. The first musical guild of which we have record was the Nikolaibrüderschaft, which was organized in 1288. Soon after the musicians of Strassburg founded the Bruderschaft der Kronen, and about the same time the famous confréries of Saint Julien des Ménestriers came into prominence in Paris. This latter guild acquired wide influence, even requiring all music teachers and organists to belong to it, and was abolished only in 1773. In England the Musician's Company of the City of London was formed in 1472, and incorporated by James I in 1604 as the Worshipful Company of Musicians. This guild was given exclusive rights. "All musicians and dancing masters playing for hire in the city of London are obliged to take up their freedom thereof in the Company of Musicians only." As every musician had to pay £1 12s. to the company for the freedom of the city, and as binding an apprentice cost £1 10s. 2d., it will be seen how the Worshipful Company quickly acquired considerable power. Every member was further obliged to take an oath swearing loyalty to the King and city, and promising to be "obedient unto the Master and Wardens of the Art or Science of Musicians of London, for the time being, in all things concerning the same Art and Science." Instrument makers fared badly in the Middle Ages. For the most part they were compelled to join nearly allied guilds, but in France and Belgium a number of separate instrument makers' societies were formed. Consult: Gross, *Gild Merchant* (Oxford, 1890); Seligman, *Medieval Guilds* (Baltimore, 1887); Saint-Martin, *Histoire des corporations de métiers* (2d ed., Paris, 1909); *Le compagnonnage* (ib., 1901); S. Kramer, *English Craft Guilds and the Government* (New York, 1905); A. Franklin, *Dictionnaire historique des arts, métiers et professions de Paris depuis le treizième siècle* (Paris, 1905); E. Staley, *Guilds of Florence* (London, 1906); G. Unwin, *The Guilds and Companies of London* (New York, 1909); H. B. Brauns, *Kurhessische Gewerbepolitik im 17. und 18. Jahrhundert* (ib., 1911); Thornley and Hastings, *Guilds of the City of London and their Liverymen* (London, 1911). See HANDEATS LEAGUE.

GUILD, gild, CURTIS (1827-1911). An American journalist, born in Boston. He began a

mercantile career, but in 1847 took up reporting for the Boston *Daily Journal*. Two years later he joined the staff of the *Traveler*, of which he became part owner in 1856. In 1857 he founded and became editor of the Boston *Daily Commercial Bulletin*, and he remained its editor until 1898. Among his publications are the following: *Over the Ocean* (1867); *Abroad Again* (1877); *Britons and Muscovites* (1888); *A Chat about Celebrities* (1896); *From Sunrise to Sunset*, a volume of poems.

GUILD, CURTIS, JR. (1860-1915). An American journalist, politician, and soldier, son of the above. He was born in Boston, Mass., graduated at Harvard in 1881 with highest honors, and took a position on the Boston *Commercial Bulletin*, his father's paper. Of this paper he became editor and proprietor in 1902. He entered Republican State politics in 1895, but at the outbreak of the Spanish American War, as brigadier general of the State troops, he was called to the front and became inspector general of the Department of Havana. At the close of the war he declined the posts of First Assistant Postmaster General, and chairman of the National Civil Service Commission. He accompanied Theodore Roosevelt, the vice-presidential candidate, in his tour of the West during the 1900 campaign and was Lieutenant Governor of Massachusetts in 1902-05, and Governor in 1906-09. He was selected Special Ambassador to the Mexican Centennial by President Taft in 1910, and after his return was Ambassador to Russia until his resignation in 1913.

GUILD, REUBEN ALBRIDGE (1822-99). An American author and librarian. He was born in West Dearborn, Mass., and was educated at Brown University, where, after graduating in 1847, he was appointed librarian, a position which he held until 1893. His publications include: *The Librarian's Manual: A Treatise on Bibliography* (1858); *History of Brown University* (1867); *Biographical Introduction to the Writings of Roger Williams* (1866); *Chaplain Smith and the Baptists* (1885). He edited *Staples's Rhode Island in the Continental Congress, 1765-90* (1870); *Literary and Theological Addresses of Abba Woods* (1868); *Letter of John Cotton, and Roger Williams's Reply* (1866).

GUILDER. See FLORIN.

GUILDFORD, gîl'fêrd. The county town of Surrey, England, situated on the river Wey, 30 miles southwest of London (Map: England, F 5). Grain, celebrated as Surrey wheat, is its staple commodity; fairs are held for horses, cattle, pigs, and sheep; it has breweries, iron foundries, brick fields, paper and powder mills, and is an important railway centre. The town consists mainly of one long wide street with many well-built and many old and picturesque houses. The prominent buildings are the Norman keep of the ruined castle which stands in a public park; the Archbishop Abbot's hospital (1619), Trinity and St. Mary's churches, the guildhall, corn market, county hospital, institute, and royal free grammar school founded in 1509 by Edward VI. Pop. (1911), 22,820.

GUILDHALL, gîl'dhâll. The council hall of the city of London, which may be regarded as the town hall, and is the place of assembly of several courts, as the court of common council, the court of aldermen, the chamberlain's court, and a police court presided over by one of the aldermen. The construction of the building was begun in 1411. It was partially destroyed in

the great fire of 1666, but was soon restored, and in 1789 it was altered to its present form. The hall proper is 153 feet in length, 48 in breadth, and 55 in height. It has been famous for centuries for the magnificence of its civic feasts. The first time it was used for this purpose was in 1500, when Sir John Shaw, goldsmith, who had been knighted on the field of Bosworth, first gave here the Lord Mayor's feast.

GUILFORD, gîl'fêrd. A borough in a town of the same name, New Haven Co., Conn., on Long Island Sound, 17 miles east of New Haven, on the New York, New Haven, and Hartford Railroad (Map: Connecticut, E 4). It has a public library and an old stone house, built in 1639, which now serves as a State museum. The borough is engaged in agriculture, is the seat of a considerable canning industry, and has manufactures of iron, wheels, and school furniture. Pop., 1900, 1512, and of the town, 2785; 1910, 3001.

Settled as Menunkatuck, in 1639, by a company from England under the Rev. Henry Whitfield, Guilford received its present name and became part of the New Haven Colony in 1643. The borough was incorporated in 1815, and in 1826 the town was divided, Madison being set off as a separate township. There is a tradition, apparently well authenticated, that the regicides Goffe and Whalley came to Guilford in 1660 to surrender to William Lette, a native of Guilford, then Governor of the New Haven Colony, and that they were carefully secreted for several days and nights in the Governor's cellar. Guilford was the birthplace and the home for many years of the poet Fitz-Greene Halleck. Consult Smith, *History of Guilford* (Albany, 1877).

GUILFORD, EARL OF. See NORTH, FREDERICK, LORD.

GUILFORD COLLEGE. A village in Guilford Co., N. C., 7 miles west of Greensboro, on the Southern Railway (Map: North Carolina, C 1). It is the seat of Guilford College (Friends), established in 1837, and contains a Carnegie library. It is surrounded by a farming and dairying region. The electric-light plant is owned by the college. Pop., about 300.

GUILFORD COURT HOUSE. Formerly a small village in Guilford Co., N. C., 5 miles northwest of Greensboro. A battle lasting five hours was fought here, March 15, 1781, between 4404 Americans under Greene and 2213 English under Cornwallis, the former losing 400 and the latter 600 in dead, wounded, and prisoners. Though neither side gained a decisive advantage, the battle has been regarded as a great strategic victory for Greene, as it closed a campaign in which Cornwallis was outgeneraled and forced to abandon the Carolinas. The site of the battle has been converted into a park, highly improved, and a number of monuments have been placed here, notably one to General Greene, for which Congress appropriated \$25,000.

GUILLAUME, CHARLES EDOUARD (1860-). French physicist to whom was awarded the Nobel prize for physics in 1920. He made many important discoveries in connection with alloys. In 1896 he found an alloy of nickel-steel (invar) that was of a more stable nature than platinum. It was of great value during the war especially when platinum was scarce. He is a member of the Academy of Sciences at Stockholm, the French Institute, and the Legion of Honor.

GUILLAUME, gâ'yôm', (JEAN BAPTISTE CLAUDE) EUGÈNE (1822-1905). A French

sculptor. He was born at Montbard (Côte-d'Or) and studied at the Ecole des Beaux-Arts under Pradier, and won the Prix de Rome in 1845. At Rome he formed an austere style, in great contrast to that of his master, and modeled his "Mower," followed (1852) by the marble "Anacreon," and in 1853 by "The Gracchi," two half-length figures in bronze, which established his reputation (all of these are in the Luxembourg Museum, Paris). Other works in the same style are the "Roman Marriage" (1877), two statues of Napoleon as lieutenant of artillery and as Emperor, and the monument of the architect Duban. Guillaume modeled busts of Ingres (Musée Bonnat, Paris), Balbard, Buloz, Sequin, Jules Ferry, President Grévy, Monsignor Darboy (Luxembourg), and others, including six busts of Napoleon. His ideal figures are less fortunate; the best known being the group of "Music" on the façade of the new Opera House. In his personality and in his work Guillaume was scholarly, dignified, and severe. His art at its best unites austere realism with high finish. He received medals of honor at the expositions of 1867 and 1878, was a member of the Institute, and was professor at the Ecole des Beaux-Arts from 1865 to 1875 and also a director of that institution. He was also a prominent lecturer and writer on the fine arts and published *Notices et discours* (1895). Consult Gonse, *La sculpture française* (Paris, 1895).

GUILLAUME DE CHAMPEAUX, de shān'pō' (c.1070-1121). A French scholastic, born at Champeaux. He was a pupil of Anselme de Laon in Paris, afterward opened a school himself in connection with the cathedral of Notre Dame, and thus became the first really great teacher to give prominence to Paris as a centre of learning. Here one of his scholars was his great rival, Abélard. Jealous, it is said, of the younger man's brilliancy, Champeaux removed to a suburb of Paris, where he founded the abbey of St. Victor (1113). At this time he was made Bishop of Châlons-sur-Marne. In the controversy regarding investiture he took the part of Calixtus II and was his representative at the Conference of Mousson. He stood for realism as against the nominalism of Abélard, but in a less positive and more scientific form than that of his old master, Anselme. Only three of his treatises have been printed, and these among the works of St. Bernard. He has been called "the first dialectician" of the Realist sect. Consult: Haureau, *De la philosophie scholastique* (Paris, 1850); Michaud, *Guillaume de Champeaux et les écoles de Paris au XII^e siècle* (ib., 1867); G. Lefèvre, *Les variations de Guillaume de Champeaux et la question des universaux* (ib., 1899).

GUILLAUME DE LORRIS, lō'rēs' (c.1215-c.1240). A French mediæval poet, born at Lorris. Of the man himself nothing is known, except that he was the author of the *Roman de la Rose* (q.v.). Four thousand of the 22,000 lines in the poem are his, and the sudden break is presumed to have been caused by his early death. The *Roman* was completed by Jean de Meun about 1277, but in a very different style. Guillaume's part in it has been called "a complete mediæval art of love." For further information, consult E. Langlois, *Origines et sources du Roman de la Rose* (Paris, 1891).

GUILLAUME DE MACHAUT, or **MA-CHAUT**, mā'shō' (c.1290-1377). A French poet and musician, born near Machaut in Cham-

pagne. He was secretary to John of Luxembourg, King of Bohemia. In this capacity he accompanied the King in his various expeditions and remained with him until his death, at the battle of Crécy (1346). When John the Good ascended the throne of France, he gave Guillaume the office of Royal Notary (1350). Meanwhile he had held different ecclesiastical positions. His musical compositions consist of motets, ballads, and rondeaux for several voices, and a mass, which was sung at the coronation of Charles V (1364). The manuscript of this is in the National Library, Paris. He was a precursor of the famous Rhétoriqueurs. Of his numerous poems, one describes the instruments of music used in those days. Among the others are: *Le confort d'ami* (1356); *La prise d'Alexandrie*, the history of Pierre I of Lusignan, King of Cyprus; and *Le livre du voir-dit*, his best-known work. Consult Tarbé, *Les œuvres de Guillaume de Machaut* (Paris, 1849), and Paulin Paris, *Le livre du voir-dit de Guillaume de Machaut* (ib., 1875).

GUILLAUME DE PALERME, de pâ'lārm'. An old French romance, of which the translation has been printed by the Early English Text Society under the title of *William of Palerme*. It is founded on the werewolf superstition. Consult: Saintsbury, *A Short History of French Literature* (New York, 1882); Léon Gautier, *La chevalerie* (Paris, 1884); K. W. Tibbals, "Elements of Magic in the Romance of William of Palerme," in *Modern Philology*, vol. i (Chicago, 1903); N. Zingarelli, *Il Guillaume di Palerme* (Palermo, 1907); A. L. Spence, *Dictionary of Mediæval Romance* (London, 1913).

GUILLAUMET, gē'yō'mā', GUSTAVE ACHILLE (1840-87). A French landscape and genre painter, born in Paris. He studied at the Ecole des Beaux-Arts under Picot and Barrias, and won the Prix de Rome in 1863. Soon afterward he went to Biskra (Algeria) and began the series of Algerian scenes by which he became known. The first of these, "Evening Prayer in the Desert" (1863), is in the Luxembourg. The somewhat melancholy and mysterious character of the Orient as he paints it in its infinite repose is in striking contrast to the brilliant, sparkling treatment by Fromentin of the same subjects. His other works include: "Laghout," "The Seguia Ravine, near Biskra," both in the Luxembourg; "Arab Market in the Plain of Tokria"; "The Famine"; "The Dogs of Douar." He also contributed to the *Nouvelle Revue* articles afterward collected and published with the title *Tableaux algériens* (1880), an interesting literary comment on his own work.

GUILLAUME TELL (Fr., William Tell). An opera by Rossini (q.v.), first produced in Paris, Aug. 3, 1829; in the United States, Dec. 3, 1842 (New Orleans). See the article **TELL**, **WILLIAM**.

GUILLEMEAU, gél'mō', JACQUES (1550-1613). A French surgeon, born at Orléans. He studied medicine at the Hôtel Dieu in Paris, served for several years in the army, and in 1595 became provost of the College of Surgeons, Paris. He was the author of several treatises of considerable value and authority, such as: *Traité des maladies de l'œil* (1585); *De la grossesse et de l'accouchement des femmes* (1621); *Œuvres de chirurgie* (1602); *La chirurgie française* (1594).

GUILLEMIN, gél'mān', ALEXANDRE VICTOR (1826-93). A French scientific writer, born at

Pierre, Saône-et-Loire. He was educated in Paris and became a teacher of mathematics. He is best known as the author of many popular books on scientific subjects, such as: *Les mondes, causeries astronomiques* (1861); *Simple explication des chemins de fer* (1862); *Le ciel* (1864; 5th ed., 1877); *La lune* (1865); *Éléments de cosmographie* (1866; 3d ed., 1891); *Les phénomènes de la physique* (1867); *Les applications de la physique aux sciences* (1873); *La vapeur* (1873); *Les comètes* (1874); *La lumière et les couleurs* (1875); *Le son* (1876); *Les étoiles* (1877); *Les nébuleuses* (1880); *Le monde physique* (5 vols., 1880-85); *Petite encyclopédie populaire* (12 vols., 1880-91).

GUILLEMIN, JACQUES ANTOINE (1796-1842). A French botanist, born at Pouilly-sur-Saône, Côte-d'Or. He was educated at Dijon and Geneva and went afterward to Paris, where he was at first a private tutor, then assistant in the museum, then professor of botany at the horticultural institute (1830-34). Four years afterward he was sent to investigate the tea plantations of Brazil to determine if the plant could not be grown in France and returned with a large number of specimens, though the greater part of them were spoiled in transit. He contributed articles to the botanical archives and to various learned societies, made also an official report of his trip to Rio de Janeiro, and published besides: *Recherches sur le pollen* (1825); *Icones Lithographicae Plantarum Australis Rariorum Decades Duæ* (1832); *Considérations sur l'amertume des végétaux* (1832).

GUILLEMOT, gîl'è-mot (Fr. *guillemot*, from Bret. *gicelan*, Welsh *gicylan*, Corn. *gillan*, gull + OF. *motte*, Fr. *mouette*, dialectic Fr. *mauwe*, from OHG. *meh*, Icel. *mar*, Dutch *meuw*, Ger. *Möwe*, AS. *mæw*, Eng. *meow*). Any auk (q.v.) of the genera *Cephus* and *Uria*; specifically, the common or "foolish" guillemot, or murre (*Uria troile*). These auks are extremely abundant in the Arctic regions and the colder parts of the temperate zone, particularly in the neighborhood of rocky coasts, the winter migrations extending as far south as the Mediterranean. It is called foolish guillemot from its often suffering itself to be taken by the hand rather than leave the cliffs on which it breeds, where numbers may be seen stationed close together on the ledges of rock. It lays only one egg, which has an exceedingly thick shell, is pear-shaped, and remarkably large, being more than 3 inches long. This egg exhibits remarkable variety in coloring. No nest is made, but the brooding bird places its webbed toes beneath the egg when incubating and warms it beneath and between its thighs. The skin, with the feathers, is used for clothing in some northern regions. Young birds and eggs are among the objects in pursuit of which the rock fowls of the northern coasts scale or descend terrifying precipices. Great numbers of the eggs are exported from the coasts of Newfoundland and Labrador. In the north Pacific the common guillemot is replaced by a subspecies of *Uria troile californica*. The thick-billed guillemot, or "arrie" (*Uria lomvia*), has the same distribution in the New World as the common guillemot, and the Pacific coast form is called "arra." It is a somewhat larger bird than the other and has a bill much shorter and thicker. The black guillemot (*Cephus grylle*) is a smaller species, about 14 inches long; the plumage is entirely black in summer, except a large white patch on each wing, but in winter the

under parts are white. The young are mottled or spotted. It is plentiful throughout the Arctic regions and has been called "Greenland dove." It lays three eggs, often on the bare rock; but if the situation is damp it piles up for them a curious nest of pebbles. On the Pacific coast it is replaced by a similar species, the pigeon guillemot (*Cephus columba*).

GUILLIM, gwi'lm, JOHN (1565-1621). An English heraldic official, native of Herefordshire. He was educated at Oxford, but for the greater part of his life was red cross herald in ordinary at the London College of Arms. He was credited with the authorship of *The Display of Heraldrie* (1610; reprinted, 1724), but in reality simply edited Dean Barkham's collections.

GUILLLOTIN, gē'yō'tān', JOSEPH IGNACE (1738-1814). A French physician, born at Saintes. He was a brilliant student, and after obtaining his education in a Jesuit college he entered the order as a novice and for several years was a teacher in their college at Bordeaux. Afterward he removed to Paris, where he practiced medicine with such success as to win recognition as one of the foremost physicians of the day. He took a prominent part in the early revolutionary movement, and his suggestion that some kind of decapitating machine be used in inflicting the death penalty forever connected his name with the most terrible events of the French Revolution. He was secretary of the National Assembly in 1790, after which he retired and took no part in the Reign of Terror, during the latter part of which, indeed, he was himself a prisoner and in constant danger of being guillotined. After the rise of Napoleon he resumed his practice in Paris, where he was one of the earliest and most earnest champions of vaccination.

GUILLLOTINE, gîl'lo-tēn'. The instrument of decapitation introduced during the French Revolution by the Convention and named after its supposed inventor, Joseph Ignace Guillotin, a physician, who, however, was merely the person who first proposed the adoption of a decapitating machine. It is said he obtained the idea from the account of an execution at Milan in 1702, which is found in an anonymous work called *Voyage historique et politique de Suisse, d'Italie, et d'Allemagne*. The guillotine consists of two upright posts, grooved on the inside and connected at the top by a crossbeam. In these grooves a sharp iron blade, placed obliquely, descends by its own weight on the neck of the victim, who is bound to a board laid below. The invention of machines of this kind is ascribed to the Persians. In Italy, from the thirteenth century, it was the privilege of the nobles to be put to death by a machine of this kind, which was called *mannai*. An instrument resembling the guillotine was likewise employed in Germany during the Middle Ages. During the sixteenth and till late in the seventeenth century a machine called the maiden, which differed but slightly from the guillotine, was employed in Scotland for the purpose of decapitation. That such an apparatus was known and used in France at an earlier period is proved by the execution of the Duc de Montmorency, who is described as having been executed by a falling axe at Toulouse in 1632. The Dutch, too, in the eighteenth century, employed a decapitating machine in executing slaves in their colonies. Consult Le Nôtre, *La guillotine pendant la révolution* (Paris, 1893).

GUILLMANT, gél'mān', FÉLIX ALEXANDRE

(1837-1911). A French organ virtuoso and composer. He was born at Boulogne and received his earliest instruction from his father, who was a professional musician. He later studied the organ with Lemmens and harmony with Carulli. From early boyhood he was distinguished for his love of music, and the persistent sincerity of his studies, which enabled him when but 12 years old to act as his father's substitute at the organ of the church of St. Nicholas. Four years later (1853) he was appointed organist at the church of St. Joseph. Other appointments were: 1857, choir master of St. Nicholas; 1871, La Trinité; 1893, Chevalier of the Legion of Honor; and 1896, professor of the organ at the Paris Conservatory. He died at Meudon, near Paris. He was the foremost exponent of the distinctively French school of organ music; and on that account, as well as for his brilliancy as an organist and wonderful powers of improvisation, met with great success in his tours of England, Italy, Russia, and the United States. His playing was marked by the striking orchestral qualities of his combinations, a feature which is similarly conspicuous in his compositions. His published works include the lyric scene for soli, chorus, and orchestra, *Belsazar*; a symphony for organ and orchestra; seven organ sonatas; and many smaller pieces for organ. His vocal compositions include motets, three masses, and a *cappella* choruses.

GUILT, GUILTY (AS. *gylt*, *gilt*, from AS. Goth. *gildan*, OHG. *geltan*, Ger. *gelten*, Eng. *yield*). In law, guilt is the fact, whether an overt act or a state of mind combined with an overt act, which renders a person liable to punishment for a criminal offense. In most cases a criminal intent is requisite to constitute guilt on the part of the person committing an act which results in harm to the person or property of another, but in certain cases the commission of a forbidden act in itself constitutes legal guilt, and there are other acts, innocent in themselves, which become criminal only when performed with a guilty intent. (See **CRIME**; **INTENT**.) To make an intent criminal, or guilty, it is not necessary that the wrongdoer intended a violation of law nor that he should have a sense of guilt, but only that he intended to commit an act which the law condemns as criminal. In the common-law system a person accused of crime is presumed to be innocent until his guilt has been established by the verdict of a jury. What is meant by this is not that the jury is to hold the opinion, as a matter of fact, that a person presented by a grand jury for trial is probably innocent, but only that the burden rests upon the prosecution of establishing all the elements of conduct and intention which constitute the crime charged, and, further, of satisfying the jury beyond a reasonable doubt of the guilt of the accused. In England and America there are only two general verdicts which can be given in criminal cases, viz., "guilty" or "not guilty"; but in Scotland there is an intermediate verdict, called "not proven" which, though in legal effect a verdict of "not guilty" (and it is so entered in England), yet is allowed to be given by juries when the evidence fails to satisfy them either of the guilt or innocence of the accused. It has been objected to this verdict that it leaves a stigma on the presumably innocent party against whom it is found. The answer to this objection is that the verdict "not proven" is a safety valve which often operates to save from

condemnation a person whom a jury believes to be guilty, but where it deems the legal evidence insufficient to establish that conclusion beyond a reasonable doubt.

A person charged with crime is said to have a "guilty mind" when he has sufficient mental capacity to understand the nature and quality of the criminal act in question. Even though he has such capacity, if the act were done under extreme duress (q.v.), the actor would not display a guilty mind. For the effect of the plea of "guilty" or "not guilty," in criminal actions, see **GENERAL ISSUE**; **PLEA**.

GUIMARÃES, gẽ'mã-rĩnsh'. A town in the Portuguese District of Braga, Province of Minho, situated in a valley surrounded by hills, 35 miles northeast of Oporto (Map: Portugal, A 2). It is a picturesque place, with its old Moorish fort, and the ruins of the former castle, in which Alfonso Henriques, the first King of Portugal, was born. Among other interesting buildings are the Dominican convent, the collegiate church of Santa Maria de Oliviera, which contains the font at which Alfonso was baptized, the church of São Miguel, dating from the eleventh century, and the town hall, a combination of Moorish and Gothic style. It manufactures preserved fruits, linen, leather, cutlery, textiles, ironware, and paper. In the vicinity of the town are situated hot sulphurous springs, known to the Romans as *Aquæ Lævæ*. Pop., 1900, 8863.

GUIMBAL, gẽm-bĩl'. A seaport town of Panay, Philippines, in the Province of Iloilo, situated 17 miles east of Iloilo. It makes rough textiles, and exports dyewood. Pop., about 7500.

GUINEA, gĩn'ẽ. A geographical term formerly designating the West African coast region between the Senegal River on the north and the Orange River on the south, and now being gradually restricted to Portuguese Guinea (adjoining Senegambia) and Angola (qq.v.) (Map: Africa, C 3). The region extending from Sierra Leone to the Gabun River in French Equatorial Africa was generally termed Upper Guinea, and the region south Lower Guinea. The term "Northern Guinea" was sometimes applied to the coast of what is now Nigeria and Kamerun. The four Guinea islands were Fernando Po, Annobon, Principe, and St. Thomas. The earliest form of the word began to appear on maps in the middle of the fourteenth century. The Portuguese were the first to explore and trade along the Guinea coast, tempted by the gold deposits, and later also by the opportunities of slave trading. The coast, besides having an almost deadly climate, is generally hard of access from the sea, owing to a rough surf and lack of good havens.

GUINEA. A gold coin formerly current in Great Britain, but now no longer coined. It derived its name from the fact that the gold from which the first specimens were coined was brought from the Guinea coast in West Africa. For the same reason it originally bore the impression of an elephant. It was first coined during the reign of Charles II in 1664 and continued in common use till 1817, when it was superseded by the sovereign (q.v.) Its value varied considerably at different periods, but was ultimately fixed at 21 shillings. It is still customary in Great Britain to estimate professional fees, honoraria of all kinds, complimentary subscriptions, prices of pictures, etc., in guineas.

GUINEA, GULF OF. That portion of the At-

lantic Ocean which washes the west coast of Africa between Cape Palmas at the southeast point of Liberia and Cape Lopez in French Equatorial Africa about lat. 1° S. (Map: Africa, E 4). It forms two open bays, known as the Bight of Benin and that of Biafra.

GUINEA, PORTUGUESE. See PORTUGUESE GUINEA.

GUINEA CORN. A name sometimes given to durra, sometimes to another cereal grass, *Pennisetum typhoideum*, or *Pennisetum spicatum*, properly called pearl millet, which is very extensively cultivated in Central Africa and to some extent also in India, where it is called *bajree*. Pearl millet is of the tribe Paniceæ and is regarded as one of the millets. It is an annual which grows to a height of 8 to 10 feet, with spikes a foot long, which bear a large amount of grain. In India it is one of the most important cereals. As a fodder plant, pearl millet ranks high, though it is rather difficult to cure perfectly. It has been successfully grown in the United States as far north as Pennsylvania. A number of other species of *Pennisetum* are cultivated for their ornamental appearance. See *SORGHUM*, *Sorghum*, *Nonsaccharine*.

GUINEA FOWL. A group of birds, in some ways closely allied to the pheasants. The guinea fowls are usually regarded as a family, Numididae, and are separated into several genera, including a score of species, all natives of Africa and Madagascar. They are usually placed between the pheasants and the turkeys and jungle fowls, but in many characters they stand alone. Nearest the typical pheasants in structure (from which the family differs in having the skin of the head more or less bare and wattled, in the absence of spurs, and in the fact that the plumage of the sexes is alike) are the crested guinea fowls of the genus *Guttera*. They have a jet-black plumage, dotted with small bluish-white or light-green spots, the bare skin of the neck blue, purplish, or scarlet, and the head crowned by a long, full black crest. There is also a ruff about the neck. The genus (or at any rate its best-known species, *Guttera cristata*, of the West African coast) possesses a unique structure in the fact that the head of its wishbone (the furcula), unlike that in all other Gallinæ, is in the form of a hollow cup which opens upward, into which the trachea, or windpipe, dips and emerges again. Another group contains the "helmeted" guinea fowls, of which the "common" species (*Numida meleagris*) is the type, the top of whose head is covered with a horny cap, or "casque," rising into a hard crest; the bare skin on the sides of the face, neck, and chin, as well as the wattles, are red, and the remainder of the neck is bluish and bristly. The plumage is black, thickly sprinkled with round white spots, to which the bird is said to owe its specific name, given to it by the Romans in fanciful allusion to the tears shed by the sisters of Meleager when he died. Its native home is West-Central Africa. Representing the group in South Africa are *Numida coronata*, a favorite game bird in Cape Colony, and *Numida papillosa*, more prevalent northeastward. Madagascar has a red-crowned species (*Numida mitrata*), now acclimatized and wild in Rodriguez, and Abyssinia a well-known form (*Numida ptilorhyncha*), without any red on the head, as have all the others, and regarded by Darwin (*Animals and Plants under Domestication*, 1875) as the source of our domestic races. The

Acryllium vulturinum of Zanibar differs from all these and is the finest of the species. Its plumage is dark blue; it has hackles on the lower part of its neck and a long tail. Two other allied birds, essentially differing from the type by the possession of spurs on the feet, are the rare black guinea fowl (*Phasidus niger*) and the turkey guinea fowl (*Agelastes meleagrides*), both of the coast of equatorial West Africa and little known. All these agree in going about in large and noisy flocks, seeking their food on the ground, but roosting in trees. They are polygamous as a rule, make nests on the ground, and lay many eggs. They furnish good sport, and their flesh is excellent.

Domestic Races. Our domestic guinea fowls are no doubt derived in the main from the *Numida meleagris* above described and were among the fowls kept by both Greeks and Romans, who also may have domesticated the Abyssinian species. This fowl disappeared, however, with the decay of Roman civilization and was reintroduced into Europe, apparently by the Portuguese explorers of Africa, in the sixteenth century. To them we owe the substitution of the name "guinea fowl" for the ancient "meleagris," which became mixed up with the turkey, whose present names are thus doubly erroneous. It was early introduced into the Cape Verde Islands and also into several of the West Indies, where it soon ran wild. It slowly became common in Europe and thence has spread around the world, but has undergone little change beyond a tendency to albinism. These fowls are not popular, however, on account of their almost incessant and harsh cries, and because they are quarrelsome and difficult to rear; but the high price commanded in the market by both the birds and their eggs compensates those who keep guinea fowls for profit. The eggs are small and have a thick, strong shell, but are particularly esteemed. See PHEASANT, and Colored Plate with PEA COCK.

GUINEA GRASS (*Panicum maximum*, or *jumentorum*). A grass of the same genus as some of the millets, a native of the west of Africa, but now naturalized and extensively cultivated in the West Indies and in the southern United States and in the tropics generally. Its height in favorable moist situations is from 5 to 10 feet, or even more; in dry grounds it is smaller. It has a much-branched spreading panicle, long flat leaves, and a somewhat creeping rootstock. In countries favorable to its growth it is very valuable cattle food. In such regions, and upon good soil, the amount of forage this grass yields is very great; it may be cut every month. It has sometimes been confused with Johnson grass, from which it is distinct. Other species of the same genus are among the most useful pasture and forage grasses of tropical countries. See ANDROPOGON.

GUINEA PEPPER. A name variously applied to the seeds of dried fruit of several different plants, which agree in their peppery character and in the place of their production—West Africa. The name "Malaguetta" (Malaghetta, Meleguetta, etc.) pepper" is generally to be regarded as equivalent to "Guinea pepper," but properly is a designation of grains of paradise (*Amomum meleguetta*). The capsules or dry berries of *Capsicum frutescens* are commonly sold by druggists under the name "Guinea pepper." Both the names "Guinea pepper" and "Malaguetta pepper" have been applied to the

GUINEA PIGS

4

1. ENGLISH CAVY, solid color (red).
2. PERUVIAN CAVY, broken color (tortoise and white).
3. ENGLISH CAVY, broken color (tortoise and white).
4. ABYSSINIAN CAVY (tortoise shell).

dried fruit of *Piper clusii*, and to the seeds of *Xylopia æthiopica*, a shrub of the family Anonaceae. This last, sometimes called Ethiopian pepper, was at one time a considerable article of export from Guinea, but is now seldom heard of. It is an aromatic and not extremely pungent condiment. There is great difficulty in determining which of these kinds is meant in many instances in which the term "Guinea pepper" or "Malaguetta pepper" is employed by older writers; yet, from the importance of the trade in this article, the name "Grain Coast" was given to a great tract of land in the Bight of Benin, and to it the establishment of the settlements of Grand Bassa and Cape Palmas is due. Guinea pepper continued in request up to the close of the eighteenth century, and then the peppers of the East drove it from the market. See GRAINS OF PARADISE; CAPSICUM; CUBEB.

GUINEA PIG. A popular but incorrect name for a species of cavy (q.v.) abundant in domestication. Some authorities consider it a valid species, *Cavia cobaya*; but it is more probably only a domesticated form of the restless cavy (*Cavia aperca*, or *porcellus*) of Guiana and Brazil. The guinea pig is a small animal, about 6 inches long, usually black, white, and tawny. Recently it has been much used in bacteriological laboratories for the study of germ diseases, and it has long been a popular pet for children. It is exceedingly prolific. It may begin to breed at two months of age, and there may be 4 to 12 in a litter. The young, which are produced five or six times a year, are very precocious, shedding the milk teeth before they are born. These animals are not pigs, but much more nearly rabbit-like rats; nor are they found in Guinea, but are confined to South America. The "guinea" may be a corruption of "Guiana," while "pig" is as accurate as many other popular names. Consult Lantz, "Raising Guinea Pigs," in *Farmers' Bulletin* No. 525, *United States Department of Agriculture* (Washington, 1913), and W. E. Castle, *Reversion in Guinea Pigs and its Explanation* (ib., 1913).

GUINEA WORM. A parasitic roundworm (q.v.) (*Dracunculus*, or *Filaria medinensis*), especially characteristic of the central and eastern parts of Arabia, but abundant in India, Persia, Nubia, the swampy regions of the White Nile, and Guinea, and found widely distributed in the warmer parts of both hemispheres. Sailors have been known to bring them into New England ports. The adult worm is whitish in color and only 1 or 2 millimeters in thickness, although it is sometimes a meter in length. The eggs are laid in water, but the young only reach maturity in the human body, where they come to lie under the skin, in the connective tissue, especially of the extremities, often producing painful sores and causing the disease filariasis (or dracontiasis), which is accompanied by emaciation and debility. The female is viviparous, while the male is unknown. Carter regards a small worm (*Urolabes palustris*), frequenting brackish waters, as the immature form of the guinea worm. It is also believed that the embryos enter the bodies of water fleas (*Cyclops*, etc.) and there molt, and that consequently they may be introduced into the body by drinking standing water; but this has not been proved. Other species of *Filaria* occur in the tropics, one of which (*Filaria sanguinis-hominis*) is said to be the cause of the disease elephantiasis (q.v.). This is a worm of microscopic size,

found living in the blood of the mosquito in India and China. It is said that the eggs are swallowed in the water drunk by man, are hatched in his intestines and obstruct the smaller blood vessels, thus causing the disease named, and perhaps even leprosy. Other species of *Filaria* live in the peritoneum of the horse and of apes, and an immature form (*Filaria lentis*) has been detected in the lens of the human eye. See FILARIA.

Bibliography. T. S. Cobbold, *Entozoa* (London, 1864); R. Leuckart, *Die menschlichen Parasiten* (2 vols., Leipzig, 1863-76); Bastian, "On the Structure and Nature of the Dracunculus," in *Transactions of the Linnean Society*, vol. xxxiv (London, 1863); also bibliography in Meuse, *Handbuch der Tropenkrankheiten* (2d ed., Leipzig, 1914).

GUINEGATE, gē'n-gāt', or **ENGUINE-GATTE**, ān'gē'n-gāt'. A small village in the French Department of Pas-de-Calais, noted as the scene of two defeats of the French, by Maximilian of Austria, Aug. 17, 1479, and by Henry VIII and Maximilian, Aug. 16, 1513, the latter engagement being known as the "Battle of the Spurs." Pop., 1901, 481; 1911, 456.

GÜINES, gwē'nās. A town of Cuba in the Province of Havana, about 30 miles southeast of Havana, with which it is connected by steam and electric railways (Map: Cuba, C 4). It has some trade in sugar and coffee. In the eighteenth century Güines was the name of a large hacienda, occupying the entire plain, in the middle of which the town was founded by the families of the laborers. It became a chartered town in 1814, but was destroyed by fire in 1817 and did not acquire any importance until 1838, when it became a railroad terminus. It is now well built and has several notable buildings. Pop., 1907, 8053.

GUINEVERE, gwīn'è-vēr (Welsh *Gwenhwyfar*; OEng. *Gaynora*). A famous figure in the later Arthurian romances. In the earlier versions of the legend her personality is scarcely developed. In the *Vita Gildæ* there is indeed a queen whom King Melvas carries off from Arthur to Glastonbury, to be recovered only after a year's search and a siege. In Geoffrey of Monmouth she appears as Guanhumara, "of a noble Roman family, and surpassing in beauty all the women of the island," and she takes the veil after Arthur's defeat by Mordred. As Wenhaver in Layamon's story, she gains little distinctness. It is not till the romance is completed, whether by Walter Map or by Chrétien de Troyes, with the magnificent invention of Lancelot, and of her sinful but romantic love for him, that she reaches her full proportions and becomes "the first perfectly human woman in English literature." The story was treated by other mediæval writers; an incident given by them but omitted by Malory (that describing her first avowal of her love for Lancelot) plays a crucial part in Dante's famous episode of Francesca da Rimini. The character was powerfully treated by Tennyson in the *Idylls of the King*, and a phase of it by William Morris, who, in his *Defense of Guenevere*, remains truer to the original conception of it. Consult: Rhys, *Studies in the Arthurian Legend* (Oxford, 1891); Weston, *Legend of Sir Lancelot du Lac* (London, 1901); Bräuner, *Der altfranzösische Prosaroman von Lancelot del Lac* (Marburg, 1911), See ARTHUR; LANCELOT.

GUINEY, gī'ni, LOUISE IMOGEN (1861-1920). An American poet and essayist, born in Boston. The daughter of Gen. Patrick R. Guiney, she was educated in Providence. Her more noteworthy volumes of poetry are: *Songs at the Start* (1884); *The White Sail and Other Poems* (1887); *The Martyr's Idyl, and Shorter Poems* (1899). She wrote also much in prose and, notably: *Monsieur Henri, a Footnote to French History* (1892); *A Little English Gallery* (1894); *Patrina: A Collection of Essays* (1897); *Hurrell Froude* (1904). She edited editions of J. C. Mangan and of Matthew Arnold, and shared with Mrs. Spofford and Alice Brown the authorship of *Three Heroines of English Romance* (1894).

GUINGAMP, gān'gān'. The capital of an arrondissement in the Department of Côtes-du-Nord, France, on the Trieux, 20 miles northwest of Saint-Brieuc (Map: France, N., B 4), and formerly the capital of the Duchy of Penthièvre. Among its relics are the ruined walls and the ducal castle. The town is noted for its pilgrimage church of Notre Dame de Bon Secours, at which a great "annual pardon" is given. A restored fifteenth-century fountain, a religious college, a mathematical school, and a museum are also noteworthy. Guingamp—whence gingham—has the original manufactories of that linen fabric, hat factories, tanneries, and a considerable cattle and agricultural trade. Pop., 1901, 9252; 1911, 9385.

GUINICELLI, gwe'né-chēllé, GUIDO (c.1240-c.76). An Italian poet, born in Bologna. He seems to have practiced law in his native city. A Ghibelline, he was banished with the rest of the Lambertazzi party in 1274 and died in exile. Dante considers him the father of Italian poets. He was the head of that school of idealistic love poetry to which belong Lapo Gianni, Cino da Pistoja, Guido Cavalcanti, Dino Frescobaldi, and Dante. To the conventionalized troubadour poetry he brought sincerity of feeling, mysticism, and a philosophical spirit. Of his verse only seven canzoni and five sonnets remain. The best known of them is the canzone of *The Gentle Heart* (as translated by D. G. Rossetti). These are printed in Nannucci, *Manuale della letteratura del primo secolo della lingua italiana* (Florence, 1843). Consult: Grion, *Guido Guinicelli e Dino Campagni* (Bologna, 1870); Cassini, *Le rime dei poeti Bolognesi del secolo XIII* (ib., 1881); D. G. Rossetti, *Dante and his Circle* (London, 1874); Maria Cenni, *I due Guidi; studio critico-letterario* (Aquila, 1893); A. Bongiovanni, *Guido Guinicelli e la sua riforma poetica* (Venice, 1896); Maria Ferrai, *La poesia amorosa* (Siena, 1900).

GUINNES, A. G. DE. See GILL, A.

GUINOBATAN, gē'nō-bū'tān. An inland town of Luzon, Philippines, on the Inaya River, in the Province of Albay. It lies about 9 miles northwest of Albay (Map: Philippine Islands, D 4). Pop., 1903, 20,027.

GUIPURE. See LACE.

GUIRAUD, gē'rō', ERNEST (1837-92). A French dramatic composer, born in New Orleans, La., of French parentage. His first studies were under his father (a music teacher, and the winner of the Prix de Rome in 1827), and later (1840) he studied in Paris under private teachers. In 1852, when but 15 years of age, he returned to New Orleans and superintended the production of his first opera, *Le roi David*, after which he went back to Paris and made it his

permanent home. He studied at the Conservatory, and won the Grand Prix de Rome with his *Bajaset et le joueur de flûte* in 1859. He served throughout the Franco-Prussian War of 1870-71 and in 1876 became a member of the faculty of the Paris Conservatory. He was the composer of many successful operas, among them *Sylvie* (1864), *Le Kobold* (1870), *La galante aventure* (1882); orchestral suites, and minor compositions, as well as of a solemn high mass. He died in Paris. *Brunhilde*, an unfinished opera, was completed by Saint-Saëns and produced in Paris as *Frédégonde* (1895).

GUIBOR, gē'rē-ōr', MANUEL, MARQUÉS DE (1708-88). A Spanish mariner and provincial governor, born in Ajoiz de Ugarte, Navarra. Entering the navy in 1733, he passed through all the grades and reached the rank of chief of squadron in 1769. In 1771 he was made Viceroy of New Granada and President of the Audiencia of Santa Fé. Here he devised better means of securing supplies and provided for the progress of commerce and agriculture. He was made lieutenant general in 1774 and the next year was appointed Viceroy of Peru, taking possession of the office Dec. 6, 1776. During his administration in Peru he favored the mining industry, protected the Indians, and suppressed a number of revolts. In 1780 he was removed from office on account of charges made by the Visitador Areche, although these were never proved, and in the same year he returned to Spain, where he spent his last years. His "Memoria" as Viceroy of New Granada is published in J. A. García y García's *Relaciones de los Virreyes del Nuevo Reino de Granada* (New York, 1869), and as Viceroy of Peru in S. Lorente, *Relaciones de los Virreyes y Audiencias . . . Perú* (Lima, 1867-72).

GUISBOROUGH, gīz'brū. A market town in the North Riding of Yorkshire, England, on the North Eastern Railway, 7½ miles east-southeast of Middlesbrough (Map: England, F 2). Neighboring mines supply the Cleveland iron ore used in steel founding, which constitutes its chief industry. Its historical interest centres in the ruins of the Augustinian priory, built in 1119 by Robert de Brus, grandfather of King Robert Bruce, and up to the time of its dismantlement by Henry VIII one of the wealthiest of English monastic institutions. Pop., 1901, 5650; 1911, 7061. Consult *Cartularium Prioratus de Gysborne, Fundati A.D. 1119* (Durham, 1889).

GUISCARD, gēs'kār', ROBERT (c.1015-85). DUKE OF APULIA AND CALABRIA. He was the son of Tancred of Hauteville and was born near Coutances in Normandy. His elder brothers, William of the Iron Arm, Drogo, and Humphrey, had gone to Italy to seek their fortunes about 1030 and had been very successful. Robert followed them about 1046, but was badly received by them. At first he served under the Prince of Capua and then acted as the leader of a band of adventurers, endeavoring to secure possessions for himself in Calabria. In 1053 he took a prominent part in the battle near Civitate, in which the papal forces, led by Leo IX, were defeated by the Normans. In 1057, after the death of Humphrey, Robert became Count of Apulia. About this time he was joined by his brother Roger, who aided him greatly in his conquests. In 1059 Robert concluded a treaty with Pope Nicholas II, who made him Duke of Apulia and Calabria, and "future lord" of Sicily if he could conquer the island. Robert, "Duke by the

grace of God and of St. Peter," became the Pope's vassal. This gave the papacy a feudal supremacy over southern Italy which lasted for centuries. In 1060 Roger engaged in the subjugation of Sicily. He was joined in the following year by Robert, and Messina was captured. The conquest proceeded slowly. Palermo was taken in 1072, and the subjugation of the island was not completed till about 1090, long after the death of Robert. On the southern mainland, however, the supremacy of the Normans was firmly established by the capture of Tarentum and Reggio in 1068 and Bari in 1071. In 1074 Robert incurred excommunication by attacking Benevento, which was a papal possession; but in 1080 there was a reconciliation between Gregory VII and the Norman Duke, who renewed the oath which he had made in 1059. After establishing a magnificent principality on the ruins of the Byzantine power in southern Italy, Robert proceeded to invade the territory of the Byzantine Empire in the Balkan Peninsula, acting as the champion of the heir of Michael VII, who had been deposed by Alexius Comnenus. In 1081 he gained a great victory over Alexius at Durazzo and captured the city. The war in Macedonia and Thessaly was carried on mainly by his son, Bohemund (q.v.). From his victorious campaigns Robert was recalled in 1085 to the aid of Gregory VII, who was besieged in the castle of Sant' Angelo by Henry IV (q.v.). Robert captured and sacked Rome, many of the inhabitants being killed or sold into slavery. He then prepared to renew the war against Alexius, but died at Cephalonia (July, 1085). He is described by Anna Comnena (q.v.) as of lofty stature, large frame, and commanding appearance. He was extremely brave, ambitious, and shrewd, but pitiless. The surname Guiscard (sly) is said to have been given him because of his ability and craft. Consult Chalandon, *Histoire de la domination normande en Italie et en Sicile* (2 vols., Paris, 1907), and Heinemann, *Geschichte der Normannen in Unteritalien und Sizilien* (Leipzig, 1894).

GUISCARD, ROGER. See ROGER I.

GUISCARD, gē'shār', KARL T. See GUICHARD.

GUISE, gū'ez' (ML. Gúisia). A town in the Department of Aisne, France, on the left bank of the Oise, 31 miles north of Laon (Map: France, N., J 3). It is strongly fortified, has the ruins of a sixteenth-century castle, from which the famous dukes of Guise (q.v.) derived their title, and a statue of Camille Desmoulins, who was born here in 1762. Its industrial feature is the coöperative stove factory founded by J. B. A. Godin, a disciple of Fourier, which employs about 1500 hands, and its *familiétère*, or workman's colony, with a phalanstery, or common dwelling house, accommodating 400 families. The foundation also includes a board of trade arbitration. Other manufactures are yarn, textiles, and beer. Pop., 1901, 7310; 1911, 8099. Guise was a noted strategical place as early as the eleventh century. It gave its name to a county, which later was erected into a duchy. The town was burned by the English under John of Hainault in 1330, but their assaults on the castle were foiled by his daughter, wife of the lord of the fortress. Guise was taken by the Germans in their advance toward Paris just after the outbreak of the European War in 1914. See WAR IN EUROPE.

GUISE. The name of the most famous branch

of the ducal family of Lorraine, the members of which played a prominent part in the history of France and Europe during several centuries. The family derived its name from the town of Guise (q.v.) and claimed an ancestry reaching back to Merovingian times. In 1333 Marie of Blois married Rodolf, Duke of Lorraine, and brought with her as part of her dower the County of Guise. The following are the most celebrated members of the Guise family: CLAUDE DE LORRAINE (1496-1550), first Duke of Guise, Count of Anmale, Marquis of Mayenne and Elbeuf, and Baron of Joinville, was the fifth son of René II, Duke of Lorraine. He was endowed by his father with the French fiefs of the family, while Lorraine went to his elder brother. Claude accompanied Francis I in all his Italian campaigns, receiving a severe wound in the battle of Melegnano (1515). Eight years later he drove the Imperialists from Champagne. In 1527 he became Duke of Guise, a peer of France, and Governor of Champagne as a reward for his suppression of the peasant revolt. In 1542 he fought in Flanders under the Duke of Orléans. He married Antoinette de Bourbon, and his daughter Mary was the wife of James V of Scotland, and mother of Mary, Queen of Scots. —FRANÇOIS DE LORRAINE, second Duke of Guise, son of the preceding, and known as *la Balafre* (the Scarred), was born Feb. 17, 1519. He won world-wide renown as a brave and skillful soldier, distinguishing himself at Montmédy (1542), Landrecies (1543), Saint-Dizier (1544), and at Boulogne (1545), and by his successful defense of Metz for two months in 1552 against Charles V. In 1557 he had command of the expedition against the Spaniards in Italy, which failed through lack of proper support. The Duke was recalled and in 1558 took Calais, the last stronghold of the English in France. His niece, Mary Stuart, being the wife of Francis II, he enjoyed for a time the highest power at court. After the death of the King the jealousy of the queen mother, Catharine de' Medici (q.v.), forced him into temporary retirement, but with the Constable Montmorency and Marshal Saint-André he formed the coalition known as the Triumvirate. It is probable that he instigated the massacre of Huguenots at Vassy, March 1, 1562, which marked the beginning of the civil wars. He took Rouen and won a victory at Dreux (Dec. 19, 1562), but was assassinated (February, 1563) by a Protestant fanatic, Poltrot de Méré. Guise cannot be cleared from the charge of cruelty and ferocity, though he was doubtless much influenced by his brother Charles, the Cardinal of Lorraine. He had a taste for literature, and his memoirs have considerable historic interest. —CHARLES DE LORRAINE, brother of the preceding, was born Feb. 17, 1525. He entered the Church, became Archbishop of Rheims in 1538, and was created Cardinal in 1547. He was known as the Cardinal of Guise until the death of his paternal uncle, when he took the title of Cardinal of Lorraine, by which he is known in history. He was deeply involved in the political intrigues of the time and inspired much that was worst in the policy of his house, of which he became practically the head after the assassination of his brother. His vacillation and cowardice rendered him inefficient as a leader, and his influence declined from the moment when he became responsible for the execution of his own designs. He introduced the Inquisition into France in 1558, and the responsibility for the

cruel excesses following the tumult of Amboise (1560) rests upon him. He was licentious in his private life. His brother LOUIS (1527-78) received the title of Cardinal of Guise after Charles became Cardinal of Lorraine, but was a figure of little importance historically.—HENRI I DE LORRAINE, third Duke of Guise, son of François de Lorraine, was born Dec. 31, 1550. At the age of 15 he distinguished himself fighting against the Turks in Hungary. He fought against the Huguenots at Saint-Denis (1567), Jarnac (1569), and Moncontour (1569), and forced Coligny to raise the siege of Poitiers. He aspired to the hand of Margaret of Valois, but, to appease the anger of the young King, Charles IX, he married Catharine of Cleves (1570). He left the court because of the favor shown to the Huguenots, but soon returned and took an active part in the Massacre of St. Bartholomew, leading in person the assault upon the house of Coligny, whose body was thrown at his feet in the courtyard. In the fight against the Huguenots at Dormans (Oct. 10, 1575) he received a wound which left a scar from which he was given his father's sobriquet, *le Balafre*. For his part in this battle he became an object of unreasoning idolatry on the part of the Parisians, and he used this shrewdly to advance the power of his house. It soon became common talk that the Valois were illegitimate and the Lorraines the true heirs of Charlemagne. Guise was a prime mover in the formation of the Holy League (1576), the primary object of which was to shut the Bourbons, whose head was Henry of Navarre, out of the succession and to bring in the Guises. The League became dormant, but was revived in 1584, and entered into alliance with Philip II of Spain by the Treaty of Joinville, to uphold the Catholic cause. Henry III wavered between the equally dangerous parties of Bourbon and Guise, but finally decided first to put down the Huguenots, and came to an agreement with Guise at Nemours. In the following War of the Three Henrys Guise defeated the German allies of the Huguenots at Vimory and Auneau (1587), while the royal forces were defeated by those of Henry of Navarre. On account of the increasing popularity of Guise the King ordered him to keep away from Paris; but he defied this command, and there followed the Day of the Barricades in Paris (May 12, 1588), when the King of France and Guise, who was called the King of the Parisians, were arrayed against each other. Finally the King retired to Blois and summoned the Estates, appearing to yield to his defiant vassal, who was induced to go to Blois and to respond to a summons of the King to a private audience in the royal cabinet. There he was assassinated by members of the royal guard, the famous Forty-Five, Dec. 23, 1588. His brother, another Cardinal of Lorraine (1555-88), was arrested and put to death on the following day.—CHARLES DE LORRAINE, Duke of Mayenne, born March 26, 1554, was brother of Henri I de Lorraine, under whom he fought in the Huguenot wars, distinguishing himself at Moncontour and Brouage. After the assassination of his brother he went to Paris and took command of the forces of the League, which he organized more thoroughly than they had ever been before. He proclaimed the Cardinal of Bourbon King and made himself lieutenant general of the kingdom. He was defeated by Henry IV at Arques (1589) and Ivry (1590), but car-

ried on the struggle until 1596, when he made his submission to the King and was one of his most loyal subjects until his death, in 1611.

CHARLES DE LORRAINE (1571-1640), son of Henry I and fourth Duke of Guise, was succeeded by his second son, HENRI II DE LORRAINE, fifth Duke of Guise, who was born April 4, 1614. Henri had been trained for the Church and was Archbishop of Rheims when the death of his elder brother (1639) caused him to abandon ecclesiastical life. He was brilliant, but fickle in his attachments and noted for many amours. He joined the league of the Count of Soissons against Richelieu (1641) and took refuge in Brussels, returning only after the death of Richelieu and Louis XIII. He went to Naples during the revolt of Masaniello, hoping to conquer a kingdom, but was made a prisoner by the Spaniards (1648). He was set at liberty in 1652 and joined the opponents of Mazarin, but soon betrayed them, and after numerous vicissitudes returned to Paris, was made Grand Chamberlain, and directed the fêtes of Louis XIV. He died in 1664. His *Mémoires* (2 vols., 1669) were really written by his secretary, Saint-Yon, and by Count Raymond of Modena. Henri II was succeeded by his nephew, LOUIS JOSEPH, Duke of Guise, Joyeuse, and Angoulême. When the son of the latter, FRANÇOIS JOSEPH, died in 1675, the direct line of the dukes of Guise of the house of Lorraine became extinct. The family possessions passed to the house of Condé, the next of kin.

GUISLAIN, A. M., BARON LIMNANDER DE NIEUWENHOVE. See LIMNANDER DE NIEUWENHOVE.

GUITAR, gi-târ' (OF. *guitarre*, *guiterno*, Fr. *guitare*, from Lat. *cithara*, Gk. *κithára*, *kithara*, lyre). A musical stringed instrument, somewhat like the lute, particularly well adapted for accompanying the human voice and much esteemed in Spain and Italy. It has six strings, tuned as follows: E, A, d, g, b, c'. Its compass is over three octaves, from E to a². The music of the guitar is always written in the G clef, and thus the actual sound is an octave lower than written. The sound is produced by the fingers of the right hand plucking the strings, which are stopped by the fingers of the left hand pressing them against the frets. The three highest strings of the guitar are usually of gut, and the three lowest are of silk spun over with silvered wire.

GUITAR FISH (so called from the shape of the fish). A long-nosed, sharklike ray of the family Rhinobatidæ. It differs from the Rajidæ mainly by the peculiarity that the eggs are hatched within the body. Like the sharks, the entire body is uniformly covered with shagreen.

There are numerous species in tropical waters, most of them olive gray in color. They feed on small bottom-living animals. The name is copied from the Spanish *guitarro*, applied especially to species of the Gulf of California. The best known is the California *Rhinobatus productus*. A familiar form from Jamaica to Brazil is the pureque, or fiddler fish (*Rhinobatus percellens*). See Plate of RAYS and SKATES.

GUITEAU, gè-tò', CHARLES J. See GARFIELD, JAMES A.

GUITGUIT, gwit'gwit'. See GUIDGUIT.

GUITY, g'itri, LUCIEN (1860-1925). A French actor, born in Paris. He spent nine years in St. Petersburg (Petrograd) at the Michel Theatre. Upon returning to Paris he became, in turn, manager of the Porte Saint-Martin, stage director of the Comédie Française, and director of the Renaissance. At Coquelin's death he was given the part of Chantecler in the play of that name by Rostand. He was not successful in the interpretation of that character, which was little suited to an actor regarded as among the leaders, if not the leader, in the drama of modern reality. Among his best interpretations were *Samson*, *Le voleur*, *L'Emigré*, *Servir*. He also played the title part in *Kismet* in a French adaptation.

GUITY, SACHA (1860-). A French dramatist, son of Lucien Guity, born in St. Petersburg (Petrograd). He was educated at various lycées, among them the famous Janson de Sailly. He wrote a number of plays which were acted at the Odéon, Capucines, Réjane, and Antoine theatres. They are all light in character: *Le page* (1901); *Le mari qui faillit tout gâter* and *Nono* (1905); *Ches les zoaques* (1906); *La clef* (1907); *Le muffle* (1908); *La prise de Berg op zoom* (1912).

GUITONE D'AREZZO, gwè-tò'nà dà-rèt'sò (c.1230-c.1294). An Italian poet, born near Arezzo. It is a legend that in his youth he devised independently the sonnet form. His early verse is in the troubadour style, but later, in accordance with the change which came over him when he entered a religious order, he wrote on theological and political subjects, exhorting his fellow citizens to well-doing. Although the form is rough, the nobility of the sentiments he expressed exerted an influence on his contemporaries. His prose has the same faults as his verse, and in addition that of affectation. It was he who in 1293 founded the monastery Degli Angeli in Florence. His letters, in a curious baroque style, were published in 1745. The best edition of his works is that by Valeriani, *Rime di Fra Guittone d'Arezzo* (Florence, 1823, 1867). Consult Romanelli, *Di Guittone e delle sue opere* (Campobasso, 1875).

GUIUAN, gè'win. A town of Samar, Philippine Islands, situated at the southern extremity of the island, about 78 miles southeast of Catbalogan (Map: Philippine Islands, E 5). Its harbor will admit vessels of 28 feet draft. Pop., about 12,000.

GUIZOT, gwè-zò', by foreigners commonly pronounced gè-zò', ELIZABETH CHARLOTTE PAULINE (DE MEULAN) (1773-1827). A French author, the first wife of Guizot the historian. She was born in Paris. Her father having died when she was 18 years of age, she sought subsistence for herself and the straitened family by literary labor. She published *Les contradictions*, a novel, in 1800; afterward joined the staff of Suard's journal, *Le Publiciste*, and as literary and ar-

tistic editor became known for her critical articles, a selection of which were published in 1802 as *Essais de littérature et de morale*. Ill health would have interrupted the series in 1807, had they not been continued by an anonymous writer, who later revealed himself as Guizot. The friendship thus begun resulted in their marriage in 1812, and during their married life she was of great assistance to her husband in his historical studies and literary work. Her subsequent writings, devoted to the moral improvement and education of the young, are: *Les enfants* (1812); *Le journal d'une mère* (1813); *L'Ecolier, ou Raoul et Victor* (1821); *Nouveaux contes à l'usage de la jeunesse* (1823); *Éducation domestique, ou Lettres de famille sur l'éducation* (1826). Her husband published several posthumous volumes of her essays and other writings. Consult Sainte-Beuve, *Portraits de femmes* (Paris, 1844).

GUIZOT, FRANÇOIS PIERRE GUILLAUME (1787-1874). A distinguished French historian and statesman, born at Nîmes, Oct. 4, 1787, of Protestant parents. His father was an advocate of liberal views, was guillotined during the Reign of Terror (April 8, 1794), and his mother soon afterward went with her two sons to Geneva, where young Guizot received his education. In 1805 he went to Paris to study law, but instead devoted himself to literature. His first work, the *Nouveau dictionnaire universel des synonymes de la langue française*, appeared in 1809 and was quickly followed by an essay on the fine arts and a translation of Gibbon. In 1812 he married Mademoiselle de Meulan, who was the editor of *Le Publiciste*, and 14 years his senior. In the same year he became a professor of history at the Sorbonne. After the Restoration he became General Secretary in the Ministry of the Interior and subsequently Secretary in the Ministry of Justice. Guizot contributed to the dissolution of the Chambre Intransigable (q.v.) by a memorial which was placed in the hands of Louis XVIII by Decazes. The latter committed to him the general direction of the administration of the communes and departments (1819). Guizot then attached himself to the Constitutional party, whose leaders were subsequently known as doctrinaires (q.v.), expounding its principles in his essay, *Des moyens de gouvernement et d'opposition dans l'état actuel de la France* (1821). In 1821-22 he published his *Histoire des origines du gouvernement représentatif*, containing his lectures at the Sorbonne. Owing to his attacks on the Villèle ministry, Guizot lost his official position and for a number of years devoted himself to literary work. His *Histoire de la révolution d'Angleterre* appeared in 1827, and he edited the *Encyclopédie Progressive* and the *Revue Française*, which he established in 1828. His first wife having died (1827), he married her niece. In 1829 the Martignac ministry granted him permission to resume his lectures on history. They were attended by large and enthusiastic audiences and gave rise to several historical works of great value, published under the collective titles of *Cours d'histoire moderne* (1828-30), which included the *Histoire de la civilisation en France* and the *Histoire générale de la civilisation en Europe*. In January, 1830, he was elected to the Chamber of Deputies from Lisieux and sided with the opposition, vigorously attacking the Polignac ministry. After acting as Minister of Education in the provisional government which succeeded the

overthrow of the Bourbons, he was made Minister of the Interior (Aug. 11, 1830), but resigned in November. He was Minister of Public Instruction in the cabinet formed by Soult in 1832 and held that position, with a brief interval, until 1837. In this capacity he did much for the improvement of educational institutions, particularly for the primary schools. During the Oriental crisis of 1840 arising from the ambitions of Mehemet Ali (q.v.) of Egypt, Guizot was sent as Ambassador to London, where he met with a cordial reception and returned to France in October of the same year, on the resignation of the Thiers ministry, to become Minister of Foreign Affairs and the chief of Louis Philippe's supporters, as the virtual head of the Soult ministry. After Soult's retirement, in September, 1847, he became the official head of the cabinet, which, however, although Guizot by his conduct, both in home and foreign affairs, had done all that was possible to make constitutional government a success in France, could not much longer retain its hold upon the people. He was bitterly opposed to universal suffrage, believing that extreme democracy would lead to tyranny. In many ways he was an ideal representative of the Liberal middle class which governed France in the reign of Louis Philippe. When the latter was overthrown in 1848, Guizot escaped from Paris to London. In April, 1849, he published a circular in which he offered his services to the electors of France. He returned to France in November, 1849, but was defeated as a candidate for the Chamber. The coup d'état of Dec. 2, 1851, put an end to his political career. The rest of his life was passed in retirement and was devoted to historical and literary work. He lived to see many changes in France and died, at the age of 87, at his villa in Val-Richer, Sept. 13, 1874. By founding the *Comités historiques*, by bringing about the publication of important historical documents, and by his own writings and lectures, Guizot did much for historical study in France. A work on Washington, published under the title *Vie, correspondance et écrits de Washington* (Paris, 1839-40), procured him the honor of having his portrait placed in the Chamber of Representatives at Washington. Of Guizot's numerous works the most important, in addition to those already mentioned, are: *De la démocratie en France* (1849); *Études biographiques sur la révolution d'Angleterre* (1851); *Études sur les beaux-arts* (1851); *Cornéille et son temps* (1852); *Shakespeare et son temps* (1852); *Histoire de la république d'Angleterre et d'Oliver Cromwell* (1854); *L'Amour dans le mariage* (1855); *Histoire parlementaire de France* (1863); *Méditations sur la religion chrétienne dans ses rapports avec l'état actuel des sociétés* (1865-68); *Mélanges biographiques et littéraires* (1868); *Mélanges politiques et historiques* (1869). For the life of Guizot, the most valuable materials are his own *Mémoires pour servir à l'histoire de mon temps* (Paris, 1858-65; Eng. trans., London, 1858-62); *Madame de Witt* (Guizot's daughter), *Monsieur Guizot dans sa famille et avec ses amis* (Paris, 1880; Eng. trans., London, 1880); *Simon, Thiers, Guizot, Rémusat* (Paris, 1885); *Bardoux, "Guizot," in Les grands écrivains français* (ib., 1894); *Crozals, "Guizot," in Classiques populaires* (ib., 1891); *Wilson, "M. Guizot and his Memoirs," in Studies in Modern Mind and Character* (London, 1881); *Mazade, Portraits d'histoire morale et politique du temps* (Paris, 1875);

Maurice Guizot, *Les années de retraite de M. Guizot* (ib., 1901); H. P. Thieme, *Guide bibliographique de la littérature de 1850 à 1906* (ib., 1906).

GUJARAT, gō'jā-rāt'. A geographical division of India, extending along the northern seaboard of the Province of Bombay. It comprises the Kathiawar Peninsula, and, on the mainland, Baroda (the dominion of the Gaikwar), and includes the native states of Cambay, Cutch, Kathiawar, Mahi Kanthar Polanpur, Rewa, and Surat. It is bounded on the north by Rajputana and on the south by Concan. The Vindhya and Satpura mountains extend into the region from the east. Area, 345,307 square miles; pop., 1911, 4,882,801. The surface generally is level and monotonous. The chief rivers are the Nerbudda and Tapti. The products are cotton, rice, wheat, barley, maize, tobacco, sugar, opium, and fruits. The name "Gujarat" is frequently applied to the country north of the Nerbudda River and east of the Rann of Cutch.

GUJARĀTĪ (gō'jā-rāt'tē) **LANGUAGE AND LITERATURE.** The language of Gujarat in western India, spoken, according to the census of 1901, by 9,928,501 persons and, by the census of 1911, 10,682,000. It is derived, through the mediæval vernaculars called Prakrit, especially the Saurasēna Apabhramśa, from ancient dialects closely akin to Sanskrit. It contains many words borrowed from Sanskrit, Arabic, and Persian. Its alphabet is a modification of the ancient Devanagari script of the Sanskrit, with the bar above the letters omitted.

Gujarāti literature is abundant and of fair character. It begins with Narsingh Mēta (1413-79), who composed short poems on religious subjects. Other poets of note were Vallabh, Kālidās, Brahmanand, Dayāram, Sāmal Bhatt, and Rēwa Shāṅkar, the translator of the *Mahābhārata*.

Consult: Taylor, *Student's Gujarati Grammar* (2d ed., Bombay, 1908); Bengali and Merchant, *New Pocket Gujarati into English Dictionary* (ib., 1899); Blumhardt, *Catalogue of Marathi and Gujarati Printed Books in the Library of the British Museum* (London, 1892); Tripāthi, *Classical Poets of Gujarat* (Bombay, 1894). For a good account of the Gujarāti language as well as a complete bibliography, consult Grierson, *Linguistic Survey of India*, vol. ix, part ii (Calcutta, 1908), which contains also specimens of both the Rājasthāni and Gujarāti languages.

GULANGANE, gō'lan-gi'nā. See DULANGAN.

GULBAR/GA, KULBAR/GA, or CALBUB/GA. A town of Hyderabad, India, 110 miles west of Hyderabad by rail (Map: India, C 6). It stands on a minor affluent of the Kistna and has been successively the capital of Hindu and Mohammedan sovereignties. The town's ancient prosperity is reviving, modern buildings, public offices, barracks, a fine bazar, a model jail, and ornamental gardens relieving the archaic aspect of numerous mosques and tombs. The chief feature of interest is the fort containing the citadel and the Jama Masjid, a unique mosque built in the thirteenth century after the design of the great Cordova mosque in Spain. It is the only mosque in India completely roofed over, and it covers an area of 38,016 square feet. Pop., 1901, 29,228; 1911, 34,437.

GULBRANSON, ELLEN (née MORGREEN) (1863-). A Swedish dramatic soprano, born at Stockholm. In 1880 she entered the conservatory of her native city and after gradu-

ation went in 1883 to Marchesi in Paris for further study. She made her début on the concert stage in 1886, on the operatic stage three years later. Her international reputation dates from her great success as Brunhilda at Bayreuth in 1896. Until 1900 she was the principal dramatic soprano of the Royal Opera of Stockholm. Thereafter she was connected with the Berlin Opera. In 1890 she married the Norwegian officer Hans Gulbranson.

GULDBERG, guld'bërg, OVE HÖEGH (1731-1808), more correctly HÖEGH-GULDBERG. A Danish statesman, theologian, and author, born at Horsens. He became preceptor of Crown Prince Frederick, the son of Christian VII, and managed the coup d'état that overthrew Queen Caroline and Struensee. By this means he became secretary of the cabinet (1773) and Secretary of State (1776). Under his leadership the country gained in importance and power. When the King reached his majority (1784), Guldberg was sent to Aarhus as Governor (1784-1802). He wrote a valuable *Universal History* and some theological works.

GULDEN, gûl'den. See FLORIN.

GULES, gûlz (from OF., Fr. *gueules*, red, from OF. *gole*, *goule*, Fr. *gueule*, throat, from Lat. *gula*, throat). The name for the color red in heraldry (q.v.). It is indicated in engravings by perpendicular lines.

GULF OF CARPENTARIA. See CARPENTARIA, GULF OF.

GULFPORT. A city, port of entry, and the county seat of Harrison Co., Miss., 68 miles east of New Orleans, on the Mississippi Sound, and on the Louisville and Nashville and the Gulf and Ship Island railroads (Map: Mississippi, G 10). It has a fine harbor accessible to large vessels, carries on an extensive trade in lumber, naval stores, and cotton, and has railroad repair shops, fertilizer works, cottonseed-oil mills, canning factories, roller, saw, and planing mills, and important truck-farming and fruit-growing interests. Among the features of the city are the United States customhouse, Gulf Coast Military Academy, and post-office building. Gulfport adopted the commission form of government in 1912. The water works are owned by the city. Pop., 1900, 1060; 1910, 6386.

GULF STREAM. The most important and best-known current in the Atlantic Ocean, deriving its name from the Gulf of Mexico, out of which it flows between the coast of Florida on the west and the Bahamas on the east. Its breadth in the narrowest portion is about 50 miles, and its depth about 2000 feet; the velocity averages between 2 and 3 miles per hour, reaching an extreme of 5 or 6 miles in some localities. This great mass of warm water, having a temperature several degrees higher than the neighboring ocean, flows northeastwardly along the American coast, but can no longer be distinguished from the rest of the ocean drift by either temperature, saltness, color, or motion, after it has passed lat. 40° N. and the meridian 60° W. As it passes the thirty-second parallel between the Bermudas and the coast of Carolina it is divided into several small streams of about 100 fathoms deep and aggregating 150 miles wide. North of this region the increasing westerly winds so break up the surface and mix the waters that it is improper to speak of the Gulf Stream as having any further existence, since it becomes the general drift of warm water from

the southwestern Atlantic northeastward to Europe, which is a general phenomenon that has little or nothing to do with the special Gulf Stream, properly so called.

By means of floating derelicts, bottles, and buoys, the general drift of the ocean surface currents has been studied with great care. The majority of the derelicts in the Atlantic Ocean circulate around the Sea of Sargasso, but occasionally one penetrates directly through it. Very rarely does a derelict make its way from America to the European coast. Where the western edge of the so-called Gulf Stream passes by and intermingles with the cold northerly drift, close to the coasts of Newfoundland and New England, banks of fog are formed; but these are not the fogs that trouble navigation. The latter are due to the flow of warm southwest winds over the cold ocean water and therefore depend for their existence on the wind rather than on the Gulf Stream. It is a common error to attribute the warmth of Europe, as compared with the cold in America in the same latitude, to the influence of the Gulf Stream; meteorology shows that the southwest winds of Europe, bringing moisture from the ocean, are not appreciably affected by the Gulf Stream. On the other hand, this deep layer of moist southwest wind contains far more latent heat than the same quantity of dry air at the same temperature; and it is the evolution of latent heat by this moist air in the formation of fog, cloud, and rain that raises the temperature of the atmosphere over Europe and prevents loss of heat by radiation. Precisely the same phenomenon is found on the leeward side of each of the Great Lakes, and of the Mediterranean Sea, the Baltic, and probably every other large sheet of water.

The mechanical cause of the Gulf Stream has been clearly expounded by William Ferrel. It is not caused wholly by the winds. The steady northwest trade winds are not strong enough to raise any considerable mass of water in front of them. Hurricane winds may raise the level several feet temporarily, but the trade winds scarcely an inch. The accurate levelings of the Coast and Geodetic Survey have shown that there is no appreciable difference of level between the water in the Gulf of Mexico and that of the Atlantic on the opposite coast of Florida. The Gulf Stream is a result of the general vertical circulation of the ocean, bringing from the north cold water which sinks below, while the warm water of the equatorial region rises and slides northward above the cold current; owing to the rotation of the earth, each of these currents deviates towards the right, so that the cold current presses towards the southwest and the surface current towards the northeast. These pressures are very slight, but by acting for long ages they have given the upper layers of the ocean a slight general rotation. By thus being pushed against the shores or through narrow channels, the mass of water far below the influence of surface winds is forced to seek its channel of easiest flow, and the cold water flowing through certain passages between the West Indian Islands into the Caribbean Sea flows thence into the Gulf of Mexico, and finally it rounds Cape Sable as warm water from the gulf. The Gulf Stream really has its origin in deep currents far east of the Windward and Leeward Islands and is pressed northward beyond Cape Sable by the force of the water pushing behind it from the Atlantic Ocean into and through the Caribbean

Sea. In other parts of the globe there are great ocean currents that depend wholly upon the winds, but this does not seem to be the case with the Gulf Stream.

Bibliography. Ferrel, *Winds of the Globe* (New York, 1895); Agassiz, *Three Cruises of the Blake* (Boston, 1888); Pillsbury, in *Annual Report*, published by the United States Coast Survey (Washington, 1890); Thomson and Blake, *Reports of the Scientific Results of H. M. S. Challenger* (London, 1880-95); C. L. Riker, *The Power and Control of the Gulf Stream* (New York, 1912).

GULFWEEED. The gulfwweeds are well known on account of their connection with the so-called Sargasso Sea. In that great ocean eddy these gulfwweeds accumulate in vast quantities, and the impression has been that they have been torn from the coast and swept out to sea. This is probably not true, but they are free floating forms that grow and pass through their whole life history in the floating condition. They are remarkable among algae for the differentiation of the body into regions which may well be called leaves and branching stems, and they also produce short branches that develop the bladder-like floats which resemble small berries. See PHAEOPHYCEAE.

GULICK, JOHN THOMAS (1832-1923). An American Congregational missionary and evolutionist, born at Kauai, Hawaiian Islands. He was a miner in California in 1849-50, graduated from Williams College in 1859, and studied at Union Theological Seminary. He served as a missionary at Peking, China, in 1864-65, at Kalgan, China, in 1865-75, and in Japan from 1875 to 1899 under the American Board of Commissioners for Foreign Missions. From 1899 to 1905 he resided at Oberlin, Ohio, and later at Honolulu, Hawaiian Islands. He is author of articles on Darwinian topics in the *Journal of the Linnean Society* and the *American Journal of Science* and also of *Evolution Racial and Habitual* (1905).

GULICK, LUTHER HALSEY (1865-1918). An American specialist in physical education, born at Honolulu, Hawaiian Islands. After studying at Oberlin Academy and at the Sargent Normal School of Physical Training, he graduated from the Medical Department of New York University in 1889. He was superintendent of the physical training department of the Y. M. C. A. Training School at Springfield, Mass. (1887-1900), principal of the Pratt Institute High School (1900-03), in 1903-08 had charge of the physical training in the public schools of New York City, and from 1908 to 1913 directed the department of child hygiene of the Russell Sage Foundation. He served as president of the American Physical Education Association in 1903-06, of the Public School Physical Training Society in 1905-08, of the Playground Association of America in 1906-09, and of the Camp Fire Girls after 1913. Besides editing *Physical Education* (1891-96), *Association Outlook* (1897-1900), *American Physical Education Review* (1901-03), and the *Gulick Hygiene Series*, he wrote: *Manual of Physical Measurements* (1892); *Physical Education by Muscular Exercise* (1904); *The Efficient Life* (1907); *Mind and Work* (1908); *The Healthful Art of Dancing* (1910); and was coauthor of *Medical Inspection of Schools* (1908, 1913).

GULISTAN, gōō'lē-stān' (Pers., rose garden). The most famous work of the Persian poet Sadi (q.v.). There are English translations by East-

wick (Hertford, 1852), Gladwin (Boston, 1865), and Sir Edwin Arnold (London, 1899).

GULL (from Corn. *gullan*, Welsh *gwyllan*, Bret. *gucelan*, gull). A web-footed bird of the subfamily Larinae, of the family Laridae. The gulls are inhabitants of the seacoasts of all parts of the world and also of the shores of large rivers and lakes far inland. The bill is strongly hooked at the tip, thus differing from that of the terns, and lacks a cere, in this respect differing from that of the jaegers. The tail is usually square across the tip, and the wings are long and pointed. The plumage is generally in great part white, variously mixed with gray, slate color, brown, and black. The white in some species assumes a rosy tint in the breeding season, and the head of some becomes black. The differences of plumage, according to age, season, and sex, are very considerable and have led to many errors as to species. Gulls have great power of wing and delight in performing varied and beautiful evolutions. They descend with great rapidity to seize prey from the surface of the water or at a small depth; but they are not good divers, and the fishes caught are chiefly those which, like the herring, swim near the surface. They are very voracious. Their food consists of almost anything animal, and they frequently rob other birds' nests of eggs or young. In winter they throng harbors and feed largely on scraps thrown from ships or drifted upon the shores. The larger gulls seize clams and other mollusks, carrying the large ones into the air and dropping them upon a rock in order to break them. The flesh of gulls is rather coarse, but that of the young is in request on many northern coasts as an article of food and is salted for winter use. The eggs are palatable and are collected in great quantities in some places. All gulls are wholly or partially migratory; they breed in colder regions than those which they inhabit in winter. In general, they lay only two or three eggs, which are large for the size of the bird, bluish white to brownish olive in color, more or less heavily spotted, blotched, and marked with brown, black, and purplish. The nest is composed of moss and seaweeds, or marsh weeds, and is usually on the ground in swamps or on rocky cliffs. Occasionally, however, the nest is built in trees and is then based on a foundation of sticks.

About 50 species of gulls are known, of which about 26 are found in North America. The commonest and most widely distributed are the ring-billed gull (*Larus delawarensis*) and the herring gull (*Larus argentatus*). The latter is 2 feet long and nearly 5 feet across the wings, while the former is considerably smaller. Both species are abundant on the Atlantic coast, in the Mississippi valley, and about the Great Lakes. They breed from the United States northward. The kittiwake (*Rissa tridactyla*), rather smaller than the first named, gray and white, and destitute of a hind toe, is plentiful in Arctic America and Europe, where the coast is girt with rocky precipices, on the narrow ledges of which it makes its nest. Its young and eggs are among the chief objects of pursuit of the rock fowlers. The great black-backed gull, or wagel (*Larus marinus*), nearly 30 inches long, is found on the Atlantic coasts of both Europe and America; and the glaucous gull, or burgomaster (*Larus hyperboreus*), scarcely inferior to it in size, of a pale bluish-gray color above and white below, is a winter visitant from the Arctic regions.

On the Pacific coast of North America the common gulls are the glaucous-winged gull (*Larus glaucescens*), the California gull (*Larus californicus*), and the western gull (*Larus occidentalis*), all large birds, $4\frac{1}{2}$ feet across the wings. Smaller than these is the white-headed gull (*Larus hcermanni*), which is lead-colored, with a white head and red bill; it is common on the coast of California. Other notable gulls are the common mew (*Larus canus*) of Europe; the red-legged kittiwake (*Rissa brevirostris*) of Bering Sea; the Arctic ivory gull (*Pagophila alba*), the entire plumage of which is pure white; the black-headed gulls of Europe and America (*Larus ridibundus* and *atricilla*); Franklin's and Bonaparte's rosy gulls (*Larus franklini* and *philadelphia*), the white underparts being suffused with rose during the breeding season; Ross's rosy gull (*Rhodostethia rosea*), which has a wedge-shaped tail and is white, rosy tinted, with a black collar, and occurs only in the most northern regions; and the forked-tail gulls (*Xema sabini* and *furcatus*), the former Arctic and common, small, the latter tropical, very rare, and large. Terns, boobies, and various other marine birds are often very improperly called gulls. See PLATE OF AUK, ALBATROSS, ETC.; KITTIWAKE; MACKEREL GULL.

GULL, LAUGHING. See LAUGHING GULL.

GULL, SIR WILLIAM WITHEY (1816-90). An English physician. He was born in Thorpe-le-Soken, graduated at London University in 1841, and from 1843 to 1865 was a teacher first of natural philosophy, then of physiology and comparative anatomy, and finally of medicine at Guy's Hospital, to which he was also for 20 years physician. From 1847 to 1849 he was a professor at the Royal Institution, and in 1848 became a fellow of the Royal College of Physicians. He was president of the Clinical Society, member of many other associations, and the author of numerous valuable papers on medical subjects.

GULLET. See OESOPHAGUS.

GULLIVER, JOHN PUTNAM (1819-94). An American Congregational clergyman. He was born in Boston, Mass., graduated at Yale in 1840, and at Andover Theological Seminary in 1845, and held pastorates at Norwich, Conn. (1846-65) (where he was active in developing the Norwich Free Academy), Chicago, Ill. (1865-68), and Binghamton, N. Y. (1872-78). From 1868 to 1872 he was president of Knox College (Galesburg, Ill.), and in 1878 was appointed professor of the relations of Christianity and science in the Andover Theological Seminary.

GULLIVER'S TRAVELS, OR TRAVELS INTO SEVERAL REMOTE NATIONS OF THE WORLD. A famous satirical romance by Jonathan Swift, narrating the travels and adventures of Lemuel Gulliver, surgeon, and then captain of several ships. It was first published anonymously in 1726. The plan and form of the romance were influenced by the works of Lucian, Cyrano de Bergerac, and Defoe. It is in four parts, of which the first describes the hero's voyage to Lilliput, the land of pygmies; the second, his adventures in Brobdingnag, among the giants; the third, his journey to Laputa, a country of quacks and pretended scientists; and the fourth his visit to the Houyhnhnms, horses endowed with superior intelligence. The characters and events are in great part satires on prominent personages and political and scientific conditions of the day.

GULLSTRAND, gul'strånd, ALLVAR (1862-). A Swedish optician and physicist, born in Landskrona, the son of a doctor, and educated at Upsala, Vienna, and Stockholm. In the University of Upsala he was professor of ophthalmology in 1894-1913 and then professor of physiological and physical optics. He received honorary degrees from Upsala (1907), Jena (1908), and Dublin (1912), and in 1911 received the Nobel prize for medicine and became a member of the Nobel committee on physics. Among his scientific writings are: *Allgemeine Theorie der monochromatischen Aberrationen* (1900), *Die reele optische Abbildung* (1906), and *Einführung in die Methoden der Dioptrik des Auges des Menschen* (1911). He contributed to H. von Helmholtz's *Handbuch der physiologischen Optik* (1910).

GULTRY, WILLIAM COCET, first Viscount SELBY (1835-1909). An English parliamentarian, born in London. He graduated from Trinity College, Cambridge, B.A. in 1856, with a first class in the moral sciences tripos, and M.A. in 1859. He was admitted barrister in 1860, Q.C. in 1877, and Benchet of the Inner Temple in 1879. In 1880 and 1885 he unsuccessfully contested Whitehaven and from 1886 to 1905 sat in Parliament for Carlisle. He became Speaker of the House of Commons in 1895, retired in 1905, was created Viscount Selby, and entered the House of Lords. He died at his country seat in Seaford.

GULPER. A fish. See LYOMERI.

GULS HORNEBOOKE, gūlz hōrn'būk, THE. A tract by Thomas Dekker (1609), giving a vivid account of the manners of Jacobean London. It is largely drawn from Dedekind's *Grobinus*. Consult R. B. McKerrow, *The Gull's Hornbook* (London, 1904).

GÜMBEL, gum'bel, KARL WILHELM VON (1823-98). A German geologist, born at Dannenfels, Rhine Palatinate. He studied at the universities of Munich and Heidelberg, in 1848 undertook a practical investigation of the mining industry in the government service at St. Ingbert collieries in the Palatinate, and in 1851 was appointed director of the Bavarian geognostic survey. In 1861 he became an honorary professor in the University of Munich, in 1868 an instructor at the Technical High School there, in 1869 was appointed to the Bavarian mining board, and in 1879 director in chief of mines. A fibrous mineral, consisting of a hydrous silicate of alumina, was discovered by him in the clay slate of Northalben (Upper Franconia, Bavaria) and is known to geology as gümbelite; while a petrified corallin is styled *Gümbelina*. In 1882 nobility was conferred upon him. His publications include four volumes of the *Geognostische Beschreibung des Königreichs Bayern* (1861-91), an *Anleitung zu wissenschaftlichen Beobachtungen auf Alpenreisen* (1879-82), and a *Geognostische Karte des Königreichs Bayern* (1891).

GUMBINNEN, gum'bin-en. Capital of the district of the same name in the Province of East Prussia, situated on the Pissa, 68 miles east-southeast of Königsberg (Map: Germany, K 1). It produces woolens, linen and cotton goods, leather, machinery, castings, forgings, furniture, bricks, lumber, dairy stuffs, yeast, and spirits. It has a large grain trade and is an important market for cattle. Gumbinnen is of comparatively recent origin, having received in 1722 its municipal rights from Friedrich Wil-

helm I, of whom a statue has been raised. Pop., 1900, 14,003; 1910, 14,540, largely descendants of exiled Protestants from Salzburg.

GUM'BO. See HIBISCUS.

GUM'BOIL'. An abscess (q.v.) near the root of a tooth and discharging itself towards the mucous membrane of the gum. Gumboils should be treated by a free incision.

GUMBO SOIL. The term "gumbo" (probably of negro origin) is popularly applied in the western United States to a class of very heavy, fine-grained soils (the grains are less than $\frac{1}{100}$ inch in diameter), rich in soluble salts (alkali), and practically devoid of sand. Water percolates through them with difficulty, and as they are soapy and waxy when wet, the names "waxy" and "black waxy" are sometimes applied to them. These soils improve with cultivation, but are difficult to till. See also SOIL.

GUM DRAGON. See DRAGON'S BLOOD.

GUM FLUX. See GUMMOSIS.

GUMILLA, gū-mē'lyā, JOSÉ (1690-1758). A Spanish missionary, born at Barcelona. He was a Jesuit and in 1714 was sent to South America, where he was made superior of the missions on the Orinoco (1728). Soon afterward he returned to Spain and was appointed head of the College of Cartagena (1734) and of the University of Madrid (1738). He was a careful student of South American fauna and flora and wrote *El Orinoco ilustrado y defendido* (1745), a very valuable work.

GUM'MA. See SYPHILIS.

GUMMERE, gūm'ēr-ē, FRANCIS BARTON (1855-). An American scholar, born at Burlington, N. J. He graduated at Haverford College (Pa.) in 1872, at Harvard in 1875, studied in Germany at the universities of Leipzig, Berlin, Strassburg, and Freiburg, and was appointed professor of English in Haverford College in 1887. He was elected president of the Modern Language Association of America in 1905, and in 1913 was chosen a member of the National Institute of Arts and Letters. In addition to contributions to the *Nation*, the *American Journal of Philology*, and other periodicals, he published a valuable and widely used *Handbook of Poetics* (1885); *Germanic Origins* (1892); *Old English Ballads* (1894); *The Beginnings of Poetry* (1901); *The Popular Ballad* (1907); *The Oldest English Epic* (1900); *Democracy and Poetry* (1911).

GUMMERSBACH, gūm'ērs-bāc. Capital of the district of the same name in the Prussian Province of Westphalia, 30 miles northeast of Cologne (Map: Germany, B 3). Its principal industry is the manufacture of cardigan jackets, woolen goods, carpets, smokers' supplies, electrical goods, paper, machinery, and boilers. Near by lie important quarries. Pop., 1900, 12,525; 1910, 16,044.

GUM'NING. See GUMMOSIS.

GUM'NITE. A uranium mineral of doubtful composition, formed by the alteration of uraninite (q.v.). It is quite strongly radioactive.

GUMMO'SIS (from Lat. *gummi*, Gk. κόμμι, *kómmi*, gum), GUMMING, or GUM FLUX. Any plant disease in which gum flows from the diseased area or its vicinity. There are many different diseases of this character, which have been noticed upon many species of plants, as shown below. The gum, according to Sorauer, is a combination of metagummic acid and lime, and its formation results from irregularities in nutrition processes due to the presence of

fungi, bacteria, and unfavorable soil conditions. When it first appears, it is soft, translucent, and gelatinous, but becomes hard, horny, and brittle upon standing and very dark brown or nearly black. Fungi and bacteria seem associated with the gummosis of many trees, but they are perhaps secondary to some cause like insufficient nutrition, wounds, etc. Poor soil and superabundant moisture and certain chemical compounds are believed to cause a flow of gum in some plants. On the other hand, there seems abundant evidence that diseases caused by bacteria produce gummosis of grape, olive, sugar beet, sugar cane, etc., and the gummy deposits noticed in the fire blight of pears and bacterial wilt of cucurbits. A common form of gummosis of cherry and other stone fruits is caused by the fungus *Ascospora beyerinckii*. This fungus can live in and kill the leaves and young fruits of these trees. In the Japanese quince (*Pyrus japonica*) the tears of gum accompany the attacks of *Cladosporium epiphyllum*. If broken off, a canker-like wound is revealed, which may extend often to the pith of the stem. In California a gummosis of citrus trees is said to be due to at least five different causes, two of which are fungi, *Pythiacytis citriophora* and *Botrytis vulgaris*. In Florida gumming of citrus trees has been found due to attacks of *Phomopsis citri* and *Diplodia natalensis*. The latter fungus attacks a large number of species of trees, causing gummosis. In the case of many of these diseases pruning below the gum deposits may be of some service in checking the disease. When wet, the gum dissolves and flows to the ground, carrying spores with it. To destroy these a dressing of lime at the base of the tree is recommended. In those forms of gummosis due to errors in cultivation, restoring the necessary functions of the plants should correct the disease. For wounds of insects, etc., coat the wounded surface with tar or some similar material.

GUMFLOWICZ, gūm-plō'vich, LUDWIG (1838-1909). An Austrian political scientist and sociologist. He was born at Cracow and studied in that city and in Vienna. In 1882 he was made professor in the University of Graz. His principal works are: *Philosophisches Staatsrecht* (1877); *Verwaltungslehre* (1882); *Der Rassenkampf* (1883; revised and enlarged ed., 1909); *Grundriss der Sociologie* (1885; revised and enlarged ed., 1909); *Das österreichische Staatsrecht* (1891); *Sociologie und Politik* (1892); *Die sociologische Staatsidee* (1892); *Geschichte der Staatstheorien* (1905); *Das allgemeine Staatsrecht* (3d ed., 1907). His works are characterized by profundity of research. *Der Rassenkampf* is generally recognized as one of the most important of recent attempts to give unity to the science of sociology. See SOCIOLOGY.

GUMRI, gūm'rē. See ALEXANDROPOL.

GUMS. A class of amorphous organic substances mostly of vegetable origin and composed of carbon, hydrogen, and oxygen. Many of them are completely soluble in water, forming with it a transparent mucilage; but they are all insoluble in alcohol. Chemically the gums are complex acids yielding simpler acids and sugars by hydrolysis. The finer varieties are used pharmaceutically for making emulsions and emollients. Other gums are used in the manufacture of confectionery, in calico printing, in making ink, finishing cloth, etc. With reference to their chief constituents the gums may be sub-

divided into the following three groups: (1) gum arabic and similar gums; (2) gum tragacanth and similar gums; (3) other gums, such as cherry gum, peach gum, etc.

(1) *Gum arabic*, or *gum acacia*, is gathered chiefly from the *Acacia Senegal*, growing in East Africa, and near the Senegal River in West Africa. It is brought into the market in the form of roundish tears, varying in color from a light straw to a garnet red, and is more or less transparent; the lightest is always the best. *Picked Turkey gum* is the most esteemed variety. Gum arabic consists chiefly of arabin (arabic acid), combined with calcium, magnesium, and potassium. *Barbary*, or *Morocco gum*, a dark-colored variety, has some qualities which render it valuable to confectioners. *Gum Gedda* is an inferior quality, now but seldom met with in commerce. *Gum Senegal* comes in fine, large, round tears, generally larger and of a darker color than the finest gum arabic. It is found in tropical parts of the western coast of Africa. *Gum gattie*, an Indian gum, is used as a substitute for gum arabic. Other varieties are: *Cape gum*, the Australian *wattle gum*, etc. *Wood-apple gum* is often used as an adulterant of gum arabic. The East Indian gums are dark colored and much inferior to those produced in Africa.

(2) *Gum tragacanth*, or *gum dragon* (Fr. *gomme adragante*; Ger. *Tragantk*), is a gummy exudation from various species of *Astragalus* (natural order Leguminosæ). It is derived chiefly from the *Astragalus gummifer*, growing in western Asia, and comes into the market by way of Smyrna and Constantinople. The best sort is the *flaky tragacanth* of commerce; *vernice* and *common tragacanth* are cheaper varieties. Tragacanth is dull, translucent, hornlike, and has a white or yellowish color. It contains both arabin and bassorin; when the gum is treated with water, the portion containing arabin goes into solution, forming a mucilaginous liquid, while the bassorin remains undissolved. Tragacanth has a soothing action when applied to a sore throat. It also finds considerable application in the arts, being much valued as a stiffening material for various textile fabrics. The following gums are more or less closely allied to gum tragacanth: *Bassora gum*, which is used to adulterate tragacanth; *wood gum*, which is derived from the birch, ash, oak, willow, etc.

(3) *Cherry-tree gum* is a colorless or yellow gum used for stiffening hats. It swells with water, forming a slimy paste. It contains a considerable amount of the insoluble substance *cerasin*.

Sugar-beet gum, *Irish-moss gum*, and a few other gums contain substances which differ somewhat in their properties and reactions from the arabin and bassorin, mentioned above. Sugar-beet gum contains pararabin; Irish-moss gum contains lichenin.

A substance named *animal gum* has been extracted from the salivary and mucous glands. It is a carbohydrate closely resembling the vegetable gums; soluble in water, insoluble in alcohol. Like the vegetable gums, it is transformed into sugar when boiled with dilute acids.

Gum Resins. These are the dried exudations of various plants. The gum resins are mixtures containing one or more gums and one or more resins. When they are rubbed with water, the gum generally dissolves, while the insoluble resin

forms an emulsion. Alcohol, on the contrary, dissolves the resin, leaving an insoluble residue of gum. It thus requires both water and alcohol to dissolve a gum resin completely. The group includes: *Ammoniac*, *asafoetida*, *galbanum*, *gamboge*, *myrrh*, and *scammony*, all of which are included in the United States Pharmacopœia, and are described in special articles under their names. Other gum resins are the following:

Bdellium, which resembles myrrh, and was highly esteemed by the ancients for its medicinal properties. The Indian variety is mentioned in the Bible; the African variety is used by French druggists in making plasters.

Euphorbium, an acrid substance formerly used in medicine: it is derived from the *Euphorbia officinarum*, growing in northwestern Africa.

Sagapenum, formerly used in medicine.

Gum Substitute. *British gum* is made from wheat starch, potato starch, and other feculas, by moistening with nitric acid and heating to 250° C. in order to convert the starch into dextrin. It is employed as a substitute for the real gums, which are more expensive. For some purposes a gum substitute is superior to the real gums. Consult: Karl Dieterich, *Analysis of Resins, Balsams, and Gum-Resins* (New York, 1901); Edmond Rabaté, *L'Industrie des résines* (Paris, 1902); F. S. Hyde, *Solvents, Oils, Gums, Waxes, and Allied Substances* (New York, 1913).

GUMS, DISEASES OF. Acute inflammation of the gums is termed gingivitis, a condition characterized by swelling, redness, soreness, and a tendency to retract from the teeth. Gingivitis is common in infants during the period of dentition. Scurvy, chronic lead and mercurial poisoning, and the severe forms of infectious diseases are attended by inflammation of the gums. A spongy condition of the gums is seen as a result of decayed or tartar-incrusted teeth or where the care of the teeth is neglected, and in those whose health is impaired from any cause.

Bleeding from the healthy gums is a symptom of the hemorrhagic diathesis. (See HÆMOPHILIA.) In scurvy (q.v.) bleeding occurs when the gums are touched even very gently. They are swollen and purplish from submucous oozing and in advanced cases may become black in color and give the breath a foul odor. After excessive doses of mercury a thin red line appears at the margin of the gums; in chronic lead poisoning a blue line forms immediately below the teeth.

The tumors peculiar to the gums are epulis—a characteristic vascular growth, which sometimes arises as a result of irritation of the teeth, especially the incisors. Epithelioma, papilloma, and polypoid tumors are also observed.

Spongy or ulcerated gums are treated locally by antiseptic astringent mouth washes. Tincture of myrrh, diluted in water, weak solutions of alum, and infusion of cinchona are favorite and valuable remedies. For the soreness of the gums during the teething period small doses of potassium chlorate are beneficial. To prevent the development of gum affections the teeth must be kept clean, decayed teeth filled or extracted, and tartar removed. In gingivitis arising from constitutional causes, a cure will result when the latter are corrected.

Pyorrhea Alveolaris, or **Rigg's Disease**, is a chronic destructive process involving the pericementum and alveolar tissues, and is not prop-

erly a disease of the gums. See PYORRHEA ALVEOLARIS.

GUM THUS. See NAVAL STORES.

GUMTI, gum'té. A river of India, remarkable for its windings. It rises in a small lake in the District of Shahjehanpur in the United Provinces of Agra and Oudh, and after a south-eastern course of 482 miles enters the Ganges about 20 miles below Benares. It is navigable for inland craft to Lucknow, more than 300 miles above its confluence with the Ganges.

GUM TREE. A name applied to many very distinct trees that exude gum or resin of some kind. In the United States, one of the best known from New York to Texas is the sweet gum (*Liquidambar styraciflua*, of the family Hamamelidaceæ), sometimes called the American storax, a large, handsome tree, with deeply five to seven lobed smooth and shining leaves, which in autumn become brilliant scarlet. The rather fine-grained wood is used to a considerable extent for furniture, and the bark, which is deeply furrowed, is valued in domestic medicine in the treatment of dysentery. Several species of *Nyssa*, a genus of the family Cornaceæ, are known as gum trees. The best known is the black or sour gum (*Nyssa sylvatica*), found from Maine to Texas, a large tree with tough, close-grained wood which, since it splits with difficulty on account of its cross-grained and interlacing fibres, is valuable for hollow woodenware. Other species are common through the Southern States, where they are better known as tupelo. *Nyssa capitata*, of rather limited range in South Carolina, Georgia, and Florida, is known as the ogeechee lime from the appearance of its edible fruit. *Bursera gummiifera*, of Florida, is known as gum elemi, and *Bumelia lanuginosa*, the shittimwood, indigenous from Illinois to Texas and Mexico, is locally known as gum elastic. In Australia the name "gum tree" is applied with various modifications to many of the species of *Eucalyptus* (q.v.). *Styrax benzoin* is called gum tree in the East Indies, and in Europe a number of other trees are similarly designated.

GUN. A heavy piece of artillery or ordnance designed chiefly for direct fire, in which it differs from howitzers and mortars, which use high-angle fire. See ARTILLERY; GUNS, NAVAL; ORDNANCE; FIELD ARTILLERY; MACHINE GUN; MORTAR; SIEGE GUN.

GUN/BOAT. A small vessel of light draft, designed for service in harbors, rivers, and in-shore waters. Modern gunboats are much larger than their prototypes. In the United States navy the vessels of the *Yorktown* class of 1700 tons' displacement are styled gunboats, though their proper designation is that of *cruiser*, for they are seagoing ships. Gunboats have always been useful auxiliaries in offensive and defensive warfare, but by themselves they have very little fighting value. As a measure of supposed economy, President Jefferson inaugurated a gunboat policy during his administration and built a large number of them, as he thought they would be better for defense than the larger ships. They achieved nothing in the War of 1812, and the money spent on them was thrown away.

GUN CARRIAGE. The vehicle or support by which artillery or heavy ordnance is brought into action or manœuvred. The modern gun carriage is a result of the great improvements made in recent years, chiefly due to better mechanical design, and the introduction of pneu-

matic and hydraulic cylinders to check the recoil, combined with powerful springs or compressed air to throw the gun back to its firing position, after recoil. For more detailed information, see ARTILLERY; FIELD ARTILLERY; COAST ARTILLERY; GUNS, NAVAL; MACHINE GUN; MOUNTAIN ARTILLERY; SIEGE GUN; ORDNANCE.

GUN/COT/TON. A name applied to certain cellulose products of the action of nitric acid on cellulose, discovered by Schönbein in 1846. The molecular formula of cellulose (q.v.) is some unknown multiple of $C_6H_{10}O_5$, and the action of nitric acid results in the substitution of a varying number of NO_2 groups for hydrogen atoms in the doubtless complex molecule of cellulose, some 11 different varieties of cellulose nitrates being recognized. The composition and chemical constitution of the resulting compounds determine their properties (e.g., the solubility in organic liquids), and upon these, in turn, depend the practical uses to which the several compounds may be applied. The higher substitution products are generally called guncotton; the lower ones, pyroxylin.

In preparing the cellulose nitrates purified cotton is treated with a mixture of nitric and sulphuric acids. The mixture used in the case of military guncotton consists of one part by weight of nitric acid, specific gravity 1.5, and three parts of sulphuric acid, specific gravity 1.845. For every pound of cotton 12 pounds of the acid mixture are used, and the cotton is immersed and digested in it for 24 hours. After the acid has been removed from the cotton by wringing, the latter is pulped, washed, and compressed into blocks. The acid liquids which have been expelled from the cotton after use are found to contain 70.91 per cent of sulphuric acid, 9.52 per cent of nitric acid, 1.04 per cent of nitrogen tetroxide, and 9.65 per cent of water. This mixture is reworked and is used again. For pyroxylin and other of the lower cellulose nitrates weaker acids are used, according to the purpose for which the resulting product is intended.

Cellulose nitrate for the manufacture of smokeless powder is prepared as follows: The base, in the form of cotton waste or cotton rags, is taken to a washing house, where the waste is put into a washer, which consists of a large iron cylinder mounted on a horizontal axis, with pipes, which carry steam for heating the charge, running through its centre. The cylinder is filled with a solution of caustic soda, the cotton waste is added to this, and the temperature raised to 120°–130° F. and maintained during the four hours of washing. The washer revolves very slowly, so as to keep the mass constantly agitated and scoured in order to remove oil, grease, and foreign bodies. From the washing house the cotton is taken to a centrifugal wringer and wrung as dry as possible. It is returned to the washer and washed a second time in clear pure water and then is wrung out again in the centrifugal wringer.

After the second wringing it is taken to the *picker*, where the cleaned cotton waste, or rags, is placed on the apron of the machine, which conducts it between two horizontal toothed cylinders revolving in opposite directions so as to pull the cotton in between them, thus tearing the knots and tangled lumps of waste apart, or tearing the cotton rags into shredded strips about 1 inch to 1½ inches long and about ¼ inch

wide. After passing through the picker it is collected in boxes and taken to the drying house. This house is provided with large wooden bins having perforated bottoms, on which the cotton is placed. Hot air circulates under these bottoms and is forced up through the bins and through the *cleaned, dried, and picked* cotton placed therein. The temperature of the air is from 90° to 105° F. The cotton is turned over by hand from time to time. It is kept in the bins about eight hours, when the water content is reduced to 0.5 per cent. As soon as the cotton is thus dried it is placed in air-tight cans, which is necessary, as it absorbs from 1½ to 2 per cent of water by mere exposure to the air. It is then taken in the cans to the *nitrating house*.

The cotton, as now prepared, is nitrated in earthen pots containing the acid mixture, or by placing it in a centrifugal machine so arranged as to allow the acid mixture to be admitted and the spent acids to be withdrawn through suitable pipes with stopcocks. In case the nitration takes place in a centrifugal machine it is conducted as follows: about 16 pounds of the dried cotton are placed in the machine with about 900 pounds of mixed acids, consisting of three parts of 98 per cent sulphuric acid and one part of 95 per cent nitric acid. The mixed acids are drawn from a large tank, called the mixed-acid tank. The spent acids, after "revivifying" by additions of concentrated "fortifying" acids, are let into the mixed-acid tank. The charge is kept in the centrifugal machine about 30 minutes, where, by becoming nitrated, the weight increases about 50 per cent; the 16 pounds of cellulose giving about 24 pounds of nitrocellulose. The degree of nitration in this case is about 12.6 per cent of nitrogen. During the 30 minutes' immersion the charge is turned over and over by iron hooks. After 30 minutes the drain cocks of the machine are opened, the machine is started, and the spent acids are forced out by centrifugal action. The remainder of the process has for its object the removal of the free acids remaining in the nitrated cotton and also such foreign bodies as may have been formed. To do so the nitrated cotton is taken at once from the nitrating machine and immersed or drowned in a large quantity of pure cold water, where it is kept immersed for eight hours, two changes of water being made during this time. From the drowning tanks the cotton is taken to another centrifugal machine, which is started as soon as the charge is placed in it, and while it is revolving cold water is played on the charge from a hose. After about 10 minutes the washing is discontinued, and the machine is then revolved at its highest speed until the charge is wrung as dry as possible. Where this cellulose nitrate is to be used in further manufacture, as, e.g., in making smokeless powder, a quantity, say about 1000 pounds, is allowed to accumulate from the foregoing operations, and this constitutes what is styled a factory "lot," to which a definite number is given under which subsequent purification operations and stability and ballistic tests of the material are recorded.

The purification is carried out in large wooden tanks having steam pipes arranged over the bottom through which steam circulates and keeps the cotton* and water at the desired temperature. Pure water is put in the tanks, a "lot" added and kept in the purifying tank for two

days, the temperature being maintained at 80° C. The water is renewed three times during this period, and at each renewal the temperature is raised to 100° C. for two hours. The mass is kept agitated by revolving arms set at different angles. In some factories the purification consists of alternate two-hour washings at 80° and 100° C., with renewal of water each time to include five renewals.

From the purifying tanks the nitrated cotton is taken to a centrifugal machine, where it is washed for a few minutes with pure water from a hose. It then goes to the *pulper*. This is the ordinary pulping machine used in paper mills and consists of an oval-shaped vat or tank provided with a horizontal shaft across its narrowest dimension. On one end of this shaft is a drum which has on its outer surface a series of parallel knife-edges. Directly below the drum is a concentric surface, with a second series of knife-edges. The clearance between these edges can be regulated. Pure water circulates slowly through the vat, running in at one point and overflowing at another. A "lot" of the cellulose nitrate from the purifying tank is placed in the pulper, where the drum in revolving pulls the fibre down and forces it between the two series of knife-edges, cutting it finer and finer until the whole mass is a smooth, even, fine pulp, about the consistency of corn meal; this requires about six hours. The contents of the vat are tested for acid from time to time, and sufficient sodium carbonate is added to neutralize any free acid that may be found to have been liberated as the pulping proceeds.

From the pulper the cotton goes to the *poacher*. This is a vat similar to the pulper in form, but it carries no knife-edges, as the horizontal shaft across its narrow part is provided with wooden paddles only. The purpose of the machine is to continue the washing with agitation, with a view to removing all free acid or alkali. Hence the contents are tested for both acid and alkali as the poaching proceeds, and the operation is continued until the lot is shown to be neutral. A chemical stability test is now made, and any further treatment depends on its result.

When completed, the cellulose nitrate is transferred to a large trough filled with pure cold water. An endless belt of coarse cotton cloth circulates through the trough and passes between two rollers at some distance outside of the trough. As the belt moves through the mass of suspended cellulose nitrate, a certain quantity adheres to it and is carried up between the rollers, which squeeze out the surplus water from it, and then to a scraper which detaches the squeezed pulp from the belt and causes it to fall into receptacles placed to receive it on the other side of the rollers. It is now in the form of small thin flakes and contains about 4 per cent of water. This is submitted to careful laboratory tests to determine its purity, uniformity, solubility, and stability.

The pyroxylin used for the manufacture of pyroxylin plastics, such as celluloid, is made by dipping cotton or tissue paper in a mixture of sulphuric acid, 66 parts; nitric acid, 17 parts; and water, 17 parts: 100 pounds of the acid mixture being used for one pound of paper, and the immersion being continued from 20 to 30 minutes at 30° C. The pyroxylin used in this art is of low nitration, containing about 10.18 per cent of nitrogen. The pyroxylin used for

collodion and in the making of varnishes contains about 11.11 per cent of nitrogen and is made by the use of stronger acids than those employed in the manufacture of the pyroxylin for plastics.

The perfection of the modern processes for the manufacture of guncotton are due principally to Baron von Lenk, of Austria, and Sir Frederick Abel, of England. Abel's improvement consisted chiefly in the reduction of the guncotton to a pulp by beating it in rag engines, such as are employed in the manufacture of paper pulp. The fibres of cotton consist of hollow hairlike tubes. When immersed in the acid mixture, they become filled with it, just as capillary tubes of any other material would be, and cannot readily be freed from it. But the acid thus retained is capable of exercising further action on the fibres and thus rendering the product unstable. Guncotton has thus frequently undergone spontaneous decomposition in storage. By pulping the long-staple guncotton Abel cut the fibres into very short tubes, which permitted of the acids being readily washed out with water in a poacher and thereby insured the stability of the product. Moreover, the moist pulp can be readily molded into any desirable shape and can be compressed to a density that may fit it best for use in military and naval mining. Thus, the guncotton used for torpedoes in the United States navy is compressed into rectangular blocks, with chamfered corners, 2.9 inches in diameter and 2 inches in height, each block being provided with a hole $\frac{1}{2}$ inch in diameter lying in its vertical axis. Such blocks are obtained by first molding the wet pulp in a molding press under a pressure of 100 pounds to the square inch and then subjecting the molded blocks to a pressure of 6800 pounds to the square inch in a final press. Although one of the most powerful of explosive substances when fired by detonation, this military guncotton can, when damp, be shaped with tools as wood is shaped, and in the preparation of the guncotton charges for use in the heads of the very large torpedo shells fired from the pneumatic guns of the United States steamship *Vesuvius*, these compressed blocks of pulped guncotton were sawed with a fret saw and turned in lathes to shape the mass so as to conform to the particular shape of the heads of the torpedoes.

The stability of guncotton or its permanency during storage is tested by exposing it to an agreed temperature and noting its behavior. This is preferably done by the method devised by Abel, in which the guncotton is placed in a test tube which is partly immersed in the water contained in a water bath, the mouth of the test tube being closed by a cork stopper from which a piece of partly moistened test paper is suspended by means of a platinum wire. When the guncotton begins to decompose, it gives off nitrogen oxides, which are absorbed by the moisture on the test paper and react with the reagents with which the paper is covered to produce a color, and as only the lower half of the paper is moistened, the color first appears as a brown line at the point of demarcation between the wet and dry parts of the paper. In making the test the water in the bath is heated up to the agreed-upon temperature, and maintained at that temperature by means of a temperature regulator. As this Abel test merely records the beginning of liberation of nitrous

oxide fumes and can be interfered with by the presence of slight quantities of other substances, other methods of testing have been devised. Among these may be mentioned the Guttman test, the explosion test, the 135° test, the Vieille test, the Will test, and the Sy test, the last two being regarded as the most satisfactory, since both record the progress of the decomposition of the nitrocellulose from beginning to end. "Stabilizing" the nitrocellulose by the addition of small quantities of calcium or magnesium carbonates to neutralize traces of acid and heating the nitrocellulose with water under a pressure of several atmospheres have been tried with apparent success.

Aside from the use of cellulose nitrates for guncotton for military purposes, for which object the product is finely pulped and compressed and undergoes the highest nitration possible, it is also employed in various important industrial applications. The solubility of pyroxylin in ether alcohol, which was discovered by Dr. Maynard, of Boston, in 1847 or 1848, afforded the liquid since known as collodion (q.v.), which can be used as a substitute for sticking plaster and as a vehicle for medicine. Subsequent applications of the cellulose nitrates have been the coating of photographic plates by collodion, the manufacture of celluloid (q.v.), the pyroxylin varnishes invented by Crane, and the making of artificial silk, artificial leather, and transparent films for photography.

The United States census for 1900 reported 10 establishments in three different States engaged in the manufacture and sale of cellulose nitrates, employing \$255,343 of capital, and having 163 employees. There were produced 922,799 pounds of the various cellulose nitrates, having a value of \$486,773, and there were consumed 991,115 pounds of cotton and 8,247,668 pounds of mixed acids. In addition there were produced and consumed in other establishments 2,739,834 pounds of cellulose nitrates, making a total product for the year of 3,662,633 pounds of cellulose nitrates.

Y., 1911). See CELLULOSE; EXPLOSIVES; SMOKELESS POWDER.

GUN'DAMUK'. See GANDAMAK.

GUNDUK'. See GANDAK.

GUNDULE. The reputed founder of an heretical sect in Artois, the bishopric of Liège, and elsewhere in the eleventh century. Of Gundulf himself nothing is known.* In 1026 a company of his fellows was arrested by Gerhard, Bishop of Cambrai and Arras, and brought to

trial. According to the rules which they avowed, they had forsaken the world, were striving to keep the flesh in subjection, to support themselves by their industry, to be honest in their dealings, and to love all who were willing to join them. In their assemblies they were accustomed to pray and to wash one another's feet. Gerhard, however, charged them with rejecting the sacraments, the Roman Catholic church, marriage, and the sanctity of churches, and forced them to recant. The acts of the synod are the only source from which knowledge of this sect can be obtained, and after the trial neither Gundulf nor his followers can be traced. The acts are best edited by Federicq, *Corpus Documentorum Inquisitionis Neerlandicæ* (Ghent, 1889). Consult Döllinger, *Beiträge zur Sekten-geschichte des Mittelalters* (Munich, 1890).

GUNDULIĆ, gún'dón-létch, Ivo FRANE (1588-1638). The most celebrated Illyrian (Croatian) poet of earlier times. He was born in Ragusa, on the coast of Dalmatia, a meeting place of Italian and South Slavic culture, and received the best education obtainable at the time, studying philosophy, jurisprudence, and classical literature. His scholarly attainments secured him various official posts at an early age, and at one time he occupied the highest office, that of Rector of the Republic of Ragusa. A translation of Tasso's *Jerusalem Delivered* was followed by original poetical works, lyric, epic, and dramatic. His greatest work is the heroic epic *Osman*, in 20 cantos, describing the campaign between the Poles and the Turks around Khotin in 1621. The poem was first published in 1826 and since then has been often republished. An edition for schools, with a commentary, is by Broz (Agram, 1887). Other works of Gundulić are the elegy *Tears of the Lost Son*, and the dramas *Cleopatra*, *Dubravka*, *Proserpina*, and *Ariadne*, to mention only a few of the many that laid the foundation of Slavic drama at the new theatre of Ragusa. His collected works were published in 1877 by the Agram Academy in vol. ix of *Ancient Croatian Writings*. Consult: Appendini, *Vita di G. Gondola* (Gundulić) (Ragusa, 1828); Jansen, *Gundulić* (Göteborg, 1900); Makowej, "Beiträge zu den Quellen des 'Osman,'" in *Archiv für slavische Philologie*, vol. xxvi (Brunswick, 1904).

GUNGL, gún'g'l, JOSEPH (1810-89). An Hungarian composer and conductor, born at Zsámbék in Hungary. He became an oboist in, and subsequently bandmaster of, the Fourth Austrian Artillery Regiment. Previously he had gained considerable experience as a teacher, but it was his work with this organization, both as soloist and conductor, that gained for him public recognition. During the eight years of his leadership the band attained a European reputation and made many tours, Gungl's compositions being the most popular features of the programmes presented. His Berlin Orchestra was established in 1843, with which organization he made a tour of the United States six years later. His other positions were royal musical director (1850) and bandmaster of the Twenty-third Regiment of Infantry, stationed at Brünn (1858). From this time on, most of his life was employed in concert tours. He has left about 400 compositions, for the most part waltzes, many of which have vied in popularity and effectiveness with the waltzes of Strauss. He died at Weimar.

GUNKEL, gún'kel (JOHANN FRIEDRICH), HER-

MANN (1862-). A German biblical scholar, born at Springe, near Hanover. He studied theology at Göttingen, Giessen, and Leipzig, was lecturer at Halle in 1889-94, became professor at Berlin in 1894, and in 1907 succeeded his former teacher Stade as professor of Old Testament exegesis at Giessen. His work was particularly important in the field of apocalyptic literature, where he tried to show the presence of Babylonian influence. Among his published works are: *Wirkungen des heiligen Geistes* (1888: 3d ed., 1910); *Schöpfung und Chaos in Urzeit und Endzeit* (1895), a bold criticism of previous commentators on the Book of Revelation, his own theory basing the book on Semitic and especially Babylonian cosmogonies; *Der Prophet Esra* (1900); *Kommentar zur Genesis* (1901: 3d ed., 1911); *Die Sagen der Genesis* (1901: in English, 1901; in Japanese, 1903); *Israel und Babylonien* (1903; in English, 1904), a reply to Delitzsch; *Zum religionsgeschichtlichen Verständnis des Neuen Testaments* (1903: 2d ed., 1910); *Die Religionsgeschichte und die alttestamentliche Wissenschaft* (1910; and in English): *Die Urgeschichte und die Patriarchen* (1911). With Bousset he edited (1903 et seq.) *Forschungen zur Religion und Litteratur des Neuen Testaments*.

GUNMAKING, GUN FACTORIES. See ORDNANCE; SMALL ARMS; SHOTGUN.

GUN METAL, or GUN BRONZE. See ALLOY.

GUNNEL, or BUTTERFISH. A kind of blenny (*Pholis gunnellus*) with a common name contracted from "gunwale fish," which has an eel-shaped body 6 or 8 inches long, and occurs abundantly along rocky shores, among algae, on both sides of the north Atlantic south to Long Island Sound and on the coast of France. It is deep olive in color, with a row of dark spots on the back, and is remarkable for the quantity and thickness of the mucous secretion with which it is covered. There are other species, all shore fishes of the northern seas.

GUNNER. In military usage throughout the world soldiers of the various branches of the artillery service are described as gunners. In the United States army the cannoners are the noncommissioned officers and men who ride on the fieldpiece and limber and who work the guns. The senior of these, a corporal, is called the gunner. He commands the gun squad and lays the piece. The grade of first or second class gunner in both field and coast artillery is open to noncommissioned officers and men who qualify by examination. Master gunners are noncommissioned staff officers of the Coast Artillery Corps and are graduated at the school of this name at Fort Monroe, Va. The grade carries with it an increased rate of pay, the soldier being distinguished by a decoration in the form of a projectile of scarlet cloth inclosed in a yellow wreath with a white star above, worn on the sleeve of his coat. (See MILITARY INSIGNIA.) In the British army there is a warrant rank in the garrison artillery known as master gunner, but it is gradually becoming obsolete.

In the United States a naval gunner is a warrant officer. On battleships and large cruisers there are two—the ordnance gunner, who has charge of ordnance material and supplies; and the electrical gunner, who has charge of electric equipment. Both are assistants to the ordnance officer of the ship, who has charge of and is re-

sponsible for all ordnance and electrical equipment except such fittings as are assigned to the care of divisional officers. Gunners are appointed from the enlisted men of the service. Examinations are usually held once a year, the appointments being made from those who pass the best examinations. After six years' service as such, gunners may be promoted, if found qualified upon examination, to the grade of chief gunner, in which they are commissioned with the rank of ensign. Any warrant officer may, if recommended by his commanding officers, take the examination for commission as ensign in the regular line of promotion. Not more than 12 in any one year are so commissioned. In 1914 there were 96 chief gunners and 80 gunners on the active list of the navy. The pay of gunners is the same as that of boatswains and other warrant officers. The pay of chief gunner is the same as an ensign's.

GUNNER'S QUADRANT. A mechanical instrument used in the artillery service, either to give the elevation directly or to verify the angles obtained by ordinary sights on every kind of gun and mortar. In the old-model 3.6-inch, 7-inch, and 12-inch mortars, two seats for the feet of the quadrant were squared off on the upper side of the piece in rear of the trunnions. The quadrant was applied to the breech of the gun, to the face of the muzzle, to an element of the bore, or to an element of the exterior surface where it is parallel to the axis of the bore, as was most convenient. It is composed of two main parts—the body carrying the graduated arc, and the movable arm carrying the index and the level. The movable arm also carries a graduation from 0 to 60; and the level, which is set for minutes and is capable of a longitudinal movement along the arm, carries an index for reading this scale. Degrees are read upon the graduated arm upon the body, minutes by the sliding level and scale on the movable arm. The principle by which the scale of this

GUNNERY. The science and art of handling guns. The science of handling guns consists of gun strategy and tactics, exterior and interior ballistics (q.v.), and a discussion of the problems arising under these heads. The art of gunnery consists of drill, target practice, ship and fire control, and allied problems.

Gun strategy and tactics involve a study of the means of gaining advantage by methods of mounting, placing, or grouping guns, direction in which it is desirable to bring the enemy as regards the sun, sea, land, arc of fire, range, etc.; in fact, a study of all means of making the most of one's own weapons and minimizing the effect of those belonging to the enemy. They are constantly changing with the development of naval and military *matériel* which extends, restricts, or gives a new direction to them. As in other fields, the strategy of the gun comprises a study of what to do and gun tactics a study of how to do it, but the dividing line between the two is often so difficult to draw that for all ordinary purposes they are grouped together.

Gun strategy and tactics exert a dominant effect upon the design of vessels and upon naval and military tactics and strategy and are in turn greatly modified by these. For instance, the guiding principle of gun strategy which requires the greatest possible concentration of gun fire led to the development of the dreadnought type of battleship and the widest possible arc of fire of guns, while the increased speed, coal capacity, radius of action, number and power of guns have greatly changed the methods of combining and adjusting forces and of approaching and engaging the enemy.

The art of handling guns is not more simple than the science. As a preliminary to considering it, let us examine the path of a projectile which strikes the ground (or water) at the end of three seconds. In the accompanying figure let the line OX be the horizontal plane through

arm is constructed to read to minutes is as follows: The arm represents a portion of the arc of a circle, which in this case has a radius of 113.45 inches. The level is a chord of this circle, and its index is at its middle point. (See GUNNERY.) The 3.6-inch and 7-inch mortars are no longer manufactured. The new 3.8-inch, 4.7-inch, and 6-inch field howitzers, designed to replace the mortars, are provided with sights which include the principle of the quadrant, so that the gunner's quadrant is now used only to test the sights.

the gun; OY , the vertical; OI , the direction in which the axis of the bore is pointed when the gun is fired. If it were not for the attraction of gravitation, at the end of the first second the projectile would be at a , at the end of two seconds at b , and at the end of three seconds at c . But the action of gravity causes it to drop so that it is at d , e , and f at the end of one, two, and three seconds—the distances ad , be , and of being determined by the formula for falling bodies, $s = \frac{1}{2}gt^2$, in which s is the distance the body falls in t seconds and g is the accelera-

tion due to gravity, or 32.2 feet. If the velocity were nearly doubled so that the projectile would reach f in $1\frac{1}{2}$ seconds, the height hf would be 36.2 feet, whereas cf is 141.9 feet. This shows the great flattening of the trajectory due to increasing the velocity.

The effect of air upon the projectile is greatly to reduce its velocity. The amount of the reduction depends upon the initial velocity, the density of the air, shape of the projectile, weight of the projectile in proportion to its cross section, etc.

To render a gun effective, four points must be considered: (1) safety, (2) accuracy, (3) destructive effect, (4) speed of fire. Safety is necessary, because the knowledge, or even the suspicion, of unsafeness will demoralize the men who handle a gun; furthermore, the gun may cause much injury in bursting, while the loss of a gun at a critical point in an engagement may lose the fight. In modern guns the greatest dangers to be feared are the premature explosion of the charge; a hangfire (q.v.) and the opening of the breech before the explosion of the charge; the jamming or explosion of a projectile in the bore; the use of bad or unsuitable powder or of proper powder in too great quantities; and weakness in the mount. There is nothing else that should cause a well-made modern gun to give way. Premature explosion of the charge cannot absolutely be prevented. It is usually due to flareback, premature firing of the primer, fragments of burning material in the bore, sparks from electric-power switches or from some slight fire in the vicinity, or the high temperature of a gun heated by rapid firing. Flarebacks are caused by very hot and incompletely oxidized gases remaining in the bore of the gun, which are suddenly further oxidized (developing flame) when the breech is opened and air admitted to the bore. This danger caused many fatal accidents a few years ago, but is now entirely overcome by admitting to the bore a considerable volume of air at high pressure before the breech is opened. This forces the heated air out at the muzzle where it can do no harm. Hangfires are prevented by a locking device which prevents the gun being readily opened if the primer mechanism has been operated and the charge has not exploded, and thus gives instant warning of the failure of the primer or a hangfire. The primer is first examined. If it did not explode or there is some doubt as to its effectiveness, another primer is inserted and the gun tried again. If it fails a second time, the hangfire is established. After a suitable interval, depending upon the size of the gun and previous experience, the breech is opened and the gun reloaded. Hangfires of several minutes' duration have occurred. The principal cause of hangfire is the placing of the charge too far forward from the face of the breech plug, but it may be brought about by several other means. The jamming or explosion of a projectile in a gun sometimes occurs, but either accident is so rare as not to be seriously apprehended. Poorly made powders and powders which do not receive proper care in handling, inspection, and stowage have caused a considerable number of accidents; but with the improvement in the manufacture of smokeless powders and the great care they now receive, such occurrences are becoming less and less frequent. Weakness in the mount is not usually dangerous to the gun's crew, but may disable

the gun. It is brought about by an attempt to save weight, as unnecessary weight is undesirable in field, siege, and ship guns.

Having secured a gun which is safe, we should next consider accuracy. In a field gun the causes of inaccuracy are: (1) variations in the angle of sight; (2) drift (due to rotation of the projectile); (3) wind; (4) jump; (5) axis of trunnions not in a horizontal plane; (6) variations in the velocity of the projectile, due to inequality of the powder; (7) incorrect setting of the sights, due to error in supposed distance of the objective; (8) personal errors of the gun pointer; (9) state of the atmosphere (height of barometer and thermometer, heat waves, and hygrometric conditions); (10) effect of strong or defective light upon the sight or upon the objective, etc. In addition to these, guns on board ship are subject to errors due to (11) horizontal movement of the ship and enemy, including changes of speed and course; and (12) rolling and pitching of the ship. As ships' guns have all the causes of error pertaining to field guns and some very important ones of their own, we need consider them only. The angle of sight is the elevation of the objective above the horizontal plane; the error due to this is trifling. This follows from the principle of the "rigidity of the trajectory," which may be briefly explained by saying that the range of a gun upon any plane passing through the axis of its trunnions is practically the same if the angle of elevation above this plane remains unchanged, provided always that the angle between the inclined plane and the horizontal is a small one. The drift of an elongated projectile from a rifled gun is considerable, but is very regular in amount, so that it may be corrected quite perfectly by inclining the rear-sight bar 2° to 3° to the left or dropping the left end of the axis of the telescope sight until it is inclined a similar amount. The exact inclination is determined on the proving ground before the gun is placed in service.

The correction for the force of the wind, incorrect range, jump, variations of velocity due to powder, and state of the atmosphere are made by the officer or officers controlling the firing upon information furnished by the spotter, who is provided with binoculars of high power and watches the fall of the shots from an elevated station. The spotter reports the estimated error "short" or "over" or to the right or left. The personal errors of the gun pointers are corrected as far as possible by instructions, drill with the "dotter" or similar apparatus, and subcalibre practice. The variations in range due to movements of the firing ship are determined by change of range indicators, plotting on paper in the central fire-control station, and direct observation by range finders. When ships roll, the pointer endeavors to keep his sights on the target. In the case of big guns this is not always possible except near the end of the roll. Medium and small calibre guns should have no difficulty in keeping on the target (enemy or target screen), except when rolling very deeply. Bad light on the target cannot always be avoided, but, whenever practicable, ships should manoeuvre to attain the best position in this respect.

The destructive effect of projectiles depends upon the character of the shell and of the ship it strikes. Before the development of satis-

factory high-explosive charges there were two or three kinds of projectiles for all guns. The armor-piercing shell contained no bursting charge, because its walls were so thick that gunpowder would not burst it and no other form of explosive had been developed which the shock of impact would not explode before the armor was pierced. Suitable explosives have now been developed so that the use of common shell with thin walls and large bursting charges is now greatly reduced, especially in the larger calibres of guns. (See PROJECTILES; ARMOR PLATE.) The destructive effect of one large shell is equal to that of many small ones. This is one of the many reasons which have led to the recent increase in calibres of guns and to the dreadnought type of ship. See GUNS, NAVAL; SHIP, ARMORED; PROJECTILES.

The last point to consider about a gun is speed of fire. Speed is last to be considered, not because it is least important, but because a gun must be safe and its fire accurate and destructive or speed is useless. A high rate of accurate fire can only be obtained by a properly designed mount and breech mechanism, adequate ammunition supply, a reasonably steady gun platform, a well-trained crew, and quick and accurate information as to ranges, objects of attack, corrections for speed of ship and enemy, etc. In addition, the mount must be strong, and all parts must work easily and quickly. Guns must be so placed as to give sufficient working space for the crew and not to interfere with the fire of others.

The present methods of operating guns in battle and target practice differ greatly from those in use a few years ago and still more greatly from the methods of the more distant past. The modern efficiency ideas received some of their earliest development in the navy. The first improvement was subcalibre target practice. The subcalibre piece is a small gun securely clamped to a very much larger one so that the sights of the large one are used to direct the fire of the smaller. For guns of 8-inch calibre and above, the subcalibre pieces are usually 1-pounder guns; for guns of less than 8-inch calibre, small-arm rifles are fitted for subcalibre.

The gun pointer trains and elevates the larger weapon, using its own sights; but when he presses the button for firing, the subcalibre piece only is discharged. The subcalibre gun is clamped so firmly to the other that the axes of both pieces are always parallel. To allow for differences of range between the two pieces, a correction is applied to the reading of the sights. Thus, if the target is 1000 yards away, the sights would read perhaps 1500, as the small piece requires a greater elevation than the large one to attain the same range. These corrections are ascertained in advance and given to the sight setter in the form of a table. The sights attached to the subcalibre gun are not used.

The subcalibre principle has been carried still further for purposes of training. Very small rifles (22-calibre, short) are attached to the guns and a moving target on a reduced scale suspended just beyond the muzzle. The size of the target represents the size that the larger one would appear to be at the practice range. It is therefore very small. To hit it requires approximately the same care and accuracy as to hit the regular target at the target-practice range.

Other means of training are sighting tubes, recording targets, dotters, etc., in which mechanism is employed to record the direction of aim when the pointer thinks he is on the target. By this means the pointer soon learns the character and magnitude of his error and how closely and evenly he must hold the cross wires of the sight on the centre of the target. He is then prepared to begin subcalibre firing. After a certain amount of practice with that he is fitted to fire at regular target practice.

The training of the individual is only a preliminary step in gunnery. The next is fire control. One or more officers are assigned to this duty. The chief fire-control officer directs the fire in accordance with the general orders of the captain. The battery is divided into several parts, and to each part is assigned a spotter, whose duty is to watch the fall of projectiles from the guns under his direction and increase or decrease the range or deflection to the right or left. Range finders are used for the beginning of an action until the fall of shots can be observed and for ascertaining the distance of the enemy for the purpose of determining his speed and course; but the fall of the projectiles is a better guide to the firing, as it takes cognizance of all errors and, as far as practicable, eliminates them. How satisfactorily the rather complicated control systems will work in a very hotly fought action must be left for actual war to decide. At present we can only devise the best apparent methods and provide alternative simpler but less certain means when the first gives way from injury to the communications or from other causes incident to battle.

The ranges at which modern large-calibre guns have been made effective have rendered the employment of smaller weapons nearly futile. Except under special conditions the smaller guns are not even manned, being reserved almost wholly to repel torpedo attack. Torpedo boats of the size in use 10 to 20 years ago are now obsolete and have been replaced by the so-called torpedo-boat destroyer, and even that is five times the size of the early designs. The magnitude and resisting powers of these boats are such that the small guns of the old antitorpedo-boat battery are no longer sufficient to hold them in check, and the modern battery of this sort consists of 4-inch to 6-inch guns.

Not the least of the advantages of the modern battleship of the dreadnought type is that its battle guns are all of one calibre, with the same range, setting of sight, etc. The fire control is therefore greatly simplified. This means less confusion of spotting and greater speed and certainty of fire. The other great advantage is concentration of power. Four ships of the U. S. S. *Pennsylvania* class would form a column about 1700 yards long, and they would carry 48 14-inch guns. Twelve ships of the U. S. S. *Connecticut* class carry 48 12-inch guns, but they would form a column 5700 yards long. The superior speed, defensive power, and arrangement of battery would enable the *Pennsylvanias* to concentrate on one end of the *Connecticuts* line and crush it, even if the heavy guns were of the same calibre.

The placing of the ship in a position relative to that of the enemy so that it has all the advantages that its design and the condition of the sea and weather render possible, while

minimizing as far as practicable those points for the enemy, constitutes ship control and battle strategy. If divisions, squadrons, or fleets are engaged, then simple ship control consists in keeping the ship in position and taking advantage of every opportunity offered by the tactics of the division, squadron, or fleet commander. The advantages to be sought are concentration of fire against a weaker possible fire of the enemy; moving so that the sun, smoke, and sea (causing rolling) affect one's own fire less than that of the enemy. To gain all these is not usually practicable, but they are to be sought if attainable without sacrifice.

The accuracy of modern heavy guns at long distances has greatly increased the probable battle range until now 16,000 to 18,000 yards is regarded as a practicable firing distance, especially when approaching the enemy. Another reason for longer battle ranges is the improvement in torpedoes. Some of the new designs call for a range of 6000 to 10,000 yards. The side which is weakest in number and range of torpedoes will be likely to avoid, if possible, ranges and positions in which they can be used by the other with much prospect of success.

GUNNY (Hind. *gannī*, Beng. *gōna*, *gōnī*, from Skt. *gōni*, sack, probably originally hide, cf. Prak. *gōṇa*, ox; connected with Skt. *gān*. Gk. *βόας*, *bous*, ox, Eng. *cow*). A coarse kind of cloth or sacking, manufactured in India, chiefly in Bengal, whence it is largely exported to other parts of the world. The fibre of which the cloth is made is chiefly that of the same species of *corchorus* which yields the jute (q.v.) of commerce, although it is made in Bombay and Madras to some extent from sunn hemp (*Crotalaria juncea*). Enormous quantities are annually exported to China, Australia, and other countries. It is partly made up into bags in Bengal, partly exported as gunny *chuts* or *chuttees*, pieces of size suitable for being immediately made up into bags. The manufacture of these bags was at one time the great domestic industry of all the populous eastern districts of lower Bengal, pervading all classes, and giving occupation to men, women, and children. At present, however, the bags are chiefly made in large steam factories. Gunny, both cloth and bags, is also manufactured in large quantities in Dundee, Scotland. (See JUTE.) There are few articles of commerce so widely diffused over the globe as the Indian gunny bag, as it is used for a covering for large packages of all kinds, including cotton bales, and bags for holding wheat, pepper, rice, coffee, and many other kinds of produce. In 1914 the United States imported 14,515,022 square yards of bagging,

gunny cloth, and similar fabrics suitable for covering cotton, valued at \$906,601.

GUN PENDULUM. See BALLISTICS.

GUNPOWDER. An explosive mixture, consisting of potassium nitrate, sulphur, and charcoal, used for military purposes, in firearms, and for blasting. For use with cannon and small arms and for high-grade sporting rifles and shotguns it is being rapidly superseded by smokeless powder (q.v.). There are, however, several important uses to which it is now put, the extent of which may be appreciated when it is stated that in 1909 the production of black gunpowder in the United States was valued at \$1,736,427. It is employed as a priming charge in firing smokeless powder and must be used in the older types of rifles and shotguns still owned throughout the United States. It is also necessary in the manufacture of fuses and fireworks and is much used for saluting, as it is far less expensive and is quite as satisfactory for the purpose as the more modern smokeless powders.

The origin of gunpowder is involved in considerable uncertainty, but it is believed that the mixture and its characteristic properties have long been known, even before its use to propel a projectile from some form of artillery. There is evidence that the recipe for making gunpowder was in the hands of some of the alchemists of the thirteenth century, and, on the strength of passages in the works of Roger Bacon, he is often spoken of as its inventor. In his *De Secretis Operibus Artis et Naturæ et de Nullitate Magiæ* (1270) he gives the following directions for making gunpowder: "Mix together saltpetre with lura nop cum ubre and sulphur, and you will make thunder and lightning, if you know the mode of mixing." The mysterious "lura nop cum ubre," after the fashion of the time, was merely a transposition of the letters of the words *carbonum pulver*, or charcoal. The discovery of gunpowder is also assigned to Berthold Schwartz, by whom it was mentioned in 1328. In addition to these references there are other quotations from mediæval writers bearing more or less on the subject, and also numberless traditions which confer on the ancients, and more especially the Eastern nations, the honor of this important discovery. Such legends go back even to the time of Alexander the Great, and it was asserted that he refused to attack the Oxydracæ, a race which occupied the country between the Hyphasis and the Ganges, because they "lived under the protection of the gods and overthrew their enemies with thunder and lightning which they shot forth from their walls." This would seem to corroborate the theory that gunpowder was well known in China many centuries before its first appearance in Europe, and that it gradually worked its way westward.

Passing now to the realm of fact, we know that by the time of the battle of Crécy (1346) cannons in which gunpowder was used as the propellant were well known, and from that time as firearms were developed the amount of gunpowder consumed increased. Although its use rapidly extended, nevertheless its improvement then and since took place at a very slow rate. Gunpowder was at one time very generally styled "meal powder" on account of its fineness of grain and the intimate mixture of its ingredients. Even in the early days of its use it was divided into different qualities, and one William

Bourne, writing on gunpowder in 1587, makes a distinction between *serpentine* and *corne powder*, the latter being the form known to-day. Serpentine powder, according to Sir Henry Manwaring (*Seaman's Dictionary*, 1644), was never used at sea. He says that the cannon powder of that date was not very strong, while the musket powder was the finest, strongest, and best that could be procured. William Bourne, to whose work reference has already been made, speaks of a gunpowder commonly made by the "Bours in Germanie," which was very irregular in its quality, and had to be judged by its taste, color, and the rapidity with which it burned, the amount necessary for a charge being gauged by such a test. He advocates the use of a *cartridge* for the larger guns on shipboard in order to prevent the frequent explosions due to scattered powder. The difficulty of obtaining powder of an even quality persisted until the middle of the nineteenth century, and while the numerous wars made its manufacture necessary on a large scale, yet it was not until the end of the eighteenth century that any substantial improvements in apparatus or machinery were effected.

Gunpowder was made even before the Revolutionary War in the United States with crude machinery which consisted mainly of stamp mills having mortars and pestles of wood and bronze, in which the materials were reduced to powder and thoroughly mixed. The powder thus obtained was coarse and uneven, and the manufacture was attended with great danger. In the eighteenth century the French government gunpowder, which was prepared under the direction of the famous chemist Lavoisier, attained considerable reputation for high quality, and it was in France that the practice of pulverizing and mixing the separate materials in wheel mills was first employed. This method was invented by Cossigny in 1787, and in 1791 a revolving drum was first used for pulverizing, and the wheel mill reserved for mixing and incorporating materials. Improved methods and apparatus were brought to the United States by Dupont, a student of Lavoisier, and the famous works bearing his name at Wilmington, Del., were founded in 1802. In 1856 these works undertook the manufacture of blasting powder, substituting the nitrate of sodium for that of potassium, and in 1868 the method previously suggested by Longchamps, Anthon, and Kuhlmann, of obtaining the potassium nitrate from sodium nitrate and potassium chloride, was adopted. About 1860 General Rodman of the United States army determined to make powder of larger-sized grains, which consequently was slower burning and enabled the Ordnance Department to construct guns of larger calibre. From this discovery resulted powders of variously shaped grains, generally symmetrical, and with perforations. By changing the nature of the carbon constituent, increasing the density through the pressure used in forming the grains, and using brown charcoal as described below, the gunpowder was rendered still slower burning, and in that form, more or less improved, has been brought down to the present.

Manufacture. In the manufacture of gunpowder great care is necessary, especially in the selection of the ingredients. The potassium nitrate, or nitre, as obtained commercially, contains potassium and sodium chlorides and sul-

phates, sand, and organic matter amounting to nearly 5 per cent. To remove these impurities the potassium nitrate is dissolved in hot water, and after boiling the solution is filtered through bags of coarse cloth into crystallizing vessels, where it is continually agitated while cooling, so that fine crystals may be formed. The crystals are then washed in distilled water and while still moist are stored in bins for use. For the making of the charcoal small wood of about 10 years' growth is preferred. Alder and willow are mostly used in the United States and Great Britain, while in France dogwood is preferred, and in Germany the willow, alder, and dogwood are employed. The wood should be straight, perfectly sound, entirely free from bark, and felled during the spring of the year when its moisture is at its maximum. The carbonization is accomplished in cast-iron retorts set in bricks, and the time of burning varies from three to five hours, according to the nature of the powder for which the charcoal is desired, and at a sufficiently high temperature to drive off all volatile matter.

After cooling, the charcoal is carefully hand-picked and then ground to powder in a mill. The sulphur employed is usually the best commercial article, but this still contains from 4 to 6 per cent of gangue. The sulphur is purified by distillation in a large iron retort, and the sublimed sulphur received in a condenser, from which it is removed in the liquid form and cast in moist wooden molds. When thoroughly cold, the sulphur is broken up into large lumps and finely ground to powder. The ground ingredients are carefully weighed, and the proper proportions mixed in a cylindrical drum of gun metal or copper in charges of 50 pounds and upward. The mixture is then hand-sifted to remove foreign substances, and again mixed in an incorporating mill, in which, by means of distilled water, the charge is kept sufficiently moist to prevent its scattering as dust. This operation is continued for several hours, and the mill cake is then reduced to meal by passing through rollers. The meal is then pressed into cakes by a hydraulic press, and the resulting press cake broken into pieces of different sizes, according to the variety of powder which it is desired to produce. A series of rollers next converts the press cake into grains, which are rough and porous on the surface and very angular in shape. It is freed from dust by placing it in revolving reels and then glazed by causing the grains to rub against each other in revolving wooden barrels. The final operation, called *drying*, consists in heating the glazed powder in large chambers at a temperature of from 52° to 54° C. (126° to 129° F.) for 24 hours. "Pebble," "prismatic," and similar names were given to forms of military powders that were used especially for artillery and were made essentially as just described, except that the press cake was cut into the shapes indicated by their names. (See *EXPLOSIVES*.) The black powder once used for military purposes by the United States, Great Britain, Russia, Sweden, Italy, and France, consists of potassium nitrate 75 parts, charcoal 15 parts, and sulphur 10 parts. Other nations used slightly different proportions, ranging from potassium nitrate 77 parts down to 61.5 parts. The sulphur is the most constant of the ingredients, while the charcoal varies from 23 to 12.5 parts.

Brown or cocoa powder received its nam-

from the color of charcoal used. It consisted of about the following proportions in the dried powder of the usual ingredients: nitre 79 per cent, sulphur 3 per cent, and charcoal 18 per cent, although when in actual use it contained about 2 per cent of moisture. The charcoal used was a lightly baked material, and the percentage of carbon that it contained was therefore but slightly higher than that of the wood or straw from which it was made. This variety of gunpowder found its chief use in heavy breech-loading guns in the forms of hexagonal prisms. The rate of combustion of the brown powder is slower than that of the black, and therefore for equal muzzle velocities of the projectile it produces less pressure in the powder chamber

made of the products of combustion of gunpowder, and the results obtained seem to show that the gases formed are, in proportions varying according to the quality of the powder, as follows: carbon monoxide, carbon dioxide, nitrogen, hydrogen sulphide, marsh gas, hydrogen, and oxygen. The temperature produced by the explosion of gunpowder is estimated at from 2100° to 2200° C. (3812° to 3992° F.), according to the quality of the powder; and the quantity of heat evolved in gram-degree units ranges from 837 down to 518.8.

The production and value of gunpowder, including blasting powder, produced in the United States is given by decades in the following table from the Thirteenth United States Census:

YEAR	Number of establishments	Capital	Average number of wage earners	Product	
				Pounds	Value
1840.....	137	\$875,875	496	8,977,348	
1850.....	54	1,179,223	579	\$1,590,332
1860.....	58	2,305,700	747	3,223,090
1870.....	33	4,060,400	939	4,011,839
1880.....	33	4,683,590	1,011	3,348,941
1890.....	37	9,609,975	1,622	95,019,174	6,740,099
1900.....	47	8,297,773	1,708	123,814,103	6,310,351 *
1909.....	46	246,339,875	11,344,692

* Of the 1900 production 97,744,237 pounds, valued at \$3,880,910, were blasting powder, and 25,638,804 pounds, valued at \$1,452,377, were black powder, produced by 10 different establishments.

of the gun than black powder; also it yields a thinner smoke than the latter. This variety of powder gives on explosion a greater quantity of heat and a smaller volume of permanent gases than does an equal weight of black powder. Brown powder has been displaced by smokeless powder (q.v.) and other high explosives. See EXPLOSIVES.

Mining or blasting powder, which is used for blasting purposes (see BLASTING), usually has a lower amount of potassium nitrate than military powder, so as to make it slow burning, and the proportions are from potassium nitrate 70 parts, sulphur 18 parts, and charcoal 12 parts, to potassium nitrate 62 parts, sulphur 20 parts, and charcoal 18 parts. The manufacture of blasting powder became an important industry in the United States when the construction of canals and railways and mining operations began to be undertaken on a large scale. With the increased demand for blasting powder, which originally did not differ from ordinary powder, it was found necessary to make a less expensive substance, and accordingly it was found by L. Dupont of Wilmington in 1857 that sodium nitrate or Chilean saltpetre could be substituted for the far more costly potassium nitrate or India saltpetre. As a result of this discovery the manufacture of blasting powder has attained considerable importance, and in 1909 there were 38 different establishments in the United States engaged in this industry, and their output in that census year was 233,477,175 pounds of blasting powder, valued at \$9,608,265.

Gunpowder, when of good quality, should have a specific gravity between 1.50 and 1.85. It explodes at about 313° C. (595° F.), and when ignited on a piece of white paper should burn away rapidly, leaving no residue. If black spots are found, they indicate an excess of charcoal, or imperfect mixture, while yellow spots show excess of sulphur. Many studies have been

GUNPOWDER PLOT, THE. A project for destroying the King, Lords, and Commons at the opening of Parliament on Nov. 5, 1605. While James I (then James VI of Scotland) was an aspirant to the English throne, he had given the Roman Catholics reason for believing that he intended to favor them. For a short time after his accession he showed them some favor. But when his policy was said to be encouraging seditious Jesuits to come to England, James joined Parliament in Catholic persecution. The judges of assize were permitted to put in force the penal laws against Catholics, in consequence of which several were put to death and several thousand were convicted of recusancy. Furthermore, James resolved on exiling the priests. Disappointed and angered by this severity, a few Catholics banded together to overthrow the government and to establish one of their own. The originator of the scheme was Robert Catesby, a man of good birth and of substance but with misdirected zeal, who had plotted against Elizabeth. First he took John Wright and Thomas Winter into his secret. After trying in vain to gain toleration for the Catholics through the mediation of Spain, these three men proceeded to their desperate task. They drew into the

plot Guy Fawkes (q.v.), a soldier of fortune, who had made a reputation in war, and whose character was determined and fearless, and Thomas Percy, a relative of the Earl of Northumberland. They began to undermine Parliament House from an adjoining tenement, which was hired in Percy's name. One day after they had laboriously pierced the wall, three yards thick, they discovered a vault under the House of Lords. Finding that this cellar was soon to be vacant, they hired it, and stored in it barrels of gunpowder, which they covered with stones, iron bars, and billets of wood. Their object was not only to conceal the powder, but also to supply an abundance of destructive missiles. While this work was progressing, a brother of Wright, a brother of Winter, and a few other obscure persons were added to the conspirators. But they needed money; and to supply it three others were induced to join the plot—Sir Everard Digby, of Gatehurst in Buckinghamshire, a young gentleman of large estates; Francis Tresham, a follower of Essex, like Catesby and Percy, but unlike them a cold, selfish man little suited to a conspiracy of the kind; and Ambrose Rokewood, also a wealthy gentleman, residing in the country. In the final arrangement for the execution of their plot at the assembling of Parliament on November 5, Fawkes was to set fire to the gunpowder in the cellar and then flee to Flanders in a ship provided from Tresham's money and waiting ready on the Thames. All went well until some of the plotters sought means of warning their Roman Catholic friends in Parliament of the impending danger, in which matter they hit upon no common plan of action. Ten days before the opening of Parliament Lord Monteagle, a brother-in-law of Tresham, was at supper in his country house at Hoxton, when a page handed him a letter received from a stranger, advising him "to devise some excuse to shift off your attendance at this Parliament, for God and man hath concurred to punish the wickedness of this time." That this letter was written by or for Tresham there can be little doubt, though Tresham himself when accused by Catesby positively denied it. That he desired to save his friend would be of itself a sufficient reason for writing it; but it is not altogether improbable that Tresham wished to expose the plot and at the same time allow his fellow conspirators an opportunity to escape. That they might have escaped but for the unreasonable hopes of Catesby and Percy is all but certain. On the evening of the 4th the Lord Chamberlain and Lord Monteagle visited Parliament House, and, entering the cellar in a casual way, told Guy Fawkes, whom they found there, and who passed as Percy's servant, that his master had laid in plenty of fuel. In spite of this direct warning Fawkes clung to his post, though escape was still possible; and on the morning of the 5th, a little after midnight, he was arrested as he came from the cellar dressed for traveling.

On his person the magistrate found slow matches, and in the cellar a lantern burning, and a hogshead and 36 barrels of gunpowder. Examined under torture, Fawkes confessed his own guilt and after long obstinacy revealed the names of his associates. Nearly all the others were killed on being taken, or died with him on the scaffold. Tresham, who at first went about openly, was finally arrested, and died of sickness in the Tower. Fawkes was a man of some excellent qualities; his aim was unselfish, but his

zeal was wholly misdirected. So far from remedying the oppression of the Roman Catholics, the plotters greatly increased their miseries. The memory of this mad plot, invested with much fiction and intentionally enveloped in mystery for state and religious purposes, was long perpetuated by an annual festival on November 5, in which it was customary to burn Fawkes in effigy.

GÜNS, guns, *Hung. KÖSZEG*, kē'ség. A free royal town in the County of Vas, Hungary, situated on the river Güns, 11 miles by rail northwest of Steinamanger (Map: Hungary, E 3). Above it tower the Altenhaus (2000 feet), and the Geschriebene Stein (2900 feet). It has an old fortified castle of the princes of Eszterházy, a fine modern church, and two convents. Its educational institutions comprise a Gymnasium and a military school; there are also cold-water baths. Güns obtained municipal rights in 1328 and became a free royal town in 1648. It offered gallant resistance to the Turks in 1532. Its trade consists of flour, fruit, and wine. Pop., 1900, 7930; 1910, 8423.

GUNS, NAVAL. Neither gunpowder nor guns were invented in the modern sense of the word. They were developments that in their earlier forms were scarcely distinguishable from previous types. Greek fire (q.v.) and other ancient incendiary compositions contained all of the essential ingredients of gunpowder, and it was discharged through tubes, the prototypes of guns, placed in the bows of galleys. The force with which the flame and gas issued from the tubes may have led to placing darts or hard substances in the tubes so that they might be thrown out as projectiles. The earliest guns of which we have knowledge were certainly very crude affairs, and their immediate predecessors were probably cruder still, so that the importance of the impending change was not realized. If we regard the incendiary tubes as the prototypes of the gun, the latter seems to have been first developed in naval warfare.

The earliest record of the use of guns on ship-board is derived from an old Japanese painting of the repulse of the Mongol fleet off the shores of Japan in 1281 A.D., the fleet being shown wreathed in smoke from its guns. Kublai Khan, the Mongol-Chinese Emperor, certainly had an ordnance department at this time, and it is not unlikely that he mounted some guns on the vessels of his fleet. The first recorded use of guns on European ships is in the thirteenth century. In 1350 the Moors of Spain are said to have used cannon in a sea fight with the Moors of Tunis, and in 1387 the French and English fleets fought at sea with guns. Up to this time the pieces were fired over the rail of the ship,

but early in the fifteenth century gun ports were invented—a suggestion of Descharges, a ship-builder of Brest—and the number of pieces carried rapidly increased, so that towards the end of the century the Queen of Louis XII made a present to the French people of the *Cordelière*, a ship carrying 60 guns; and the English immediately built a very similar vessel, the *Regent*, to oppose her. The guns carried on these ships were mostly breechloaders, and we are struck by the fact that they still retained a removable chamber for the powder, similar to the charging piece of the incendiary tubes used in the old galleys. The inefficient closing of the breech made the guns very ineffective, and breech-loading was very generally abandoned in the early part of the seventeenth century. The metal of the earlier guns was wrought iron or brass, but after the general introduction of muzzle-loaders it was either cast iron or cast brass. Some of the early guns were rifled; at the Woolwich Arsenal there is a barrel dated 1547 which is rifled with six grooves, of a twist of one turn in 26 inches.

By the year 1600 rifled small arms firing spherical lead bullets were common, but the disuse of heavy breech-loading guns prevented the development of rifled artillery. Guns of very large size were made in the fifteenth century, those used by Mohammed II in the siege of Constantinople in 1453 having a calibre of about 25 inches, and firing a stone ball of over 600 pounds weight (see ARTILLERY); and still larger ones with a calibre of 30 inches, and firing stone balls of 1100 pounds' weight, are yet to be seen in some of the old batteries on the Dardanelles. Iron shot began to be used about the middle of the fifteenth century, though stone shot were not wholly given up for many decades after this. By the end of the sixteenth century the batteries of ships had become formidable. The Spanish Armada of 1588 was composed of 130 ships carrying 3165 guns, most of which were 4, 6, and 10 pounders, but the two largest ships, the *San Lorenzo* and *Nuestra Señora del Rosario*, were better armed. The former carried four 60-pounders, eight 30-pounders, six 18-pounders, six 9-pounders, 10 6-pounders, and 16 small guns—50 guns in all; the latter mounted three 30-pounders, seven 24-pounders, four 18-pounders, one 9-pounder, and 26 small guns, or 41 guns in all. The *Triumph*, the largest English ship in the fleet which opposed the Armada, carried four 60-pounders, three 30-pounders, 17 18-pounders, eight 9-pounders, six 6-pounders, and 30 small guns, or 68 guns in all.

Sir Jonas Moore, writing in 1689, says: "All artillery are commonly reduced to three sorts: The first is that of the Culvering, the second Cannons of Battery, the third Cannons Petrieri. To offend afar off, in case of strong resistance, the Culverings do serve, which carries a ball of iron from 14 to 30 pounds weight, though some make these to 120 pounds. As to calibre they are called Whole-Culvering, Culvering, and Demi-Culvering. The Whole-Culvering are called anciently Dragon-Drakes, and carry a ball of iron from 40, 50 to 60 pounds, etc. The Culvering from 35, 30, 25, 20 pounds. The Half-Culvering from 18, 16, and 14. As to length, they distinguish the Culvering into ordinary, extraordinary, and bastard. The ordinary Culvering are long from the touch-hole to the muzzle, 32 calibres. The extraordinary are longer than the ordinary, viz., to 39, 40, and 41 calibres. The bastard are shorter than the ordinary, viz., only

28, 27, and 26. The Cannons of Battery are pieces ordinarily shorter than Culverings. The One-fourth Cannon carries a ball of iron from 16 to 18 pounds. The Demi-Cannon from 20 to 28 pounds. The Cannon from 30, 40, 45 to 50 pounds. The Whole-Cannon from 70 to 120 pounds. The Cannon-Royal from 130 to 150 and 200 pound ball, used by the Turks. The Petrieres are so called from its ball of stone, with which they are loaded, from 2 to 100 and 150 pounds." An illustration of the Culverin will be found in the article ARTILLERY.

During the seventeenth century ships increased in size and in battery power, but there was little change in the guns from the muzzle-loaders of 1600. Early in the eighteenth century the method of boring out the guns instead of casting them hollow and not boring out, added something to their accuracy and power. Robins, who published his treatise on gunnery in 1742, invented the ballistic pendulum (see BALLISTICS) for measuring velocities and pointed out the advantages of rifling and of elongated projectiles.

Until after the War of 1812 the heaviest pieces in use were the long 32-pounder of 55 hundredweight, and the 42-pounder of 57 hundredweight. The advantages of large calibre were understood, as may be seen by the adoption of carronades, but long guns firing projectiles of this size were too heavy for use on board the ships of the day. These pieces were generally fired by means of a priming and slow match; Sir Charles Douglas brought out the flintlock about 1780, but it was not until after Rodney's battle of April, 1782—in which action was the *Duke*, previously commanded by Sir Charles, and having guns fitted with flintlocks at his own expense—that the advantages of the lock were appreciated. No measures were taken to supply these locks until 1790, when brass locks of a new pattern were supplied, and used up to 1818. The discovery of a composition which could be ignited by friction or percussion was made in 1807 by G. Forsyth, a clergyman. Sir Charles Douglas designed quill primers for his locks about 1780, and a modification of these was used for the new percussion locks. Flintlocks continued in general use up to 1835 or 1840. In 1828 percussion locks were fitted to the guns of the U. S. S. *Vandalia*, but they were not exclusively used in the United States Service until 1842, when Hiddon patented the hammer with a slot permitting it to be drawn back from the vent. In 1832 an efficient percussion lock was introduced into the French navy; the British continued to use some flintlocks until about 1845, when they adopted a modified form of Hiddon's lock.

Sighting was effected by looking along the "line of metal," and decisive actions necessarily took place at close range. Soon after 1801 fixed sights on guns were adopted in the British navy, but the invention of the movable rear-sight, attributed to Colonel Jure of the French army, did not take place until much later, the method of allowing for distance being to shoot at certain parts of the ship which were higher than the point to be hit.

The next important improvement was the development of the shell gun by General Paixhans. In his *Nouvelle Arme*, published in 1821, he most strongly advocated the abandonment of the use of solid shot in long guns and the adoption of explosive shell, which had hitherto been fired from mortars and howitzers only. General Paixhans's views were adopted, and shell guns were intro-

duced in all navies. The consequences of the introduction of shell guns General Paixhans also foresaw; in 1824, after the new guns were adopted in the French navy, in an official letter to the government he prophesied that the new departure in projectiles would force the creation of armored ships. His prophecy was fulfilled, and the armored ships in turn caused the development of the rifled gun. In this France was again the leader. During the Crimean War some 6.5-inch cast-iron rifles were made and mounted for trial on board ship. These were muzzle-loaders of crude design modeled after the Paixhans shell guns and used studded projectiles; but they

earlier pieces were muzzle-loaders, but in 1862 he exhibited at London his first five cast-steel breech-loading guns. Armstrong brought out his breech-loading rifled field gun in 1855, and naval guns a year or more later. In 1858-59 a series of competitive trials of Whitworth and Armstrong breech-loading rifles resulted in the adoption of the latter. But the method of breech closure was very defective, and after numerous serious accidents the navy demanded a return to muzzle-loaders. The French adopted breech-loaders in 1862, but adhered to cast iron as a cannon metal until 1875. The retention of cast iron by the French and the return to muzzle loading in England left Krupp's primacy undoubted (as we view the question now), but of course this was not acknowledged at the time.

In the United States the perfection to which muzzle-loading smoothbores had been brought blinded the people to the value of the rifle. Many Parrott rifles were made and used in the navy, but it was never a favorite gun. After the close of the Civil War the development of ordnance in both army and navy ceased—largely owing to lack of funds, Congress refusing to grant money for new work. All sorts of repairs and makeshifts were resorted to, such as cutting off the breech of Parrott rifles, putting on a larger hoop, inserting a lining tube, and making them into breechloaders. (See ORDNANCE.) Eleven-inch Dahlgren smoothbores were reamed out to a calibre of 13 inches and wrought-iron cores inserted, and these were in turn bored out to a diameter of 8 inches and rifled. In the development of the new ordnance (1880-85) all sorts of difficulties were met, the chief of which was

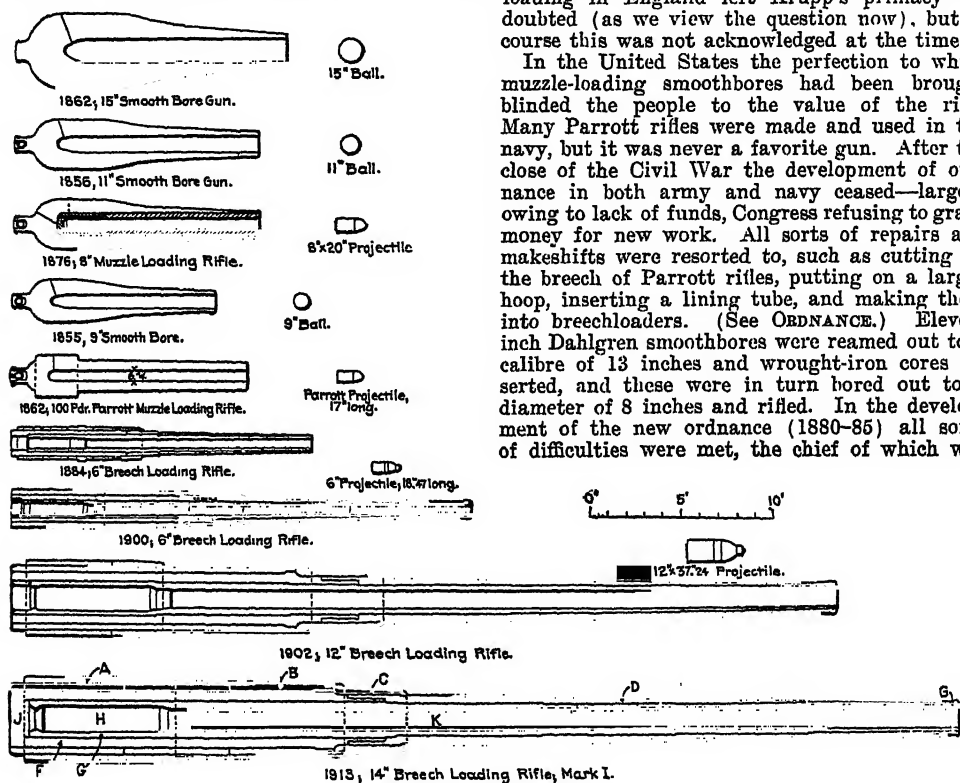

DIAGRAM ILLUSTRATING DEVELOPMENT OF GUNS AND PROJECTILES IN UNITED STATES NAVY FROM 1855 TO 1913.

proved to be so much more powerful against armor that they immediately gained favor. Other countries followed suit in the development of rifled guns. Prussia decided upon a breech-loading rifle, and in England Armstrong and Whitworth brought out breechloaders. Krupp's

the crop of ideas which the mistaken views of the preceding 20 years had fostered. The Dahlgren and Rodman smoothbore guns had become an article of faith with the American people, who had been taught to believe that their naval successes were due to cast-iron smoothbore guns,

instead—which was the fact—of being won in spite of them. Numerous inventors and manufacturers appeared before Congress with ideas based upon previous mistaken practices, but the breech-loading, forged-steel, built-up gun conquered its way past all attempts to supplant it. The slotted-screw breech block was used in all the new guns. The design of these pieces was practically the same as that of the best European practice, and included a tube extending the full length of the bore; a heavy jacket in one piece extending from the breech end of the tube for a little more than half its length; over the jacket a row of hoops and over the tube beyond the jacket, hoops extending part way or all of the way to the muzzle. The first guns were made of 30 calibres' length; between 1883 and 1890 the length increased to 35, after 1890 to 40 and 45 calibres, and in 1899 to 50 calibres in the sizes below the 7-inch. In 1910, 50-calibre 12-inch guns were completed, and, in 1913, 14-inch guns of 45 calibres were placed on the *Texas* and *New York*. This latter was in 1914 the standard calibre for United States battleships.

The breech mechanisms used in the United States naval service are the Fletcher (several modifications), Dashiell, Vickers-Maxim, Hotchkiss, and Driggs-Schroeder. The Fletcher, which is a development of the Farcot system, is probably the simplest and is certainly one of the neatest and strongest breech mechanisms known. A worm wheel on a vertical spindle works in a rack on the breech plug and first causes it to turn and disengage the threads and then move to

and Vickers-Maxim are operated by a short arm driven from the vertical axis of the operating lever, which shifts its centre during the motion. The Hotchkiss breechblock is a vertically sliding wedge, and the Driggs-Schroeder block drops to clear its upper end from the housing of the breech and then revolves to the rear about a horizontal axis; these two mechanisms are only used in 6-pounders and smaller pieces. See RAPID-FIRE GUNS.

U. S. N. MARK VI BREECH MECHANISM FOR 12-INCH GUNS.
HORIZONTAL SECTION AND PLAN.

1, breechblock; 2, mushroom pad; 3, rear end of tube; 4, rear pad ring; 5, mushroom head; 6, mushroom stalk; 7, lock nut; 8, frictionless washer; 9, vertical shaft, carrying pinion (11) and worm wheel (12) for withdrawing and turning aside the breechblock; 10, face of breech; 11, pinion for turning shaft (9); 12, worm for rotating breechblock; 13, worm shaft driving pinion (11) and causing shaft (9) to turn; 14, worm driving 11; 15, crank for operating 13; 16, screw threads (block is shown disengaged, ready to be withdrawn); 17, rack on plug in which 12 operates; 18, plug tray or carrier to receive breechblock; 19, tray latch. In the latest types of breechblock (models of 1912 and 1913) the side of the breechblock opposite the hinge or pinion (9) is cut away in the arc of a circle so that the block is turned out at once without the necessity of retraction. The threads of the block and seat are out in this curved surface to fit a corresponding curvature in the breech.

Breech closed.

Breech open.

EARLY TYPE OF VICKERS BREECH MECHANISM, SHOWING
WELIN BREECH.

the rear and turn out clear of the breech. The vertical spindle is driven by a worm and worm wheel in the larger calibres, in the smaller ones simply by a handle pivoting on it. The Dashiell

All new guns in the United States navy are fitted with the Welin system of breech closure, a modification of the slotted screw. The inside of the screw box is cut away in steps in the following manner: It is divided by 12 (usual number) radial planes; three of the sectors are

smoothed out to a maximum diameter and form the *blanks* of the screw box; the next sector (in the direction towards which the block turns in closing) has a radius which is less by a little more than the height of the threads on the block or in the screw box; the next has a radius smaller than the preceding by a similar amount; the next sector is likewise reduced in radius; while the next is another blank from which the succeeding sectors rise in steps, as from the first one. The advantage of the Welin system is that three-fourths or five-sixths (if desired) of the circumference of the block is available for screw surface to resist the powder pressure instead of one-half, as in the old block of ordinary model; this enables the Welin block to be made shorter and therefore lighter.

The gas checks used in naval guns are the Broadwell ring or cup-gas check used by Krupp and some modification of the De Bange gas check, such as is used in United States naval ordnance and in nearly all ordnance using a screw breech-block. The Broadwell ring is a steel ring with a section somewhat like a letter L. When the gun is fired, the pressure of the powder gas presses the lips of the ring against the walls of the chamber and against the face of the breechblock and so cuts off the escape of the gas to the rear. The De Bange gas check is more complicated. As originally made, it consisted of a ring-shaped pad of asbestos saturated with suet, covered with canvas, and held between two disks with large holes through their centres, through which and the hole in the pad passes the stalk of the steel block called the *mushroom* because of its shape. The disks holding the pad between them are themselves held between the mushroom head and front face of the breech plug. The opposing faces of the disks are hollowed out so that a section of one side is somewhat like half of the letter I. When the powder pressure acts on the mushroom head, the pad is squeezed and forced out against the surface of the bore, and at the same time the outer lips of the disks are also forced outward against it; this combination of metallic and pad contacts cuts off all escape of gas to the rear. In the latest types of gas checks used in United States naval guns the shape of mushroom head, gas check, and rings has been modified, but the principle remains the same. The rear disks are double—one at the outer and one at the inner edge of the pad; the front disk is much smaller and only extends a short distance from the outer edge.

Naval guns are fired by means of electric, percussion, combination (electric and percussion in one), or friction primers, which set fire to the charge. Electric and percussion primers are both used, but the former are preferred, and the latter employed only when the other fails. By the use of somewhat higher voltage the certainty of operation of the electric primer is increased, and its greater safety and ease of ignition render it more desirable. As the primer seats in the breechplugs of nearly all service guns have been prepared for the large combination primer, the present electric and percussion primers are of the same size, which is about that of a 32-calibre cartridge shell of double the usual length. The ignition of the percussion primer is caused by the blow of a firing pin pressed forward by a spring; that of the electric primer by an electric current which passes through a platinum bridge in it. The heating of the platinum bridge ignites the priming com-

position, which in turn ignites the fine black powder in the body of the primer. The flame of this powder is sufficient to start the burning of the ignition charge of black powder in the cartridge. This ignition charge of black powder is used because smokeless powder is not easily or quickly ignited. The lock in which the primer is seated is screwed on the rear end of the mushroom stem, and the flame of the primer must pass through a hole in the axis of the stem before it reaches the charge. In guns using fixed ammunition the primer is sunk in a recess in the head of the case. All locks in service in the United States navy are fitted to use either percussion or electric primers. In all cases they screw on the rear end of the mushroom stem. Somewhat similar locks are used in European and other navies. To prevent premature firing of guns—for it is convenient to insert the primer while loading is going on—the electric circuit is not complete through the primer until the breech-block is closed and fully turned into place, so that the contacts placed in the proper position are pressed together; the pressure of the firing key will then complete the circuit. In quick-fire and rapid-fire guns (see RAPID-FIRE GUNS) a detent holds the percussion firing pin back so that it cannot strike the primer until the breech is closed and locked. The electric current for firing is obtained from electric batteries at the guns or a current of reduced voltage derived from the dynamo.

The rifling of United States naval guns is polygroove with a twist which increases from zero to one turn in 25 calibres; i.e., the projectile starts along grooves which at first are parallel to the axis of the bore, but which almost immediately begin to incline to form a spiral on its inner surface, the inclination increasing to a point near the muzzle from which the spiral is uniform; the projectile is thus caused to rotate faster and faster, until, when it leaves the muzzle, it is spinning at a rate that will make it revolve once while moving a distance equal to 25 times its diameter. The grooves are 0.05 inch

in depth and several times as wide, but decrease in width as the muzzle is approached, and their number is usually four times the calibre expressed in inches (for a 6-inch gun, $4 \times 6 = 24$); but there are some exceptions.

TURRET MOUNT AND MECHANISM

In the design of naval guns the weights are kept down as much as possible, as every additional ton of weight carried involves three or four tons' extra displacement in the ship. In guns for forts and fixed defenses on shore small savings in weight are unimportant.

The recent increase in calibre of naval guns was brought about for reasons given in the article on GUNNERY. The largest gun so far mounted on board ship is the 15-inch gun placed on recent British ships. Other nations are using or intend to use guns of 12 to 15.1 inches. The general tendency seems to be towards adopting calibres between 14 and 15 inches, though the United States navy has designed and in 1914 was building guns of 16 inches for trial. Wire-wound guns are used in the British service, and some of this type have been built for Japan; but the naval authorities of other countries do not favor them. A chamber pressure of about 17 tons is as high as it is desirable to go, because the erosion of the bore increases rapidly with pressures above 12 tons. It is possible to make a built-up gun which is amply strong to stand a pressure of more than 20 tons to the square inch, so that the increased strength of the wire-wound gun is unnecessary. Moreover, wire-wound guns lack stiffness or longitudinal rigidity, and this reduces accuracy.

to come in far enough to be easily loaded. After loading, the gun was run out and trained by tackles.

The next step was the pivoting of guns and mounting the carriage on slide rails. Some guns pivoted amidships or on each side, and others pivoted to the side only. Mechanical appliances were soon afterward fitted to the slide rails for taking up the force of recoil. At first only friction was used, but the hydraulic cylinder followed a few years later. About 1885 central pivot carriages were devised. The earlier designs were very cumbersome and difficult to operate, but in a few years they developed into the pedestal mount turning on a nearly frictionless bearing of curved rollers; and this type, much improved from the early designs, is now used for broad-side guns. A recent type of the pedestal mount is shown in the accompanying plate. In this mount the rack and pinion for training is replaced by friction gear. The gun can only be trained from the right side and elevated from the left. The carriage is supported on ball bearings. Later types use prismatic sights to reduce the port opening. The names of the different parts are given on the plate.

Broadside guns in battleships are now designed for use as defense against torpedo boats, as the range at which the greater part of a naval

TABLE OF ELEMENTS OF LATE TYPES OF UNITED STATES NAVAL GUNS

GUN AND MARK	Length in calibres	Wght. of gun	Weight of projectile	Weight of powder charge	Muzzle velocity	Muzzle energy	Penetration at muzzle in Krupp armor, using capped projectiles	AT 3,000 YDS.		AT 6,000 YDS.		AT 9,000 YDS.

Mounts for Naval Guns. Mounts for naval guns are of three types: turret, deck, and rail—the latter being used on small vessels only. The principal features of mounts are the methods of supporting the gun, checking the recoil, returning the gun to the firing position after recoil, elevating, training, sighting, and loading. Up to the middle of the nineteenth century naval guns were mounted upon simple wooden carriages with heavy side frames or timbers supporting the trunnions and resting on little wooden wheels, called the trucks. The sides of the carriages were held together by framing, called transoms, the rear one being horizontal and supporting the elevating gear. The latter consisted at first of a large wooden wedge, but this was later replaced by an iron elevating screw. (See ORDNANCE.) The recoil was checked by a very large hemp rope, called the breeching, which passed through a score in a projection on the breech and was secured at each end to the ship's side; the length was sufficient to allow the gun to recoil several feet, and this not only reduced the strain on the breeching, but allowed the gun

battle is likely to be fought renders them of little or no service, so that it is useless waste of life to man them under such circumstances. These guns are usually of 5-inch calibre in United States battleships of recent type and from 4 to 6 inch calibre in those of other nations.

Guns of 4-inch calibre and less are carried by cruisers, gunboats, and torpedo-boat destroyers. The latter, which are the real torpedo boats of to-day—the small torpedo boat having become obsolete—have reached a size of more than 1000 tons and carry 4-inch guns. The mounts of these and of the 3-inch are similar to those already described, but smaller and simpler. Six-pounder guns (2.2-inch) are still carried by gunboats and small cruisers and destroyers of the older types. They are mounted on cage (heavy tripod) stands or on rail mounts. The mechanism is simple; elevation and train being effected by the shoulder bar.

Turret mounts have changed very considerably in the last few years. In the ships under construction in 1914 the guns were installed three in a turret, the middle one being raised above

the line of the others and drawn farther to the rear. This enabled the outer ones to be brought closer together. By putting three guns in a turret, a battleship with 12 heavy guns can carry her battery in four turrets on the midship line and fire six guns ahead and six astern by raising the second and third turrets high enough to fire over the first and fourth respectively.

The training and elevating of turret guns are effected by electric gear in nearly all navies, though very excellent hydraulic gear is used in some services. The guns may be fired simultaneously or separately; if separately, there must be an appreciable interval to let the smoke get clear, for even smokeless powder gives a cloud of vapor with some smoke, which is in part due to the black-powder ignition charges.

The danger of accidents in turrets has been greatly reduced by (a) an upper ammunition-handling room just below the turret, and (b) gas-ejecting mechanism which admits compressed air (100 pounds per square inch) to the bore before the breech is opened. This latter drives the heated gases out of the muzzle and prevents flarebacks. Danger from the sparks of electric switches has also been reduced by covering the entire switch mechanism.

The magazines and shell rooms are grouped about the lower handling room, though the main and reserve magazines may be on another deck below. If so, hoists connect them with the service magazines. The projectiles used by turret guns are all of the armor-piercing type with soft-steel caps. The bursting charge is of high explosive of some sort which is strong enough to burst the shell and yet sufficiently insensitive to shock to be fired through armor. The great difficulty has been to get a satisfactory fuse which would let the shell go through and then explode it.

GUNSAULUS, gŭn-să'lŭs, FRANK WAKELEY (1856-1921). An American Congregational clergyman. He was born at Chesterville, Ohio, graduated at Ohio Wesleyan University in 1875, was ordained to the Methodist ministry, but became a Congregationalist in 1879, and was pastor of Congregational churches at Columbus, Ohio (1879-81), Newtonville, Mass. (1881-85), and Baltimore, Md. (1885-87). From 1887 to 1899 he was pastor of Plymouth Church, Chicago, and in 1899 accepted a call to the Central Church of that city. He was also president of the Armour Institute of Technology from 1893 to 1901. He became widely known as a preacher and lectured on "Savonarola" and "John Hampden." His writings include: *Metamorphosis of a Creed* (1878); *November at Eastwood* (1879);

Monk and Knight: An Historical Study in Fiction (1889); *Phidias, and Other Poems* (1887); *William Ewart Gladstone* (1898); *The Man of Galilee* (1899); *Paths to Power* (1905); *Paths to the City of God* (1906); *Higher Ministries of Recent English Poetry* (1907); *The Minister and the Spiritual Life* (1911).

GUNSHOT WOUND. A wound produced by a missile projected from a pistol, rifle, cannon, etc., by the force of any explosive. Such wounds may vary in severity from a simple bruise to the tearing away of a whole limb. Single balls produce an incised, bruised, or lacerated wound, according to the amount of their velocity when they strike the body. The effects of small shot vary with the distance and power of the gun; when at short range, the pellets enter so close together as to make one wound like that of a single ball. It was once commonly believed that the "wind of a large shot" could produce serious injuries; this belief may have arisen from the circumstance that when a heavy ball, which has lost some of its force, strikes the body at a particular angle, the skin does not always give way, but the deeper structures, such as the muscles, or large organs, as the liver, may be completely crushed. When a bullet perforates the body, the entrance opening, which is generally depressed, round, and regular, is often smaller than that of the exit. The modern conical ball makes a well-defined oblong wound; but it may shift its direction, strike longitudinally, and cause a more extensive injury to the skin. When a bullet strikes the shaft of a bone, it cracks or splinters it and either remains in or passes through the cancellated ends. In its course the ball may carry before it pieces of cloth, coins, or other foreign bodies, which increase the danger from the wound. The modern bullet of small calibre, traveling at a very high rate of velocity, such as the bullet projected by the new Springfield, Mauser, Lee-Netford, or Krag-Jørgensen rifle, produces a small round wound of entrance and a wound of exit of nearly, if not quite, similar character. As a rule, all tissues, including bone, are clearly perforated; but occasionally, when the fire is at close range, or where a soft-nosed bullet is employed, the destruction of tissue may be very great.

Hemorrhage is, as a rule, very slight, though occasionally a blood vessel of importance may be perforated. Injuries to the blood vessels are considerably more frequent with modern high-velocity projectiles than they were with the old-fashioned bullets of low velocity, which occasionally bruised the vessels, but more often pushed them aside instead of cutting them. Hebler, in 1882, was the first to describe the effect of the small-calibre rifle. He calls attention to their superior accuracy and to the production of more humane wounds. Hebler and others, however, have been perhaps overenthusiastic in their claims, which give the impression that to be hit by a modern bullet entails little more risk than to undergo an aseptic operation by a surgeon—an impression that is far from the real truth.

Arguing from a purely military point of view, Major Charles Lynch, of the United States army, in his official report as an observer with the Japanese army during the war with Russia, remarks: "While from the surgical standpoint the extremely small calibre of the Japanese rifle is desirable, it is a great question if they have not carried their desire for long range, flat

trajectory, and light weight of cartridge too far, and have thus sacrificed the stopping power of the bullet to such an extent that their weapon does not yield the best results in war. A man hit with a Japanese bullet will come on when it has passed through his body anywhere, except at a vital point." Killing an enemy is not the prime object of modern military authorities, the infliction of death being simply an unavoidable incident of warfare. A dead soldier is merely a loss and after burial requires no further attention. A wounded man, however, does require care, and if sufficient numbers can be injured to oblige combatants temporarily to assist the sanitary forces, a great advantage has been gained.

So-called "explosive shot wounds" are a misnomer, no explosive effect being possible with modern rifle bullets. Civilized nations are strictly forbidden by international treaties to use explosive bullets. Greater shattering effects will, of course, be produced by nonjacketed bullets, such as are still used in ordinary revolvers. Hunters of large game sometimes resort to explosive bullets. In these the point or nose of the bullet is left unjacketed. Such a missile striking bone will break up into many parts and produce great damage, as is intended. Many persons who have been shot during the excitement of battle describe the initial sensation as resembling the sharp stroke of a cane; but in most instances the man soon begins to tremble, complains of cold, his face becomes pale, his pulse is scarcely perceptible, and he appears as if about to die. This is the condition termed *shock*; and though death sometimes does ensue during this state of prostration, it is not so serious as it appears, and the patient will probably pass out of it in a few hours, with the help of stimulants and rest. Although excessive bleeding is not so common after gunshot as after other kinds of wounds, it may occur immediately and to a fatal extent, if assistance be not afforded. The first assistance in the treatment of a gunshot wound is to preserve cleanliness in the locality of the injury. This is to be done by immediately applying a dressing or compress of gauze to the injured surface. In modern warfare every man who goes into the field is supplied with one of these sterile dressings in a compact form, with directions for applying it. In private practice, or under circumstances where a sterile dressing is not immediately at hand, the dressing should be wet with some antiseptic solution, such as carbolic-acid solution of a strength of 1 to 60, or mercuric chloride (corrosive sublimate), 1 to 1000. Where hemorrhage is free, pressure should be applied directly to the wound by means of compresses or with the hands or bandage. If this does not control the bleeding, an improvised tourniquet (q.v.) should be applied to the limbs. When a bone has been broken by the shot, a suitable splint or support must be applied. The further management of a case, beyond the administration of such stimulants as may be needed, should be in the hands of a surgeon.

At the present time surgeons do not probe for a bullet except in rare instances. To pass a probe through the opening made by a missile in several layers of tissue it is necessary to place the patient in the same position in which he was when the wound was received, if the tissues are movable or slide one upon the other. This is generally impossible; and very often the probe

will make a false passage, opening up a new track for possible infection, and never strike the bullet. In the case of the embedding of a bullet in the brain, the substance of which is not contractile, and which alters but little in relative position to the skull after a gunshot wound, probing is allowable if the probe enters easily. It is most desirable to remove the bullet in such a case. Frequently its position may be inferred with considerable accuracy from the symptoms, and the X-ray will furnish exact information as to the location of the missile. Portable X-ray outfits are now available for use in field hospitals. Consult Lagarde, *Gunshot Injuries* (New York, 1914).

GUNTER, ARCHIBALD CLAVERING (1847-1907). An American novelist and playwright. He was born in Liverpool, England, and when quite young was taken by his parents to California, where he was educated in the public schools and at the School of Mines of the State University. From 1868 to 1874 he was employed as a mining and civil engineer and chemist and from 1875 to 1878 was a stockbroker in San Francisco. He then removed to New York City and devoted himself to literature. He became the owner of the Home Publishing Company. His novels include: *Mr. Barnes of New York* (1887); *Mr. Potter of Texas* (1888); *That Frenchman!* (1889); *Jack Curzon* (1898); *A Manufacturer's Daughter* (1901); *My Japanese Prince* (1904); *Adventures of Dr. Burton* (1905); *A Prince in the Garret* (1905); *The Changing Pulse of Madame Touraine* (1906). His most successful plays are *Prince Karl* and *Mr. Barnes of New York*.

GUNTER, EDMUND (1581-1626). An English mathematician and astronomer, born in Hertfordshire. He was educated at Westminster and at Christ Church, Oxford, and became professor of astronomy in Gresham College (1619). He was an enthusiastic student of mathematics and a genius of no mean order. He observed the variation of the magnetic needle, improved the instruments for navigation, and invented the surveyor's chain. The latter, known as *Gunter's chain*, is 66 feet long and is composed of 100 links of 7.92 inches each. It is convenient in practice, since it is graduated on the decimal scale, and since 10 square chains make an acre. For certain purposes, however, chains (or steel tapes) of 50 or 100 feet (called engineer's chains) are more convenient. Gunter's sector or line consisted of a scale graduated according to the logarithms of numbers of sines, and of tangents, so that areas, heights, volumes, and other magnitudes could easily be calculated therefrom. He was the first (1622) to give the annual variation of the magnetic declination and to use arithmetical complements in logarithmic work. In 1618 he invented a portable quadrant for finding the hour and azimuth. His chief works are the *New Projection of the Sphere* (1623) and the *Canon Triangulorum*, or *Table of Artificial Sines and Tangents* (1620). His collected works were published in 1624 (2d ed., 1636; 5th ed., 1673).

GUNTHER, gunt'ər. A Burgundian king, in the *Nibelungenlied*, the brother of Kriemhild and husband of Brunhild, whom he won with the assistance of Siegfried. He was put to death by his sister Kriemhild.

GUNTHER, or GUNTHERUS, gunt'ər-us. A German poet, historian, and theologian, born in the twelfth century. He was long established

as a scholiast in south Germany and became the teacher of Prince Konrad, a son of the Emperor Frederick Barbarossa. About 1215 he entered the Cistercian convent of Pairis in Alsace. He is the author of the two Latin epic poems *Solimarius* and *Ligurius*. *Solimarius* was dedicated to Frederick Barbarossa in 1186, and treats of the First Crusade; but nothing remains of the work except a fragment discovered by Wattenbach in the Cologne Library. The poem entitled *Ligurius* is considered the greatest mediæval Latin epic of Germany. It consists of six books and celebrates the achievements of the Emperor Frederick in northern Italy. The facts upon which it is based are taken largely from the *Gesta Friderici* of Otto von Freising. Apart from its high poetic value, it presents a faithful picture of the conditions of the time. Consult A. Pannenberg, *Der Verfasser des Ligurius* (Göttingen, 1883).

GÜNTHER, gūnt'ēr, ALBERT CHARLES LEWIS GORTHLIF (1830-1914). An English zoologist, born at Esslingen (Württemberg). He was educated at the universities of Tübingen, Berlin, and Bonn, and became an assistant in the zoological section of the British Museum in 1856. In 1875 he was appointed director of the zoological section and in 1895 was superannuated. He was vice president of the Royal Society (1875-76), president of the biological section of the British Association (1880), and president of the Linnean Society (1898-1901). He founded and became the first editor of the *Record of Zoological Literature* in 1864, was a coeditor of the *Annals and Magazine of Natural History*, and contributed the reports on "Shore Fishes," "Deep-Sea Fishes," and "Pelagic Fishes" to the *Voyage of U. S. Challenger* (1887-88). For his services in the promotion of zoological science he was awarded gold medals by the Royal Society (1878) and the Linnean Society (1904). His publications include: *Medizinische Zoologie* (1858); *Catalogue of the Batrachia Salientia and Fishes in the British Museum* (10 vols., 1858-70); *The Gigantic Land-Tortoises, Living and Extinct* (1877); *Introduction to the Study of Fishes* (1880); *Fische der Südsee* (1873-1910); *Reptiles and Batrachians of Central America* (1885-1902).

GÜNTHER, ANTON (1783-1863). A Catholic theologian and philosopher. He was born Nov. 17, 1783, at Lindenau in Bohemia. He studied law at Prague, but later took orders, became a priest in 1820, and after 1824 lived in Vienna, where he died Feb. 24, 1863. His studies were directed to reconstructing Catholic dogmatics as a rational science, aiming to settle the ancient strife between reason and religion. Inasmuch as all his attempts to reach this goal by means of pure reason resulted in pantheism, which he saw to be irreconcilable with the doctrines of his church, he sought to solve his difficulties by an appeal to inner experience and self-consciousness. Thus gradually arose his theologiospeculative system first presented in his *Vorschule zur spekulativen Theologie des positiven Christentums* (1828). In his *Der letzte Symboliker* (1834) the Tübingen positions are attacked. By these and similar works Günther gained numerous adherents, whose "Young Catholicism" spread through Germany and Austria. He turned from the scholastic method and attempted to use the philosophy of Hegel and Shelling, and his work called forth a large controversial literature in the Catholic

church. Günther received and declined a call to the University of Munich, preferring to remain a priest, although his collected works were put on the *Index Librorum Prohibitorum* in 1853. His collected works appeared in Vienna in 1882. For his life, consult Knoodt (Vienna, 1881).

GÜNTHER, JOHANN CHRISTIAN (1695-1723). A German lyric poet, born at Striegau. He was the most gifted poet of an unpoetic generation, but wasted his genius in dissipation. At 22 he won recognition by a poem on the Peace of Passarowitz (1718). His later vagabond lyrics are marked by more sincerity and freedom, cleverness and imagination, than were common in his time, but they were as unconventional in morals as in treatment. His poems to Lenore are among the best lyrics from the time of Walter von der Vogelweide to Goethe, who put Günther among those from whom he got his first lyric inspiration. Günther's poems (1742) are edited by Fulda in Kürschner's *Deutsche Nationalliteratur*, vol. xxxviii by Tittmann (1874), and by Litzmann (in *Reclams Universal-Bibliothek*). Consult: Kalbeck, *Neue Beiträge zur Biographie des Dichters Christian Günther* (Leipzig, 1879); Litzmann, *Zur Textkritik und Biographie Johann Christian Günthers* (Frankfort, 1880); Wittig, *Neue Entdeckungen zur Biographie des Dichters J. Chr. Günther* (Striegau, 1881).

GÜNTHER, JOHANN HEINRICH FRIEDRICH (1794-1858). A German veterinary surgeon, born at Kelbra and educated at Jena and Berlin. He was director of the veterinary college at Hanover from 1847 until his death. From 1821 to 1835 he devoted himself chiefly to the healing of contractures. He adopted the subcutaneous method of operating in 1835 and after 1846 collaborated with his son on dental diseases. Their treatise, entitled *Ueber gesunde und kranke Zähne des Pferdes*, an appendix to *Die Beurteilungslhre des Pferdes* (1859), was the first valuable contribution to the pathology of dental disease in animals. His investigations on veterinary diseases, particularly those on pulmonary affections, are very important. His principal works include: *Lehrbuch der praktischen Veterinärgeburtshilfe* (1830); *Das Gangwerk der Pferde* (1845); *Lupinenbau* (1857).

GÜNTHER, KARL WILHELM ADALBERT (1822-96). A German veterinary surgeon, son of the preceding, born at Hanover and educated there and at Berlin. From 1847 until 1881 he was the principal teacher in the veterinary school at Hanover, where he was appointed professor in 1867 and director in 1870. He was an expert anatomist and one of the best veterinary operators of his time. His works include: *Topographische Myologie des Pferdes* (1866); *Die Wuthkrankheit der Hunde* (1880); *Das Kapauen red Hähne* (1890); *Studien über das Kehlkopfpeifen der Pferde* (1894).

GÜNTHER, SIEGMUND (1848-). A German mathematician and geographer. He was born in Nuremberg, was educated at Erlangen, Heidelberg, Leipzig, Berlin, and Göttingen, and in 1886 became professor of geography, and later prorector, in the School of Technology in Munich. His contributions to mathematics have been largely historical and geographical, and in these lines they are valuable. They include the following: *Lehrbuch der Determinantentheorie* (1875; 2d ed., 1877); *Vermischte Untersuchungen zur Geschichte der*

mathematischen Wissenschaften (1876); *Der Einfluss der Himmelskörper auf Witterungsverhältnisse* (1876; 2d ed., 1884); *Grundlehren der mathematischen Geographie und Astronomie* (1878; 3d ed., 1893); *Die Lehre von den gewöhnlichen und verallgemeinerten Hyperbelfunktionen* (1881); *Parabolische Logarithmen und parabolische Trigonometrie* (1882); *Lehrbuch der Geophysik und physikalischen Geographie* (1884-85); *Die Meteorologie ihrem neuesten Standpunkt gemäss dargestellt* (1889); *Handbuch der mathematischen Geographie* (1890); *Lehrbuch der physikalischen Geographie* (1891); *Das geschichtliche Element beim Mathematischen Unterricht* (1893).

GÜNTHER VON ANDERNACH, fön ün'-dër-näg, JOHANN (1487-1574). A German physician, born in Andernach, Rhenish Prussia. He was educated at Utrecht and Marburg, became professor of Greek at Louvain, and subsequently took his doctorate in medicine at Paris. There he became physician to Francis I. Obligated, as a Protestant, to flee the city, he established himself at Strassburg, where he achieved distinction as a physician and anatomist. His published works include *Anatomicarum Institutionum Libri Quattuor* (1536).

GUN'TON, GEORGE (1845-). An American social economist, editor, and author. He was born in Cambridgeshire, England, emigrated to the United States in 1874, and was active from 1874 to 1890 as a writer on economic and allied topics. Subsequently he was connected with economic, sociological, and scientific work, and in 1890 became president of the Institute of Social Economics. From 1890 he was also editor of the *Social Economist*, the name of which was changed in 1896 to *Gunton's Magazine*. In 1899 he was appointed director of the economic and sociological work of the Young Men's Christian Association in North America. His publications include: *Wealth and Progress* (1887; 7th ed., 1897); *Principles of Social Economics* (1891); *Trusts and the Public* (1899); *Outlines of Social Economics* (1900).

GUNTRAM, gun'trám. An opera by Richard Strauss (q.v.), first produced at Weimar, May 10, 1894.

GURA, göö'rá, EUGEN (1842-1906). A German barytone singer. He was born at Pressern, Bohemia, and after studying music at Munich, made his first appearance at the Court Theatre in that city in the rôle of Count Liebenau, in Lortzing's opera *Der Waffenschmied*. He subsequently sang at Breslau, Leipzig, Hamburg, and London, and was a member of the Munich Opera from 1883 to 1902, when he retired. Although at first excelling in rôles such as Nelusco, Tell, the Templar, he subsequently devoted himself more exclusively to the interpretation of Wagnerian parts. He was equally famous as a concert singer. His autobiography, *Erinnerungen aus meinem Leben*, was published in Leipzig in 1906.

GURAMAI, göö-rá'mi. See GOURAMI.

GUR'JUN (East Indian name) **BALSAM**, GURJUN OIL, or WOOD OIL. A limpid, dark-brown balsamic liquid, obtained from the gurjun tree, growing on the Burma coast, East India. It is used medicinally for checking leprosy and sometimes as a substitute for copaiba. In the arts it is chiefly employed as a varnish for ships. It may be distinguished from the balsam of copaiba by applying heat: at 132° C. (270° F.),

gurjun balsam coagulates, while copaiba remains liquid.

GURKHAS, GHURKAS, GOORKHAS, or GHOORKHAS, göör'kaz (from Skt. *gōrakṣa*, cowherd, from *gāu*, cow + *rakṣa*, guard, from *rakṣ*, to protect). A Hindu race of supposed Rajput origin, inhabiting Nepal, a state situated on the southern slope of the Himalayas, between Tibet and British India, which they first invaded about the twelfth century A.D., and where they have been permanently settled since the latter half of the eighteenth century. An attempt to extend their power farther south brought them into conflict with the British in the Gurkha War of 1814, which ended in the Treaty of Segauli and clearly defined their territorial limits. They now supply the Indian Empire with a corps of infantry renowned for its loyalty and bravery. Their war record began with the Indian Mutiny in 1857, during which they remained loyal and rendered invaluable service to the British. In 1900 they formed part of the British contingent in the international campaign in China, and in the European War of 1914 they were conspicuous for their daring and bravery. (See WAR IN EUROPE.) In physique the Gurkha is very short and stout; a natural infantryman and an instinctive foe of cavalry, whose horses he is an adept at hamstringing. In addition to the ordinary equipment of the native soldier, he carries a knife, called the *Kukri*, peculiar to his race, and which at close quarters he uses in preference to the bayonet. The Gurkha troops form 20 battalions of the native army in India, numbering about 20,000, and are greatly valued by the British government. See NEPAL.

GURKO, göör'kō, OSSIP VLADIMIROVITCH (1823-1901). A Russian general. He entered the army as cornet of the Hussars of the Imperial Guard in 1846, was made a captain in 1852, and in this capacity served in the Crimean War (q.v.). In 1857 he was assigned to the command of his old regiment of the Guards and in 1860 was made an aid-de-camp of the Emperor. His next promotion was to a colonelcy (1861), in which capacity he served in the campaign of Poland in 1863. In 1867 he was a major general in the suite of the Emperor and assigned to the command of a brigade in the second cavalry division of the Guards. In 1876 he was given the command of the same division. At the opening of the war with Turkey he led the Russian advance across the Danube and occupied Tirnova, July 7, 1877. At the head of a large force, composed chiefly of cavalry, Gurko passed the Balkans, moved rapidly on Adrianople, advancing within two days' march of that city. He was, however, defeated by Suleiman Pasha at Eski-zagra and compelled to fall back to the Shipka Pass, which he held against repeated attacks. In December he advanced again across the Balkans and occupied Sophia, Jan. 4, 1878. He defeated Suleiman Pasha in a three days' battle near Philippopolis, Jan. 15-17. In 1879 he became Governor-General of St. Petersburg, but was removed in the following year because he had failed to protect the Czar sufficiently against an attempt on his life, even going so far as pardoning some Nihilistic conspirators. In 1882 he was Governor of Odessa. From 1883 to 1894 he was Governor-General of Poland, retiring in the latter year with the title of field marshal. He died Jan. 28, 1901.

GURLEY, RALPH RANDOLPH (1797-1872). An American philanthropist. He was born in Lebanon, Conn., and graduated at Yale in 1818. Beginning in 1822, he was for half a century agent and secretary for the American Colonization Society. He visited Africa three times in the interest of the negroes and aided in establishing Liberia. He edited the *African Repository* and published a *Life of Jehu Ashmun* (1839) and *Life and Eloquence of Rev. Sylvester Larned* (1844).

GURLITT, gurlit, CORNELIUS (1820-1901). A German composer. He was born at Altona, near Hamburg, and studied under the elder Reinecke (composition) and subsequently with Weyse at Copenhagen. In 1864 he became organist of the Altona Hauptkirche and during the Schleswig-Holstein campaign was appointed army musical director, after which he became a member of the faculty of the Hamburg Conservatory. In 1874 he was appointed royal musical director. His compositions include several operas and opérettas, string quartets, violin sonatas, cello sonatas, vocal duets, and songs. His operas had but a local significance, and while his string compositions are more generally known, his claim to fame will rest on his pianoforte compositions, and particularly on his instructive pieces, which are used throughout the civilized world.

GURLIT, gurlit, ERNST FRIEDRICH (1794-1882). A German veterinary surgeon, born at Drentkau, near Grünberg, Silesia, and educated at Breslau. He was professor of the School of Veterinary Surgery at Berlin from 1826 to 1870, and also director of the technical department of that institution during the last 20 years of his life. He may be said to have been the founder of that branch of anatomical science which treats of the organic structure of the domestic animals, and his investigations on animal deformities are especially noteworthy. His principal publications include: *Handbuch der vergleichenden Anatomie der Haussäugetiere* (1821; 7th ed., 1890); *Lehrbuch der pathologischen Anatomie der Haussäugetiere* (with 35 plates, 1831-32, with supplement, 1849); *Lehrbuch der vergleichenden Physiologie der Haussäugetiere* (1837; 3d ed., 1865); *Anatomy of the Horse* (Eng. trans. by J. Willmott, 35 plates, 1833).

GURLIT, ERNST JULIUS (1825-99). A German surgeon, son of Ernst Friedrich Gurlit, born in Berlin. He was appointed professor at the university in that city in 1862. From 1867 to 1898 he was editor of the German Red Cross periodical, *Kriegerheil*, and he also edited the *Biographische Lexikon der hervorragenden Aerzte aller Zeiten und Völker* (6 vols., 1884-88). His writings on medical statistics are especially valuable. His principal publications include: *Handbuch der Lehre von den Knochenbrüchen* (2 vols., 1862-64); *Leitfaden für Operationsübungen am Kadaver* (1862; 7th ed., 1889); *Zur Geschichte der internationalen und freiwilligen Krankenpflege im Krieg* (1873); *Die Gelenkresektionen nach Schussverletzungen* (1879); *Geschichte der Chirurgie und ihre Ausübung* (3 vols., 1898).

GURNAH. See KURNAH.

GURNARD (connected with OF. *gournauld*, *gournant*, *grougnant*, from *grognard*, grunter, from *grogner*, Fr. *grogner*, to grunt; so called in allusion to the sound made by the fish when taken from the water). Any of the marine

spiny-rayed fishes of the family Triglidae. The head in the gurnards is angular and wholly covered with bony plates; the body is elongated, nearly round, and tapering. There are two dorsal fins. The lower three rays of the large pec-

AN AMERICAN GURNARD (*Prionotus carolinus*).

toral fins are detached and elongated into long feelers, which are used mainly in search for food. Many gurnards are distinguished for their beauty of color. They live on the bottom, some at considerable depths, in which case they have a red color. The red gurnard of the British coast (*Trigla cuculus*) is the most common of many European species, and takes its name, red crooner or cuckoo gurnard, from the note it utters when lifted out of the water; another species is called piper. In the United States these fishes are better known as sea robins. The most common one (*Prionotus carolinus*) is found abundantly on the east coast from Maine to South Carolina. There are many other species. The flying gurnard (*Cephalacanthus volitans*) occurs in the Atlantic on both coasts. (See FLYING FISH.) The gurnards are known by various other names, such as batfish and sea swallows. The maximum size is 18 inches. They are regarded as good food fishes in the Old World, in spite of their uncouth appearance, but in the United States are little used as food.

GURNEY, EDMUND (1847-88). An English philosophical writer, born at Hersham. He graduated from Trinity College, Cambridge, in 1871; then devoted himself to music, especially the violin; and wrote a book called *The Power of Sound* (1880). He studied medicine at University College, London, and at Cambridge, between 1877 and 1880, and law at Lincoln's Inn in 1881-83. Long interested in philosophy and psychical problems, he devoted himself to the work of the Society for Psychical Research (which he had helped to found in 1882), collecting for the society alleged instances of telepathy in the work *Phantasms of the Living* (2 vols., 1886) and contributing largely to the first five volumes of the society's *Proceedings* and to the periodical *Mind*. A collection of his essays was published under the title *Tertium Quid* (2 vols., 1887).

GURNEY, EPHRAIM WHITMAN (1829-86). An American educator, born in Boston, Mass. He graduated at Harvard in 1852, was tutor in Latin there from 1859 to 1863, and in 1863-67 assistant professor of Latin. In 1868 he became assistant in history, in 1869 university professor of history, and in 1886 McLean professor of history. He was editor of the *North American Review* from 1868 to 1872 and dean of Harvard from 1870 to 1876. In 1880 he was elected a member of the American Academy of Arts and Sciences. As an academic lecturer, he was exceedingly able.

GURNEY, SIR GOLDSWORTHY (1793-1875).

An English inventor, born in Cornwall. He was probably the first to devise the oxyhydrogen blowpipe and the so-called Drummond, or lime, light, and the first to produce and employ, for purposes of rapid locomotion, the high-pressure steam jet, as well as an ammonia engine, probably the first ever made, which was used in driving a small locomotive. He also devised a system of mechanical power-driven legs, which were tested until found impracticable. In 1827 he built a steam carriage, in which he made a journey of 85 miles in 10 hours. He was knighted in 1863. He published a *Course of Lectures on Chemical Science Delivered at the Surrey Institution* (1823); *Account of the Invention of the Steam-Jet or Blast, and its Application to Steamboats and Locomotive Engines* (1859); and several other works.

GURNEY, JOSEPH JOHN (1788-1847). An English Quaker, prominent as a philanthropist and reformer. He was born at Earlham Hall, near Norwich, of an ancient and wealthy family, was educated privately at Oxford, and in 1818 became a minister of the Society of Friends. His life was devoted to the prosecution of benevolent enterprises, to many of which he also made liberal gifts. He cooperated with his sister, Mrs. Elizabeth Fry, in prison reforms, and with Clarkson, Wilberforce, and Sir Thomas Fowell Buxton (his brother-in-law) in the advocacy of the abolition of slavery. He made a number of visits to various European countries and to the United States in the interest of the Society of Friends and in the United States spoke frequently in public in favor of the abolition of slavery and capital punishment. Among his numerous works are *Observations on the Distinguishing Views and Practices of the Society of Friends* (1824) and *A Winter in the West Indies Described in Familiar Letters to Henry Clay of Kentucky* (1840). Consult Braithwaite, *Memoirs of Joseph John Gurney* (3d ed., London, 1902), and Mrs. Geldart, *Reminiscences of a Good Man's Life* (1853).

GUROWSKI, GŮŮ-rŏv'skĕ, ADAM, COUNT (1805-66). A Polish author, long resident in the United States. He was expelled from Polish schools in 1818 and in 1819, for having taken part in revolutionary demonstrations, and subsequently studied in Germany. He returned to Warsaw in 1825, however, and had a share in the insurrection of 1830, after the failure of which he fled to Paris, where he joined the Polish committee. In 1835 he published *La vérité sur la Russie*, a work advocating Pan-slavism, which was so favorably received in Russia that he was recalled and employed in the Russian civil service, though his confiscated estate was not restored. In consequence of opposition to him at court, he left the country in 1844, studied at Heidelberg, taught at Bern, Switzerland, and in 1849 came to the United States. He was for several years engaged in active literary work and from 1861 to 1863 was employed as a translator in the State Department of Washington. He published: *La civilisation et la Russie* (1840); *Pensées sur l'avenir des Polonais* (1841); *Aus meinem Gedankenbuche* (1843); *Die letzten Ereignisse in den drei Theilen des alten Polens* (1846); *Le Pan-slavisme* (1848); *Russia As It Is* (1854); *The Turkish Question* (1854); *A Year of the War* (1855); *America and Europe* (1857);

Slavery in History (1860); and a diary of notes on the Civil War.

GURTEEN, STEPHEN HUMPHREYS VILLIERS (1840-98). An American Protestant Episcopal clergyman, born at Blean House, near Canterbury, England, and educated at Cambridge and subsequently at Paris and Berlin. He was professor of Latin at Hobart College, held rectorates at Buffalo, N. Y., and at Toledo, Ohio, and was dean of St. Paul's Cathedral, Springfield, Ill. His publications are chiefly devoted to the discussion of English charity organization, which he was instrumental in introducing into the United States. They include: *What Is Charity Organization?* (1879; 4th ed., 1882); *How Paupers Are Made* (1883); *Handbook of Charity Organization* (1882); *Beginnings of Charity Organization in the United States of America* (1894); *The Arthurian Epic* (1895); *The Epic of the Fall of Man* (1896).

GURTON, GAMMER. See GAMMER GURTON'S NEEDLE.

GURU, GŮŮ-rŏŏ (Skt., teacher). A spiritual guide or teacher among the Hindus. The title was applied to a religious preceptor from whom a youth received initiatory instruction, and who conducted the necessary ceremonies up to the time when the lad was invested with the sacred cord, as described in detail in *Manu* and the other law books. The guru not infrequently possesses considerable temporal power, as, e.g., in Nepal (q.v.). Among the Sikhs (q.v.) the guru was at first the spiritual guide, but came in time to be practically the temporal ruler or leader, while the teaching was done by the other priests, who acted as guardians of the sacred books. The followers of Vallabha are required to place at the guru's disposal *man, tan, dhan*, i.e., mind, body, and property.

GURY, gu'rĕ, JEAN PIERRE (1801-66). A French Roman Catholic theologian. He was born at Mailleroncourt, and at the age of 23 entered the Society of Jesus. After teaching at various Jesuit colleges he became professor of moral theology at Vals in 1833. His principal works, the *Compendium Theologiæ Moralis* (2 vols., 1850; 4th ed., 1868; Ger. trans., 1869) and *Casus Conscientiæ in Præcipuas Questiones Theologiæ Morales* (1864; 8th ed., 1891), gave rise to considerable polemical discussion. They have been frequently republished in France, Germany, and elsewhere, and, reedited by Ballerins, have also been used as textbooks.

GUSSENBAUER, gu'sen-bou'ĕr, KARL (1842-1903). An Austrian surgeon. He was born at Ober-Vellach, Carinthia, and was educated at Vienna, where for some time he was assistant to Billroth. In 1875 he was appointed professor of surgery at Liège, in 1878 he was made professor at Prague, and in 1894 he became professor of surgery in Vienna. He was the first to construct a serviceable artificial larynx. His researches were devoted chiefly to gastrotomy, removal of the larynx, partial intestinal resection, and methods of artificial bone severance. His principal works include: *Die traumatischen Verletzungen* (1880); *Septhämie, Pyohämie und Pyo-Septhämie* (1882); *Beitrag zur Exstirpation von Beckenknochengeschwülsten* (1891).

GÜSSFELDT, gu's'fĕlt, PAUL (1840-). A German explorer. He was born in Berlin and was educated in natural history and mathematics at Heidelberg, Berlin, Giessen, and Bonn. When the first expedition was sent out by the

German African Society in 1872, he was chosen its leader. The expedition sailed to the coast of Loango, but was shipwrecked near Free-town, Liberia, Jan. 14, 1873, and lost all its stores and equipments. Although Güssfeldt succeeded in establishing a station on the coast, he was unable to penetrate into the interior and returned to Germany in the summer of 1875. In 1876 he visited Egypt and the Arabian Desert (with Schweinfurth) and afterward explored a portion of the Andes, where he discovered a number of glaciers in lat. 34° 30' S. He also ascended to the top of the volcano of Maipo and reached almost the summit of Mount Aconcagua, the highest peak of South America. In 1892 he became professor of physical geography in the seminary for Oriental languages in Berlin. Among his principal works are the following: *In den Hochalpen: Erlebnisse aus den Jahren 1859-85* (3d ed., 1893); *Kaiser Wilhelms II Reisen nach Norwegen in den Jahren 1889-92* (2d ed., 1892); *Die Loangocexpedition*, jointly with Falkenstein and Pechuel-Loesche (1879 et seq.).

GUSTAFSON, gus'táf-son, GABRIEL ADOLF (1853-1915). A Scandinavian archaeologist, born in Visby, Sweden, and educated at the University of Upsala. In 1881 he became a clerk in the Antiquarian Museum at Upsala, in 1889 director of the antiquarian division of the Bergen Museum, and in 1900 Rygh's successor at the University of Christiania as professor of archaeology and director of the Archaeological Museum, which he reorganized in its new building. He supervised many important excavations and restored the famous Viking ship found at Oseberg. In 1903 he was elected a member of the Royal Academy. He published *Norges Oldtid* (1906), particularly valuable for its illustrations and reconstructions of Viking remains.

GUSTA'VIA. The capital of Saint Bartholomew (Saint-Barthélemy) (q.v.), a French island of the West Indies. It is on the southwest coast and has a good harbor.

GUSTA'VUS I (GUSTAVUS VASA) (1496-1560). King of Sweden from 1523 to 1560 and founder of the royal house of Vasa. He was born at Lindholmen, May 12, 1496, and was known in private life as Gustavus Ericsson. The name "Vasa" came into use after his accession to the throne, being derived, it is conjectured, from a black fascine in his arms, which was drawn so that it resembled a vase and was changed to yellow by Gustavus, giving it the appearance of a sheaf. His father, Erik Johansson, had been a Swedish senator and was a patriotic member of the Swedish nobility who followed the Stures in the struggle of the Swedes for independence from Denmark. The young Gustavus began his studies at Upsala in 1509 and five years later entered the service of the Regent Sten Sture, distinguishing himself by gallantry in the battle of Bränkyrka, in which Sture defeated the forces of Christian II of Denmark (1518). After the battle Christian sought an interview with Sture and asked that six hostages be given for his safety. Gustavus was chosen as one of these hostages. As soon as they were on board the Danish ship it sailed away to Denmark, where the hostages were held in captivity. From this captivity Gustavus escaped to Lübeck in 1519 and, returning to Sweden, finally found a refuge among the loyal peasantry of Dalecarlia, for the death of Sture in 1520 had given the country

over to the Danes. In Dalecarlia he wandered about for several months in disguise, with a price set on his head. In November, 1520, 90 of the nobles and leaders of Sweden who had been summoned to attend the coronation of Christian II were beheaded. Among them were the father and the brother-in-law of Gustavus. The young fugitive vainly attempted to rouse the inhabitants of Dalecarlia to revolt and was forced to seek refuge in the less frequented parts of the country, where for a month he earned his living as a field laborer and more than once owed his life and safety to the generosity of the peasant women of the district. Not until his account of the tyranny of the Danes was corroborated by the testimony of several fugitives from Stockholm was the national enthusiasm roused, and the peasants of Dalecarlia, at Mora, on Christmas eve, 1520, proclaimed him head of their own and other communes in Sweden. His first victories over the Danes brought recruits in large numbers. He defeated the Danes at Vesterås, took Upsala, and on Aug. 24, 1521, was proclaimed Administrator of the Kingdom of Sweden. In June, 1523, the Swedish Diet at Strängnäs declared the union with Denmark dissolved and proclaimed Gustavus Ericsson King of Sweden. Two weeks later he made his triumphant entry into Stockholm. See SWEDEN, *History*.

The King early showed his determination to favor the Lutheran doctrines, and, without attempting to force his subjects into an unwilling change of ecclesiastical alliance, he gradually, by patience and tact, established Lutheranism as the religion of the state and placed Sweden unalterably in the ranks of Protestant countries. This was finally accomplished and legalized in the Diet at Vesterås in 1527 and a national council held at Örebro in 1529. His attitude towards the Reformation was largely influenced by his desire to overthrow the power of the Catholic clergy, which he considered dangerous to the royal authority and the cause of Swedish independence. The problems of government he had to encounter were many. The young King found a country divided into factions, poor, and with almost wholly undeveloped resources, and wasted by barbarous wars. He also felt the lack of good administrative men and advisors. He had to do his own clerical work and was the only one in his Council who could speak German. He devoted himself with fine patience and moderation to the task of developing and reorganizing it. He had owed much to the devotion of the peasantry, while in the proud and turbulent nobility, many of whom belonged to the Danish and Catholic factions, he saw a grave menace to stable government. He therefore sought to give the peasantry better opportunities and fuller participation in the national life and to limit the dangerous power of the nobles. From 1525 to 1542 he was kept busy putting down four formidable rebellions. He was a practical business man as well as a large-minded statesman, and he fostered the commerce, mining, and fisheries of the kingdom with the most careful personal attention, even as to details. Land was reclaimed, hydraulic works were constructed, and saw mills built. The reforms in the state were not accomplished without great difficulties. The King had to meet disaffection and revolt; he carried on war with Lübeck and the Hansa towns.

After 40 years' rule Gustavus left Sweden a peaceful and civilized realm, with a full exchequer, a well-organized army of 15,000 men, and a good fleet. He made commercial treaties with foreign nations and established fairs for foreign traders. Roads and bridges were made in every part of the country, and canals begun. In his relations with his subjects Gustavus was firm and sometimes severe, but seldom unjust, except in his dealings with the Catholic clergy, whom he despoiled of all their lands and funds. He did much to promote the cause of Lutheranism, although he took care that the Reformed clergy should be dependent on the crown and enjoy only very moderate emoluments. He was three times married and had 11 children. By an act (reënnacted in 1860) of the Diet of 1544, at Vesterås, the crown was declared hereditary in the male descendants of Gustavus; in conformity with which, his eldest son, Eric (see ERIC XIV), succeeded to the throne on his father's death, Sept. 29, 1560. Consult: Geijer, *Geschichte Schwedens*, vol. ii (Hamburg, 1834); Watson, *The Swedish Revolution under Gustavus Vasa* (Boston, 1889), which contains a good bibliography; Bain, *Scandinavia* (Cambridge, 1905).

GUSTAVUS II (GUSTAVUS ADOLPHUS) (1594–1632). King of Sweden from 1611 to 1632, and one of the greatest generals of modern times. He was born Dec. 9, 1594, and was the grandson of Gustavus Vasa, by his youngest son, Charles IX, at whose death in 1611 he succeeded to the throne. Gustavus was brought up in the Lutheran faith, carefully trained in habits of business, and was one of the most accomplished princes of his age. He was educated under the care of John Skytte, a traveled and accomplished Swede, Von Morner, a German, and James de la Gardie, a Swedish noble of French origin. On his accession to power he found the country involved in wars with Denmark, Russia, and Poland. Two months after his accession Gustavus was declared of age by the Estates, and the regency was dissolved. The young man found it necessary to wrest a large part of southern Sweden from the Danes and to thwart the designs of Sigismund of Poland upon the Swedish crown. To strengthen Sweden for the struggles which this involved, the young King, with the approval of the great Chancellor, Axel Oxenstierna (q.v.), believing that the time had come for a halt in the policy of repression of the nobility, which his father and grandfather had found necessary for the authority of the crown, sought to secure the hearty coöperation of the nobles, whose privileges he confirmed, holding them in return strictly accountable for loyal service. He sought to unite the classes—nobles, clergy, burghers, and peasants—in a common purpose, the upholding of Swedish power. While reorganizing the internal government, the King entered upon a war with Denmark, which ended in January, 1613, with the relinquishment of some Swedish districts of Denmark. Gustavus had a clear appreciation of the importance of Russia and of the possible menace to Sweden in Russian aggrandizement, and therefore, after disposing of Denmark, he opened a victorious campaign against Russia. By the Peace of Stolbova, Feb. 27, 1617, Russia ceded to Sweden Ingria and Carelia. The boundary of the Swedish territory then included the site of the future St. Petersburg. The Russian war was but a prelude to that against Poland in which, during eight

years of active campaigning (1621–29), Gustavus developed his innovations in the art of war, trained the Swedish armies, which became noted as the best troops of Europe, and brought out that brilliant body of commanders who followed him in his later campaigns and carried out his policy after his death. Gustavus conquered all of Livonia and Courland, and occupied the Duchy of East Prussia, held by Brandenburg as a fief of the Polish crown. The war against Poland was to prevent the aggrandizement of Sigismund and to compel his recognition of Gustavus as King of Sweden. In a larger sense it was a defensive war, since the ultra-Catholic powers—Spain and the Empire—had schemed to use Sigismund as an instrument against the Protestant "Lion of the North." Largely through the efforts of Richelieu (q.v.), an armistice for six years was arranged (Sept. 16, 1629) on the basis of a full recognition of Gustavus as King of Sweden, and Gustavus was thus left free to take an active part in Germany, where the course of the Thirty Years' War had been steadily against the Protestant princes, and the advance of the Imperialists under Wallenstein (q.v.) was already threatening to establish a new power on the Baltic.

In June, 1630, Gustavus, with an army of about 13,000 men, landed in Germany to aid the Protestants in their struggle against the Catholic League, backed by the power of the Empire. The Swedes soon drove the Imperialists from Pomerania. France, through hatred of the Empire, agreed to furnish Gustavus with a subsidy of 400,000 rix-dollars as long as he maintained an army of 36,000 men. The Protestant Electors of Brandenburg and Saxony, jealous of this new power in Germany, were little inclined to coöperate with Gustavus, but were forced to join the Swedes. On Sept. 17, 1631, Gustavus completely defeated the Imperialists under Tilly at Breitenfeld, near Leipzig, saving the cause of Protestantism just when it seemed threatened with utter destruction. The King now advanced into Franconia, and after allowing his armies to recruit their strength in the rich bishoprics of Würzburg and Bamberg, overran the Palatinate and held a splendid court at Mainz, surrounded by princes and ambassadors. Thence he advanced into Swabia. On April 15, 1632, in the face of Tilly's army, he forced the passage of the Lech, where Tilly was mortally wounded. The road to Vienna was now open to Gustavus, and the Emperor Ferdinand II in terror recalled his general Wallenstein (q.v.), who gathered a large army and advanced to meet Gustavus. The two great commanders confronted each other for a time at Nuremberg, before which town Wallenstein occupied an intrenched position, from which Gustavus, who held Nuremberg, attempted in vain to dislodge him. Then the armies moved northward and met at Lützen, southwest of Leipzig. Here, on Nov. 16, 1632, Gustavus fought his last battle. The Swedes won the day, but in the course of the fighting Gustavus fell, mortally wounded. Bernhard of Weimar (q.v.) succeeded to the command of the Swedish army.

Although Gustavus was eminently a warlike king, he made many salutary changes in the internal administration of his country and devoted his short intervals of peace to the promotion of commerce and manufactures. He was preëminently religious, and his success in battle is perhaps to be ascribed not only to a better mode of warfare and the stricter discipline which

he enforced, but also still more to the moral influence which his deep-seated piety and his personal character inspired among his soldiers. The spot where he fell on the field of Lützen was long marked by the Swedenstein, or Swede's Stone, erected by his servant, Jacob Ericsson, on the night after the battle. Its place has now been taken by a noble monument erected to his memory by the German people on the celebration of the second centenary of the battle, held in 1832. He raised Sweden to a commanding position as the great power of the North, which she retained for a century, and his brief and brilliant campaign saved the cause of Protestantism in Germany. He was succeeded by his daughter Christina.

Bibliography. Of especial value for the history of Gustavus Adolphus is the third volume of Geijer's standard *Sveriges Historia*, in the German translation *Geschichte Schwedens* (Hamburg, 1836). Geijer makes much use of contemporary documents, including the correspondence of the King. Consult also: Droysen, *Gustav Adolf* (Leipzig, 1879), a valuable study by one of the foremost German scholars; Gfrörer, *Geschichte Gustav Adolfs, Königs von Schweden und seiner Zeit* (ib., 1869), a Catholic presentation; in English, Stevens, *History of Gustavus Adolphus* (New York, 1885), the work of a former United States Minister to Sweden and an interesting product of studies pursued under most favorable conditions; Fletcher, *Gustavus Adolphus* (New York, 1890), in the "Heroes of the Nations Series"; Dodge, *Gustavus Adolphus* (Boston, 1895), a study especially on the military side; G. Eggenhaaf, *Gustav Adolf in Deutschland 1630-1632* (Berlin, 1901); Hon. E. Noel, *Gustaf Adolf, King of Sweden* (London, 1905); C. H. L. Johnston, *Famous Cavalry Leaders* (New York, 1908). See THIRTY YEARS' WAR.

GUSTAVUS III (1746-92). King of Sweden from 1771 to 1792. He was born Jan. 24, 1746, and succeeded his father, Adolphus Frederick (q.v.), in 1771, at a period when the royal power had almost disappeared before the encroachments of the nobility, and the country was distracted by the strife of the rival political parties known as the "Hats" and "Caps." (See CAPS AND HATS.) Finding that the people, weary of the misrule of the nobles, were ready for any change, Gustavus covertly fomented the general discontent, and having raised a fictitious rebellion, through the agency of his friends and adherents, he collected a large body of troops on pretense of restoring order, and arrested the Council in a body, Aug. 19, 1772. He convoked the Diet, and laid before it a new constitution to which the Assembly was compelled to subscribe. A revolution was thus effected without the shedding of blood, and by a stroke of the pen Gustavus recovered all the regal powers that had been gradually lost by his immediate predecessors. He acted with great moderation after this successful coup d'état and might have long retained the advantages he had gained if his love of display and his wish to emulate the King of France in extravagance and magnificence had not led him into profuse expenditure, which embarrassed the finances; at the same time the introduction of the manners and usages of Versailles in his court irritated the national party, while it undoubtedly tended to demoralize the upper classes. In 1788 he entered upon a war with Russia, when that Empire was engaged in

active hostilities against the Turks, but derived no advantage from the contest. In February, 1789, a Diet at Stockholm conferred extensive powers upon the King in the matters of war and of the civil administration. This incensed still further the turbulent nobility, who saw the royal authority thrive at the expense of the privileges of their class. A conspiracy against the King's life was formed, the leaders being Counts Ribbing and Horn and General Pechlin. On the night of March 16, 1792, Gustavus was mortally wounded by their agent, Anckarström (q.v.), at a masked ball in the opera house which he had himself built. The pistol had been loaded with broken shot, which rendered the wound especially painful, and the King suffered the most dreadful agony for 13 days before his death. Gustavus was a man of varied learning, and the author of several dramatic works and poems of considerable merit. His writings have been published in a collective form both in Swedish and French. In 1788 Gustavus deposited certain papers in the library of Upsala, which excited much interest from the fact that they were not to be opened for 50 years after his death. Their publication, which was confided to Geijer (q.v.), disappointed the general expectation, as they were found to consist of historical notes and letters of little value. Consult: Bain, *Gustavus III and his Contemporaries, 1746-92* (London, 1894); L. Stavenow, *König Gustaf III* (Berlin, 1901); id., *Geschichte Schwedens, 1718-1772*, translated by C. Koch (Gotha, 1908); N. Erdmann, *Gustaf III* (Stockholm, 1907). See SWEDEN.

GUSTAVUS IV (GUSTAVUS ADOLPHUS) (1778-1837). King of Sweden from 1792 to 1809. He was the son of Gustavus III and was born Nov. 1, 1778. He succeeded his father on the latter's death, March 29, 1792. He was engaged to the daughter of Catharine II; but the Greek religion of the Russian princess was a bar to their marriage. By his father's will he was to be vested with the actual sovereignty at the age of 18. His uncle, the Duke of Sudermania, acted as regent during his minority. He was crowned King April 3, 1800. Gustavus rashly entered the coalition against Napoleon, and hatred of the Corsican became the guiding influence of his life. The result of his policy was the occupation of Swedish Pomerania by French troops under Marshal Brune, who took Stralsund and Rügen from the Swedes in 1807 and thus deprived them of the last of their German possessions. By this time all the patriotic Swedes had come to the conclusion that the King was insane. The King opened all his ports to English vessels and thereby involved himself in a war with Russia, which was then the ally of France. The scene of these hostilities was Finland, which was invaded and conquered by Russia in 1808, the Swedes being assisted by an English auxiliary force of 10,000 men. This unfortunate war with Russia, which had been excited entirely through the folly of the King, gave rise to so much discontent in Sweden that a conspiracy was set on foot by several officers and nobles, the object of which was to dethrone the unpopular monarch. He was seized in the palace at Stockholm, March 13, 1809, and made a prisoner, and the powers of government were assumed by the Duke of Sudermania. On May 10 the King was formally deposed by the Diet, and the crown forever denied to his descendants. The Duke of Sudermania was chosen King of

Sweden as Charles XIII. After wandering for a time from place to place, Gustavus finally settled at Saint-Gall, Switzerland, where he died, Feb. 7, 1837, in poverty, having refused to accept a pension from Sweden. His body was brought back to Sweden for burial. Consult: *Mémorial du colonel Gustafsson* (pseudonym) (Leipzig, 1829); Kleinschmidt, *Die Irrfahrten Gustavus IV Adolf von Schweden* (ib., 1888); Sophie Elkan, *An Exiled King, Gustaf Adolf IV of Sweden*, translated by E. Koch (2 vols., London, 1913).

GUSTAVUS (GUSTAF) V (GUSTAVUS ADOLPHUS) (1858-). King of Sweden, son of Oscar II and Queen Sophia Wilhelmina. He was born at Drottningholm, studied at the University of Upsala in 1877-78 and 1880, and traveled in most of the countries of Europe in 1878-79. He entered the army in 1875 and became lieutenant general in 1892. In 1881 he married Victoria (1862-), daughter of Frederick William Louis, Grand Duke of Baden; five sons were born—the Crown Prince, Gustavus Adolphus, in 1882. Gustavus was Regent during his father's absence in 1899-1900, and on Dec. 8, 1907, he succeeded to the throne of Sweden. The fear of Russian aggression led in 1914 to a great demonstration, or the yeoman's march to the King, in favor of increased armament. To a mass meeting of 40,000 peasants King Gustaf made a rousing speech, which was enthusiastically applauded. Nevertheless, the King had taken unconstitutional action by favoring a militaristic policy in opposition to his cabinet and by choosing a new cabinet in agreement with his views. These acts roused criticism among the Liberals and Socialists.

GUSTAVUS VASA, vā'sā. See GUSTAVUS I (GUSTAVAS VASA).

GÜSTROW, gū'strō. Capital of the circle of the same name in the Grand Duchy of Mecklenburg-Schwerin, situated on the Nebel, 22 miles south of Rostock (Map: Germany, E 2). Its chief public buildings are the thirteenth-century cathedral of St. Cecilia, restored in 1868; the parish church, dating from the sixteenth century and containing Flemish oil paintings and fine specimens of wood carving; a sixteenth-century castle with many towers; the town hall, and the theatre. Its gymnasium dates from the sixteenth century. Güstrow produces machines and other iron articles, tobacco, lumber, borax, dyes, vehicles, mattresses, dairy goods, bricks, wire rope, soap, sugar, and beer. The trade in grain, wool, butter, and cattle is especially important; an annual wool fair is held. Güstrow was founded in the thirteenth century and was for a long time the residence of different reigning houses. Pop., 1900, 16,882; 1905, 17,161; 1910, 17,805.

GUTENBERG, gō'ten-bĕrk, JOHANNES (c.1400-c.1468). The inventor of printing from movable types. He was born at Mainz, of the patrician family of Gensfleisch; the latest investigations tend to fix the date between 1394 and 1399. The name of Gutenberg was taken from a property long supposed to have been brought in by his mother, but discovered by recent researches to have been in the possession of his great-grandfather. The family was expelled from Mainz in 1420 and took refuge in Strassburg, where Gutenberg is found living in 1434, having already acquired some reputation for technical skill. He left Strassburg for Mainz in 1444. Attempts at printing were heard of in

various quarters: to carry out his own schemes, Gutenberg in 1450 associated himself with Johannes Fust, a wealthy citizen of Mainz, who supplied the money to set up a press and print the "forty-two-line" Bible. Fust dissolved the partnership in 1455 and, since Gutenberg could not repay his advances, retained possession of the plant, which he improved and used. In this manner, though Gutenberg was known as the inventor throughout the fifteenth century, it was possible to claim the honor for Fust in the sixteenth; but for a century past the Dutch Koster (q.v.) has been the only serious rival of Gutenberg, and the searching investigations carried on in 1900, in connection with the fifth centenary of his birth, have established Gutenberg's claims more firmly than ever.

His commercial success was never large. In 1465 the Archbishop Adolf, of Nassau, gave him a benefice, to which various privileges as well as an income were attached. He died at Mainz towards the end of 1467 or in the beginning of 1468. He has been honored by statues in various German towns, and in 1901 a Gutenberg museum was opened in his native town supported by a society also named after him. Consult: Van der Linde, *Gutenbergs Geschichte und Erfindung* (Stuttgart, 1878); Börckel, *Gutenberg* (Giessen, 1897); Hessels, *Gutenberg: Was he the Inventor of Printing?* (London, 1882); Meissner and Luthier, *Die Erfindung der Buchdruckerkunst* (Bielefeld, 1900); Zedler, *Gutenbergforschungen* (Leipzig, 1901); id., *Die älteste Gutenbergtype*, in the publications of the *Gutenberg-Gesellschaft* (Mainz, 1902).

GUTENBERG BIBLE. See BIBLE, CURIOUS EDITIONS OF.

GUTHE, gō'te, HERMANN (1825-74). A German geographer, born at Andreasberg in the Harz region, and educated at Clausthal (1839-45), Göttingen (1845-47), and Berlin (1847-48), where he was a pupil of Ritter. In 1849 he obtained an appointment as teacher in the Lyceum of Hanover, and subsequently he taught mathematics at the Polytechnic High School of the same city. In 1873 he was appointed to the chair of geography at the Polytechnic Institute, Munich. He died of the cholera. His geographical works include: *Die Lande Braunschweig und Hannover mit Rücksicht auf die Nachbargebiete geographisch dargestellt* (2d ed., 1887; 4th abridged ed., 1890); *Lehrbuch der Geographie für die mittleren und oberen Klassen höherer Bildungsanstalten* (6th ed., 1894 et seq.).

GUTHE, HERMANN (1849-). A German Semitic scholar. He was educated at Göttingen, at Erlangen, and (after several years as a private tutor) at Leipzig, where in 1884 he became professor of Old Testament exegesis. In 1881 and 1894 he traveled in Palestine; from 1877 to 1896 he edited the *Zeitschrift*, and from 1897 to 1906 the *Mitteilungen und Nachrichten*, of the German Palästina-Verein; and his published work was in the fields of philology and religion and of archaeology and topography, the more important titles being: *Ausgrabungen bei Jerusalem* (1883); *Palästina im Bild und Wort* (1883-84), with George Ebers; *Das Zukunftsbild Jesaias* (1885); some of the minor prophets in Kautzsch's translation of the Old Testament; a metrical version of Amos (1907), with Eduard Sievers; *Palästina* (1908); *Bibel-Atlas* (1911); *Geschichte des Volkes Israel* (3d ed., 1912).

GUTHE, KARL EUGEN (1866-1915). An American physicist. He was born at Hanover,

Germany, and was educated at the Hanover Technical School and at the universities of Strassburg, Berlin, and Marburg. Removing to the United States in 1892, he taught physics at the University of Michigan, where, after four years as professor at Iowa State College, he became professor in 1909 and dean of the Graduate Department in 1912. He was a member of the jury of awards at the St. Louis Exposition in 1904 and was vice president of the American Association for the Advancement of Science in 1908. He is author of a *Manual of Physical Measurements* (1902; 3d ed., 1912), with J. O. Reed; *Laboratory Exercises with Primary and Storage Cells* (1903); *Textbook of Physics* (1908; 2d ed., 1909); *College Physics* (1911), with J. O. Reed; *Definitions in Physics* (1913); and contributions on physics and electricity in scientific journals.

GUTHRIE, gŭth'ri. A city, until 1911 the capital, of Oklahoma, and the seat of Logan County, 31 miles by rail north of Oklahoma City, on Cottonwood and Cimarron rivers, and on the Atchison, Topeka, and Santa Fe, the Chicago, Rock Island, and Pacific, the Missouri, Kansas, and Texas, the St. Louis, El Reno, and Western, and the Fort Smith and Western railroads (Map: Oklahoma, D 3). It was founded in 1889, when the Territory was opened for settlement, and became the capital in 1890. Later occurred a spirited contest between Guthrie and Oklahoma City (q.v.), the rival cities both developing rapidly. Because of its fine climate and mineral waters with medicinal properties recently discovered, Guthrie has become popular as a health resort. Among its industrial establishments are cottonseed-oil and flouring mills, foundries, railway and machine shops, broom works, cotton compress, and cotton mills. The principal buildings include the Scottish Rite Temple, Carnegie library, the city hall, county courthouse, large municipal bathhouse, the Oklahoma University (Methodist Episcopal), Methodist Hospital, Guthrie Hospital, high school, and a Federal building costing \$250,000. Guthrie has adopted the commission form of government. The city owns and operates its water works. Pop., 1890, 5333; 1900, 10,006; 1910, 11,654; 1914 (U. S. est.), 11,011; 1920, 11,757.

GUTHRIE, CHARLES CLAUDE (1880-). An American physiologist. He was born at Gilmore, St. Charles Co., Mo., and graduated (M.D.) from the University of Missouri in 1901 and (Ph.D.) from the University of Chicago in 1908; taught physiology while engaged in advanced studies, and was professor of physiology and pharmacology at Washington University in 1906-09 and at the University of Pittsburgh after 1909. He is author of *Blood-Vessel Surgery and its Applications* (1912) and of contributions on blood reactions and alterations, resuscitation, cerebral and other anemias, isolated and engrafted tissues, and sutures and anastomosis of blood vessels.

GUTHRIE, FREDERICK (1833-86). An English physicist. He was born at Bayswater, London, and was there educated at University School and College. He then studied chemistry at Heidelberg and at Marburg, where he received the degree of Ph.D. He subsequently occupied positions at Owens College, Manchester, University of Edinburgh, and the Royal College, Mauritius. In 1869 Guthrie became connected with the Normal School of Science at South Kensington and lectured there until his death. His early ex-

perimental work was for the most part in chemistry, but later he took up physics, and two of his first papers in this field were on "Drops" and "Bubbles." In 1870 he discovered the phenomenon of the attraction of a vibrating tuning fork for a light suspended body near by, known as "Approach Caused by Vibration," and later investigated the thermal conductivity of liquids, stationary vibration of liquids in various shaped vessels, electrolysis, solution, and melting points. Guthrie was elected a fellow of the Royal Society of Edinburgh in 1859, and of the Royal Society of London in 1873, in which year he founded the Physical Society of London, whose president he became in 1884. His efforts in promoting and improving elementary science teaching were most successful, and he devised many simple methods and considerable apparatus for teachers which came into extended use in schools. He was an experimentalist rather than a mathematical physicist and was thoroughly practical in his teaching and investigations; he was also a student of the modern languages and a man of letters, having published, under the pseudonym of Frederick Cerny, a poem entitled *The Jew* (1863); *Elements of Heat and Non-Metallic Chemistry* (1868); *Magnetism and Electricity* (1875); *Introduction to Physics* (1877); and the *First Book of Knowledge* (1881).

GUTHRIE, GEORGE JAMES (1785-1856). An English surgeon, born in London of Scottish parents. He was admitted to membership in the Royal College of Surgeons in 1801. As army surgeon, he served in the Peninsular campaign, and his work there won the praise of the Duke of Wellington. In 1816 he began a series of lectures in surgery to the officers of the army and navy, which he continued for nearly 30 years. In 1824 he became a member of the council of the Royal College of Surgeons, of which he was three times president, and also professor in 1828-31. His principal works are: *On Gunshot Wounds of the Extremities Requiring the Different Operations of Amputation, and their After Treatment* (1814; 6th ed., 1855); *Lectures on the Operative Surgery of the Eye* (1823; 3d ed., 1838); *On the Anatomy and Diseases of the Urinary and Sexual Organs* (3d ed., 1843).

GUTHRIE, GEORGE WILKINS (1848-1917). An American publicist and diplomat, born in Pittsburgh, Pa. He graduated from the Western University of Pennsylvania (now University of Pittsburgh) in 1866, and from the law department of Columbia (now George Washington) University in 1869. After 1869 he practiced law at Pittsburgh, where he was candidate for mayor on the reform ticket in 1890 and was mayor in 1906-09. He was associate counsel for the Tilden electors in 1876, was active in the work of the National Municipal League, and was candidate for Lieutenant Governor of Pennsylvania in 1902. In 1913 President Wilson appointed him United States Ambassador to Japan.

GUTHRIE, JAMES (1792-1869). An American lawyer and politician, born near Bardstown, Ky., and educated at the academy in that town. He was engaged in the Mississippi River trade for several years, during which he made a number of trips down the river to New Orleans on flatboats, returning to Kentucky each time on horseback. He then studied and began practicing law at Bardstown, and removed to Louisville in 1820, on receiving his appointment as commonwealth's attorney. For 15 years consecutively

he served as a member of the State Legislature, for the last six years being a member of the Senate. In 1849 he was president of the State Constitutional Convention, and from 1853 to 1857 was Secretary of the Treasury in the cabinet of President Franklin Pierce. In 1860 he became president of the Louisville and Nashville Railroad. In 1860 he was a candidate for the presidential nomination at the Democratic National Convention at Charleston, S. C., but when the Secession movement began he took his stand as a staunch friend of the Union and contributed much towards keeping Kentucky in the Union. He was a delegate to the Chicago Democratic Convention in 1864, and from 1865 to 1868, when ill health compelled him to resign, was a member of the United States Senate. In 1866 he was a delegate to the National Union Convention at Philadelphia.

GUTHRIE, SIR JAMES (1859-). A Scottish genre and portrait painter, the chief leader of the Glasgow school. He was born at Greenock, near Edinburgh, the son of an eminent divine. After attending the University of Glasgow he studied painting, first at Edinburgh, and later in London under John Pettie, but his trend towards realism evinced his sympathy in other directions, and he learned most from independent study of nature. Mingling in the artistic life of Paris, he first attained recognition abroad, receiving awards at the Salons at Munich, and at Berlin. He was elected member of the Royal Scottish Academy in 1892 and its president in 1902, knighthood following; a member of the Société Nationale des Beaux-Arts; and honorary member of the royal academies of London, Dresden, and Munich. At first a painter of outdoor genre scenes, after 1890 he devoted himself chiefly to portraiture. Important among Guthrie's works are: "Mid-Summer," in the Edinburgh Museum; "A Burial in the Scottish Highlands" and two portraits, in the Glasgow Gallery; "Schoolmates," in the Ghent Gallery; and "Charles Barrie," in the Museum of Victoria, Australia. In America he is known chiefly through his contributions to the exhibitions of the Carnegie Institute, Pittsburgh. Probably the most able member of the Glasgow school, Guthrie is to be ranked in the forefront of British art in the early twentieth century. Eschewing the anecdote, he built his dignified art upon qualities chiefly of color, in which the influence of the Impressionists and of Whistler may be noted. Consult Martin, *The Glasgow School of Painting* (London, 1897), and Caw, *Scottish Painting, Past and Present* (Edinburgh, 1908).

GUTHRIE, SAMUEL (1782-1848). An American chemist, born at Brimfield, Mass. He studied medicine under his father, and later attended the University of Pennsylvania. During the War of 1812 he was an examining surgeon in the army. He was the first to produce percussion powder successfully and in 1831 discovered "chlorig ether," or chloroform (q.v.). His other inventions include the punch-lock, which superseded the flintlock, musket; and a process for rapid conversion of potato starch into sugar. Consult *Silliman's American Journal of Science and Art*, ii (New Haven, 1831-32).

GUTHRIE, THOMAS (1803-73). An eminent Scottish pulpit orator and philanthropist. He was born July 12, 1803, at Brechin, Forfarshire, where his father was a merchant and banker. He went through the curriculum for the ministry

at the University of Edinburgh and devoted two additional winters to the study of chemistry, natural history, and anatomy. Meanwhile he was licensed as a preacher by the Presbytery of Brechin in 1825. He subsequently spent six months in Paris, studying comparative anatomy, chemistry, and natural philosophy. Returning to Scotland, for two years he conducted the affairs of a bank agency in Brechin. In 1830 he became minister of Arbirlot, in his native county, and in 1837 was appointed one of the ministers of Old Greyfriars Parish in Edinburgh. In 1843 Guthrie joined the Free church and for years ministered to the large congregation of Free St. John's in Edinburgh. In 1847 he advocated ragged schools (q.v.), the first of which he himself established. He also earnestly exerted himself in many ways in opposition to intemperance and other prevailing vices. He retired from the ministry in 1864, and from that time until his death he was editor of the *Sunday Magazine*. Guthrie possessed great rhetorical talent, and his style abounded in illustrations. Of his many works, the most important are: *The Way to Life* (1862); *A Plea for Drunkards and against Drunkenness*, a pamphlet (1851); *A Plea for Ragged Schools*, a pamphlet (1847); followed by a second and a third plea (1848 and 1849), the latter with the former republished under the title of *Seed-Time and Harvest of Ragged Schools* (1860); *The City: Its Sins and Sorrows* (1857). His *Autobiography and Memoir* was published by his sons (London, 1874-75). For his life, consult Smeaton (London, 1900), and Brastow, *Representative Modern Preachers* (New York, 1904).

GUTHRIE, THOMAS ANSTEEY (1856-). An English author (pseudonym, F. ANSTEEY), born at Kensington. After graduating at Cambridge, he was called to the bar in 1880. His works include: *Vice Versa* (1882), which was successfully dramatized: *The Black Poodle* (1884); *The Tinted Venus* (1885); *The Fallen Idol* (1886); *The Pariah* (1889); *The Traveling Companions* (1892); *Under the Rose* (1894); *Lyre and Lancelet* (1895); and *Paleface and Redskin* (1898, 1912). *The Brass Bottle* (1900), subsequently dramatized, *Baboo Jabberjee B.A.* (1897), and *A Bayard from Bengal* (1902) are humorous yet truthful studies of the East Indian with a veneer of English civilization. Later books are *Only Toys* (1903) and *Salted Almonds* (1906).

GUTHRIE, WILLIAM DAMERON (1859-). An American lawyer and educator. He was born in San Francisco, Cal., and was educated in Paris, in England, and at the Columbia Law School (1879-80). In his practice before the United States Supreme Court he argued the income tax, California irrigation, Illinois inheritance tax, oleomargarine, and Kansas City stockyards rate cases. He was Storrs lecturer at Yale University in 1907-08 and became Ruggles professor of constitutional law at Columbia University. Besides his contributions to periodicals on legal and political subjects, he is author of *Lectures on the Fourteenth Amendment to the Constitution* (1898) and *Introduction to American Constitutional Law* (1913).

GUTI, and GUTIAN DYNASTY. See **BABYLONIA.**

GUTIÉRREZ, A. GAROÍA. See **GAROÍA-GUTIÉRREZ.**

GUTIÉRREZ, gū-tyār-rās, SANTOS (1820-72). A Colombian soldier and politician, born in Cocui, State of Boyacá. Having studied law, he entered practice in 1839. He successively filled a number of judicial, civil, and military positions, both provincial and national. Of Liberal views, he combated the dictatorship of Melo in 1854, and in the revolution of the Liberals, in 1850-63, he was one of the leading generals, winning a number of important battles. He then served as a member of the national Congress, Governor of Boyacá, national senator, and Minister of Foreign Relations. After the deposition of President Mosquera, in 1868, Gutiérrez was elected President for a term of two years, at the close of which he retired to private life.

GUTIÉRREZ DE LA CONCHA, JOSÉ, MARQUÉS DE LA HABANA. See CONCHA, JOSÉ GUTIÉRREZ DE LA, MARQUÉS DE LA HABANA.

GUTIÉRREZ DE LA CONCHA, MANUEL, MARQUÉS DEL DUERO. See CONCHA, MANUEL GUTIÉRREZ DE LA, MARQUÉS DEL DUERO.

GUT MANUFACTURE. See CATGUT; GOLD-BEATER'S SKIN.

GUTNIC, gū't'nik, or **GUTNISH**. The dialect of the island of Gotland in the Baltic, forming, with Swedish and Danish, the philological group known as East Norse. It is preserved in runic inscriptions extending from the seventh to the sixteenth century and also in several fourteenth-century manuscripts.

GUTSCHMID, gū't'shmīt, ALFRED VON (1831-87). A German historian, born at Loschwitz, near Dresden. He was educated at Leipzig and Bonn and held the chair of history at the universities of Kiel, Königsberg, Jena, and Tübingen. His writings, mostly on the history of Greece and Persia and on ancient chronology and annals, include *Untersuchungen über die Geschichte des Königreichs Osroëne* (1887) and *Geschichte Irans und seiner Nachbarländer von Alexander dem Grossen bis zum Untergang der Arsaciden* (1888).

GUTSMUTHS (written GUTSMUTHS), gūts'mūts, JOHANN CHRISTOPH FRIEDRICH (1759-1839). A German pedagogue and author of the first modern manuals of physical education. He was born at Quedlinburg and after three years in the University of Halle became preceptor in the parental home of the renowned geographer Karl Ritter, upon whose development GutsMuths exercised a powerful influence. He subsequently became instructor in various branches, but more especially in geography, the French language, and gymnastics, in Salzmann's newly established educational institution at Schnepfenthal, where he remained from 1785 until his death. Besides his activities in the field of physical education, he did much to systematize the study of geography and to make it interesting. His most important books were *Gymnastik für die Jugend*, the first modern handbook of gymnastics (1793; 2d ed., much changed, 1804), and *Spiele zur Übung und Erholung des Körpers und Geistes* (1796). Reprints, translations, or abridgments of the former, or compilations based upon it, appeared in Denmark, Sweden, Holland, France, Austria, Italy, Greece, England, and the United States. In the English translation the work is attributed to Salzmann! Besides other books on gymnastics, swimming, and mechanical vocations (manual training), he wrote numerous

books devoted to geography and edited and published the *Bibliothek der pädagogischen Literatur* (1800-20).

GUTTÆ (Lat., drops). Pendent ornaments attached to the underside of the mutules (q.v.) and to the *regulæ* under the triglyphs (q.v.) of the Doric order. (See COLUMN.) They are in the form of the frustum of a cone or are cylindrical. They are obviously a reminiscence in stone of pegs or nails, which had a practical purpose in the wood and clay structures from which the Doric style was developed, but in the stone buildings have become merely ornamental.

GUTTA-PERCHA (Malay *gatah*, gum + *percha*, name of a tree). A substance in many respects similar to caoutchouc and consisting of the dried milky juice of certain trees and climbers, the best being obtained from the *Isonandra gutta*, which is found in the Peninsula of Malacca, the Malayan Archipelago, and the Philippines. The tree belongs to the natural order Sapotaceæ. It is a very large tree, the trunk being sometimes 3 feet in diameter, although it is of little use as a timber tree, the wood being spongy. The leaves are alternate, on long stalks, obovate oblong, entire, somewhat leathery, green above, and of a golden color beneath. The flowers are in little tufts in the axils of the leaves, small, each on a distinct stalk, the corolla having a short tube and six elliptical segments; they have 12 stamens and one pistil. Other trees producing good gutta are found in Cochinchina, Venezuela, Costa Rica, and Australia. In 1860 vast forests of gutta-percha trees were found in Guiana, and many varieties of the tree flourish in the luxuriant forests of Brazil. An inferior quality is obtained from trees and climbers in Africa and Madagascar. There is also a variety known as *caoutchouc gutteux*, which combines many of the characteristics of gutta-percha and India rubber. The gutta-percha of commerce, which dates from 1843, when specimens were first sent to London from Singapore, comes chiefly from the Sunda Islands, Cochinchina, Cambodia, and Hindustan, Singapore being the chief shipping port. The different varieties on the market are designated by the place where they grew, the best being that coming from Macassar and Sarawak.

The present mode of obtaining the gutta-percha is a most destructive one, and attempts are being made in many countries to regulate by legislation the collection of the juice providing for the tapping of the standing trees. Ordinarily the finest trees are selected and cut down, and the bark stripped off; between the wood and bark a milky juice is found, which exudes and is scraped up into little troughs made of plantain leaves. The milk, as it flows from the tree, is snow white, but darkens on being exposed to the air. Like rubber, a thick cream forms on the top of the milk when allowed to stand and coagulate by gentle beating. This is removed, molded into cakes, and thrown into boiling water, from which it emerges ready to be shipped. Professor Jungfleisch of Paris has found that the leaves, whether fresh or dry, will yield to solvents like toluene from 9 to 10 per cent of an excellent quality of gutta-percha, and this has greatly improved the supply and will prevent the wasteful sacrifice of the trees.

It is imported in blocks and lumps of 5 to 10 pounds' weight, in various forms—chiefly large cakes or rounded into gourdlike lumps. It has a very light, reddish-brown, or almost a

flesh color, and is full of irregular pores elongated in the direction in which the mass has been kneaded. It has a corklike appearance when cut and a peculiar cheeselike odor. Before it can be used it has to undergo some preparation. This consists in slicing the lumps into thin shavings, which are placed in a deviling or tearing machine revolving in a trough of hot water. This reduces the shavings to exceedingly small pieces, which, by the agitation of the tearing teeth, are washed free from many impurities, especially fragments of the bark of the tree. These, if not separated, would interfere with the compactness of its texture, which is one of its most important qualities. The small fragments, when sufficiently cleansed, are kneaded into masses which are rolled several times between heated cylinders, which press out any air or water and render the mass uniform in texture. It is then rolled between heated steel rollers into sheets of various thickness for use, or is formed into rods, pipes, or tubes. Hollow tubes are made in a machine similar to that which is used for making macaroni. Sometimes *caoutchouc guttux* is mixed with the gutta-percha to make it more supple, or India-rubber to make it more elastic or possess other properties. Pigments as desired may be incorporated.

Gutta-percha was early turned by surgeons to various uses, chiefly for splints and covering moist applications to retard evaporation. A splint of gutta-percha is made by taking a rigid board of the substance cut to the desired shape, soaking it in hot water, and then bandaging it to the limb. In a few minutes the gutta-percha is found hard and modeled to the shape of the parts. Gutta-percha being readily soluble in chloroform, such a solution is sometimes used for covering raw surfaces, as, when the chloroform evaporates, it leaves a pellicle of solid gutta-percha. It is also used extensively in dentistry. It softens in warm water and can be molded into any form in that state, as when soft it is not sticky and turns well out of molds. It will always be of great value as a material in which to take casts, as it can in the soft state be made to take the sharpest forms most faithfully; and as it quickly becomes hard and preserves its shape, if not too thin, the range of its utility in this respect is very extensive.

The covers of golf balls are made of gutta-percha, and for this purpose the material is hardened by the removal of the resin.

Payen, after purifying gutta-percha by evaporation of its solution in carbon disulphide, succeeded in 1852 in separating it into three proximate principles: *gutta* (insoluble in both cold and boiling alcohol), 78 to 82 per cent; *fluavile* (soluble in cold alcohol), 4 to 6 per cent; *albane* (soluble in boiling alcohol), 14 to 16 per cent; but these substances are now thought to be mixtures rather than a single compound. In 1892 Oesterle discovered in gutta-percha a fourth constituent, guttane. The composition of gutta is $C_{20}H_{32}O_2$, that of fluavile is $C_{20}H_{32}O$, and of albane, $C_{20}H_{32}O_2$.

Gutta-percha is supple, flexible, and very tenacious and extensible, so that it may be drawn out to many times its length and retain almost all the extension. It is insoluble in water and dilute acids; it resists alkalis and hydrofluoric acid, so that the latter may be contained in bottles or other receptacles made of or coated with gutta-percha. The most important application of gutta-percha is for the insulating coating

of submarine conductors. While it oxidizes and becomes brittle when exposed to air, under water, as in the ocean cables, it is unchanged. Its value arises from the ease with which it can be worked and its being so complete a nonconductor of electricity. Its nonconducting power is not modified by burying it in the ground or plunging it in fresh or salt water, and it does not absorb water. Gutta-percha, specially selected and prepared, is used as an insulating material in more than 250,000 miles of ocean cables, and the weight thus employed is estimated in excess of 32,000 tons, not to mention the amount used on land lines stated at 8000 tons. It is its successful application to this purpose that made the extensive development of submarine telegraphy possible. From the time when Morse laid his telegraph line in New York harbor from the Battery to Governor's Island, in 1842, using an insulated copper cable, the promoters of submarine telegraphy began to seek for a suitable insulating material. At the same time Montgomerie was independently studying the properties of gutta-percha, and it was suggested by Wheatstone, who was unable to put the idea into practice, that it would be a suitable insulating covering for a submarine conductor. This was successfully accomplished about 1848.

Gutta-percha differs very materially from caoutchouc, or india rubber, in being nonelastic or elastic only in a very small degree. Notwithstanding this very striking character of caoutchouc, the two articles are often confounded in the public mind, probably from the similarity of their applications. India rubber is displacing gutta-percha in some of its most important applications and especially in the coating of both land and marine telegraph cables. See TELEGRAPH, SUBMARINE.

The amount of gutta-percha produced in the world is declining. In 1890 it was estimated at 4,500,000 kilograms, in 1901 at 2,400,500 kilograms, and in 1913 at 2,300,000 kilograms. The amount of unmanufactured gutta-percha imported into the United States reached a maximum in 1911, when, 1,648,921 pounds, valued at \$390,548, entered the country. In 1913 these amounts were 480,853 pounds and \$167,313. Manufactures of gutta-percha imported were valued as follows: 1910, \$80,567; 1911, \$61,283; 1912, \$41,098; 1913, \$77,300. In 1910, 97,000 hundredweight of gutta-percha, valued at £1,130,000, were imported into the United Kingdom.

Dr. Eugen Obach, *Die Gutta-percha* (Dresden, 1899); M'Intosh, *India-Rubber and Gutta-Percha*, from the French of Seeligmann and Tonilhon (London, 1903; 2d ed., 1910); Clouth, *Rubber, Gutta-Percha, and Balata* (New York, 1903); Pearson, *Crude Rubber and Compound Ingredients* (2d ed., New York, 1909).

GUTTA ROSEA (Lat., red drop). A very old term used to denote a cutaneous eruption sometimes popularly called "toddy blossoms" from its frequent occurrence in aged drunkards. It is really a form of acne. (See ACNE.) Gutta rosea febrilis is a condition of the nose in certain malignant fevers when that organ becomes purple, swollen, and pustular. It was considered a fatal symptom. Gutta rosea herpetica was applied to eczema of the nose, accompanied by itching, formation of pimples, and blisters, and scaling of the skin. Gutta rosea leprosa was applied to leprosy of the face with pustules. Gutta rosea syphilitica was applied to the corona

venerea, or row of papules and pustules appearing on the forehead of a syphilitic patient.

GUTTA SERENA (Lat., serene drop). An old name for a form of complete blindness. See AMAUROSIS.

GUTTATION. Plants growing in an atmosphere so humid that it is at or near saturation often exude liquid water that, issuing from water pores near the ends of the veins, form drops at the tips or at the marginal teeth. This process is known as guttation and may be observed in the early morning on grass, on grain seedlings, on cabbage, and many other plants. It is also evident on the mycelium of many fungi growing under moist conditions. Guttation is supposed to prevent the infiltration of the aerial system of the plant with water, with the consequent retardation of the process of food synthesis.

GUTTE. See GUTTY.

GUTTENBERG, güt'en-berg. A town in Hudson Co., N. J., 10 miles northeast of Jersey City on the Hudson River (Map: New Jersey, E 2). It has stone quarries, a lard refinery, and embroidery and pearl button factories. Pop., 1900, 3825; 1910, 5647.

GUTTENBRUNN, güt'en-brun', ADAM MULLER. See MULLER-GUTTENBRUNN.

GUTTER (OF. *gutiere*, Fr. *goutière*, from OF. *gote*, Fr. *goute*, drop, from Lat. *gutta*, drop). An open horizontal channel for conveying water from buildings, roads, etc. The Greeks used gutters at the eaves of their buildings, hollowed out of the stone which formed the cornice. These gutters discharged their contents on the ground at intervals through small gargoyles (q.v.), usually in the shape of lions' heads. The Romans followed this example and also formed gutters with tiles laid in cement. In the Middle Ages the eaves of secular buildings were often gutterless, except where it was found desirable to collect the rain water into cisterns. In ecclesiastical architecture it was necessary to convey the water from the roofs with great care, so as to prevent damage to the vaulting under the roof as well as to lower parts of the building. It was collected at the eaves of the central roof, thence conveyed to channels formed in the crest of the flying arches, and finally thrown off through gargoyles in each buttress, in a number of small streams, to the ground. Later, lead pipes were used to carry the water to the side-aisle roofs and still later to convey it directly to the ground and discharge it into open gutters. Pipes conveying the water to the base of the building were first employed in England, where they seem to have come into use during the fourteenth century, especially in secular buildings. They were formed with great taste and had ornamental cups or cisterns at the top to receive the water from the mouth of the gargoyle. They were then made square in form, not circular, as they usually now are. Such vertical pipes are called *leaders* or *conductors*, not gutters. In modern building the roof gutters are commonly of metal—copper in fine work, galvanized iron or tin in common work—or even of wood (cedar or cypress) in cottages and cheap buildings. The stone gutters of monumental buildings are often lined with metal to assure their water-tightness.

GUTTER POINT. The greatly elongated tip of foliage leaves not uncommonly seen in plants native to the rainy tropics. This facilitates the run off of the rain water that might otherwise

flood the stomata and check the gas exchanges necessary for photosynthesis.

GUTTY, or **GUTTE** (OF. *gouté*, *gotié*, spotted, from Lat. *guttatus*, spotted, from *gutta*, spot). In heraldry, a term used to describe a particular charge on a field, covered with drops. When the drops are red, they are supposed to represent drops of blood. In this case some great suffering or labor, such as fighting for the recovery of the Holy Land, is supposed to be indicated. Where the drops are blue, they represent tears. Where white, they are called drops of water; but it is possible that tears are intended in this case also, and that repentance or penitence is signified by both. A field or charge may be also *gutté de vert*, or green, to represent oil; *gutté de pois*, or black, to represent pitch; etc. See HERALDEY.

GUTZKOW, guts'kō, KARL (1811-78). A distinguished German novelist and dramatist, born in Berlin. He studied theology and philosophy in Berlin and early contributed to literary journals. He subsequently studied law and political sciences at Heidelberg and Munich, but devoted himself exclusively to literature. His early fiction is satirically skeptical, as is implied in the title of his first significant novel, *Wally, die Zweiflerin* (1835), for whose doctrines of free thought and free love he was imprisoned and all his writings forbidden, and others of his stripe, with the usual result of making them widely popular. This work is usually taken as the starting point of the so-called school known as Young Germany, literary reformers heralding the democratic upheaval of 1848. After his release from prison Gutzkow went to Hamburg and published four great dramas: *Richard Savage* (1839); *Zopf und Schwert* (1844); *Das Urbild des Tartüffe* (1847); *Uriel Acosta* (1848); and others of less merit. In 1847 he went to Dresden as director of the Court Theatre (till 1850) and wrote two remarkable political novels, *Die Ritter vom Geiste* (9 vols., 1850-52) and *Der Zauberer von Rom* (9 vols., 1859-61). From 1852 to 1862 he edited the family weekly *Unterhaltungen am häuslichen Herd*. In 1864 he had an attack of insanity, and though after his recovery he continued to write voluminously, he never regained his power. Gutzkow's strong controversial purpose obscured his artistic genius, but his work has profoundly influenced the popular thought of modern Germany and gives one of the best pictures we have of the intellectual life and the social struggle of his generation and nation. His complete works appeared, 1873-78, in 32 volumes. Consult: Pröls, *Das junge Deutschland* (Stuttgart, 1892); Frenzel, *Erinnerungen und Strömungen* (Leipzig, 1890); Houben, *Studien über die Dramen Gutzkows* (Jena, 1899); Caselmann, *Karl Gutzkows Stellung zu den religiös-ethischen Problemen seiner Zeit* (Augsburg, 1900); J. Dresch, *Gutzkow et la jeune Allemagne* (Paris, 1904); H. H. Houben, biographical introduction to Gutzkow's selected works (Leipzig, 1908); Bernhard Rieffert, *Karl Gutzkows Stellung zur Romantik* (Münster, 1908); Paul Weiglin, *Gutzkows und Laubes Literaturdramen* (Berlin, 1910).

GÜTZLAFF, gützláf, KARL F. A. (1803-51). A missionary, historian, and author, born at Pyritz, Pomerania. In the service of the Netherlands Missionary Society he studied Chinese at Batavia (1826-28). Severing his connection with the Missionary Society, he went to Singapore and a few months later to Siam, where he en-

gaged in translating the Scriptures into Siamese. His wife dying in 1831, he went to Macao, where, and later at Hongkong, he assisted Morrison (q.v.) and Medhurst (q.v.) in translating the Bible into Chinese and was incessantly active in gospel labors. In personal appearance Gützlaff was so like a native that he was able to pass for one when traveling in the costume of the country. His influence as physician and preacher was magnetic. He served for a while as interpreter to the British government, assisting in the peace negotiations of 1842. He was especially active in raising up a native ministry and in diffusing information in Chinese. He made many voyages in countries near China. On his visit to Europe his powerful addresses inspired many young men to enter upon Eastern careers, among them G. F. Verbeck (q.v.), Japan, and Sir Harry Parkes (q.v.), China. Consult his *Journal of Three Voyages along the Coast of China, with Notices of Siam, Corea, and the Loo Choo Islands* (New York, 1833); *Chinese History* (2 vols., London, 1834); *China Opened* (rev. by the Rev. Andrew Reed, 2 vols., ib., 1838; a German edition of this work was also published, Stuttgart, 1847); *Life of Taou-Kwang, Late Emperor of China* (1851), besides many learned contributions to periodicals. He died at Hongkong. One of the ablest and most efficient men in the opening of the East, his services have received scant recognition. A biography of Gützlaff by Gaßman, *Gützlaff der Missionar der Chinesen*, was brought out at Duisburg in 1850.

GUY, THOMAS (c.1645-1724). An English philanthropist, the founder of Guy's Hospital (q.v.) in London. After serving as apprentice to a bookseller for eight years, he began business for himself on a capital of £200; he dealt largely in Bibles, which at first he imported from Holland. Later he became printer to the University of Oxford, and it was largely owing to him that the universities were able to beat the King's printers, who were trying to drive them out of the publishing business. He was a member of Parliament from 1695 to 1707. In 1678 he gave his first public charity—an almshouse at Tamworth for the accommodation of six poor women. Five years later he enlarged this almshouse so that it could accommodate 14 men and women. He gave generously to the poor, to release insolvent debtors, and to start young men in business. To relieve the overcrowded condition of St. Thomas's Hospital, he built three new wards, and then, having acquired a great fortune by the rise of South Sea stock, applied a large part of it to building the hospital which bears his name. Consult *A True Copy of the Last Will and Testament of Thomas Guy, Esq.* (London, 1725).

GUYAU, gé'yó', JEAN MARIE (1854-88). A French philosopher, born at Laval. His ill health did not lessen his activity, and he produced much before his early death. A critic rather than a constructive scholar, he still advanced the theory that altruism is not artificial, but instinctive—a particularization of psychological law that instinct tends to be destroyed or diminished as it becomes conscious; and, in ethics, he held that "I can, therefore I must," is a truer characterization than "I must, therefore I can." Besides contributions to the *Revue des Deux Mondes* and the *Revue Philosophique*, he wrote: *Vers d'un philosophe* (1881); *La morale anglaise contemporaine* (1885); *Esquisse*

d'une morale sans obligation ni sanctions (2d ed., 1890); *L'Irréligion de l'avenir* (1887); *Éducation et hérédité* (1889); *La genèse de l'idée du temps* (1890). Consult the essay in Royce, *Studies of Good and Evil* (New York, 1898); Lambert, "L'Œuvre sociologique de Guyau," in the *Revue Internationale de Sociologie*, vol. viii (Paris, 1901); G. Aslan, *La morale selon Guyau* (ib., 1906); M. Weisner, *Jean Marie Guyaus Philosophie der Moral* (Heidelberg, 1910).

GUY DE MAUPASSANT, gè de mô'pá'sän'. See MAUPASSANT.

GUY D'HARDELOT. See HARDELOT, GUY D'.

GUY FAWKES, gí faks. An English conspirator. See FAWKES.

GUY (gi) MAN'NERING. A novel by Walter Scott (1815).

GUY OF AREZZO, á-rét'só. See GUIDO D'AREZZO.

GUY, or GUIDO (gwé'dó), **OF LUSIGNAN**, lú'zé'nyän' (?-1194). King of Cyprus and Jerusalem. He was the son of Hugo VIII of Lusignan, the head of that family in Poitou. During a journey to the Holy Land he married Sibylla, the daughter of Amahric, or Amaury, King of Jerusalem (1180), was Regent from 1182, and became King himself upon the death in 1186 of Baldwin V, Sibylla's son by her first husband, the Marquis of Montferrat. In a war which ensued with Saladin he was defeated and taken prisoner at the battle of Tiberias, or Hattin (1187). In 1190, after the death of Sibylla, the crown passed to Conrad through his wife Isabella. He was not kept long in captivity and resumed operations against the Moslems, laying siege to Acre in 1189. Richard I of England in 1192 transferred to Guy the island of Cyprus (1192), where he reigned until his death. He was succeeded by his brother, Amaury, Count of Jaffa. Consult Röhrich, *Geschichte des Königreichs Jerusalem* (Innsbruck, 1893).

GUY OF WARWICK, wör'ík. The hero of a popular English legend. Guy is represented as the son of Siward of Wallingford. Becoming page to Rohand, Earl of Warwick, he falls in love with the Earl's daughter, named Felice, who declines to marry him until he has proved his knighthood. To this end he makes two expeditions to the Continent, going as far east as Constantinople. He returns to England, slays a dragon, marries Felice, and departs for the Holy Land. Returning to England just at the time when Athelstan is besieged by the Danes at Winchester, he slays in single combat Colbrand, a terrible giant in the Danish army. He retires to a hermit's cell, where he dies. Scholars have attempted to find at the basis of the legend some historical incident. The fight between Guy and the giant has been doubtfully identified with the battle of Brunanburh (937) between Athelstan and Anlaf the Dane. While this is hardly more than conjecture, it is generally agreed that the legend rests upon English traditions of the tenth and eleventh centuries. It was given literary form by an Anglo-Norman poet of the twelfth century, and from French it passed into English (fourteenth century). From that time on, the story, implicitly believed in all its details, was extremely popular, as is indicated by several Middle English versions. It was printed by William Copland (middle of the sixteenth century); versified incidents from it were recited by minstrels; it was dramatized by Day and Dekker in collaboration; and, reduced to a chap-

book, it circulated widely throughout the eighteenth century. Samuel Pegge, in 1781, first showed the unhistorical character of the legend. Consult: Zupitza, *Zur Litteraturgeschichte des Guy von Warwick* (Vienna, 1873); manuscripts of the Middle English versions edited by him for the Early English Text Society (London, 1875-76, 1888-92); *Speculum Guy de Warewyke*, edited by Morrill for the same society (London, 1898); M. L. A. Deutschbein, *Studien zur Sagen-geschichte Englands* (Cöthen, 1900).

GUYNON, gè'on', JEANNE MARIE BOUVIER DE LA MOTTE- (1648-1717). A French writer on mystical subjects. She was born of noble parents at Montargis, April 13, 1648. She wished to enter a convent, but her parents prevailed upon her when not quite 16 to marry Jacques de la Motte-Guyon, who was 22 years her senior and at first had no sympathy with her extreme mystical tendencies. Before his death, in 1676, he learned to appreciate her goodness. A widow at 28 with five children, she devoted herself to their education for several years. Later she moved to Paris, where, as an attractive wealthy widow, she had many suitors. About 1680, after settling most of her fortune on her children, she went to Geneva for religious work. At this time she fell into melancholic depression, from which her spiritual director, Père Lacombe, aroused her. Madame Guyon followed in her director's footsteps and wrote a *Short and Easy Method of Prayer* (rev. trans., London, 1902), besides commentaries on the Scriptures, which brought her under ecclesiastical censure. While protesting submission, she continued to write and teach as before. Her life after this is a series of persecutions for her religious ideas. She was accused of laying too much stress on faith and the quietude of contemplation rather than good works in the Christian life. Shut up by a royal order in the convent of the Visitation (1688), she was set free by the influence of Madame de Maintenon, and through her obtained entrance into the highest circles of the French nobility. Fénelon, convinced of her personal goodness, allowed himself to be led into a false position in her defense. (See FÉNELON.) Politics became a factor in her condemnation and the severity of her sentence. For a time Madame Guyon was confined in the Bastille, but her virtuous character was acknowledged by the assembly of the French clergy in 1700. She was released from prison, however, only in 1702 and then was banished. She passed the rest of her life in retirement at Blois, where she died June 7, 1717, professing absolute faith in the Roman Catholic church and its dogmas. Her life has attracted attention partly because of Fénelon's interest in her and partly because of her persecution by the Church authorities. See seems to have been neurotic and hysterical, but the imputations made against her moral character because of her relations to Père Lacombe are undoubtedly groundless. Her religion was the form of mysticism called quietism (q.v.).

Consult: *Œuvres spirituelles de Mme. Guyon* (42 vols., Cologne, 1713-22); Guerrier, *Mme. Guyon, sa vie, sa doctrine, son influence* (Paris, 1881); Upham, *Life, Religious Opinions and Experiences of Mme. Guyon* (New York, 1847). For her spiritual life, the best work to consult is *La vie de Mme. J. M. B. de la Motte Guyon écrite par elle-même* (3 vols., Cologne, 1720). This was probably not composed by herself as it now exists, but is a compilation of documents

left by her. The most complete translation is *Autobiography of Madame Guyon* (2 vols., St. Louis, 1897). There is a *Récueil de poésies spirituelles* (5 vols., Amsterdam, 1689). Some of these have been translated by the English poet Cowper. Consult her *Spiritual Torrents* translated by Marston (London, 1908), and M. Masson, *Fénelon et Madame Guyon* (Paris, 1907).

GUYON, gi'on, RICHARD DEBAUFRE (1813-56). A general in the Hungarian army in the revolution of 1848-49. He was born at Wolcott, near Bath, in England. After fighting against Dom Miguel in Portugal, Guyon entered the Austrian service in 1832 and was among the first to offer his services to the Hungarian government in 1848. He fought with great distinction at Schwechat (Oct. 30, 1848) and Tyrnau (December 14), and in February, 1849, as a commander of a division in Görgey's army, carried the mountain pass of Branyiszko. When in April, 1849, the garrison of the besieged fortress of Komorn was to be apprised of the victorious approach of the national army, Guyon, with a detachment of hussars, cut his way through the enemy's lines and entered the town. He was made a general for this service. He took Arad, July 1, and shared in the victory of Hegyes and in the disasters of Szüreg and Temesvár. After the last battle Guyon escaped to Turkey, and entered the service of the Sultan as a lieutenant general. Under the name of Kurshid Pasha he was Governor of Damascus, and at the beginning of the Crimean War did much to organize the Army of Kars. He died at Constantinople.

GUYOT, gé'ot, ARNOLD (1807-84). A Swiss-American geographer and geologist, born near Neuchâtel, Switzerland. He studied at the College of Neuchâtel and the University of Berlin, from 1835 to 1839 was a private tutor in Paris, and from 1839 to 1848 professor of history and physical geography in the College of Neuchâtel. In 1848 he settled at Cambridge, Mass., in the same year gave a series of lectures at the Lowell Institute, Boston, from 1848 to 1854 was in the service of the Massachusetts State Board of Education as a lecturer, and from 1855 until his death was professor of physical geography and geology in Princeton. He also held a lectureship in Princeton Theological Seminary from 1861 to 1866. In 1838 he made one of the earliest scientific investigations regarding glaciers, and in a paper submitted in that year to the Geological Society of France was the first to proclaim and account for the laminated structure of the glacial ice. He perfected a system of meteorological observations for the United States from which the present Weather Bureau was derived; made barometric surveys of the Appalachian Mountain chain, and prepared *Meteorological and Physical Tables* (1852; rev. ed., 1884), a collection that has been very extensively used. He also did much for the study of geography in America through the preparation of series of textbooks and wall maps, for which he obtained a medal of progress at the Vienna Exhibition of 1873. In addition to numerous papers, contributed to the *American Journal of Science*, the reports of the American Association for the Advancement of Science and the Smithsonian Institution, and other periodicals, he published *Earth and Man* (1853; the Lowell Lectures, trans. by C. C. Felton); *A Treatise on Physical Geography* (1873); *Memoir of Louis Agassiz* (1883); *Creation, or the Bible Cosmogony in the Light of Modern Science* (1884). A

sketch of his life is given by Dana in the *Biographical Memoirs of the National Academy of Sciences* (vol. ii Washington, 1886), which contains a complete list of Guyot's writings.

GUYOT, YVES (1843-). A French politician and publicist, born at Dinan (Côtes-du-Nord) and educated at Rennes. After a career as a journalist, and as a member of the Radical party in the Chamber of Deputies, he was appointed Minister of Public Works in the Tirard cabinet (1889) and retained this portfolio in the Freycinet ministry (1890-92). He became known as a champion of commercial and industrial freedom and an opponent of protectionism and of Socialism, especially of the Socialistic government ownership theory. M. Guyot took a prominent part in the discussion over the Dreyfus affair. In association with A. Raffalovitch he published a *Dictionnaire du commerce, de l'industrie et de la banque*. His works include: *Études sur les doctrines sociales du christianisme* (2d ed., 1881); *La science économique* (2d ed., 1887); *La tyrannie socialiste* (1893); *Les conflits du travail et leur solution* (1903); *Le commerce* (1908); *La gestion par l'Etat* (1913), translated and published in New York City (1914) as *Where and Why Public Ownership has Failed*; *L'industrie et les industriels* (1914).

GUYSBOROUGH, gīz'būr-ō. A seaport town, capital of Guysborough Co., Nova Scotia, Canada, on Chedabucto Bay, 61 miles east-southeast of Pictou (Map: Nova Scotia, H 3). It has a fine harbor, and there is steamer communication with Mulgrave. Fishing is the leading occupation. There are also lumber and wood-carving industries and manufactories of carriages and barrels. Guysborough was founded in 1783. Pop., 1901, 1,411; 1911, 1,218.

GUYSE, gīz, JOHN (1680-1761). An English Presbyterian divine. From 1727 till his death, Nov. 22, 1761, he was a preacher in London. He is remembered for his *Practical Expositor, an Exposition of the New Testament in the Form of a Paraphrase* (London, 1739-52), frequently republished and reprinted and once very popular.

GUY'S HOSPITAL, Southwark, London. An institution founded by Thomas Guy (q.v.), a London bookseller, who leased from the governors of St. Thomas's Hospital a large piece of ground for a term of 999 years, at a ground rent of £30 a year. The building was begun in 1722, and the hospital admitted its first patient in 1725, a few days after the death of its founder, who bequeathed £219,499 to endow it. In 1829 William Hunt bequeathed to the hospital £180,000, and additional bequests have since been received. The number of beds has been increased from 400 to 618. The yearly average of patients is over 9000; the out-patients relieved numbered, in 1913, 120,988, with a maternity service of 3195. The annual income in 1912 was £61,862 in addition to £14,330 in legacies. A library and valuable museum are attached to the hospital. New wards were built in 1882 and a chemical laboratory in 1872. Additional laboratories were added in 1893. Students enter the hospital medical school and pay annual fees. Guy's confers no degrees. Sixty students besides the house staff are lodged in the residential building. There is also a dental school (Guy's Hospital Dental School) in conjunction with the medical college and affiliated with the University of London. In the chapel is a fine marble statue of Guy by Bacon. Sir Astley Cooper, the emi-

nent surgeon, is buried in the chapel. Consult Wilks and Bellamy. *History of Guy's Hospital* (London, 1893).

GUYTON DE MORVEAU, gē'tōn' de mōr'vō, **LOUIS BERNARD, BARON** (1737-1816). A French chemist, born at Dijon. He was from 1751 to 1782 deputy attorney-general in the parliament of his native city, but devoted most of his time to the study of the physical sciences and published a number of interesting original researches. In 1782 he undertook to reform the system of chemical nomenclature. Soon Lavoisier, Berthollet, and others joined him in this important work, and in 1787 they published their *Méthode d'une nomenclature chimique*, which was unanimously adopted by the scientific world. Guyton wrote a "Dictionary of Chemistry" for the *Encyclopédie méthodique*. He was professor of chemistry at the Ecole Polytechnique and one of the first members of the Institute. In 1791 he was a member of the Legislative Assembly and in 1792-97 of the Convention, where he voted for the execution of Louis XVI. From 1800 to 1814 he was at the head of the French mint, where he did much to promote the use of the decimal system.

GUZEL-HISSAR, gū'zel-hīs-sīr'. A city in Asiatic Turkey. See **ADIN**.

GUZERAT, gū'ze-rūt. See **GUJARAT**.

GUZMÁN, gūth-mān', **DE**. A title often applied to St. Dominic. See **DOMINIC, SAINT**.

GUZMÁN, GÁSPARO DE. See **OLIVÁREZ, COUNT**.

GUZMÁN, NUÑO (or **NUÑEZ**) **BELTRAN** (c.1485-1544). A Spanish lawyer and soldier, born at Guadalajara. He was for a time Encomendero at Puerto de Plata, Española, and in 1526 was appointed Governor of Pánuco, a province of northwestern Mexico, where he ruled with great cruelty. He schemed against Cortés and invaded Narváez's territory of Río de las Palmas. On account of his ability he was made President of the first Audiencia of Mexico in 1528, with instructions to check the excesses of Cortés. Unscrupulous, he misruled the country till 1531, when he was superseded by the President of the second Audiencia. He conquered the district long known as Nueva Galicia in 1530 and was appointed its Governor. He had little save his bravery to recommend him. Consult Bancroft, *History of Mexico* (San Francisco, 1883-88).

GUZMÁN BLANCO, blān'kō, **ANTONIO** (1829-99). A Venezuelan soldier and political leader, born in Carácas. He studied law at the University of Carácas, and after practicing some years he began his military career in 1859. Banished for his share in political disturbances he took a prominent part in two invasions, and became Vice President of Venezuela under Falcón in 1863. Driven from office in 1868, he headed a revolution, which restored him to power in 1870. He was acclaimed *Ilustre Americano, Regenerador y Pacificador de Venezuela*, and for many years he was virtual dictator of the country. Other men were occasionally permitted to fill the office of President, but they were merely figureheads. In 1889, however, popular discontent was aggravated by reports of corrupt contracts made in Paris; and Guzmán Blanco, who was then acting as envoy to all the European powers, was practically deposed by Congress. Although he amassed great wealth by questionable methods, and his rule was despotic,

he introduced many beneficent reforms, improved the public credit, founded schools, and built canals and railways. *Glorias del . . . General Guzmán Blanco* (Caracas, 1875) contains his writings and public documents.

GUZMÁN DE ALFARACHE, dà al'fà-ril'-chá. The hero of a Spanish romance by Mateo Aleman, published at Madrid—the first part in 1599, the second in 1605.

GWALIOR, gwá'lî-ôr. A native state or agency of Central India, the dominions of the Maharajah Sindhia, consisting of a main northern portion, which is separated from Rajputana, on the northwest, by the Chambal River, and of several detached portions straggling far to the south (Map: India, C 3). Area, 25,107 square miles. Lying partly in the basin of the Jumna, and partly in the basins of the Nerbudda and the Tapti, it divides its drainage between the Bay of Bengal and the Arabian Sea. The population, including that of the Guna Agency, which was united with Gwalior in 1806, in 1901 was 2,933,000 and, in 1911, 3,093,082. Though Gwalior is a Mahratta principality, it is only to the south of the Nerbudda that the Mahrattas form any considerable proportion of the people. More than 84 per cent of the people are Hindus, mainly engaged in agriculture, the chief products being wheat, millet, and other cereals, cotton, and tobacco. Since 1803 the country has been under British protection; the existing relations date from 1844. In 1843 the death of the sovereign, by producing universal anarchy, led to the forcible interposition of the British government. By a treaty of the following January, in addition to a large contingent under British authority, the native government was permitted to have 9000 troops of its own. Capital, Gwalior, also known as Lashkar (q.v.).

GWALIOR. The capital of the state of the same name in Central India, near the northeast extremity of its straggling territory (Map: India, C 3). Its nucleus is a citadel crowning an isolated rock about 300 feet in height, perpendicular on all sides, and measuring 1½ miles by 300 yards. It can accommodate a garrison of 15,000 men. The spot is supposed to have been occupied as a stronghold for more than 1000 years, and the summit has been provided from time to time with several spacious tanks. Along the eastern base of this eminence lies the old city of Gwalior, which contains a beautiful mosque of white sandstone, while in the vicinity palaces, rock temples, and statues abound, of particular archaeological and architectural interest. The old town is now decaying, and a new town has sprung up to the southwest at Lashkar, originally the camp of the Maharajah's army; to the northeast is the Murar, formerly the cantonment of the protecting contingent. The city includes the towns of Gwalior, Lashkar, and Gwalior Brigade. Gwalior has had a long and eventful history, not the least important among its varied incidents being the mutiny of the native army in 1857, notwithstanding the fidelity of the Maharajah. Pop., 1901, 119,433; 1911, 70,881.

GWATKIN, HENRY MELVILL (c.1844–). An English Church historian. He was educated at Shrewsbury and at St. John's College, Cambridge, of which he was fellow in 1868–74 and theological lecturer in 1874–91. In 1891 he became fellow of Emmanuel College and Dixie professor of ecclesiastical history. He was Gifford lecturer at Edinburgh in 1903–05; the lec-

tures were published (1906) under the title *The Knowledge of God*. His other publications include: *Studies of Arianism* (1882; 2d ed., 1900); *The Arian Controversy* (1889); a volume of sermons, *The Eye of Spiritual Things* (1906); and *Early Church History* (1909). He was one of the editors of the *Cambridge Medieval History*.

GWIN, NELL. See GWYNN, ELEANOR.

GWIN, WILLIAM MCKENDRY (1805–85). An American politician. He was born in Sumner Co., Tenn., graduated in medicine at Transylvania University in 1828, and for five years was a practicing physician at Clinton, Miss. He was a Democratic Congressman from that State in 1841–42, but in 1848 declined a renomination and in 1849 went with the gold hunters to California. He was a member of the California Constitutional Convention late in 1849 and was a member of the United States Senate from 1850 to 1861. He was influential in building up the Pacific coast. After leaving the Senate, he was arrested on a charge of disloyalty and was imprisoned for two years. On his release, he went to France and took part in an unsuccessful scheme for colonizing Sonora, Mexico, with people from the southern part of the United States.

GWINNETT, BUTTON (c.1732–77). An American patriot, a signer of the Declaration of Independence. He was born in England, engaged in business in Bristol, and later removed to Charleston, S. C. About 1770 he purchased a plantation on St. Catherine's Island, Ga. Through acquaintance with Dr. Lyman Hall he became intensely interested in the early Revolutionary movement in Georgia and in 1775 was a member of the first delegation elected by that province to the Continental Congress. He was a member of that body at the time of the adoption of the Declaration of Independence, of which he was one of the signers. In 1776–77, as a member of the Georgia Constitutional Convention, he took a prominent part in framing the new State constitution and in the same year was president of the Provincial Council. Defeated both for the office of Governor under the new constitution and for selection as brigadier general of the Georgia troops, he expressed his resentment openly against Gen. Lachlan McIntosh, who had been successful in securing the latter post. A duel followed in which both principals were wounded, Gwinnett mortally. Consult Dwight, *Lives of the Signers* (new ed., New York, 1895).

GWYNLIAD, gwîn'î-ad (Welsh, whiting). A British whitefish (*Coregonus færo*), usually called a herring on account of its form, large scales, and silvery appearance. It is of inferior quality as a food fish. See WHITEFISH.

GWYNN, GWIN, or **GWYN, ELEANOR** (1650–87). An English actress, mistress of Charles II. The place of her birth is not definitely known. She was brought up in poverty and as a child sold oranges at the Theatre Royal in London. In 1665 she made her first public appearance as Cydaria in Dryden's *Indian Emperor* and from that time until 1670 (when she left the stage) was a great favorite in parts which were supplied by Dryden. If not a great actress, her sprightliness, beauty, and skill in dancing made her a popular favorite. She had many lovers, among them Charles Hart the actor and Charles Sackville, who in 1677 became sixth Earl of Dorset. About 1669 she

became the mistress of the King, by whom she had two sons, Charles (1670), called Beauclerk, who was subsequently made Duke of St. Albans, and James (1671), who died young. She retained her popularity throughout life. As the King's mistress, she was received into the best of London society, and she was in favor with the people for her many acts of charity. She was illiterate, even for those times; but her animation, humor, and good nature seem to have more than overbalanced her defects. According to Burnet and Evelyn, the dying request of Charles II was, "Let not poor Nelly starve." After the King's death she led a quiet life. She died in London and was buried in the church of St. Martin's-in-the-Fields. According to her request Dr. Tenison, afterward Archbishop of Canterbury, preached her funeral sermon. Consult: Seymour, *Memoirs of the Life of Eleanor Gwynn* (London, 1752); Airy, *Charles II* (ib., 1904); Cunningham, *The Story of Nell Gwynn*, ed. by Goodwin (new ed., ib., 1908); Cecil Chesterton, *Nell Gwynn* (Edinburgh, 1912).

GYA, g'ā. A town in Bengal, British India. See GAYA.

GYAROS, j'ā-rōs. One of the Cyclades (q.v.), known at present as Giura, situated 10 miles northwest of Syros. Area, about 12 square miles. It is mountainous and uninhabited and was once used by Rome as a place of banishment.

GYAS, j'ās. 1. A companion of Æneas and commander of one of his ships. 2. A Latin in the army of Turnus, slain by Æneas.

GYBE. See JIBE.

GYGES, j'j'ez (Lat., from Gk. Γύγης). King of Lydia from c.689 to c.657 B.C. and the founder of the powerful dynasty of the Mermnadae. According to Herodotus (i, 8-14), Gyges was the favorite of King Candaules of the ancient line of the Heraclides and commander of the household troops. Herodotus declares also that Candaules, proud of his beautiful queen, Nyssia, concealed Gyges in the royal bedchamber one night to prove the truth of the extravagant praises he had bestowed on her beauty. The Queen became aware of the presence of Gyges, but pretended ignorance, and, summoning him on the morrow, offered him the choice between her hand, together with the throne of Candaules, and death. Gyges slew the King and seized the crown. The Lydians resisted his usurpation until the oracle at Delphi, bribed by gifts of immense value, declared in his favor. He waged successful wars against the Greek cities on the coast of the Ægean and extended the boundaries of the Empire. According to the *Annals of Asurbanipal*, "Gyges [Gugu], King of Lydia," sent a messenger to Nineveh requesting the assistance of the Assyrian King against the Cimmerians (Gimirrai). With the aid of the Assyrian gods Gyges defeated the Cimmerians and sent two of their chiefs in chains together with a large present to Asurbanipal. This seems to have occurred c.666 B.C. Later he threw off his dependence upon Assyria, entered into an alliance with Psammetichus, King of Egypt (663-610 B.C.), when this ruler rebelled against Asurbanipal, and furnished him with troops. A new Cimmerian invasion followed; Gyges was defeated and killed in battle, and his country was devastated (c.657 B.C.). The *Rassam Cylinder* and allied texts, recounting these events, have been translated by Jensen in *Keilinschriftliche Bibliothek*, vol. ii (Berlin, 1890). Plato (*Republic*, 359) has a fable in

which Gyges is represented as a shepherd of Candaules, who had discovered a magic ring by which he was enabled to make himself invisible, by which means he murdered Candaules and secured the sovereignty. According to a third tradition Gyges overthrew Candaules with the aid of foreign mercenaries. The "riches of Gyges" and the "ring of Gyges" were popular proverbs in ancient and mediæval times. Consult the edition of Herodotus by How and Wells (Oxford, 1912); Schubert, *Geschichte der Könige von Lydien* (Breslau, 1884); Radet, *La Lydie et le monde grecque au temps de Mermnades* (Paris, 1893); Smith, "The Tale of Gyges and the King of Lydia," in *American Journal of Philology*, xxiii (New York, 1902); Gelzer, "Das Zeitalter des Gyges," in *Rheinisches Museum*, vol. xxx (Frankfurt, 1875), vol. xxxv (1880); Ed. Meyer, *Geschichte des Altertums*, vol. ii (Stuttgart, 1893); Winckler, *Altorientalische Forschungen*, vol. i (Leipzig, 1897); id., in Schrader, *Die Keilinschriften und das Alte Testament* (3d ed., Berlin, 1902); Beloch, *Griechische Geschichte*, vol. i (2d ed., Strassburg, 1912).

GYLDÉN, yul-dān', JOHANN AUGUST HUGO (1841-96). A Swedish astronomer, born and educated at Helsingfors, Finland. Having been an assistant to Struve in the observatory at Pulkova from 1863 to 1871, he was appointed director of the Royal Observatory at Stockholm, Sweden, in the latter year. In 1884 he was offered the directorship of the observatory at the University of Göttingen. He published: *Untersuchungen über die Konstitution der Atmosphäre* (1866-68); *Studien auf dem Gebiete der Störungstheorie* (1871); *Die Grundlehren der Astronomie nach ihrer geschichtlichen Entwicklung dargestellt* (1877); *Versuch einer mathematischen Theorie zur Erklärung des Lichtwechsels der veränderlichen Sterne* (1879); *Die intermediäre Bahn des Mondes* (1883); *Untersuchungen über die Konvergenz der Reihen welche zur Darstellung der Koordinaten der Planeten angewendet werden* (1887); *Nouvelles recherches sur les séries employées dans les théories des planètes* (1893); *Traité analytique des orbites absolues des huit planètes principales* (1893).

GYLIPPUS, j'l-lp'pūs (Lat., from Gk. Γύλιππος). A Spartan general in the Peloponnesian war, son of Cleandridas, the councillor and fellow exile of the young King Pleistoanax. He was appointed the commander of the expedition sent to aid the Syracusans against the Athenians (414 B.C.). Though his ships were so few that Nicias at first thought they belonged to an insignificant privateering expedition, Gylippus, with the reinforcements drawn from various Sicilian towns, by his skillful operations completely defeated the Athenians and captured their commanders, Nicias and Demosthenes, in 413 B.C. (See SYRACUSE.) After the capitulation of Athens to Lysander, Gylippus was commissioned by the latter to take home the treasure, but stole a considerable portion and was condemned to death for the crime. He escaped, however, and died in exile. Consult: Plutarch, *Nicias*, 19, 21, 27, 28; Diodorus Siculus, xiii, 28-32; Thucydides, vii.

GYLLEMBOURG-EHRENSVÄRD, yul'-lem-bōr-y'ā-rēn-svård, THOMASINE CHRISTINE, BARONESS (1773-1856). A Danish novelist, born at Copenhagen. Born Buntzen, she married first Peter Andreas Heiberg, banished for politi-

cal activity, and had one son, Johan Ludvig Heiberg (q.v.). She then married a Swedish political refugee, Baron Ehrensvärd, who assumed in Copenhagen his mother's name, Gyllembourg, and who died in 1815. After this she lived with her son, the poet Heiberg, and at 53 began a busy literary career with *The Polonius Family* (1825), in the weekly edited by her son. Not till after her death was her authorship known. Among her better novels are *Near and Far* (1841) and *Two Generations* (1845). Her collected works appeared in 12 volumes (1840-51).

GYLLENBORG, yul'len-bör-y', KARL, COUNT (1679-1746). A Swedish statesman and author. He was born at Stockholm and after serving in the Polish War was sent to London as Secretary of Legation. In 1715 he was made Minister Plenipotentiary and two years later was imprisoned for five months because of his participation in the plot to reinstate the house of Stuart. In 1723 he was appointed Councilor of State and in 1738 Prime Minister. While in this office he founded the *Hattparti*, or *Hattar* (Hat party), which instigated the disastrous war with Russia (1741-43), resulting in the loss of the Province of Viborg. He was successively chancellor of the universities of Lund (1728) and Upsala (1739), was a patron of letters and art, and wrote several poems and the first Swedish comedy, *Den svenska Sprütthöken* (1740). His *Letters . . . Relating to a Design to Raise a Rebellion on His Majesty's Dominions, to be Supported by a Force from Sweden* were published in French and English (1717).

GYMKHANA, gym-ka'nä (probably a corruption of Pers. *gand-khanah*, ball house, influenced by popular association with *gym-nasium*; also explained as being from Eng. *game* + Pers. *khanah*, house). A generic term, originating in India and signifying an outdoor meeting for recreation purposes. Ordinarily gymkhanas are of two kinds—one, a race meeting on a small scale, in which any sort of horse takes part in order to make up a "card," and in which the races are generally for catch weights. The second type of gymkhana is a variety of what was formerly called the "pāgil" (foolish or amusing) gymkhana, in which, besides the usual horse and pony races, other competitions for men and women, mounted and dismounted, are introduced; also tent pegging and tilting—the former for men and the latter for women. Every cantonment in India, no matter how remote or how large or small, has its periodical gymkhana. The "card," or programme, is arranged so as to include all classes of cantonment society and consists of flat and obstacle racing, jumping, blindfold races, egg and spoon races, sack races, etc., for the rank and file of the local garrison. Among the events set apart for the natives none is more important than the race with an earthenware chatti full of water, carried on the head, or the wheelbarrow races. For the officers, military and civil, are such events as "tent pegging" and "tilting" in couples, in which the man rides at the peg and the woman tilts at a ring; "threading-the-needle" race; "Aunt Sally" race, performed by two men and two women, riding from the starting point to a fixed place, where the men dismount their partners and hold their horses, while the women throw stones at four empty bottles. The moment the bottles are broken the women are remounted, and the partners race back to the post.

A favorite competition is the "wand," or "maize" event, in which mounted competitors canter in and out between rows of posts or wands driven into the ground and placed at convenient distances apart from one another in two parallel lines. The competitors must "make the ride" without touching a post. A menagerie race usually winds up the meeting, and, owing to the many varieties of animals common to the country, an extremely varied assortment of competitors is always possible. In the hill stations the concluding feature is generally a "jinrikisha" (colloquially ricksha) race, in which these light conveyances, drawn by coolies and driven by Europeans, race with each other. A ricksha may be described as an enlarged perambulator mounted on two wheels and fitted with a shaft. It is drawn by two natives in the shaft, while two push behind. Although the gymkhana has become popular in England within recent years and has also been introduced into America, it has not the same reason for existence, or value as a sport. In India, owing to the nature of the climate and the few hours of comparative coolness, together with the impossibility of following the ordinary sports of the West, considerable ingenuity has to be exercised to invent games which shall afford harmless amusement and at the same time be within the scope of the usually limited resources of the average cantonment.

GYMNASIA (gim-ni'zi-ä) **AND REAL-GYMNASIA**, rä-äl'gim-nä'zi-ä (Lat. nom. pl., from Gk. γυμνάσιον, *gymnasion*, from γυμνάζειν, *gymnazein*, to train, from γυμνός, *gymnos*, naked). The classical higher or secondary schools of Germany, graduation from which, until recently, necessarily preceded the university course and all professional careers. The Gymnasia arose in Germany out of the humanistic movement during the sixteenth century. The existing schools were monastic and cathedral under the control of the Church, and guild schools controlled by the guilds or municipalities, but yet taught and dominated by the clergy. Such schools were devoted almost exclusively to the study of Latin, organized into the traditional curriculum, consisting of the trivium (q.v.) grammar, rhetoric, and dialectic, and the quadrivium (q.v.) arithmetic, astronomy, geometry, and music. The study of the quadrivium was of a most superficial character, while that of the trivium was formal, with no appreciation of the spirit of the Latin literature and no devotion to classical ideas. The humanistic movement reached the German states during the last quarter of the fifteenth century and soon modified not only the culture of the universities, but also the work of the secondary schools. Probably the first schools to respond to the new influences were those of Nuremberg, which were modified in 1485 and again in 1496. It was not till 1521, however, that this movement was complete, and instruction in Greek and Hebrew added, thus constituting a true humanistic school. Meanwhile the Protestant Reformation had begun, and for the time being coincided in its educational aspects with the earlier Renaissance movement. In addition to instruction in classical Latin and Greek, the Reformation influence favored the consolidation of existing schools into stronger centralized ones, or even into complete systems extending over an entire state, and also the placing of these under secular control.

The first Protestant school of the humanistic

type was that of Magdeburg, established in 1524. About the same time Melancthon formulated his "school plan" providing for both Greek and Hebrew, at least for the favored few, and this plan became the basis of most of the Protestant schools of Germany. The first general system of schools which provided for the Gymnasia was that of Saxony, formulated in 1528, but without providing for Greek in such schools until a later date. The Gymnasium most influential as a type was that of Strassburg, founded (or modified) in 1538, under the headship of Johannes Sturm (q.v.). Only of slightly less importance were the Gymnasium of Goldberg under Trotzendorf and that of Ilfeld under Neander. The Protestant movement for the establishment of Gymnasia may be said to have culminated in 1580 with the establishment of the revised school plan of Saxony. From 1540 on, the Jesuit Order established numerous schools that were similar to the Gymnasia in all respects save in their religious instead of secular control. The rivalry between these types of schools, together with the change in the character of the Reformation movement, which eliminated the earlier sympathy shown with humanism, was responsible for the decline in the character of the Gymnasia. Instruction became most formal, little interest was shown in the content of ancient literature, scholasticism was rehabilitated, and the sympathies of the masses were alienated. Such remained the condition throughout the seventeenth century. During the last decade of that century and the earlier part of the eighteenth the Pietistic movement put new life into education. This change in spirit and motive of education, and the substitution of a more vital interest in the study of classics in place of the existing formalism, culminated in the formation of a new type of school—the Realschule (q.v.), for those who were not destined for the learned professions, the best known and one of the earliest being that of Johann Julius Hecker (q.v.), opened in Berlin in 1747. The Prussian monarchy exerted throughout the eighteenth century, especially under Frederick the Great, a quickening influence on education. But it was not till the latter part of that century, under the leadership of such men as Herder, Kant, Lessing, Goethe, and Schiller, that there was infused the new humanistic spirit that has characterized the German Gymnasia from that day to this. During the past century, particularly, the needs of an age devoted more to the material than to the ideal, as well as the rapid rise to importance of mathematical and natural science, could not fail of influence or be left without due provision. Yet even now the chief subject of gymnasial teaching is the pursuit of the humanities—i.e., the study of classical antiquity, the two languages of which, Latin and Greek, form the foundation of the teaching and study of the Gymnasia. Still, while retaining this foundation, the strongest efforts are no longer directed, as in former times, towards the most exact familiarity possible with the languages per se, but the introduction of the students into the spirit of antiquity is made of prime importance; and hence the ancient writers are treated not so much with reference to their grammar and style as to their general human, moral, and æsthetic significance. In the lower classes, naturally, a certain formal strictness is indispensable for strengthening the linguistic foundation, for sharpening the perception, and develop-

ing a clear, logical method of thought, for which nothing else is so well adapted, according to the German view, as the structure of Latin grammar.

The character of the Gymnasium is best seen through a statement of the entire system of higher schools in Prussia. The Gymnasia include a nine-year course, with both Greek and Latin; the Progymnasia are similar schools of six or seven year courses; the Realgymnasia give a nine-year course, with Latin, but no Greek; the Realprogymnasia, similar courses of six or seven years' length; the Oberrealschulen offer a nine-year course, with neither Latin nor Greek; the Realschulen, or burgher schools (Bürgerschulen), are similar schools, with six-year courses only. The burgher school in many of the German states is simply a higher elementary or intermediate school with one or two years and a few new subjects added to the ordinary course. The organization and curriculum of the Gymnasium in the various states of Germany present many points of difference, but in essential characteristics there is unity throughout, so that students can be transferred from one to another without interruption of their work. The Gymnasium embraces nine classes, or one-year courses—Sexta, Quinta, Quarta, lower and upper Tertia, lower and upper Secunda, lower and upper Prima. Pupils are admitted to Sexta at 9 or 10 years of age and are required to have a knowledge of reading, writing, and arithmetic. Latin is the basis of instruction from the beginning. In the Prussian schools eight hours a week is given to it for the first five years, seven for the next four. The emphasis on Latin is much greater in the other states than in Prussia, where the entire course calls for 68 week hours in this subject, while in Württemberg it is 81. The official programme of 1901 expresses the aim of Latin instruction thus: "On the sure basis of grammatical training to enable boys to understand the more important writers of Rome, and thus to introduce them to the intellectual life and culture of the ancient world." In the Realgymnasium the purpose is stated to be the comprehension, based on accurate grammatical knowledge, of the easier works of Roman literature. Latin essays are no longer required. Reading begins in the Quarta with Cornelius Nepos and Phædrus; in the Tertia, Cæsar and Ovid; in the Secunda, Cicero, Livy, Sallust, and Vergil; in the Prima, Cicero, Tacitus, and Horace; sometimes extracts from Catullus, Tibullus, and Propertius, and, exceptionally, Terence or Plautus. Greek in the fourth year (Lower Tertia) occupies six hours a week in each class. The grammar is finished in the fourth year; the authors read are the following: First, Xenophon; then, in the Secunda, Homer's *Odyssey*, Xenophon, Herodotus, and Lysias; in the Prima, Homer's *Iliad*, Demosthenes, Thucydides, and Plato, extracts from the lyric poets; of the tragic poets, Sophocles and Euripides, rarely Æschylus. Besides the authors named various others are not excluded, as Isocrates, Plutarch, Arrian, Curtius, Quintillian.

A change, revolutionary in character, which to a great degree breaks down the distinction between the Gymnasia and the Realgymnasia, was introduced in 1901 and 1902, as a result of the conflict begun some 10 years previously, under the leadership of the present Emperor, and waged for the modernization of the higher curriculum. This change is the introduction of English into the gymnasial course and making Greek elec-

tive. This is the most far-reaching change made since the introduction of the Realschulen. In 1901 the higher professions, save that of the ministry, were opened to those who had no knowledge of the Greek language, but who possessed in its stead a corresponding knowledge of modern languages. A strong tendency away from the Greek immediately made itself felt. The school which gave the necessary languages, Latin, French, English, was the Realgymnasium. But there were in Prussia (in 1898) 277 Gymnasias and only 67 Realgymnasias, and hence such a shifting of clientele would have been injurious to both schools. Moreover, the character and amount of the instruction in Latin in the Realgymnasias is inferior to that of the Gymnasias. Hence some modification of the gymnasia curriculum was necessary. Then followed the introduction of English and the placing of Greek on an elective basis.

The great difference existing between the Gymnasias and the Realgymnasias is still that of the respective emphasis on the classics. A much greater time is given to the study of Latin in the Gymnasias and to science in the Realgymnasias. Both French and mathematics receive greater attention in the Realgymnasias. In the Gymnasias, French begins in the third year (Quarta) with four hours a week; later, two; and three in the last four years. A reform has taken place in the method of instruction in the last few years, and more attention is given to oral expression than formerly. The reading embraces the classical and the most important of other poets and prose writers. German is given four to three hours with the following course: in the lower classes, mythology, grammar, and explanation of poetical works; in the middle classes, rhetoric, poetics, and the reading of easy plays and larger poems; in the Prima, the history of German literature, reading of the *Nibelungenlied* and Walther von der Vogelweide, with the most important works of the classical period, especially Lessing, Schiller, and Goethe, and some introduction of Shakespeare. Hebrew and English are elective and are given two hours a week. The recent change has given much more time to English. Mathematics has four hours throughout, except in Tertia, where it has only three, and includes geometry, mensuration, plane and spherical trigonometry, stereometry, and the elements of analytical geometry; in arithmetic, the fundamental operations, equations of the first and second degree, arithmetical and geometrical computations, compound interest and stocks, combinations, the theory of probability, and the binomial theorem. The natural sciences have throughout two hours and embrace descriptive natural history, zoölogy and anthropology, botany and mineralogy, physics, mathematical geography, and an introduction to astronomy and chemistry. History receives two hours in the lower middle classes and three in the upper. The matter is so divided that the whole passes twice before the pupil—in the Quarta, ancient history; in the Tertia, mediæval and modern; in the Secunda, the history of Greece and Rome for the second time; and in the Prima, general history, from the migrations of the nations to the present time, with special reference to German history. Geography has two hours in each of the lower classes, one in the Tertia and Untersekunda, with a review of the subject in the upper classes in connection with history. Sexta and Quinta have each two hours

of penmanship. Religion (separately, according to creed) has two hours throughout, except in Sexta, where it has three hours. Singing and drawing have each two hours; the last branch is not pursued in the four upper classes. Three hours a week are given in every class to gymnastics.

The number of hours of teaching averages 30 to 35 per week. The instruction is given from 8 to 12 A.M. (intermission at 10 o'clock) and from 2 to 4 or 5 P.M.: the afternoons of Wednesday and Saturday are free. For home preparation one to two hours are required from the lower classes, two to three hours from the upper. Vacations occur at Christmas, Easter, sometimes at Whitsuntide, and the longest in the autumn, altogether 11 weeks. At the end of the school year (generally at Easter) formal public closing exercises are held, with the announcement of promotions and distribution of prizes to the best scholars. A pupil who has in no report the note "unsatisfactory" is transferred to the next higher class. If two branches are unsatisfactory, he is required to pass through the same class again, in Prussia even with one "unsatisfactory." In southern Germany in such a case a reëxamination in the study after vacation determines his remaining or advancement.

As the Gymnasias are only very seldom boarding schools (*Internate*), the maintenance of discipline outside of school is accomplished by certain regulations, which, however, allow scholars of the Prima somewhat greater freedom. The punishment for transgressions is arrest, imprisonment, or the *consilium abeundi*, which is followed at the next offense by expulsion. Each class is in general limited to 40 students, and when that number is exceeded parallel divisions are formed. Since many Gymnasias have 700–800 pupils, all their classes contain two, sometimes even three, divisions. Each class is under the special supervision of a class teacher, or *Ordinarius*, who teaches the chief branches in that class. At the head of the Gymnasium is a *Direktor*. The directors are themselves responsible to an *Oberschulrat*, or *Oberstudienrat* (Board of Education), in Prussia the *Provinzialschulkollegium*, and the latter to the Ministry of Public Worship and Instruction. Conferences of the directors and higher school officials act on questions of instruction, and determine changes in method, conditional upon the Imperial sanction.

The higher schools are primarily state institutions; some are also municipal. The state supervises the schools by inspections, appoints and pays the teachers, who bear in the south the title of Professor, in the north that of *Oberlehrer*; but specially deserving teachers in Prussia also receive the title of Professor. Younger teachers, from their state examinations to their definite appointment, bear the title of *Lehramtspraktikant* or *Probekandidat* (probationary instructor). Teachers without academic education are employed only for arithmetic, natural history, penmanship, and the special branches, drawing and gymnastics. The instruction is not free; the state receives a tuition fee of 60–120 marks, according to the class. At the completion of the gymnasia course the examination for graduation (*Arbiturienten- or Maturitätsprüfung*) is held under the direction of a state commissioner and is judged very severely. The successful candidates receive the certificate of fitness for the university. The privilege of granting this

certificate belonged formerly to the Gymnasium alone, but since 1902 the graduates of the other nine-year schools have the same privileges, with the exception that Latin is required of students of medicine, and Latin and Greek of students of theology. The other higher schools fit for the great technical schools. A privilege quite as highly prized as that of fitness for the university, and one that is to a great degree responsible for the large attendance and public support of the secondary schools, is the exemption from one year of the required two years' military service on successful completion of the six-year course. Nearly one-half of all secondary pupils in Prussia leave school at the end of six years after securing this privilege (*Einjährigenschein*). This privilege also explains the formation of the Progymnasium, which offers simply the first six years of the gymnasial course. The Realgymnasium differs from the Gymnasium in the stronger emphasis on the nonclassical subjects, as is seen in the greater number of hours given to mathematics and the sciences, and the fewer hours given to Latin, in the omission of Greek, and in the requirement of English as well as French. The Realschulen (q.v.) and the Oberrealschulen are altogether nonclassical. Every higher school has a well-endowed school library and a teachers' library and publishes at the end of each school year a Programme, which is, first, a handbook of school information records, vacations, and lists of students, and, second, contains a scientific treatise written by a teacher of the school.

In essential unity of method and in the equal supervision of the state, the higher schools as a whole stand on the same plane of excellence, although one or another institution may occasionally enjoy a position of preëminence through the influence of a specially gifted director or a happily constituted faculty, as, e.g., in Prussia the Landes- und Fürstenschule Pforta (Foundation school), in Saxony the Landes- und Fürstenschulen at Meissen and Grimmen, all founded previous to the middle of the sixteenth century, in Württemberg the "élite" schools of the upper Gymnasia (without lower classes), in which only pupils of marked excellence are received—e.g., at Maulbronn. Some of these most noted institutions are boarding schools. In 1913 there were in Germany 1390 secondary schools for boys, of which 516 were Gymnasia and 220 Realgymnasia. In addition there were 34 Gymnasia for girls—a recent development. GYMNASIARCH (Lat. *gymnasiarchos*, from Gk. γυμνασιάρχος, *gymnasiarchos*, from γυμ-

νάσιον, *gymnasion*, gymnasium + ἀρχός, *archos*, leader, from ἀρχεω, *archein*, to lead). The name of a Greek official, whose rank and duties varied widely in different places and at different times. In Athens during the fifth and fourth centuries B.C. a gymnasiarch was chosen annually from each tribe to bear the expenses of the torch races. (See LAMPADOPHORIA.) The duties included the payment of all expenses connected with the training of the competitors, and the office was one of the most expensive of the public services demanded by Athens of her wealthy citizens. The name seems to imply that the gymnasiarch had also certain rights and duties in the gymnasia during the training of the youths, but there is no definite information on this subject. After the establishment of the Macedonian power we find a change at Athens. There is now one gymnasiarch chosen annually, and his office is one of great dignity. He has the general oversight of order and discipline in the gymnasium of the ephebi (see EPHEBUS), sometimes undertaking heavy expenses from his own purse. The same name is given to rich ephebi who undertake for a longer or shorter period, generally one month, to bear certain heavy charges for their comrades, such as the expenses of festivals or of furnishing the oil needed in the gymnasium. Outside of Athens and the states which copied her gymnastic system, the term denotes either magistrates who have charge of the gymnastic and literary instruction or those who have to provide for certain expenses connected with the gymnasium or festivals, either from their own property or from the public funds. The wide diversity in details cannot be discussed here. Consult Glatz, "Gymnasiarchia," in Daremberg et Saglio, *Dictionnaire des antiquités* (Paris, 1896); Gardiner, *Greek Athletic Sports and Festivals* (London, 1910); Oehler, "Τυμνασιάρχος," in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. vii (Munich, 1912).

GYMNASIUM, GREEK. See ATHLETICS; EDUCATION, *History of the Theory of Education*.

GYMNASTICS (Lat. *gymnasticus*, from Gk. γυμναστικός, *gymnastikos*, relating to athletic exercises, from γυμνάσειν, *gymnazein*, to train). Systematic exercise undertaken for the preservation of health and the development of strength, skill, and the sturdy qualities that go with them, or for the pleasure of activity and as a means of social enjoyment. Apparatus of some sort is usually employed, and in most cases a teacher is present to direct and oversee. An outdoor space, or a room or building set apart for such purposes and furnished with the necessary appliances and paraphernalia, is termed a gymnasium. In contrast with athletics, the idea of competition or of mere recreation is commonly a subordinate one. The systematic and progressive training of the gymnasium furnishes the best preparation for participation in vigorous games and competitive sports. Gymnastics occupied a preëminent place in the life of ancient Greece, but died out with the decay of that nation. As practiced to-day, it dates only from the last quarter of the eighteenth and the first quarter of the nineteenth century. Its widest spread and most rapid development belong to the last 50 or 75 years and must be viewed as a product or result of modern life and conditions. The movement of population from the country and small towns into crowded cities and the introduction of machinery in the industrial

world have lessened the demand upon human muscles and increased that made on the nervous system and the mind. They also require a lifetime spent under conditions frequently injurious to health and unfavorable to good physical development. The provision of some sort of motor activity, in suitable surroundings, has therefore become an absolute necessity to the individual and a subject of serious importance to the nation at large. At present gymnastics forms an integral part of the educational system of continental Europe, receiving its original impetus in German-speaking and Scandinavian countries and reaching its highest development there. It has also been introduced into the grade and high schools of many American cities and forms a part of the curriculum in nearly all colleges and universities.

Indiscriminate gymnastic exercises are rarely beneficial and frequently injurious if indulged in by any one who is not qualified by physical capacity, or who has not the knowledge or experience necessary for profitable practice. A medical examination is always a wise preliminary to a course of work in the gymnasium, and a physical director or instructor in gymnastics is now a regular officer in every modern gymnasium.

Exercises performed without apparatus of any sort (*free gymnastics*) are usually borrowed from the material of medical gymnastics, or they are patterned after some actual occupation or form of sport or other kind of activity which makes an appeal to the imagination. The favorite pieces of *hand apparatus* are the wand, the Indian club, and the wooden or iron dumb-bell—the former weighing about a pound and the latter seldom over three pounds. Suitable movements are often combined into an orderly series ("drill") which lends itself to rhythmical performance, with or without a musical accompaniment. *Pulley-weight* machines, the use of which became general in American gymnasia 25 years ago and is peculiar to them, allow the adjustment of resistance to strength and the development of any desired group of muscles. By varying the height of the handle, or the character of the attachment, or one's position at the apparatus, the effects can be localized at will, as suggested by the names given to the different modifications: chest weight, high pulley, low pulley, foot machine, leg pulley, wrist machine, neck or head machine, traveling parallel, quarter circle, and rowing machine. Another form of rowing machine and the wrestling machine are friction appliances, capable of regulation to suit the strength of the user.

The *fixed apparatus* of the gymnasium, aside from the wall varieties just mentioned, is most of it intended either for jumping and vaulting exercises, or for hanging, swinging, and climbing exercises, or for both of these uses. The older form of horizontal bar is usually made of steel, or of hickory with a steel core, and is about 6 feet long, round, and thick enough to be readily and tightly grasped. It may be suspended from the ceiling at a fixed height, or so arranged that it can be adjusted to any height by sliding it up or down the upright posts to which it is attached. The Swedish form (also called *bom*, or *boom*), intended primarily for class use, has an adjustable bar about 12 feet long, heart-shaped on section, and a second narrower bar sharp on one edge and flat on the other. These can be used separately or together, and detach-

able wooden "saddles" are also provided for the thicker bar. Parallel bars are two oval or round bars supported side by side on posts at a distance of 18 or 20 inches, and preferably made adjustable for both height and width. The vaulting horse, made of wood covered with leather and supplied with pommels fixed on the back saddlewise, is still sometimes shaped so as to resemble its prototype somewhat, but more commonly neck and rump are indistinguishable. The buck is merely a short horse without pommels, and the vaulting box, with detachable sections, permits many of the same exercises where firm grasp is not essential. Flying rings are two leather-covered iron rings suspended from above by ropes. Traveling rings consist of a number of such rings arranged in a row so that, commencing with the first one, the performer may swing himself to the second, after which he lets go of the first, and so on down the line. Stall bars are a series of ladder-like structures with the rounds placed about 6 inches apart and each "stall" from 2½ to 3 feet wide, placed vertically against the wall and used for a great variety of exercises. Movable benches are often employed in connection with them. Other fixed apparatus includes vertical, horizontal, and oblique ladders, and vertical and oblique ropes and poles. The trapeze is less frequently used nowadays, and the giant stride is intended especially for children. Long thin mattresses of felt covered with canvas are employed for tumbling and to break the jar in vaulting. Provision is also commonly made for indoor games, such as basket ball, indoor baseball, volley ball, and the like. In American gymnasia a gallery with a padded running track, inclined at the turns, will generally be found encircling the main room.

The term *Swedish gymnastics*, as applied in America, still suggests to most persons either the exercises of the "movement cure" or medical gymnastics, first brought to this country a few years before the opening of the Civil War, or else a series of more or less monotonous exercises without apparatus performed in unison by pupils at the command of the teacher. Either view involves an error and does injustice to the Swedes. Pehr Henrik Ling (1776-1839), opened the Royal Central Institute of Gymnastics in Stockholm in 1814, with the idea of preparing teachers for the army and the schools and of applying exercise also in the treatment of deformity and disease. During the remainder of his lifetime he brought *military* gymnastics, including especially fencing with the foil, sabre, and bayonet, to a high degree of perfection. Branting, who was director from 1839 till 1862, devoted himself chiefly to the development of *medical* gymnastics, and during his term of office German and other foreign physicians began to visit Stockholm to study the new methods. Through their reports and in other ways the "movement cure" was soon widely heralded, and even now is regarded by many as synonymous with the Ling or Swedish gymnastics in its entirety. Ling's son, Hjalmar Fredrik Ling (1820-86), one of the teachers at the Institute from 1858 till 1882, gave to Swedish *school* gymnastics its present characteristic features, devising new forms of apparatus and arranging it for the use of large numbers at once, and elaborating a lesson plan commonly referred to as the "day's order." He used no hand apparatus, but a great variety of fixed apparatus—the long double horizontal bar, or *bom*, described above, the stall bars and

benches, vaulting box, ropes, a peculiar ladder that suggests latticework, the horse and buck, etc. His lesson plan was an attempt to analyze school conditions, ascertain the needs of the pupil at different stages, select exercises and devise apparatus to meet those needs, and arrange the material progressively in groups which were each aimed at a definite goal, and then combine the groups into a complete lesson scheme. One who visits the secondary schools of Sweden, or the elementary schools in larger towns and cities, will find fixed apparatus as freely and universally used as in German, Swiss, or American school gymnasia. Unless circumstances compel it, such a thing as a lesson composed of "free gymnastics" is seldom seen in Sweden.

Towards the close of the last century much was said and written in America regarding *Delsarte gymnastics*. But François Delsarte (1811-71) was a teacher of emotional expression through voice and gesture, and not the inventor of a system or method of gymnastics. "Relaxing" exercises and training in poise and in control of the breath form a part of the necessary preparation for effective appearance on the platform or the stage; but complete physical education of the growing child and youth could never be accomplished by such means, and the adult requires a much broader range of motor activities.

Roberts* (Springfield, Mass., 1899); Sargent, *Handbook of Developing Exercises* (Cambridge, Mass., 1899); id., *Health, Strength, and Power* (New York, 1904; 2d ed., 1914).

GYMNEMA, jīm-nē'mā (Neo-Lat., from Gk. γυμνός, *gymnos*, naked + νῆμα, *nēma*, thread), or Cow-PLANT, *Gymnema lactiferum*. A climbing perennial shrub of the milkweed family, native of the East Indian Archipelago, the milky juice of which has been said to be used by the natives as a substitute for milk and cream, but which is believed to contain enough of the poisonous principle peculiar to the order to cast a doubt upon its reputed use.

GYMNOCLADUS, jīm-nōk'lā-dūs (Neo-Lat., from Gk. γυμνός, *gymnos*, naked + κλάδος, *klados*, branch). A genus of leguminous trees. *Gymnocladus dioica* is a North American tree, found in rich bottom soils from the eastern United States as far south as Tennessee and west to Oklahoma and Nebraska. It attains a height of 50 to 60 feet in cultivation, or 75 to 100 feet when growing wild. It is remarkable for its

upright branches and its exceedingly rough bark. The leaves of young trees are very large and bipinnate. The flowers are white in short spikes. The pods are 5 inches long and 2 inches broad. The tree is called chicot in China, where a second species (*Gymnocladus chinensis*) is found, and sometimes stump tree, from its dead appearance in winter and the absence of conspicuous buds. It is one of the last trees to put out its leaves, which are very ornamental when young. Its common name, Kentucky coffee tree, was applied because its seeds are said to have been formerly washed and ground as coffee in Kentucky. The wood is used both by cabinetmakers and carpenters. It has very little sapwood. The pods, preserved like those of the tamarind, are said to be wholesome and slightly aperient. See Plate of GINKGO.

GYMNODONTES (Neo-Lat. nom. pl., from Gk. γυμνός, *gymnos*, naked + ὀδούς, *odous*, tooth). A suborder of plectognath fishes, which includes the puffers, sunfishes, porcupine fishes, globe-fishes, and the like. These forms have no separate teeth, but the jaws are enveloped by an enamel-like covering. Many of them have the power of inflating their bodies, probably for protection. (See GLOBEFISH.) There are many species, mostly found in the warm seas.

GYMNONOTI (Neo-Lat. nom. pl., from Gk. γυμνός, *gymnos*, naked + νῶτος, *nōtos*, back). A suborder of eel-like fishes of the fresh waters of South America, named from the electric eel (see ELECTRIC FISH), formerly called *Gymnotus*. The group embraces two families, regarded as being between the true eels and the eel-like silurids (Clariidae).

GYMNOPÆDES, jīm'nō-pē'dez. See under Plumage, in the article BIRD.

GYMNOPHIONA (Neo-Lat. nom. pl., from Gk. γυμνός, *gymnos*, naked + ὄφις, *ophis*, serpent). An order of small snakelike amphibians, with no trace of limbs or tail. The body is vermiform, the skin hardened to form scales, the eyes rudimentary, and the membranous skull complete and substantial. They are tropical burrowers and number about 42 species, principally of the family Caeciliidae. See BLINDWORM.

GYMNOSOPHISTS (Lat. *gymnosophistæ*, from Gk. γυμνoσοφιστής, *gymnosophistēs*, naked sage, from γυμνός, *gymnos*, naked + σοφιστής, *sophistēs*, sage, from σοφός, *sophos*, wise). The name given by the Greeks to those ancient Hindu philosophers, or religious devotees, who wore little or no clothing and dedicated themselves to mystical contemplation and the practice of the most rigorous asceticism. They often adopted a solitary life in the forest, for which reason the Greeks termed them also *Hylōbioi*, answering to *Vāna-prasthās* of the Sanskrit literature. They correspond to the yogis, fakirs, or "holy men" of India to-day. According to Strabo there were two classes of these, the Brahmins and the Samanēans. The former adhered strictly to the rules of caste distinction; the latter did not. Calanus (q.v.), who allowed himself to be burned alive, was a type of these naked philosophers.

GYMNOSPERMS, jīm'nō-spēr'mz (from Gk. γυμνός, *gymnos*, naked + σπέρμα, *sperma*, seed). One of the two great divisions of seed plants (Spermatophytes) (q.v.). The Gymnosperms have exposed seeds, and the Angiosperms have seeds inclosed in a case. The Gymnosperms are very ancient and form a comparatively small part of the present seed-plant vegetation, but they were

the only seed plants from the early Paleozoic until the appearance of Angiosperms sometime during the Mesozoic. Seven great groups of Gymnosperms are recognized, as follows:

Cycadofilicales. This is the primitive group of Gymnosperms and is known only in the Paleozoic and chiefly in the Carboniferous. Until recently all these plants were thought to be ferns, the evidence from their leaf forms and venation appearing to be conclusive. However, they are now found to be seed-bearing, so that the so-called fern vegetation of the coal period is the primitive Gymnosperm vegetation. These Gymnosperms resemble ferns so closely that they cannot be distinguished except when seeds are attached. These seeds are borne in the same relation to the leaf that the fruit dots hold to the fern leaf. The connection of this group with the very early ferns is quite evident.

Cordaitales. Associated with the Cycadofilicales in the Paleozoic were the Cordaitales, which were once thought to be the only representatives of the Gymnosperms during the Paleozoic. The group was evidently derived from the Cycadofilicales, but was of very different habit. They were tall and slender trees, with a dense crown of branches bearing a great abundance of simple and large leaves. Their advance is also shown in the presence of cones in which the seeds are borne and also in the abundance of secondary wood.

Bennettitales. This extinct group of Gymnosperms was very conspicuous during the Mesozoic, and they have been called fossil cycads. Recent investigations have shown, however, that they are very distinct from the living cycads. They were extraordinarily abundant during the Jurassic, and many remains have been found in North America, Europe, and Asia. The richest display of forms occurs in the United States. The stem is either tuberous or short columnar and in either case bears a crown of large, fernlike leaves. The group is distinguished by bearing the cones on numerous small branches that issued from the trunk of the stem, and also in the fact that the cones contain both the stamens and the ovules.

Cycadales. The cycads are the living representatives of the Mesozoic Bennettitales. They are tropical plants, including about 100 species, distributed almost equally between the Oriental and Occidental tropics. The stem is tuberous or columnar, covered by an armor of leaf bases, and bearing a crown of large, fernlike leaves and a terminal cone. The plants are dioecious; i.e., the staminate cones and ovulate cones are upon different plants. Cycads are the most fernlike of living Gymnosperms.

Ginkgoales. This is a very ancient group, connected with the Cordaitales of the Paleozoic, displayed extensively throughout the world during the Mesozoic, and represented at the present time by a single living species. In all probability this species has been kept alive because of its extensive cultivation by the Chinese and Japanese in connection with temple worship. *Ginkgo*, or maidenhair tree, has become somewhat extensively cultivated in this country as an ornamental tree. It resembles a conifer in habit, but the leaf is very characteristic in form and veins, the broadly wedge-shaped outline, often more or less lobed, and the forked veins resembling somewhat the pinnules of maidenhair fern.

Coniferales. This is the largest group of liv-

ing Gymnosperms, comprising approximately 350 species. In contrast with the tropical distribution of the cycads, the conifers are characteristic of the north and south temperate zones, where they often form conspicuous forest masses. The group as a whole has been derived from the Cordaitales, and during the Mesozoic split up into six distinct tribes, which form the conifer vegetation of the present time. These tribes are as follows:

1. **Abietineæ.** This tribe includes 9 genera and about 140 species, including pines, spruces, firs, hemlocks, larches, and cedars, the large genus being *Pinus*, with about 80 species. This is the characteristic Gymnosperm forest group of the north temperate latitudes.

2. **Araucarineæ.** A tribe characteristic of the Southern Hemisphere, known as the Araucarians, or Araucarian pines. Only 2 genera are known, including about 20 species, which are as characteristic of the south temperate regions as the pines are of the north temperates. One of the genera (*Agathis*) includes the well-known Kauri tree of the Australasian region, as valuable a lumber tree for that region as is the white pine of the northern latitudes.

3. **Taxodineæ.** This tribe includes about 8 genera and 15 species, the characteristic American genera being *Sequoia* (redwood) and *Taxodium* (bald cypress).

4. **Cupressineæ.** In this tribe, with 9 genera and about 80 species, are included the cypress, arbor vitae, and junipers, the large genus being *Juniperus*, with about 30 species. This tribe is peculiar among conifers in its whorled leaves.

5. **Podocarpineæ.** The podocarps in general are south temperate forms, *Podocarpus* being the largest genus, with about 65 species, and is as characteristic of the Southern Hemisphere as are the pines of the Northern Hemisphere.

6. **Taxineæ.** The taxads in general are north temperate, the yew tree and ground hemlock (*Taxus*) being the most widely distributed genus.

Gnetales. This group comprises three remarkable and very distinct genera. *Ephedra* is a genus of about 50 species, distributed throughout the arid regions of the Mediterranean basin and adjacent Asia, and also in the arid regions of western North America and South America. They are straggling shrubs, with long-jointed and fluted green stems, and scalelike opposite leaves, forming at each joint a two-toothed sheath. The genus *Welwitschia* is represented by a single species in the arid districts of western South Africa. It has a huge, woody, turnip-shaped body, whose crown bears a single pair of elongated strap-shaped, parallel-veined, and persistent leaves. The genus *Gnetum* comprises about 15 species, distributed throughout the tropics of both hemispheres. They are small trees or woody twiners, with leathery, net-veined, opposite leaves, resembling those of Dicotyledons. There is no record of Gnetales as fossils, and therefore all the evidence available indicates that they are relatively modern among Gymnosperms.

In addition to the books cited under MORPHOLOGY, all of which treat more or less fully of this group, consult Coulter and Chamberlain, *Morphology of Gymnosperms* (Chicago, 1910).

GYMP. See GIMP.

GYMPIE, gim'pi. A gold-mining town of March Co., Queensland, Australia, on upper Mary River, 107 miles north of Brisbane by rail

GYMNOSPERMS

1. GINKGO
2. CYCAS

5. WELWITSCHIA

3. EPHEDRA
4. GNETUM

(Map: Queensland, H 9). In the vicinity are valuable mineral deposits, including coal, all as yet undeveloped. Pop., 1901, 11,959; 1911, 12,419.

GYNÆCEUM, jin'ê-s'ûm (Lat., from Gk. *gynaikeion*, *gynaikeion*, women's apartments, from *gynaikeios*, *gynaikeios*, relating to women, from *gynê*, *gynê*, woman). The apartments for women in ancient Greek houses, distinguished from the *andron*, the apartments for men. In the fourth century A.D. and later, the term was applied to large factories where slaves of both sexes wove and made up clothing of fine stuffs for the Imperial families and also of coarser materials for the soldiers. These factories were in direct dependence on the Emperor and under the supervision of Imperial officers. Procopius uses the term *gynaecoonitis* to indicate the place reserved in the Eastern church for women.

GYNÆCOLOGY, jin'ê-kôl'ô-jî (from Gk. *gynê*, woman + *-logia*, *-logia*, account, from *λέγειν*, *legein*, to say). That branch of medicine which treats of diseases and affections peculiar to the physical organization of women. All operative work upon the female genital apparatus is called gynecological surgery. But childbirth and the care of the parturient woman belong to the domain of OBSTETRICS (q.v.). Consult Dudley, *Practice of Gynecology* (New York, 1914).

GYNÆCONITIS. See GYNÆCEUM.

GYNOMEHRO. See POMO.

GYOMA, dyô'mô. A town of Hungary, in the County of Békés, situated on the Kőrös, about 114 miles east-southeast of Budapest by rail. The country is extremely fertile and produces much grain and fruit. Cattle and sheep are raised in considerable numbers; wine, bricks, and cereals are made, and the fishing is also important. Pop., 1900, 11,541; 1910, 11,688, mostly Magyar Reformed.

GYÖNGYÖS, dyên'dyêsh. A town of Hungary, in the County of Heves, situated on the Gyöngyös River, at the base of the Matra Mountains, about 60 miles northeast of Budapest (Map: Hungary, F 3). The town has a Gymnasium, a large Franciscan monastery, and a hospital of the Sisters of Mercy. It manufactures bricks, alcohol, copper goods, and spirits, and carries on a large trade in grain, cattle, and wine, the vineyards yielding the grape which produces the fine Erlauer wine. In the vicinity are excellent medicinal baths containing iron and alum. Pop., 1900, 16,442; 1910, 18,314, nearly all Magyar Catholics.

GYÖR, dyër, or **RAAB**, räb. A royal free city and the capital of the County of Raab, Hungary, 63 miles west by north of Budapest, at the confluence of the Raab with the Little Danube (Map: Hungary, E 3). It has many religious edifices and handsome new public buildings. The educational institutions include an Obergymnasium, a normal school for girls, a trade school, a priests' seminary, and training school for wood and metal workers. The city manufactures cloth, spirits, vehicles, matches, bricks, chemicals, oil, machinery, and agricultural implements. It has a good trade in hogs and grain, and the horse market is famous. It is the seat of a bishop. Györ was built on the ruins of the Roman *Arrabona*. It was taken by the Turks in 1594. Four years later they were driven out, and Györ was made a fortress of the first rank. Pop., 1900, 26,166; 1910, 26,849.

GYP, zhép. The nom de plume of the French writer Sibylle Gabrielle Marie Antoinette de Riquetti de Mirabeau, Comtesse de Martel de Janville. See MARTEL DE JANVILLE.

GYP/SIES. A singular race of wandering tribes, scattered through western Asia, all the countries of Europe, and northern Africa, and found, where the tide of modern immigration has flowed, in North and South America and in Australia. From the standpoint of ethnography and language alike they present one of the strangest problems with which modern scholarship has to deal. Dwelling in the midst of highly civilized nations, associating in the daily life of diverse peoples, they yet retain their physical and racial characteristics and their peculiar language wherever they may live. No similar phenomenon is to be observed in all the world. The nearest parallel is to be found in the Jews, who, also scattered among the nations of the earth, retain the distinguishing characteristics and customs of their race; but the Jews are numerous and powerful and have the influence of a long history and strong traditions, not to speak of the bond of their ancient religion. The gypsies, on the other hand, are isolated, unlettered, the despised of the earth, with no common bond of religion, history, or tradition. It is an unexplainable native instinct that holds them together in communities and roving bands, that keeps them apart from the rest of the world, and that drives them to endless, restless roaming. It is in their blood to love the open-air, nomadic life; and even where education or self-interest leads them here and there to adopt the settled habits of civilization, the old native instinct returns at times and forces them from house and town to the wandering life in the fields.

Name. In his own language a gypsy calls himself and his race *Rom* (i.e., man), *the man par excellence*, for all the rest of mankind he defines under the generic term *gäjo* (English-gypsy dialect *gäjo*, gentile). His wife is *romni*, and all that characterizes him and his ways is summed up in the term *romnipen*, while his language is *romani*. The gypsy of each country accepts the name applied to him by the people, but knows not what it means. These local names are as varied as the countries in which he lives; but if we except the many appellations of gypsy-like tribes in the East (the Luri and the Karachi in Persia, Nowars in Syria, Jüt and Sinti in India, etc.), of which but little is known, they may be reduced to three general categories: (1) those referring to the supposed origin of the tribe; (2) a group of allied names of uncertain etymology; (3) depreciatory appellations, such as "heathen" and "outcasts." Instances of the third class occur in Holland, where the gypsies are known as *Heidenen* (heathens), and in Egypt, where they are *Harami* (i.e., robbers). To the second group belong most of the appellations of eastern Europe and Germany. Early Byzantine writers (ninth to twelfth century) speak of the wandering tribes under the name *Ἀρολῳγοί*, *Atsinkanoi* (i.e., Touch-me-nots, since they feared to be defiled by the touch of other races whom they considered unclean), whence the gypsy in Turkey is to-day called *Chingiané*, in Bulgaria *Tsiganin*, in Rumania *Tigan*, in Hungary *Ozigány*, in Bohemia *Cinkán*, in Germany *Zigeuner* (Old German *Zigimer*, *Zigeiner*), in Italy *Zingaro*, and it may be possible that the

English word *tinker* is but a variation of the same term. To their emigration from the East we owe the first group of appellations; a very general, but wholly false, belief that they had wandered into Europe from Egypt led the Greeks to call them *Γύφτοι*, the Albanians *Jeuk*, the Turks *Fārāwī* (i.e., Pharaohs), the Hungarians *Faraonépe* (or Pharaoh's people), Spaniards *Gitanos*, and the English in olden times *Egipcions*, whence *Gypsies*. Similarly in Denmark, Sweden, and northern Germany they are designated as *Tatars*, and in France *Bohémiens*.

Origin and Ethnic Traits. Of their own origin the gypsies can give no sensible account. They are apt, at least those of western Europe, to follow the popular belief that they came originally from Egypt. Among the many authors that have written about them from the fifteenth century to recent times the most diverse and absurd theories have been advanced. A fanciful resemblance in their German name *Zigeuner* led early writers to trace them to Zeugitania (Tunis), or to Singara, in Mesopotamia. Others have sought to trace them to the Saracens, the Jews, the Amorites, the Canaanites, the Lost Tribes of Israel, or the "mixed multitude" that followed Moses out of Egypt. It was the comparison of their language that gave the first clue to their real origin. As early as 1776 a certain Captain Székely published a letter in a Viennese review, in which he mentioned that an Hungarian clergyman named Vályi, during his student days at the University of Leyden, had become acquainted with some fellow students from Malabar in India and had acquired from them a small vocabulary of Malabar words. On his return to Hungary he read his list to some gypsies, who understood almost every word. In 1783 two Germans, Rüdiger and Grellmann, writing on the gypsies, arrived independently at the conclusion of their Indian origin. The growing study of Sanskrit and the modern Indian languages drew further attention to that of the gypsies, and in 1844-45 Pott published a monumental work, *Die Zigeuner in Europa und Asia*, in which was fully set forth the Hindu origin of "romani." There can be no further question of the fact that the gypsies are an Indian race, and every step in the study of their language and racial type tends still more to confirm the fact. It is unnecessary here to treat in detail the many investigations of Bataillard, MacRitchie, De Goeje, Miklosich, and others, that seek to connect them closely with one or another of the wild tribes of northwestern India. A few words taken at random will serve sufficiently to show the Hindu origin of their language:

English	Gypsy	Sanskrit	Modern Hind.
oal	angar (wangan)	angara	ungara, vangar
two	dui	duo, dui	dū
to do	ker	kar	kurnā
man	manush (mush)	manushya	manus
mouth	mut	mukha	mukh
nose	nak	nasa	nak
five	panch	panchan	panch
gentleman	rai	rāja	rāja
lady	rani	rājñi	rāñi
golden	sonakai	swarna	sonakai
four	shtor	chatur	char
three	trin	tri	tiu
hand	uat	hast	haih
fire	yaq	agni	yag
eye	yak	akshi	ankh
one	yek	eka	yek

In appearance the full-blooded gypsy is rather undersized, with swarthy complexion, oval face, and regular features, often very handsome. He

has very black hair, piercing dark eyes, white teeth, a lithe figure, and small hands and feet. Kopernicki studied 20 gypsy crania in a hospital at Budapest and found a very striking resemblance to the Hindu crania of low caste. The gypsy marries early. The young girls are often very beautiful, but their beauty soon fades. As a race, the gypsies are long-lived; it is not unusual to find very aged men and women, exceedingly wrinkled, but robust and active. They retain their deep-black hair until a great age.

Sketch of their Migrations. At precisely what period the gypsy hordes left their early home in northwestern India and commenced their long migration into the west cannot be determined. Historical information on this point is entirely wanting; but their language affords sure evidence of the course of their wanderings, for their sojourn in each country has left its impress on their vocabulary. In addition, we are so fortunate as to have some slight records of their early apparition among the nations of Europe. They must have left their original home not later than the beginning of the tenth century, and how much before it is quite impossible to say. Perhaps the irruption of the hordes of Genghis Khan moved them from their earlier abode and started them on their long march of centuries. They evidently took the direction of Kabulistan and Persia and made a lengthy stay in each of these countries, as the presence of Kabul and Persian words in their language amply proves. Here they seem to have split into two main divisions—the one striking south through Syria into Egypt and northern Africa, where their descendants are still to be found in considerable numbers; the other migrating west through Asia Minor into Turkey in Europe. According to Finck, however, the dialect of the Armenian gypsies is more closely related to Prakrit than that spoken by the European gypsies, while the gypsy dialects of Asia Minor and Syria, as a whole, are very different from those of Europe. This seems to show that the gypsies of Armenia and Syria represent a later migration than those of Europe. Greece and the Greek-speaking countries of southeastern Europe were their earliest abiding place on the European continent, and there is no way of deciding how many decades or centuries they roamed about here before pushing their restless way still farther to the west. As early as 1378 we have mention of a gypsy chief named John as established with certain feudal privileges at Nauplia, in the Peloponnesus, under Venetian rule; and numerous ruined castles in that country still bear the name *Γυφτόκαστρον*, or gypsy castle, from the name by which they are known in Greece, *Γύφτοι*, or *Koptas*. Earlier still, in 1370, we find feudal settlements of gypsies in certain parts of the island of Corfu—a sort of gypsy "ghetto," or reservation.

Early in this same century large bands of gypsies began to stream north from Greece and Turkey into the wild and scantily populated Balkan countries, especially Wallachia, where they found ample room to gratify their nomadic instincts unmolested, and thrived and increased in numbers amazingly. From here they readily found their way in vast numbers into Transylvania and Hungary. They were settled in these countries already before 1417, and the plains of Hungary and the mountains of Transylvania may be regarded as the second important sta-

tion in their European wanderings. They formed an important and not useless part of the population, devoting themselves to a limited number of nomadic occupations, notably the simpler kinds of smith work and music, and were neither maltreated nor despised by the people.

The first appearance of the gypsies in Germany is recorded in 1417. At about the same time other bands passed through the whole of Europe. They are recorded in Switzerland in 1418; in Denmark, 1420; in Italy, 1422; in France and Spain, 1447; in Poland and Russia, about 1500; in England shortly after. At first they were treated kindly and assisted in their poverty alike by people and government; but their thievish habits soon caused them to be driven from place to place, and stringent laws were frequently passed against them. This probably explains their sudden appearance in such distant parts of Europe at about the same period. The curious notion that they were of Egyptian origin was already widespread, and the gypsies themselves found it to their purpose to lend credence to it. They invented an imaginary "Little Egypt," and their chiefs, riding their well-kept horses, clad in many-colored garments and coin-bedecked, and followed by the miserable rabble of their tribe, posed as "counts" and "dukes" and "kings" of that land; or gave out that they were pilgrims on their way to Rome to do penance for apostasy, thus gaining the aid and good wishes of the simple. A large band wandered into Italy under the leadership of a "duke of Egypt" named Andrew, and encamped before the gates of Bologna on July 18, 1422. The "duke" himself entered the city and took lodgings at the "Albergo del Re," displaying a passport for himself and his tribe, signed by Sigismund, King of Hungary, and explaining to the town authorities that he and many others of "Little Egypt" had turned against Christianity and consequently had been driven from their country by King Sigismund. He himself and 4000 of his people had thereupon decided to renounce the error and return to the Church; and the King, after putting to death the most obstinate renegades, had imposed upon the others a penance of seven years' wandering and the obligation of going to Rome to get the papal absolution, as a condition of receiving back their lands and goods. For five years had they already wandered and now were approaching Rome. This story served the "duke" well for several years; but the imposition was ultimately discovered, and the whole band was expelled from Italy. In 1429 we find the city of Arnhem in Gelderland furnishing money and provisions "to the Count of Little Egypt, with his company," and another item "to the same Count and the heathen women, for the honor of God." In 1459 the town of Zutphen made a like present to the "King of Little Egypt," and Duke Egmont granted a passport to "Count Martin Gouvy, geboren van Klein-Egypten, so that he might be helped on his pilgrimage." Many more instances might be cited; and it may be observed that in all these cases the gypsies were from Hungary, and strangers in the lands through which they were wandering. In the course of time their fraud was naturally exposed; and then the "dukes" and "counts," reduced to common vagabonds, either retraced their path to Hungary or remained with their tribes and became severally German and Italian

and Dutch gypsies. As such they were treated as outcasts and often rigorously persecuted. In Germany acts of banishment were passed against them in 1479, 1500, 1544, 1548, and 1577, each more stringent than the last; and that of 1725, under Frederick William I, was the most cruel of all: "Gypsies, whether men or women, that are caught in the Prussian states, if over 18 years of age, shall be sent to the gallows without mercy, and may previously also be punished with branding and flogging, whether they have come into the country for the first time singly or in company, and whether they have passes to show or not." Christian III of Denmark gave the gypsies three months to leave the country in 1536, under penalty of death in case of return, and a similar royal edict was passed against them by Sweden in 1662. In France they were never allowed to gain a foothold. Hungary, Rumania, Poland, Russia, and England, on the contrary, have on the whole been generous to them, they have thriven in Spain, and Italy has tolerated the comparatively few that dwell there. To-day the tent-dwelling gypsies seldom pass from one country to another; they have become habituated to their adopted country, and with the growth of popular education and the increasing difficulty of leading the nomadic life, they are gradually losing their peculiar character and becoming assimilated to their neighbors. Their last migration is to the New World or to Australia; and here, in new surroundings, many thousands are already living, mostly English gypsies, but also bands from the Continent, especially from Hungary and the Balkan states. The gypsies are most numerous in Rumania and various parts of the Balkan region, Hungary (with Transylvania), and Russia. Their aggregate number in these countries is in the neighborhood of 500,000. On the migrations of the gypsies, consult especially Von Wlislöcki, *Vom wandern den Zigeunervölke* (Hamburg, 1890). That the gypsy question is yet a live one may be gleaned from the fact that in 1906 the ministry of Prussia issued edicts against them, and the following year an effort was made to expel them from the German Empire.

Language. It is a very prevalent impression among English-speaking people that the language of the gypsies is a simple jargon or cant. Nothing could be further from the truth. The broken dialect of the English gypsies, indeed, is a strange mixture of English and Romany, in which the grammar has almost wholly disappeared, and it is this fact that has created the popular impression. But in the farther East, where the race is more compact and has preserved far better its habits and instincts, Romany is a true and complete language, with a considerable vocabulary and a highly developed system of inflections. A brief characterization is all that is possible here; but the student is referred to the list of valuable works appended to this article.

There are fourteen distinct dialects of Romany in Europe: (1) the Greco-Turkish, (2) Rumanian, (3) Hungarian, (4) Slavonian, (5) Polish-Lithuanian, (6) Russian, (7) Finnish, (8) German, (9) Scandinavian, (10) Italian, (11) Basque, (12) Spanish, (13) Anglo-Scotch, (14) Welsh. Any one of these dialects is not easily intelligible to the speakers of the others. The purest are those of Turkey, the Balkan states, and Hungary-Transylvania; the most corrupt

are those of England, Scotland, and Spain. We may first select the dialect of Turkey as an example of the pure Romany—the *lacho romano chib*—and then illustrate its corruption in the hybrid dialect, the *pōsh* and *pōsh romani*, of the English gypsies. For the Turkish dialect we owe our accurate knowledge to Dr. Alexander G. Paspati, of Constantinople, whose extensive researches are summed up in his *Études sur les Tchingianès, ou Bohémiens de l'Empire Ottoman* (Constantinople, 1870).

Alphabet.—As Romany is not a written language, it properly has no alphabet; but it is very rich in sounds, both vowel and consonantal.

Article.—(a) Definite masc. *o*, fem. *i*, from the Greek *ὁ, ἡ*. (b) Indefinite: *Yek*, properly "one." Examples: *o rakló*, the boy; *i rakli*, the girl; *yek charó*, a child.

Noun.—There are two genders, masculine and feminine. Nouns may terminate equally in vowels and consonants. All nouns are fully declined, and there are eight cases, as follows:

	Masc. <i>rakló</i> , boy	Fem. <i>rakli</i> , girl
	Singular	
Nom.	<i>rakló</i>	<i>rakli</i>
Gen.	<i>rakléskoro</i>	<i>rakliáskoro</i>
First Dat.	<i>rakléste</i> , to the boy	<i>rakliáste</i> , to the girl
Second Dat.	<i>rakléske</i> , in the boy	<i>rakliáske</i> , in the girl
Acc.	<i>raklés</i>	<i>rakliá</i>
Voc.	<i>rakléya</i>	<i>raklié</i>
Instr.	<i>raklésa</i>	<i>rakliása</i>
Abl.	<i>rakléstar</i>	<i>rakliástar</i>
	Plural	
Nom.	<i>raklé</i>	<i>rakliá</i>
Gen.	<i>rakléngoro</i>	<i>rakliángoro</i>
First Dat.	<i>raklénde</i> , to the boys	<i>rakliánde</i> , to the girls
Second Dat.	<i>raklénghe</i> , in the boys	<i>rakliánghe</i> , in the girls
Acc.	<i>raklén</i>	<i>raklién</i>
Voc.	<i>rakléda</i>	<i>rakliéda</i>
Instr.	<i>raklénda</i>	<i>rakliéndá</i>
Abl.	<i>rakléndar</i>	<i>rakliéndar</i>

Examples: *E roméskoro raklé ta rakliá*, the boys and girls of the gypsy. *Terasa yek raklés*, we have a boy. *E rakliá é penéla o raklo*, the boy says to the girl. *So sovén romále?* why do you sleep, O gypsies?

Adjective.—Masc. ends in *-ó*, fem. in *-i*. Exceptions are rare, as *shukár*, beautiful; *yavér*, other. All the oblique cases and the entire plural end in *-é*. Examples: *lachó charó*, good child; *laché chavéskoro*, of the good child; etc.

Pronouns.—These are fully declined, like the nouns. The personal pronouns are *me*, I; *tu*, you (singular); *ov*, he; *oi*, she; as follows:

	Singular			
Nom.	<i>me</i>	<i>tu</i>	<i>ov</i>	<i>oi</i>
Gen.	<i>mángoro</i>	<i>ti</i> [tiro]	<i>lákoro</i>	<i>lákoro</i>
First Dat.	<i>mánde</i>	<i>títe</i>	<i>lákste</i>	<i>lákste</i>
Second Dat.	<i>mánghs</i>	<i>títke</i>	<i>lákste</i>	<i>lákste</i>
Acc.	<i>man</i>	<i>tui</i>	<i>les</i>	<i>la</i>
Voc.	<i>me</i>	<i>tu</i>
Instr.	<i>mánáya</i>	<i>tísa</i>	<i>lésa</i>	<i>lésa</i>
Abl.	<i>mánáar</i>	<i>títar</i>	<i>léstar</i>	<i>lákstar</i>
	Plural			
Nom.	<i>amén</i>	<i>tumén</i>	<i>os</i>	<i>léngoro</i>
Gen.	<i>améngoro</i>	<i>tuméngoro</i>		<i>lénđe</i>
First Dat.	<i>aménde</i>	<i>tuménđe</i>		<i>lénghs</i>
Second Dat.	<i>aménghs</i>	<i>tuménghs</i>		<i>lén</i>
Acc.	<i>amén</i>	<i>tumén</i>		...
Voc.	<i>amén</i>	<i>tumén</i>		...
Instr.	<i>aménáya</i>	<i>tuménáya</i>		<i>lénáya</i>
Abl.	<i>aménáar</i>	<i>tuménáar</i>		<i>lénáar</i>

Examples: *Me isóm*, I am; *pendé manghé*, they said to me; *tu penghiás aménghs*, you (sing.) said to us; *dikliás la lákoro dat*, her father saw her; *asálas lasa*, he laughed with her. The possessive pronouns are *mo*, my (fem. *mi*; oblique cases and plural *me*); *to*, your

(sing.; fem. *ti*; oblique cases and plural *te*); *minró* (fem. *minrí*), my; *tinró* (fem. *tinrí*), your, yours (sing.); *léskoro* (fem. *lákoro*), his, hers; *amaró* (fem. *amarí*), ours; *tumaró* (fem. *tumari*), yours (pl.); *léngoro* (masc. and fem.), their, theirs. The demonstrative pronouns are: *aká* or *avaká*, this (fem. *akiá* or *avakiá*, pl. *aklé* or *avaklé*). The interrogative is *kon*, masc., fully declined; and so, defective, neuter; and the relative is *ka*, indeclinable. Examples: *Mo charó*, my boy; *mi rakli*, my girl; *me charé*, my children; *to vast*, your (sing.) hand; *tinró sukaribé*, your (sing.) beauty; *léskoro grast*, his horse; *léskere dant*, his teeth; *lákoro pral*, her brother; *aká rakló*, this boy; *avaklé gavéste*, in this village; *kon kachél*, who will be left? *ta tu*, so *penés mánghe*, and you, what do you say to me?

Numerals (all Hindu, except "seven," "eight," "nine," from the Greek): *Yek*, one; *dúí*, two; *trin*, three; *shtor*, four; *panch*, five; *shov*, six; *está*, seven; *okhtó*, eight; *cnéa*, nine; *desh*, ten; *desh-u-yek*, eleven, etc.; *bish*, twenty; *bish-u-yek*, twenty-one, etc.

Verbs.—The conjugation of verbs, regular and irregular, is exceedingly complex and full. As a general example, the regular verb *dáva*, to give, will suffice.

		Present	
<i>dáva</i> , I give	<i>déa</i> , you give	<i>dáva</i> , we give	<i>déna</i> , you give
<i>déa</i> , he gives	<i>déna</i> , they give		
		First Aorist	
<i>dávas</i>	<i>déas</i>	<i>dinióm</i>	<i>diniám</i>
<i>déas</i>	<i>dénas</i>	<i>dinián</i>	<i>dinián</i>
<i>déas</i>	<i>dénas</i>	<i>dinís</i>	<i>dinís</i>
		Future	
<i>diniómas</i>	<i>diniómas</i>	<i>kamadáva</i>	<i>kamadása</i>
<i>diniémas</i>	<i>diniémas</i>	<i>kamadéa</i>	<i>kamadéna</i>
<i>dinís</i>	<i>dinís</i>	<i>kamadéla</i>	<i>kamadéna</i>
		Imperative	
<i>de</i> , give!		<i>den</i> , give! (pl.)	
		Subjunctive	
<i>te dáva</i>	<i>te déa</i>	<i>te dáva</i>	<i>te déna</i>
<i>te dáva</i>	<i>te déna</i>	<i>te dáva</i>	<i>te déna</i>
		Participle	
<i>dinó</i> , taken		(fem. <i>diní</i> ; pl. <i>diné</i>)	

Examples: *Kerava*, I make; *terélas but chavén*, he had many children; *so kamavéla*, what will come? *me chinghióm les*, I killed him.

It will readily be seen from the above résumé that Romany, where well preserved, is a fully developed and highly inflectional language. This character it has kept where the gypsies live in large numbers, as in Hungary, for instance; but in every country it has received many influences from without. In Hungarian the word accent falls invariably on the first syllable, and this has influenced the Hungarian dialect. Thus, what would be pronounced *rakló*, boy, *rakli*, girl, in Turkey, would become *raklo*, *rakli*, in Hungary and in all the gypsy dialects of the farther west.

A word about the corrupt English dialect. When the gypsies arrived in England, early in the sixteenth century, they spoke Romany of a pure and inflectional character. But association with the country people, and especially with the questionable gentry of the horse fairs and the roads, caused their speech to become more and more corrupt, until to-day it is the English grammar applied to several hundred gypsy words. The old gypsy men and women who spoke the "real language" (*tacho romani jib*)

are dead, and their descendants have forgotten it; but fortunately scholars took it from their lips before it disappeared. Almost every inflected form of Romany may be found in the English dialect. Thus, of the verb, *keráva*, *kerésa*, *keréla*, *keréna*, *kérdo*, I, you, he, they make, made, are recorded; but the English gypsies of to-day, instead of *me keráva*, I make, say *mánde kers* (using the English vulgar termination -s in I makes), *tute kers*, *lesti kers*, etc. The migrations of the English gypsies are very discernible in their language. The basic stock is Indian; the Persian has supplied many words, as *devruál*, *dovyal*, sea, *vesh* or *wesh*, forest; the Armenian several, as *grast*, horse, *chor*, deep; not a few are from the Greek, as *drom* road, (*δρομος*), *pet'l* horsehoe (*πέραλον*), *stadi*, hat (*σκάδι*); the Slavic languages have furnished, among others, *krális*, king, *kichéma*, inn, *lovinor*, beer; while German is represented by *stift-pal* and *stift-pen* (*Stiefbruder*, *Stiefschwester*), and French, as some think, by *bíti*, little (*petit*).

Representative specimens of several Romany dialects are here appended for comparison. Non-Romany words and forms are given in italics.

TURKISH DIALECT (Paspatis, p. 600): Yek

dakár tércas trinén raklén, diniás e khurdés
king had three sons he gave to the youngest
hiliades [Greek] ghroscha [Turkish], diniás e
one hundred piastres he gave to
thousand the
barés ta e maskaritnés. Ufkinótar o khurdó, liás
eldest and the middle Up rose the youngest, took
[the same].

o baró drom kárin t'arakélas choré délas lové,
the long road, every-that he found poor he money,
where people, gave
akaring okoring diniás len khaliás o lové.
here there he them, he the money.
gave scattered

HUNGARIAN DIALECT (Von Wisllocki, p. 286):

Oh díldoro, báro ruk ándro bes, tu pélyál, tu men
Oh dear great tree in the forest, you have you us
father, fallen,
múkyál! Ameu ávnás túte cári. Akáná ná hin
have left! We were your grasses. Now not is
ménge úshályin. Ameu ávnás tut' chiriklá!
to us shade. We were your birds!
Akáná ná hin rúkú! Kai úshályin th' árakús, kai
Now no are trees! Where shade to find, where
rúkú th' árakús?
trees to find?

BOHEMIAN DIALECT (Ješina, p. 133): Kai jas,

mále? Jáv ándro foros. So hi odof túke te kérel?
friend? I go into town. What is there for to do?
you
Mri rómni odof géyas ókia the n'ável pále; na
My wife there went away and not comes back; not
jínáv so pes láke tálinyás.
I know what to her has happened.

GERMAN DIALECT (Liebich, p. 269): Ap o yek

divio grai klisyas givéses yek dsáskero chávó. Goi
wild horse rode proud a spirited boy. Then
péndas o divio gúro graleske: "Laj! Tu múkyal
said the wild bull to the horse: "Shame! you allow
te ríkkervel tut yek chávéster?" "Áva," péndas
to hold you a boy?" "Yes," said
o grai, "har pátib véles mánge, yek chávés te
the horse, "How honor come to me, a boy to
chiverváva téle?"
throw down?"

ENGLISH DIALECT—old pure form (Smart and Crofton, p. 215): Dósta dosta béshq ghíás koná
Many, many years gone now
sas a [Eng.] báro krális adrá Anghiterra. Ed-
was a great king in England. Ed-
wardus sas lésko nav, kúshto kómelo rai sas-lo.
ward was his name, good lovely gentle-was he.
man

ENGLISH DIALECT—modern corrupt form:
Where's yer jal'in' to ách yer tán? We doesn't
Where's yer goin' to pitch yer tent? We doesn't
jin. We pens we'll dik some kusho tán to ách
know. We thinks we'll see some nice place to camp
adoi aprá the drum adoi. Mándi pens I jin a
there in the road there. I thinks I know a
kúshto tán to ách akai under dóva rúkyá. There's
nice place to camp there under those trees. There's
shade adoi, and chor for the grais, and dústa
shade there, and grass for the horses, and plenty
pám, yúso for the chals to pé. Jal with mándi,
water, clean for the gypsies to drink. Go with me,
ta mándi'll siker túte the kúshto tán.
and I'll show you the nice place.

Religion and Folklore. Of the religion of the gypsies there is little to be said. On the one hand they are not idolaters, nor on the other have they any well-defined religious ideas. They may go by the name of Christians or Mohammedans, according to the religion of the people among whom they live, but at best they attach little vital significance to religious rites and worships. Their religious attitude was probably the same on their arrival in Europe; they brought with them their Indian religion, but so slightly grounded that it was easily obscured and then wholly lost. A curious proof of this is to be found in the Romany word *trúshul*. The *trísula* in Sanskrit is the three-pointed spear, or trident, borne by the Hindu god Shiva. From India the gypsies brought the word, along with a vague memory of the old god; but, arrived in Christian countries, they speedily forgot Shiva and transferred his symbol, the trident, to the symbol of the Christian religion, the cross; and all over Europe, in England as in Turkey, the *trúshul* is the cross of Christ.

It is stated in many books on the gypsies that they have no conception of God, and that there is no word for God in their language. This is wholly false. The name of God is to be found in every gypsy dialect and is of pure Hindu origin: *Devél* (Skt. *dēva*, god, Avesta *daeva*, an evil genius, Lat. *deus*). The English gypsy calls God o *bóro Dúol*, the great God, or *mi-dúvl*, my God. The gypsy conception of God is partly pantheistic, but largely anthropomorphic. It varies, of course, with the grade of culture of the tribe. In England the gypsy is, to all intents and purposes, a Protestant Christian, with theological notions of a very vague sort and rather indifferent in the matter of devoutness; but often, in individual cases, he becomes an ardent evangelist and missionary. At the other extreme, geographically and racially, the gypsy of eastern Europe is almost a pagan, so rich is his mythology and folklore in supernatural beings, male and female, benign and pernicious, of every grade. It would be impossible in a limited space to give an adequate idea of the complete mythological system, e.g., of the Transylvanian gypsies as recorded by Wisllocki. They have developed a thorough cosmogony; and the sky and woods and streams are peopled in their imagination with numberless beings, whose influence must be sought and whose vengeance must be averted with amulets and charmed words. Not an illness, not an animal in nature that does not have its "spirit"; and every "omen," every coincidence, every dream, has its portentous meaning.

Peculiar Customs, etc. The gypsy, wherever he lives, inclines naturally to some occupations rather than others, and especially to those that admit of a roving life, or at least of a life in

the open air. He is universally a mender of pots and pans, and in the East, where the gypsies are settled in communities, they engage in many employments, such as smithing, basket making, and the like. Horse trading is a favorite means of livelihood and almost the only one in England and America. The women "tell fortunes" and gained no small profits by their skill in more credulous days, while even now they earn a good living in this way from the frivolous. In Hungary especially, also in Rumania, Russia, and Poland, the gypsies are noted as musicians, and Liszt himself has borne tribute to their genius. (See his work on Gypsy music, cited below.) This music is wild and wonderfully effective, being wholly by ear and most accurate in technique. In their relations with *gaje* (gajos) or nongypsies, they are genial, friendly, ready to do business; but in matters pertaining to themselves, their life and language, often inclined to be reticent. When, however, they have confidence in a nongypsy friend, their sincerity and fidelity know no bounds. Much has been written about the gypsies in a spirit of hostile prejudice or commiseration; it must be admitted, none the less, that those who have gained their confidence and learned their ways and their point of view have always spoken well of the Romany.

GYPSUM (Lat., from Gk. γύψος, *gypos*, chalk, probably of Semitic origin; cf. Ar. *gibṣ*, gypsum, from *jabasa*, to walk haughtily). A hydrated calcium sulphate, composed of lime 32.56 per cent, sulphuric acid 46.51 per cent, and water 20.93 per cent. It crystallizes in the monoclinic system, has a hardness of 1.5 to 2, and a specific gravity of 2.32. The crystals are found in beds of massive gypsum, in veins by themselves or with ore, or scattered through beds of marl and clay. When transparent, they are called selenite. Alabaster (q.v.) is a massive white, opaque variety of gypsum, and satin spar is a fibrous variety. A loose, earthy gypsum found in Kansas passes under the name of gypsite, or gypsum dirt. Gypsum sand is a sand composed almost entirely of gypsum grains. The color of gypsum may be white, red, green, blue, gray, or brown. When pure gypsum is heated to a temperature of between 250° F. and 400° F., it loses about three-fourths of its water of combination, the calcined product being plaster of Paris, which, when mixed with water, takes up in chemical combination as much as it has lost and sets to a hard mass. The presence of impurities retards the setting, and such slow-setting plasters are termed *cement plasters*. They are of value for structural work. Gypsum calcined above 400° F. is dead-burned and appears to lack setting properties. If heated to about 900° F. and finely ground, it sets slowly to a hard product called *flooring plaster*.

The impurities which gypsum may contain, sometimes in quantity, are clay, lime carbonate, sand, and anhydrite. The last may be very irregular in its mode of occurrence, forming beds, lenses, or veins in the rock gypsum. It is of no commercial value and in districts where abundant is an annoyance.

Occurrence. The three main types of occurrence are (1) rock gypsum, which is the most

important commercially; (2) gypsite, forming shallow surface deposits, in the western United States; and (3) gypsum sands, found in Arizona and New Mexico. Other types of little or no commercial importance are periodic lake deposits, disseminated lumps in clays and shales, veins, and fumarolic deposits around volcanic vents.

Origin and Distribution. The origin of gypsum is usually ascribed to the evaporation of sea water, although to yield a deposit several hundred feet thick would require the evaporation of an ocean of enormous depth. (For further discussion of this, see *SALT*.) Most deposits of gypsum found in the world are considered to have been derived in this manner, although the gypsum is not deposited until about 80 per cent of the salt water has been evaporated. Gypsite deposits are probably formed by underground waters leaching gypsum from the hills, carrying it in solution to the lowland soils, and there depositing it, when the water evaporates. Some beds of the material have been formed by the action of sulphuric acid liberated by the decomposition of pyrite, acting on carbonate of lime, converting it into calcium sulphate. In such cases there may be a gradual passage from the limestone into the gypsum rock. Gypsum is widely distributed geologically, being found in various formations, ranging from the Silurian up to the Tertiary. Extensive beds of gypsum are found in the Silurian formation in New York, the Carboniferous of Ohio and Michigan, the sub-Carboniferous of Virginia, and the Cretaceous of Iowa and Kansas. Deposits also occur in Arizona, California, Colorado, Wyoming, Oklahoma, Texas, and Utah. It is also found in Canada, Germany, Norway, France, Austria, Bohemia, Italy, Egypt, Arabia, and Persia. That found in New Brunswick and Nova Scotia is often of high purity. It is mined sometimes by quarry methods and sometimes by underground workings.

Uses. The use of gypsum seems to have been known at a very early period, for the Greeks were familiar with it, as shown by the writings of Theophrastus and Pliny. The commercial value of gypsum depends largely on the color and freedom from grit, the whiter grades being calcined and used for plaster. This calcining is commonly done in large kettles, the material having been previously ground in crushers and mills. The kettles are usually about 6 feet deep and 8 feet in diameter, and are filled to a depth of 5 feet. They are heated from below, and the gypsum is constantly stirred during the calcining process by revolving arms. Aside from its uses for ordinary plastering, it is also extensively employed in the manufacture of ornamental stucco work, as a filler in paper, in making imitations of marble, and sometimes for calcimining. Where a slow set is desired a retarder is sometimes used, such as glue, hair, lime, etc. Much gypsum is used as a retarder for Portland cement and as a bed for polishing plate glass. Raw gypsum is also used as a basis for paints, the pigments being mixed with it. *Keene's cement* is made by calcining gypsum at a red heat, immersing it in an alum bath, drying and calcining again. *Mack's cement* is a dehydrated gypsum mixed with a 0.4 per cent of sodium or potassium sulphate. It is used for flooring, walls, or ceilings. The impure crude gypsum finds application only for fertilizing purposes and is extensively employed in both

England and America for increasing the fertility of soils. (See *MANURES AND MANURING*.) It is also employed at times to counteract the black alkali which forms in many of the soils of the arid region. Alabaster has been used for many years for decorative purposes and in the making of statuary, while satin spar has been employed for necklaces, inlaid work, and other ornaments.

The marketed production of gypsum in the United States in 1912 was: crude gypsum, 441,608 short tons, valued at \$623,522; calcined gypsum, 1,731,674 short tons, valued at \$5,940,386. In the United States, New York is the largest producer, with Iowa second. The imports in 1912 were valued at \$488,481. Among the world's producers France leads, with the United States second and Canada third, in amount of production.

GYPSY MOTH. This insect is abundant throughout the temperate zone in the Old World and often does much damage to fruit, shade, and forest trees, particularly in France, Germany, and southern Russia. It was first described by Linnaeus in 1758 and named by him *Bombyx dispar*, but later authorities place it in the genus *Poritetr*. The eggs of the moth are laid in August in a yellow, hairy mass on tree trunks, rocks, and fences. They hatch the following spring, and the caterpillars feed on all kinds of trees, shrubs, and plants. Even conifers are not exempt from their ravages, and the latter trees usually die after one defoliation. By the middle of July the caterpillars become full grown, when they pupate in loose cocoons in sheltered places, and the moths emerge in about two weeks' time. The male moth is brown and flies actively, while the large white female does not fly.

This insect was introduced into Medford, Mass., by Leopold Trouvelot, who in 1869 was experimenting with various American and European silkworms in the effort to find some hybrid which might be exempt from the attacks of the pébrine disease of silkworms. Trouvelot's specimens escaped accidentally, and although he notified the proper authorities, the matter was lost sight of until about 1889, when the ravages of the caterpillars at Medford were sufficient to cause general alarm. A year or two of desultory efforts on the part of property owners in this vicinity were sufficient to convince them that they could not successfully cope with the insect, and the aid of the State was asked. In 1890 the Legislature of Massachusetts began the effort to exterminate the moth, first placing the work in the hands of a commission and later transferring it to the State Board of Agriculture. This work was carried on systematically for about 10 years, at an aggregate expense to the State of nearly \$1,000,000, when it was permitted to lapse, chiefly because public senti-

ment in Massachusetts would not support it further. The insect having become scarce, it was difficult to convince taxpayers of the necessity of further appropriations to secure the last remaining ones. Since the abandonment of the work by the Legislature in 1900, the moth has gradually increased to a point where several municipalities have been obliged to take up the work of destroying it, using the methods originated and perfected by the Board of Agriculture. Unless thorough work can be prosecuted over the entire district, it is quite probable that in a few years damage by the moth will become much more severe than ever before. Consult: Forbush and Fernald, "The Gypsy Moth," *Massachusetts State Board of Agriculture* (Boston, 1896); Howard, "The Gypsy Moth in America," *Bulletin 11, United States Department of Agriculture* (Washington, 1898); all annual reports of the State Entomologists of our Northeastern States; bulletins published by the Massachusetts State authorities, by the United States Bureau of Entomology, and especially scattered articles in the *Journal of Economic Entomology* from 1908 to the present date. GYRFALCON, jēr'fā'k'n (OF. *gerfaucon*, *gir-faucun*, *gerfaul*, Sp. *gerifalite*, *gerifalco*, from ML. *hierofalco*, *gyrfalcon*, from Gk. *lepós*, *hieros*, sacred; popularly connected with *lépa*, *hierax*, falcon, although the words are only remotely akin, + Lat. *falco*, falcon, confounded in popular etymology with Lat. *gyrus*, circle, in fancied allusion to the bird's circling flight). A large falcon (*Falco islandus*), the female of which is about 2 feet in entire length. The plumage is almost brown when the bird is young, but gradually changes to white as it advances in age, the white margin of each feather encroaching on its brown centre, until aged birds are almost pure white. It is rarely seen in the United States or other temperate regions, except in severe winters, but inhabits all the very cold northern parts of the world. It was formerly in high esteem for falconry and was procured at great expense from Iceland and Norway. Two species (*Falco islandus* and *Falco rusticolus*) and two subspecies are recognized in America. See *PLATE OF FALCONS AND FALCONRY*.

GYROSCOPE (from Gk. *γῦρος*, *gyros*, circle + *σκοπεῖν*, *skopein*, to view). The name given by Foucault to an instrument for the exhibition of various phenomena of rotation, of a freely suspended body and the composition of such rotations first described by Bohnenberger in 1817. It differs from a top in having both ends of its axis of rotation supported. The invention is probably French or German, and in some of its forms it dates from about the end of the eighteenth century, but no certain information can be obtained as to the original inventor. Its action is based on the principle that if a mass is set in rotation about its principal axis of inertia of greatest or least moment, it will continue to revolve about it, and unless extraneous force is applied the direction of the axis will remain unchanged. If, then, a mass of metal—

as, e.g., a circular disk, loaded at the rim and revolving in its own plane—be made to rotate rapidly about its axis of greatest moment of inertia, and if it be freely supported (in gimbals, like the box of a compass), the direction of its axis will be the same so long as the rotation lasts. It will therefore constantly point to the same star and may be employed to show that

GYROSCOPE.

the apparent rotation of the stars about the earth is due to a real rotation of the earth itself in the opposite direction. This application was described by Foucault in 1852, who set his gyroscope in rotation, and then with a microscope observed the apparent change in the plane of its rotation caused by the movement of the earth.

The most interesting phenomena shown by the gyroscope are those depending on the composition of rotations. Any motion of a body which has one point fixed is of the nature of a rotation about an axis passing through that point. Hence simultaneous rotations about any two or more axes, being a motion of some kind, are equivalent to a rotation about a single axis. The effect, then, of impressing upon the frame in which the axis of the gyroscope is suspended a tendency to rotate about some axis, is to give the whole instrument a rotation about an intermediate axis; and this will coincide more nearly with that of the gyroscope itself, the greater the rate of its rotation. It is not possible to explain to the nonmathematical reader the exact nature of the compound motion, but the rotation of the axis of a top round the vertical (when it is not "sleeping" in an upright position), and the precession of the earth's axis, are precisely similar phenomena. Thus, when the gyroscope is spinning, its axis being horizontal, a weight attached to the framework at one end of the axis (Fig. A) makes the whole rotate about the vertical, in fact, taking up a movement normal to the impressed force, this being known as precession. Often the apparatus is so arranged that the framework may be lifted

by a string attached near one end of the axis (Fig. B), as in the familiar toy, and the gyroscope will then revolve without falling. Its axis still projects horizontally from the string, but it revolves as a whole round the string.

When a top is suspended, as in Fig. B, it is obviously under the action of a torque due to the weight of the top; this torque has as its axis a horizontal line perpendicular to the axis of the top. If I is the moment of inertia of the top about its axis of spin, h its angular velocity of spin, and K the value of the torque, then the whole top will be maintained in its precessional motion about a vertical axis with an angular velocity H , where $K = IhH$. Thus, if the top is spinning slowly, its precession is rapid. The general statement, then, is that in order to turn the axle of a spinning wheel about a perpendicular axis, it is necessary to apply a torque K about a third axis, perpendicular to the other two, whose value is $K = IhH$; this may be called the "gyroscopic resistance."

If the top in Fig. B is set spinning but not at first allowed to precess, and is then set free, its axis will at first incline downward, and then precession will begin; the top will rise and fall during this motion, making a series of oscillations.

In the general case of a symmetrical top spinning on its axis, but having one point fixed, as in Fig. B, the main effect of a torque about any axis may be deduced at once by the ordinary laws of composition of vectors; thus, if one attempts to hurry on the precession by pushing the framework sidewise, this is a torque about a vertical axis, and being compounded with the existing rotation around a horizontal axis causes this axis to tilt upward. In many applications of gyroscopes this applied torque is due to friction.

If by any means the direction of the axis of a spinning body is changed, there will be a reaction in the way of a torque upon the supporting framework. This may be used in many ways, as is shown in the description of various practical instruments, which follows.

The spinning top of Fig. B is free to have its axis in any direction; but by suitable clamps this freedom may be restricted. The reaction upon these clamps when the top is moved may be studied by means of the principles given above.

But the gyroscope must be considered as more than a piece of scientific apparatus to interest the physicist and the mathematician, or as an amusing toy that seems to defy the laws of nature. It has found important applications in stabilizing rolling ships at sea, in directing automobile torpedoes, in the useful gyro compass, in various monorail schemes for transportation, and in the autostabilizer for aeroplanes. Perhaps the first of these applications was the Ohry gear for torpedoes, the invention of an Austrian naval officer, but modified more or less as used in various other services. This is discussed under TORPEDO. Then there was the application of the gyroscope principle to the compass by Martienssen and Anschütz-Kaempfe in Germany and by Elmer A. Sperry in the United States. As a result, there has been developed a compass that is independent of magnetism and which has proved remarkably successful, as will be found discussed under COMPASS. Likewise the various schemes to use the gyroscope to support a high-speed car on a single track have met with some

experimental if not practical success, as will be discussed under MONORAIL; but perhaps the most interesting fields of usefulness have been the autostabilizing devices for ships and aircraft, in both of which departments an American engineer and inventor, Elmer A. Sperry, has achieved marked success: while Dr. Schlick, of Germany, has also accomplished much by the use of a so-called passive type of gyro, where the machine was suspended in a ship with freedom of movement about its axis of rotation, which was vertical, and about its axis of precession, which was athwartship. The Sperry gyro received a full test on the U. S. S. *Worden*, a destroyer of the United States navy, and the S. S. *Ashtabula*. On the *Worden* the gyros were mounted with their axes horizontal and normally athwartship, having the precession rings pivoted about the vertical axis, movement about the latter being controlled by a so-called "precession engine," which in turn was controlled by a small gyroscopic pendulum. Thus any tendency to roll caused the precession engine to move the gyros so as to deliver an impulse to the ship about its longitudinal axis that would counteract this tendency. The spinning wheel was driven by an induction motor with friction drive, requiring along with the apparatus for controlling precession but a limited amount of power. The gyro was able to reduce extraordinarily the amount of rolling and thus presented many advantages, especially for warships. On the other hand, for an ice-breaking steamship with the gyro apparatus it was possible to produce artificial rolling.

For the Sperry aeroplane stabilizer a gyro spun by three-phase alternating current from a generator on the shaft of the engine works a pilot valve which operates the horizontal rudders against a tendency to tip about the horizontal axis, while another feature of the longitudinal stabilizer operates to volplane the machine in case the speed falls below the critical point. The lateral stabilizer also employs a gyro which through a pilot valve controls the ailerons to counteract against lateral tipping. This gyroscopic machinery has been constructed of such small weight relatively that its use does not interfere with the operation of an aeroplane or hydroplane. Gyroscopic apparatus also has been fitted to roll and pitch recorders on board vessels and to an artificial horizon for use in astronomical observations, especially with the sextant at sea.

The gyroscope is thoroughly discussed in H. Crabtree's little book *Spinning Tops and Gyroscopic Motion* (2d ed., London, 1914). For its "engineering applications" consult Sperry in *Journal of Franklin Institute* (Philadelphia, 1913). See COMPASS; MONORAIL; TORPEDO.

GYROSCOPIC PENDULUM. See MECHANICS.

GYROS'TEUS. See CHONDROST'EUS: STURGEON.

GYROWETZ, gè'rô-vêts, ADALBERT (1763-1850). An Austrian composer. He was born at Budweis, Bohemia, and, after studying law at Prague, devoted himself entirely to music. Introduced to the Vienna public through the influence of Mozart, his first symphonies were received with marked favor, and he was soon enabled to continue his studies at Naples, Milan, and Paris. He afterward became a favorite of the Prince of Wales at London and upon his return to Vienna was appointed conductor of the

Imperial orchestra. In that capacity he directed the opera from 1804 to 1831. He was a very prolific composer, writing over 60 symphonies, 40 ballets, and 30 operas, the most popular of the latter being *Agnes Sorel* (1811) and *Der Augenarzt* (1811). His autobiography was published in 1848.

GYTHIUM, γῆθη-ῖον (Lat., from Gk. Γύθιον). A town in the Peloponnesus, at the mouth of the river Gythius, on the Laconian Gulf, near the modern Marathonisi. It lay opposite the island of Cranaë, and was the port of Sparta, 27 miles distant. The harbor was an artificial one and was protected by a breakwater. Its inhabitants claimed Apollo and Heracles as its founders, but it seems to have been originally a settlement of Phœnicians, attracted by the presence of the murex, which yielded the Phœnician red dye. It was the ordinary station of the Spartan fleet, and in the wars against Athens it was therefore exposed to frequent attacks. Tolmides, the Athenian commander, burned it (455 B.C.). Later it was besieged unsuccessfully by Epaminondas (370 B.C.). It was strongly fortified by the tyrant Nabis; but he was compelled by Flamininus to give up Gythium and other coast towns to the Achaean League (195 B.C.). In 192, however, it was recovered by Philopœmen; it remained part of the Achaean League (see *ACHÆANS*) till that league was dissolved in 146 B.C. It afterward became a member of the league of independent Laconian towns, which after the time of Augustus received the name of the Free Laconians. Excavations in 1891 uncovered part of the theatre and of other ancient structures, and there are numerous ruins of Roman times in the neighborhood. A considerable part of the ancient city seems to be covered by the sea, as extensive ruins can be seen in the bay on a calm day. The site is described by Leake, Le Bas, Ross, Curtius, Philippson, and others in their books on the Peloponnesus, and a good plan is given in Le Bas, *Voyage archéologique, Itinéraire* (Paris, 1888). The excavations are described in the *Πρακτικά* of the Greek Archaeological Society (Athens, 1891). The modern town is a busy place, the chief exporting harbor for the plain of Sparta. Pop., 1909, about 4000.

GYULA, dyoo'lo, or **BÉKÉS-GYULA**, há'-kúsh dyoo'lo. Capital of the county of Békés, Hungary, situated on the White Körös, in a somewhat swampy district, 45 miles southwest of Grosswardein (Map: Hungary, G 3). Formerly a fortress, it has a museum of antiquities, and manufactures of flour, wine, oil, and spirits; turtle fishing; and a considerable trade in cattle. It is lighted by electricity. Pop., 1900, 22,446; 1910, 24,284.

GYULAI, dyoo'loi, **FRANZ, COUNT VON MAROS-NÉMETI AND NÁDASKA** (1798-1868). An Austrian soldier, born at Pest. In 1814 he entered the Austrian army and by 1846 had risen to the

rank of major general commanding a division. In that year also he was appointed commandant of Trieste, in which post in 1848 he assembled the scattered vessels of the Austrian navy, so far as possible, under his control, and after the outbreak of revolution assumed command of this naval force upon his own responsibility and maintained a coast defense. He became War Minister in 1849. The most conservative member of the cabinet, he tried to overcome the effects of 1848. In 1859 he received chief command of the Austrian army in the Italian War, but after his defeat by the Franco-Sardinians at Magenta he retired from the service. Consult Rüstow, *Der italienische Krieg 1859, politisch-militärisch geschrieben* (Zurich, 1859).

GYULAI, PÁL (1826-1909). An Hungarian poet and literary critic. He was born and educated at Klausenburg and was appointed professor of Hungarian literature at Budapest in 1875. He was also president of the Kisfaludy Society (1881-99) and editor of the review *Budapesti Szemle*. His works include a biography of Vörösmarty (2d ed., 1879), a critical work on Katona (2d ed., 1883); the collection of novels entitled *Vászlatok és képek* (Sketches and Pictures, 2 vols., 1867); and a volume of poems (1882; new ed., 1895), which, though of a popular tone, reveal a lofty elevation of thought and an impeccable art.

GZOWSKI, gzhov'ski, **SRN CASIMIR STANISLAUS** (1813-08). A Polish-Canadian engineer, born in St. Petersburg, Russia. He graduated at the military engineering college in Kremnitz, Volhynia, and had a commission in the regular army that he relinquished to join the patriots of Poland in their insurrection, for which he was imprisoned in Austria and banished, going to the United States in 1833. Having no knowledge of English, he could not follow his own profession there, so he taught French, German, drawing, and fencing; studied law in Pittsfield, Mass., and practiced it in Pennsylvania. In 1841 he went to Toronto, where he obtained a position in the Department of Public Works. In 1842-48 he was superintending engineer of roads and harbors in western Ontario. He had charge of the harbor works at Montreal (1850-53), was chief engineer of the St. Lawrence and Atlantic Railway Company, and in 1857-60 was a partner in a railroad-building firm which owned rolling mills in Toronto. In 1871 he was engineer of the International Bridge across the Niagara River. In the same year he made a report on the enlargement of the Welland Canal and the Baie Verte Canal scheme. Gzowski took a prominent part in Canadian military matters, and for some years was president of the Dominion Rifle Association. He became colonel in 1870, was the first president of the Society of Canadian Civil Engineers, and in 1890 was created a K.C.M.G.

H

H The eighth letter and sixth consonant in the English alphabet. Its form is derived, through the intermediate Latin H, from the Chalcidian Greek H, and the Phœnician . As this character was used in Greece for both an aspirate and a vowel sound, some differentiation of form was found to be necessary, and accordingly *h* was used for *h* and *H* for *ē*. The form *h* passed through the stage *L* to the symbol *ʰ*, for the rough breathing. In like manner *ʰ* came to stand for the smooth breathing. The Latin H and the Greek *ēta* (H) are identical in both form and alphabetic position, but they have not the same value. They have taken the position of *cheth*, the eighth letter in the north Semitic alphabet. This letter has been supposed by some scholars, both from its form and the meaning of a similar root in Syriac, to denote an inclosure, a barrier; but it is generally admitted to-day that no word exactly like it is found in any Semitic language. It may have been the non-Semitic name of the object represented by it, used by the people, possibly of Cretan origin, whence the alphabetic signs came to Syria. See ALPHABET.

Phonetic Character. The modern sound of *h* is a gradual weakening of an old strong guttural or back-palatal, as in Ger. *lachen*, Scot. *loch*. In OEng. *h* was a guttural; later on, it softened to a spirant, or often practically disappeared. Linguistically the Eng. *h* comes from: (1) Indo-Ger. *h* > Ger. *h*, as *hurdle*, OHG. *hurt*, Goth. *hairs*, Lat. *crates*, Gk. *κράτης*, Indo-Ger. *kert*, to bend, to weave; (2) Ger. *hv*, as *who*, Goth. *hvas*, Lat. *quis*, Indo-Ger. *gho*; (3) the combination *gh* in English orthography is usually a way of writing the OEng. spirant, thus, *high*, OEng. *heah*, Ger. *hoch*. This *gh* sometimes shows labialization, as the sound of *f* as in *trough*, *slough*; or sometimes it is so attenuated through palatalization as practically to disappear, e.g., *mighty*. In *ch*, *th*, *ph*, *sh*, the *h* indicates a spirant pronunciation. The pronunciation of the *h* is one of the most difficult things in the English language. It depends partly on the following vowel and partly on accentuation. In French the sound is disappearing, but it is being more used in England and America.

As a Symbol. H in chemistry = hydrogen. As a numeral, H = 200, H = 200,000. In Greek *h* was used for 8; *η* for 8000.

HAAG, häg, J. CARL (1820-1915). A German painter in water color, long a resident of England. He was born at Erlangen, studied

principally with Reindel in Nuremberg and at Munich and later with Cornelius at Rome. From the time of his removal to England in 1847, he devoted himself to water color. In 1850 he was elected member of the Royal Society of Painters in Water Color. He traveled much in the Balkans, Greece, and in the Orient, especially among the Bedouins, whose life he has portrayed with truthful vigor and brilliant color effects. He received special permission from the Sultan to paint the holy places of Jerusalem and was painter to Queen Victoria on her yearly travels in Scotland. After his return, after 55 years of absence, to Germany, he lived in the famous Red Tower at Oberwessel on the Rhine, which he bought and restored.

HAAKON, hā'kōn, improperly HAKON. The name of several Norwegian kings. The earliest of them, HAAKON THE GOOD, was sent to the court of Athelstane in England, from which he returned with a fleet when the Norwegian throne was seized by his brother Eric, after the death of their father, Harald Haarfager (933). He defeated Eric and ruled from about 934 to 961. He was a Christian, and English missionaries under his protection did much to Christianize Norway.—HAAKON MAGNUSSEN, a grandson of Harald Haardraade, was King for a short time, in association with his cousin, about 1093-95.—HAAKON HERDEBERG (1147-92), son of Sigurd, ruled for only five years (1157-62), a stormy period, full of revolt and strife.—HAAKON HAAKONSSON (1204-63), "the Old," grandson of Sverre and son of the Haakon who ruled from 1202 to 1204, is best known for the addition of Greenland and Iceland to the Norwegian realm during his reign.—HAAKON MAGNUSSEN, the elder, succeeded his brother, Eric, on the throne in 1299 and reigned to 1319. He was the last descendant of Harold Haarfager in the male line.—Another HAAKON MAGNUSSEN, called "the Younger," was son of Magnus Eriksson, King of Sweden and Norway, who was forced to resign the crown to Haakon in 1343, when the latter was still a child, remaining Regent during his minority. Haakon reigned in Norway till his death, in 1380; he was also King of Sweden in 1362-63; he married the Danish Princess Margaret, and thus prepared the way for the union of the three Scandinavian kingdoms. Consult G. Sturlason, *Stories of the Kings of Norway* (trans. from Icelandic, London, 1906). See HAAKON VII, below.

HAAKON VII (1872-). King of Norway after 1905. He was born Aug. 3, 1872, as the second son of Frederick VIII of Denmark,

then Crown Prince, and was baptized Charles. In 1896 he married Princess Maud, youngest daughter of Edward VII. On Oct. 31, 1905, when the separation of Norway from Sweden had become a fact, the Norwegian Storting empowered the government to enter into negotiations with Prince Charles relative to his acceptance of the Norwegian crown. On November 12 the people approved the offer of the crown to the Danish Prince by 259,563 votes to 69,264. On November 18 Prince Charles was elected King by the Storting. He assumed the title of Haakon VII and gave to his son (born in 1903) the name of Olaf. He took the oath before the Storting on November 27 and was crowned in the historic cathedral at Trondhjem, June 22, 1906.

HAANEL, EUGENE (1841-1927). A Canadian physicist and mineralogist. Born at Breslau, Germany, and educated there at the Gymnasium and University, he went to the United States in 1856 and served in the Federal army during the Civil War. He held the chair of modern languages in Adrian College (1864) and in Hillsdale College (1865); and was professor of natural science in Albion College, Michigan (1868-72); of physics and mineralogy in Victoria University, Cobourg, Canada (1872-89)—while there he built and equipped Faraday Hall for practical science; and of physics in Syracuse University until 1901. He then became superintendent, and in 1908 director, of mines for Canada. In 1901 he was appointed chairman of a commission to investigate electro-thermic processes in iron-ore smelting and steel making in Europe. In 1909 he was elected vice president of the American Institute of Chemical Engineers, in 1909-10 he was president of the American Peat Society, and he was made a charter fellow of the Royal Society of Canada. In 1912 he was appointed a special lecturer on economic geology in McGill University. His publications include *Report on Experiments made at Sault Ste. Marie in the Smelting of Canadian Iron Ores by Electro-Thermic Processes* (1907), and *Experiences in the Use of Peat Fuel from the Government Plant at Alfred, Ont.* (1911).

HAAR, BERNARD TER (1806-80). A Dutch poet, born in Amsterdam. He obtained his degree in theology, held several pastorates, and in 1854 was made professor of Church history in the University of Utrecht, retiring in 1874. He wrote a number of theological articles and *Wie was Jesus?* (1863). His other prose works include *De Historiographie der Kerk-geschiedenis* (2 vols., 1870-73). Some noteworthy poems are: *Johannis en Theogenes* (1838); *Huibert en Klaartje* (1844; 3d ed., 1858); *De Sankt Paulus Rots* (5th ed., 1865); and those in collections published in 1871, 1878, and 1879.

HAARLEM, här'lēm. The capital of the Dutch Province of North Holland, situated on the Spaarne, 11 miles west of Amsterdam (Map: Netherlands, C 2). It is an extremely clean and well-built city, situated amid very picturesque environs intersected by canals and full of interesting houses. The principal church is the Groote, or St. Bavo's Kerk, a fifteenth-century cruciform edifice, with a tower 262 feet high and an organ built in 1735, with 5000 pipes, 64 stops, and 3 keyboards—one of the largest instruments of its kind in the world. In front of the church is a statue of Coster, the alleged

inventor of printing. In the Groote Markt is the meat market, a brick and stone building dating from the beginning of the seventeenth century and considered to be of great architectural merit. The town hall, a former palace of the counts of Holland, remodeled in 1620, contains a small collection of paintings by Dutch artists, including eight large canvases by Frans Hals. In the same building are also the town library and a collection of weapons, glasses, and instruments of torture associated with the early history of Haarlem. Among other interesting buildings may be mentioned the Pavilion, a château in Italian style, now the seat of the Society for the Promotion of Industry, and containing an industrial art and a colonial museum. The educational institutions of Haarlem include a Gymnasium; a seminary for teachers; the Teyler Museum with its numerous scientific collections and an extensive library; the episcopal museum with a collection of Dutch ecclesiastical antiquities. There are also two theatres and the oldest printing house in Holland. The town contains numerous homes for the aged, known as *hospjes*. Haarlem has a number of industrial establishments, notably textile mills. One of the oldest and most extensive industries is the cultivation of flowers, Haarlem exporting bulbs to many European countries. There are electric and horse tram lines for local purposes and an electric railway for interurban traffic. Pop., 1911, 70,491.

Haarlem grew up around a castle, and obtained municipal rights in 1245. In 1492 it was seized by the peasantry, and upon its being recovered by the Imperial Stadholder, Duke Albert of Saxony, it was deprived of its privileges and burdened with heavy taxes. In 1559 it became the seat of a bishop. Haarlem took a prominent part in the revolt of the Netherlands and was besieged in 1572 by an army of 30,000 men under Don Federico, a son of the Duke of Alva, and after an heroic resistance capitulated to the Spaniards, who, regardless of their promise of mercy, avenged themselves on the city and its inhabitants in the most cruel way. In 1577 it was freed from the rule of Spain by the Prince of Orange and became a part of the Netherlands.

HAARLEM LAKE. A district in the Dutch provinces of North and South Holland, formerly a lake. It lies between Haarlem, Amsterdam, and Leyden (Map: Netherlands, C 2). It was formed from four small ponds by an inundation of the sea at the end of the sixteenth century. At one time its area was 60,000 acres. In consequence of the destructive overflow of 1836 the government decided to drain the lake. The work was begun in 1840 and completed in 1853. The land reclaimed forms at present an island of 70 square miles, with a fertile soil and a population of 19,707 in 1910.

HAAS, hās, HANS (1868-). A German missionary to Japan. He was born in Donndorf, near Bayreuth, studied in the University of Erlangen, was ordained in 1894, and from 1898 to 1909 was pastor of German Evangelical congregations in Tokyo and Yokohama and director of the theological school of the German mission in Japan. In 1903-04 he taught in the Imperial University of Tokyo. He then returned to Germany and in 1913 became professor at the University of Jena. He wrote: *Geschichte des Christentums in Japan* (1902-04); *Die Sekten des japanesischen Buddhismus* (1905);

Der japanesische Buddhismus (1906; 2d ed., 1913); *Japans Zukunftsreligion* (1907; 2d ed., 1909); *Wie ein Japaner Christ wurde* (1907); *"Amida Buddha, unsere Zuflucht"* (1910); *Drei Buddhisten* (1912); *China und Japan* (1912).

HAASE, hā'ze, FRIEDRICH (1825-1911). A distinguished German actor. He was born in Berlin, the son of the first valet de chambre of Frederick William IV, under whose patronage he received a thorough education and was prepared for the stage by Ludwig Tieck. In 1846 he made his début at Weimar, acted there until 1848, then in Potsdam and Berlin, and rose to prominence during his connection with the theatre in Prague in 1849-51. His subsequent performances at Karlsruhe, Munich, and in 1855-58 at Frankfurt, steadily increased his reputation, while starring tours made his name familiar in various countries of Europe, and an engagement at St. Petersburg during the six winters from 1860 to 1866 firmly established his position in the front rank of German actors. In 1869 he visited America; then was for one year a member of the Court Theatre in Berlin, and in 1870 succeeded Laube as director of the Stadttheater in Leipzig, and managed it cleverly to great pecuniary advantage for six years. Henceforth he made his home in Berlin and undertook only starring engagements, the most important of which was his tour through the United States as far as California in 1882-83. His distinguished appearance made him an apt impersonator of the aristocratic types in high comedy, which belong to the most brilliant parts of his repertory, and which he presented with original conception, exquisite refinement, and ingenious elaboration of character. Chief among these were Count Thorane in Gutzkow's *Königsleutnant*, Klingsberg the elder in *Die beiden Klingsberg*, Chevalier Rocheferrier in *Eine Partie Piquet*, and similar rôles. He is the author of *Ungeschminkte Briefe und Was ich erlebte 1846-1898* (Berlin, 1898). Consult Simon, *Friedrich Haase: Eine dramaturgische Studie* (ib., 1898).

HAASE, HEINRICH GOTTLIEB FRIEDRICH CHRISTIAN (1808-67). A German classical scholar, born at Magdeburg, Prussia. After studying at Halle, Greifswald, and Berlin, he made extensive researches in the libraries of Paris, Heidelberg, Strassburg, and Bern, in the Greek and Roman military writers. He was made professor of philology at the University of Breslau in 1840, and in 1851 became codirector of the Philological Seminary at the same institution, where he remained until his death. He was highly successful as a teacher. His most important publications are editions of Xenophon, *De Republica Lacedæmoniorum* (1833); Thucydides, with a Latin translation (1840); Velleius Paterculus, *Historia Romana* (1851 and 1858); Seneca (1852-53; 2d ed., 1872), a valuable work; and Tacitus, with admirable prolegomena (1855). Mention should be made of his article "Philologie," in Ersch and Gruber's *Allgemeine Encyclopädie*, and his *Die athenische Stammverfassung* (1857). He contributed valuable notes to the *Vorlesungen über lateinische Sprachwissenschaft* by Reisig. His *Vorlesungen über lateinische Sprachwissenschaft* (1874-80) was edited after his death by A. Eckstein and Hermann Peter and greatly stimulated research in the field of Latin philology. Consult: Burian, *Geschichte der klassischen Philologie in Deutschland* (Munich, 1883); Fickert, *Friderici*

Haasii Memoria (Breslau, 1808); Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

HAAST, häst, SIR JOHANN FRANCIS JULIUS VON (known in Germany as JULIUS VON HAAST) (1824-87). An English colonial geologist and explorer, born at Bonn, Germany. His scientific training was obtained at Bonn and in extended continental travel. In 1858 he went to New Zealand, where in the following year he was appointed by the provincial government to conduct explorations of Nelson and prepare reports on the natural history and geology of the region. During the execution of this task he discovered fields of coal and gold. He became government geologist of Canterbury Province in 1861, and as such he directed a 10 years' exploration of the interior of the island. His topographical and geological maps won for him the gold medal of the Royal Geographical Society. He also discovered the remains of the gigantic extinct birds *Dimornis* and *Palapteryx*. As an authority on glaciation, he was well known in scientific circles. In 1866 he founded the Canterbury Museum, which he enriched by exchanging moa bones with the museums of Europe for specimens he required. He was elected F.R.S. (1867) and published *Geology of the Provinces of Canterbury and Westland, New Zealand* (1879).

HABAKKUK. The eighth of the minor prophets. Concerning his life nothing is known. In the deuterocanonical fragment, Bel and the Dragon, he is ordered to bring food to Daniel in the lions' den, and in order to carry out this command an angel seizes Habakkuk by the hair and transports him to Babylon; this is said to be in the time of Cyrus. But this legend is evidently later than the third century B.C. (see DANIEL, BOOK OF) and has no historical value. The Greek version gives his name as Ambakum; it has therefore been suggested that it is of Assyrian origin and connected with the word *hambuku*, which is the name of a garden plant, and that the original pronunciation was therefore Habbakuk. Such a name would point to the Chaldean or early Persian period. The contents of the book ascribed to him do not give a clear idea of when he lived.

The Book of Habakkuk consists of six poetic utterances, viz., i. 2-4; i. 5-11; i. 12-17; ii. 1-3; ii. 4-17; and iii. 2-16. In the first poem the prophet complains of violence, lawlessness, and the overturning of the righteous by the wicked without divine interference. In the second he describes the advance of a terrible people swiftly conquering foreign nations, overthrowing their kings, and making a god of its own power. The third seeks for a divine purpose in allowing this enemy to fatten on nations mercilessly massacred. In the fourth he places himself in his watch tower to find a divine oracle, and the command comes to him to write down on tablets the vision which assures him that the end is coming, even though it seems to be delayed. The prophet then hurls a fivefold woe against the enemy for his ambition, greed, injustice, cruelty, and indecency. The last poem is a psalm in imitation of Deut. xxxiii, with a special superscription like those in the Psalter.

As to the historic situation that is reflected in this book, there is much difference of opinion. The Hebrew text in i. 6 refers to the Chaldeans. This has led to the idea that either the whole book or some part of it was written c.600 B.C.

There is so much, however, that seems to point to a later time that, e.g., Marti finds it impossible to ascribe to the prophet more than seven verses (i. 5-11). Budde, followed by Sellin, Moore, and others, has suggested that the wicked one is the Assyrian, and the avenger the Chaldean, that i. 5-11 originally had its place after ii. 4, and that the date is c.615 B.C., while iii. 2 ff. is a late psalm added to the book. Duhm regards the entire book, aside from some short interpolations, as the work of a seer living in the time of Alexander and describing his career and the judgment on him: he supposes that i. 6 originally read "Kittæans," and not "Chaldeans." Ward looks upon some of the poems as coming from the Chaldean period (c.600 B.C.), but the bulk of chap. ii as well as chap. iii as having been written in the Maccabean age, Habakkuk being the name of the editor of the book. The chief difficulty with Duhm's view, which preserves the unity of the book, is that there is no textual warrant for changing the Chaldeans into Kittæans; but it is true that the description does not seem to suit the Chaldeans either in 615, 600, or any subsequent time, and that the woe against him who gives his friend to drink in order to see his nakedness and is told to intoxicate himself and show his uncircumcised condition (ii. 15 f.) would not be impossible reflections on Alexander's revels. In the original text the enemy may not have been named at all, as is the case with the Scythians in Zephaniah and Jeremiah, and only supplied afterward: or Habakkuk may have been a legendary figure, like Daniel, on whose lips it seemed proper to place oracles. Chap. ii. 18-20 is clearly an addition, and chap. iii has the appearance of having been taken from some collection of hymns where it was ascribed to Habakkuk, as Psalms cxlvi-cxlviii were once ascribed to Haggai and Zechariah. Consult the commentaries on the Minor Prophets (q.v.), and also Delitzsch, *De Habakkuk Prophetæ Vita atque Ætate* (Leipzig, 1842); Davidson, *Nahum, Habakkuk, and Zephaniah* (Cambridge, 1896); Duhm, *Das Buch Habakuk* (Tübingen, 1906); Ward, "Habakkuk," in *The International Critical Commentary* (New York, 1911); Moore, *The Literature of the Old Testament* (ib., 1913); Sellin, *Einleitung in das Alte Testament* (2d ed., Leipzig, 1914).

HABANA. See HAVANA.

HABANA, MARQUÉS DE LA. See GUTIÉRREZ DE LA CONCHA, JOSÉ.

HABBERTON, JOHN (1842-1921). An American editor and miscellaneous writer, born in Brooklyn. He was educated in southern Illinois, then learned the printing trade in New York, served in the Civil War, and did editorial work for the *Christian Union*, *Godey's Magazine*, and the *New York Herald*. He became well known through *Helen's Babies* (1876), widely circulated in America, England, France, and Germany, a slight but amusing account of children's fun and drollery. Among his other works may be mentioned: *The Barton Experiment* (1877); *Other People's Children* (1877); a drama, *Deacon Cramket*; *The Chautauquans* (1891); *All He Knew* (republished 1900); *The Tiger and the Insect* (1902); *Budge and Toddy* (1909).

HABEAS CORPUS. In English and American law, a common-law process whereby a person kept in confinement may be brought before a superior court of justice, either to have the

cause of his detention inquired into and its lawfulness determined or for some other specified purpose. As the purposes for which a person in custody might be required to be produced in court were various, several forms of the writ by which this result was effected were devised, and these were distinguished by adding to the mandatory words, *habeas corpus* (you are commanded that you have the body of the prisoner, etc.), the words designating the particular purpose for which the prisoner's presence was desired, as *ad subjiciendum* (that he may be disposed of), *ad testificandum* (that he may give evidence), *ad respondendum* (that he may make answer), etc. That some such process emanating from the highest authority in the state must be resorted to in order to secure the presence in court, for any purpose, of a person in confinement is obvious. Such a person is unable to respond to the ordinary process of the courts, as a subpoena to testify in a pending lawsuit; and if his presence is to be obtained it can be only by the intervention of the superior authorities by some extraordinary process. The writ of habeas corpus is a process of this character. It issues in the name of the King or Queen (in the United States in the name of the people) and is for that reason, as being an exercise of the royal prerogative, known as a high prerogative writ. It issues out of one of the superior courts of judicature or, in vacation time, from a judge of such a court, and is usually of a summary character, i.e., requiring the immediate production of the prisoner before the court or the judge issuing the writ.

Of the various writs of habeas corpus formerly in use, seven in all, most have fallen into desuetude or have been abolished by statute, and only one, the writ of *habeas corpus ad subjiciendum*, has retained its preëminence. Its importance in the history of individual liberty, as an effective method of maintaining the reign of law by the protection of the individual against arbitrary arrest and imprisonment, is too well known to require statement. The writ of habeas corpus has come to be regarded as the glory of English and American law.

Habeas Corpus ad Subjiciendum. This is defined as a prerogative writ requiring the body of a person alleged to be unlawfully restrained of liberty to be brought before the judge or into court, that the lawfulness of the restraint may be investigated and determined. The writ is addressed to the person in whose custody the detained person is alleged to be and commands him to produce the body of the prisoner before the court and there state the cause and warrant for his detention or show cause why this was not done.

At the time when Magna Charta declared that no "freeman may be taken or imprisoned but by the lawful judgment of his peers or by the law of the land," there seems to have been no effective machinery available by which a freeman unlawfully imprisoned could recover his freedom. This was due partly to the fact that the judicial power was not yet fully centralized, partly to the fact that the King's Court (through which this was then to be accomplished if at all) was not yet ready to set at naught the King's will, and partly, perhaps, because the action for false imprisonment seemed a sufficient check on merely lawless confinement. The words "habeas corpus" are already making

their way into various writs, but they do not definitely point to a specific method of investigating the cause or legality of an imprisonment.

A person arrested on a criminal charge was ordinarily set free as soon as sufficient sureties became bound for his appearance in court. It was not common to keep men in prison, not (apparently) because of any love of the abstract idea of liberty, but because imprisonment was costly and troublesome to the sheriff. The sheriff enjoyed a discretionary power of detaining or releasing prisoners upon sureties such as he considered sufficient, except that he might not set at liberty any one imprisoned by the special command of the King. A writ (*de homine replegiando*), which came into use during this period, directed the sheriff to deliver the prisoner unless he were taken at the special command of the King or his chief justiciar, or for the death of a man, or for some forest offense, or for some other cause which by law made him irrepleviable; but the writ was so worded as to throw upon the sheriff the responsibility of deciding whether the prisoner should be kept in custody or not.

In theory the central court (King's Court) exercised control over the entire province of criminal justice and at times directed a sheriff to send prisoners to Westminster for trial; but such instances were rare, and such orders issued generally from Chancery rather than from the justices and were governmental rather than judicial in their nature. Undoubtedly, also, if a man thought himself unlawfully imprisoned by the sheriff or by some lord of a franchise, and made himself heard in the King's Court, the justices of that court had power to order that his body be brought before them and to liberate him if persuaded that his imprisonment was unlawful.

Although in 1234 the royal court declared null and void the outlawry of Hubert de Burgh (q.v.), which the King had especially commanded, this victory of law over arbitrary power was gained only after a revolt and a change of ministry. In spite of this, a man committed to jail by the "mandate of the King" would have found none to liberate him. It was 200 years before the process of habeas corpus, as the appropriate instrument for enforcing the law of personal liberty granted by Magna Charta, became well established, and it was not until the reign of Charles II that the last vestige of the superior authority of the King's mandate disappears. In Darnel's case (3 Car. I, 1627) the judges declared that a return to a writ of habeas corpus directed to the warden of the Fleet Prison, which set forth that the prisoner was detained by warrant of the Privy Council, was a sufficient answer to the writ. As a result of the indignation consequent upon this subservency of the judges to the King's will, the Petition of Right (16 Car. I, c. 10, § 8) was passed by Parliament, which provided that the writ of habeas corpus should be granted as of course to any person committed by the King or Privy Council upon demand made to the Court of King's Bench or Common Pleas, thus extending by statute the power of granting the writ to the Court of Common Pleas. In 1676 the court refused to grant a writ upon such a motion in vacation, and this resulted in the passing of the Habeas Corpus Act. The substance of the act is that the sheriff or other person having a prisoner in his custody shall, when

a writ of habeas corpus is directed to him, bring the body of his prisoner into court, within a time fixed, with the true cause of his detainer or imprisonment, unless the commitment was for treason or felony plainly expressed in the warrant; that the writ of habeas corpus should be granted in vacation time by the Lord Chancellor, the writ to be returnable immediately and the prisoner to be discharged on giving security for his appearance before the proper court, except in case of persons committed for treason or felony expressed in the warrant of commitment, persons convicted or suffering execution by legal process, and persons detained upon a legal process or for an offense not hailable upon a justice's warrant; that persons discharged on habeas corpus should not be recommitted for the same offense except by the court having cognizance of the case; that persons committed to prison for treason or felony if not indicted and tried in or before the second term or session after commitment should be discharged; and that no inhabitants of England (except convicted felons and those contracting to be transported) should be sent as prisoners to Scotland, Ireland, Jersey, etc., or any place beyond the seas. Stringent penalties provided for a forfeit of £500 against a judge delaying the issue of the writ, with costs and damages of not less than £500, besides the penalties of *præmunire* for illegal transportation beyond seas.

This act was gravely defective in not extending the right to habeas corpus to cases other than those of persons arrested on criminal charges. This defect was not remedied until 1816, when an act (56 Geo. III, c. 100) was passed providing that the writ should be granted in other than criminal cases; that though the return might be good on the face of it, if the facts on which it was made appeared doubtful, the prisoner should be admitted to bail; and that the writ should run to harbors and roads on the coast, although not within any county. In 1861 it was decided that the writ ran throughout the British Empire, and the act 25 and 26 Vict., c. 20, was passed restricting the jurisdiction so that the writ should not run from the English court into those colonies or dominions where the granting of the writ by a local court had been provided for.

In the United States the right to the benefit of the writ of habeas corpus was always claimed by the English colonists in America and was enjoyed by them except in rare cases of arbitrary oppression. An instance of its early use occurs in New York in 1707, in procuring the release of certain ministers arrested under an illegal warrant issued by Governor Cornbury. In New Jersey in 1710 the Legislature by resolution denounced a judge who had violated the "undoubted right" of a colonist to the privileges of habeas corpus by refusing the writ to him. In 1692 the South Carolina Assembly adopted the Act 31 Car. II, and during the reign of Anne the act was expressly extended by act of Parliament to Virginia. Maryland in 1725 claimed the benefit of the writ as a "birthright of the inhabitants," independently of the royal favor. But, although the Colonial charters generally contained express provisions that the colonists should have all the privileges and immunities of natural-born British subjects, no express mention seems to have been made in them of the writ of habeas corpus. It was rather taken for

granted as belonging of right to every British subject, and when the Colonies separated from the mother country, the right of habeas corpus became a part of the general common law of the States, derived by them from the laws existing while they were still Colonies. The Constitution of the United States (Art. I, sec. 9, subdiv. 2) provides that "the privilege of the writ of habeas corpus shall not be suspended unless when, in cases of rebellion or invasion, the public safety may require it." The constitutions of most of the States contain provisions of a similar effect; and in Virginia, Vermont, Louisiana, and North Carolina the suspension of the writ in any case is forbidden. The constitution of Maryland, however, does not mention the writ. Several of the States provide in their constitutions for suspensions in cases of grave public emergency, as in Massachusetts for 12 months, New Hampshire three months, Florida in case of insurrection or rebellion, etc.

As the Federal Constitution does not specify by what authority or in what manner the privileges of the writ may be suspended, President Lincoln claimed the right as an incident of the war power vested in the executive, and accordingly by proclamation in 1861 authorized the commanding general to suspend the writ. His action in so doing was severely criticized, and it was decided by Chief Justice Taney, in the Circuit Court of the United States, that Congress alone possessed the right to suspend the writ; and this seems to be the better opinion, although the right of the President was supported by leading constitutional lawyers at the time. Later, in March, 1863, Congress passed a bill authorizing the President to suspend the privilege of the writ; but in cases arising under the exercise of this authority it was held that the suspension of the privilege did not justify the courts in refusing to issue the writ but only suspended its further operation. Neither does the suspension of the privilege of the writ deprive an unlawfully arrested or imprisoned person of his action of damages for false imprisonment nor protect the wrongdoer from criminal prosecution. None of the States have exercised the constitutional power of suspending the writ except Massachusetts, where the privilege of the writ was suspended from November, 1786, to July, 1787, on the occasion of Shays's Rebellion.

In England, as noted above, the King's Court, or Court of King's Bench, and the Court of Chancery were the ordinary courts from which this writ was issuable; but it could be issued by the Court of Common Pleas and by the Court of Exchequer, at least in case of persons privileged in those courts. The Habeas Corpus Act (31 Car. II, c. 2) and other later acts prescribed the courts which could issue the writ, extending the jurisdiction so that it is always possible to obtain the writ in vacation as well as in term time.

In the United States the authority of the Federal courts is purely statutory in origin. The original statute defining the judicial power was the Judiciary Act, passed Sept. 24, 1789 (1 Stat. at L., 81, sec. 14), which provided "that writs of habeas corpus shall in no case extend to prisoners in gaol, unless they are in custody under or by color of the authority of the United States, or are committed for trial before some court of the same, or are necessary to be brought into court to testify." The jurisdiction created

by this act, it is now settled, is vested exclusively in the Federal courts. Subsequent statutes have extended this jurisdiction to cases where the prisoner is in custody for an act done or omitted, in pursuance of a law or process of the United States (Rev. Stat., sec. 753), this being the general effect of the Act of March 2, 1833 (4 Stat. at L., 634), commonly called the Force Bill: to cases where the prisoner is held in violation of the Constitution, or a statute, or treaty of the United States, whether in a State or Federal court (Rev. Stat., sec. 753); "to all cases of any prisoner in jail or confinement who are subjects of a foreign state, and domiciled therein, who are confined or in custody under or by any authority or law, or process founded thereon, of the United States, or of any of them, for or on account of any act done or omitted under any alleged right, title, or authority, privilege, protection, or exemption set up or claimed under the commission or order or sanction of any foreign state or sovereignty, the validity and effect whereof depends upon the law of nations, or under color thereof" (Act of Aug. 29, 1842, 5 Stat. at L., 539; Rev. Stat., sec. 753).

These provisions do not grant to the Federal courts the authority by habeas corpus to discharge a prisoner from the custody of the State courts or officers where the prisoner is within the jurisdiction of the State authority by which he is imprisoned, merely because rights are involved which arise under the laws of the United States, since where there is a proper jurisdiction the State courts are equally bound with those of the Federal government, and are equally supposed to support and give effect to the Federal laws, and any erroneous ruling in this respect would involve an error of law, which could be remedied by a proper appeal to the Federal courts. But where the denial of right by the State court involves not only an error of law, but such a refusal as places the court in a position of acting without jurisdiction, as in acting under an unconstitutional State law, a basis is laid for the remedy of a writ of habeas corpus from the Federal court. This power of the Federal courts to grant the writ under the special grounds mentioned above is discretionary, and the writ is frequently refused in cases where the granting of it would tend to subvert the ordinary course of justice in the State courts.

The general function and purpose of the writ is to determine whether the person in whose behalf the writ is granted is detained or held in custody lawfully or unlawfully. The cases where the writ is used may be broadly classified as those where the person is detained without any legal process, and where he is held under some form of legal proceedings, which may or may not be lawful. The first of these classes is exemplified where a parent seeks to obtain the custody of a child under the control and in the custody of the other parent or some other person, and for that purpose obtains a writ in behalf of the child, setting up the illegal confinement of the child. Here the merits of the whole case must be heard and determined in order to decide to whom the custody of the child lawfully belongs. So, in the case of a person confined as an insane person, without legal process, the merits of the case must be heard and decided, both as to whether the person is insane, and if so whether the confinement is lawful. Where the confinement is under legal process, however, the purpose and function of the

writ is to procure a hearing and determination as to the question whether the confining authority is lawfully exercising its jurisdiction or not. Mere irregularity does not necessarily deprive the court of jurisdiction; but when the irregularity is so material that no jurisdiction over the prisoner has been obtained for the purpose of confinement, then the prisoner will be discharged. In other words, generally speaking, the writ cannot be used to do away with the regular trial of an action, or to inquire into the merits of proceedings any further than this is necessary to determine the legality of the confinement complained of.

The procedure by which the writ is obtained, both at common law and under the various statutes regulating the subject, in some of the States, is by some form of petition or motion signed by the party or by some one acting in his behalf, setting up such facts as are necessary to make out a *prima facie* case. The person entitled to custody of one illegally detained by another, as a father deprived of his child, may himself apply for the writ. The courts of the Federal government in the United States have the discretionary right to withhold it; but in some of the States the writ must be granted, as in England, upon a proper petition or motion whenever a *prima facie* case for relief is presented by the petitioner.

The question as to when the Federal and when the State courts have authority in cases where their authorities clash with each other is determined by the general principles governing the conflict of laws between the two. For a discussion of that subject and of the method of return of the writ, the general principles of jurisdiction, etc., see the titles **CONFLICT OF LAWS; CONSTITUTIONAL LAW; WRIT; JURISDICTION; ETC.**

Habeas Corpus ad Faciendum et Recipiendum. A writ by which a superior court commands an inferior court to produce the body of a defendant, together with the cause (whence the writ is also called a *habeas corpus cum causa*) or grounds of his being taken and held, there to do and receive whatsoever shall be adjudged of him in the superior court. The writ is sometimes used in the United States.

Habeas Corpus ad Prosequendum. A writ issued to remove a prisoner for trial in the jurisdiction where the act was committed.

Habeas Corpus ad Respondendum. A writ for bringing up a prisoner from a lower court to be charged with a new offense.

Habeas Corpus ad Satisfaciendum. A writ used to bring up a prisoner to a superior court to charge him with process of execution (q.v.) upon a judgment.

Habeas Corpus ad Testificandum. A writ used to bring a witness into court when he is in custody at the time of the trial. It directs the sheriff to have his body in court. The power to issue writs of *habeas corpus ad testificandum* in cases where it is necessary to bring prisoners into court to testify, is vested in the Federal courts by the General Judiciary Act of 1789.

Consult: Church, *Habeas Corpus, with Practice and Forms*, containing an extended account of its history in the United States (2d ed., San Francisco, 1893); Spelling, *A Treatise on Injunctions and other Extraordinary Remedies* (2d ed., Boston, 1901); the commentaries of Kent, Story, Blackstone, and Stephen; *Encyclopædia of the Laws of England* (London, 1907); Dicey, *The Law of the Constitution* (ib., 1908);

W. F. Bailey, *Treatise on the Law of Habeas Corpus and the Special Remedies* (Chicago, 1913); and the authorities referred to under **CONSTITUTION; CONSTITUTIONAL LAW; CONFLICT OF LAWS; WRIT; ETC.**

HABENDUM. A technical term in the common law of conveyancing, to describe the part of a grant, or deed of lands, which immediately follows the description of the premises conveyed. This was formerly written in Latin, *habendum et tenendum* (to have and to hold), whence the name of the clause. Though not essential to the validity of a conveyance, it is still commonly employed in the English form of the words. Its purpose is to qualify or define the estate granted, as "to have and to hold, to the said John Doe (the grantee), his heirs and assigns forever," whereby a fee simple is created; or "to the said John Doe and the heirs of his body," showing the estate granted to be a fee tail. Where the *habendum* is clearly repugnant to the "granting part" of a deed, it will be rejected, but if it be consistent with the grant it will control it. See **CONVEYANCE; DEED; GRANT.**

HABENECK, ab'nĕk', FRANÇOIS ANTOINE (1781-1849). A French violinist and conductor, born at Mézières. He entered the Conservatory in Paris (1801), where he studied under Baillet and obtained the first violin prize (1804). Afterward he was appointed first violin at the Opéra, and he served as director (1806) and conductor of the orchestra from 1821 to 1824. For 20 years, beginning in 1806, he conducted the Société des Concerts du Conservatoire and was made permanent conductor in 1828. These concerts attained a European celebrity, and by means of them he introduced Beethoven's symphonies into France. He composed two concertos, compositions for the violin, and several songs. Among his pupils were Alard and Léonard.

HABER, hä'bĕr, FRITZ (1868-). A German chemist, born at Breslau. He was educated at Berlin, Heidelberg, and Charlottenburg. In 1894 he became an assistant in a technical school, and from 1896 to 1911 he was lecturer, assistant professor, and professor at the technical Hochschule at Karlsruhe. Thereafter he served as professor of physical chemistry and director of chemical investigations at the University of Berlin. With Dr. Carl Bosch he invented in 1911 a synthetic process of manufacturing ammonia. See **AMMONIA**. Besides his articles on ammonia in the *Zeitschrift für Elektrochemie* and in other technical journals, he is author of *Grundriss der technischen Elektrochemie* (1898) and *Thermodynamik technische Gasreaktionen* (1905), the latter translated into English by Arthur B. Lamb as *Thermodynamics of Technical Gas-Reactions* (1908).

HABERL, hä'bĕrl, FRANZ XAVER (1840-1910). A Catholic clergyman and writer on music, born at Oberellenbach, Lower Bavaria. He was ordained to the priesthood in 1862, in which year he was also appointed conductor of music at the cathedral of Passau and musical director of the Catholic Seminary in that city. During the period 1867-70 he was organist of the church of Santa Maria dell' Anima at Rome, and from 1871 to 1882 served in a similar capacity at Ratisbon. In 1875 he founded in that city the celebrated School for Church Music, which under his management became one of the leading institutions of its kind. In 1880 Haberl assumed the editorship of the periodical entitled

Musica Sacra. He was also chief editor of the splendid edition of the works of Palestrina, published by Breitkopf and Härtel (Leipzig, 32 vols., completed in 1894). A Palestrina Society was established by him in 1870. The following are a few of his principal publications: *Magister Choralis* (1865; 10th ed., 1893; trans. into English, Spanish, French, and Italian); *Cicilien-Kalender* (1876-85; since 1886 published as *Kirchenmusikalisches Jahrbuch*); *Psalterium Vespertinum* (8th ed., 1901); *Bibliographischer und thematischer Musik-katalog des päpstlichen Kapellarchivs im Vatikan zu Rom* (1888).

HABERLANDT, hā'ber-lānt, GOTTLIEB (1854-). An Austrian botanist, born at Ungarisch-Altenburg, Hungary, and educated at Vienna and Tübingen. In 1884 he was appointed professor of botany at the university at Graz, where he also became director of the Botanical Institute in 1888; and in 1891 he made a scientific tour through Java. In 1910 he took charge of the Botanical Gardens of Berlin and also accepted a professorship in the university of that city. His publications, mainly on the physiology and ecology of plants, include: *Die Entwicklungsgeschichte der mechanischen Gewebesystems der Pflanzen* (1879); *Vergleichende Anatomie des assimilatorischen Gewebesystems der Pflanzen* (1881); *Die physiologische Leistungen der Pflanzen-gewebe* (Shenk's Handbuch, 1882); *Physiologische Pflanzenanatomie* (1884; 4th ed., 1909); *Das leitende Gewebesystem der Sinnerpflanzen* (1870); *Eine botanische Tropenreise* (1893; 2d ed., 1910); *Sinnesorgane im Pflanzenreich zur Perception mechanischer Reize* (1901; 2d ed., 1906); *Perception des Lichtreizes durch das Laubblatt* (1904).

HÄBERLIN, hā'ber-lēn, KARL FRIEDRICH (1756-1808). A German authority on constitutional law. He was born and educated at Helmstedt and was professor of German constitutional law at Erlangen (1782-86) and Helmstedt (1786-1808). His fame rests chiefly on his *Handbuch des deutschen Staatsrechts* (2d ed., 1797) and *Das deutsche Staatsarchiv* (16 vols., 1796-1808), which contain valuable essays and treatises on constitutional and statistical affairs.

HABIB ULLAH. Ameer of Afghanistan (q.v.).

HABICHT, hā'bīkt, LUDWIG (1830-1908). A German novelist, born at Sprottau. After 1881 he lived for many years in Italy. He wrote: *Der Stadtschreiber von Liegnitz* (2d ed., 1881); *Schein und Sein* (2d ed., 1878); *Er muss studieren* (1896); *Widersprüche* (1899); *Besondere Kennzeichen* (1902); *Wahrheit* (1902).

HABETINER, hā-bē'ti-nēk, KARL (1830-). An Austrian statesman, born in Prague. He graduated at Prague University (German) in 1855, in 1858 was appointed lecturer in Austrian civil law at Vienna, from 1864 to 1868 was at Prague as professor of civil law and the law of trade and exchange, and from 1868 to 1871 occupied a similar chair at Vienna. In 1871 he was for a time Minister of Justice, in 1879 became a life member of the Upper House of the Reichsrat, and in 1881 vice president of the Reichsgericht, a tribunal for the settlement of conflicts between the ordinary administrative courts and the special court for government officials. He was vice president of the Supreme Court of Justice and Cassation from 1881 to 1899 and in the latter year was appointed its president. He retired in 1904.

HABINGTON, WILLIAM (1605-54). An English poet, born at Hindlip, Worcestershire, of Roman Catholic parentage. He was educated at Saint-Omer and Paris, but declined to become a Jesuit, and returned to England. He married Lucy Herbert, youngest daughter of Lord Powis, and retired to his ancestral estate. Habington addressed to his wife, under the name of Castara, a series of beautiful lyric poems, distinguished from similar contemporary work by their purity of tone. His tragi-comedy, *The Queene of Arragon*, appeared in 1640. To the volume entitled *Castara* (1634) additions, including religious poems, were made in 1635 and 1640. Consult Arber, *English Reprints* (London, 1870), and Ward, *English Poets*, vol. ii (ib., 1880-83).

HABIT (from Lat. *habitus*, condition, from *habere*, to hold). In its most extended sense, a settling of any plastic material into determinate form. Since the organism at large, and the nervous system in particular, are characterized by nothing so much as by plasticity, more especially during the years of growth that precede maturity, it is clear that habit must play an important part in biology as well as in the sciences of mind (psychology, ethics) that follow upon biology. Habit, in this technical sense, is common both to man and to the lower animals. It may be defined as a "fixed tendency" acquired by an organism during its lifetime; it should therefore be clearly distinguished from reflexes and instincts (q.v.), which have been acquired before birth. In biology habit is chiefly important as one of the concepts for the explanation of the behavior of the organism. In psychology, on the other hand, the term has served as an explanation of the rise and course of mental processes; though of recent years it has been largely replaced by the terms "disposition" (q.v.) and "tendency." (See DETERMINING TENDENCY.) Furthermore, both biology and psychology are interested in the course of the acquisition of a habit. The former notes the simplification of the movements required to achieve a given result, the increased accuracy of the movements, and the diminished tendency to fatigue. Psychology, on its side, is concerned with the nature of the conscious patterns present at various stages in the formation of a habit; analysis of the formation of an habitual movement results, e.g., in the psychology of impulsive, sensorimotor, and automatic action. (See ACTION.) Moreover, in animal psychology, the rate at which a habit is acquired (the time consumed, the number of repetitions, the dropping of useless movements, etc.) has become an important index of the mentality of the animal. See LEARNING IN ANIMALS.

Finally, the explanation of habit must be sought in physiology. The formation of the simplest habit is the formation of simple sensorimotor coordinations. In the acquisition of a skillful act, such as piano playing, typewriting, etc., the simple coordinations are first brought together in complex or integrated groups of coordinations. Gradually the longer series are short-circuited or abridged; ideas which at first accompanied the voluntary direction of the various movements drop out; and at last the whole movement follows automatically when touched off by a single stimulus. Physiologically regarded, habit thus implies that nervous functions are relegated by the higher to the lower (automatic) centres; the cortex is re-

lieved of so many burdens and is free for so many new combinations. Psychologically regarded, it implies the possibility of mental progress: what we have learned becomes a matter of course with us, unconsciously utilized when the right cue is given; so that we can drop, without fear of forgetting, the topic that we have been working upon and proceed to new acquisitions upon the organized basis of previous effort.

Consult: James, *Principles of Psychology* (New York, 1890); Carpenter, *Mental Physiology* (London, 1888); Huxley, *Lessons in Elementary Physiology* (New York, 1896); Colvin, *The Learning Process* (ib., 1911); Titchener, *Text-Book of Psychology* (ib., 1910). For ethical implications, consult Wundt, *Ethics* (ib., 1897).

HABITATION. See HOUSE.

HABITUAL CRIMINAL. One whose habit of indulging in criminal acts has been established by previous convictions. In some of the United States there are statutes fixing three convictions as the minimum number required to constitute one an habitual criminal or offender, and, in the absence of legislative definition, this number is sufficient to make out a case of habitual or common criminality. In other States, one previous conviction of a felony or five convictions of a misdemeanor warrant a judgment of habitual criminality. It is the present policy of the criminal law, in European countries as well as in the United States, to punish an habitual offender more severely than a first transgressor. Accordingly modern legislation provides a sliding scale of punishments for persons convicted of crime. For the first offense a mild penalty is imposed, while a heavier penalty is inflicted with each repetition of the same offense. (See SENTENCE.) In some States it is provided that the person of an habitual criminal shall be at all times subject to the supervision of every judicial magistrate of the county, and of the overseer of the part of the town where the criminal may be found, to the same extent that a minor is subject to the control of his parent or guardian. Consult Bishop, *New Criminal Law* (Chicago, 1892), and *Blackburn v. State*, 50 Ohio St., 428 (1893).

HABITUAL DRUNKARD. In ordinary language a drunkard is one who has the habit of getting drunk, and the term "habitual drunkard" is therefore tautological; but the term has a technical legal sense as applied to a person who has become so confirmed in this habit of getting drunk as to render him a proper subject of legal guardianship, analogous to that exercised over insane persons, under provisions of statutory law.

The law of the State of New York is typical of this class of legislation. Under it the proceedings for the appointment of a guardian, commonly known as a committee, of a person as an habitual drunkard involves an inquest, or judicial inquiry by a jury, into his character and habits, as in the case of insane persons. The committee, when appointed, has charge, not only of the estate of the drunkard, but also, subject to control of the court, of his person, so that he can fix his residence and otherwise determine his method of living.

A finding of habitual drunkenness upon the inquest deprives the habitual drunkard of his capacity to bind himself by contracts, even when sober; but it does not incapacitate him from making a valid will if at the time of its execution he was "of disposing mind." See DRUNK-

ENNESS, and consult the authorities there referred to.

HACHETTE, à'shèt', JEAN NICOLAS PIERRE (1769-1834). A French mathematician, born at Mézières (Ardennes). He studied at Charleville and at Reims and taught at Rocroy (1787), Mézières (1788-92), and at the Collège de Collioure (1793). On the founding of the Ecole Polytechnique in Paris, in 1794, he was given a subordinate position and in 1797 was called to the chair of descriptive geometry in this institution. In 1810 he was nominated to a professorship in the university, but for political reasons the government refused to confirm the nomination. His first election, in 1823, to the Academy of Sciences also failed of confirmation, although he was finally, in 1831, successful in securing a seat. Hachette was a prolific writer on mathematical topics, his memoirs appearing in the *Journal de l'Ecole Polytechnique*, in the *Correspondance de l'Ecole Polytechnique* (Paris, 1817, 3 vols., which he edited), in *Crelle's Journal*, and in various other scientific publications. He also wrote a number of works, among which the following are the most prominent: *Traité élémentaire des machines* (1809; 2d ed., 1828); *Programme d'un cours de physique* (1809); *Éléments de géométrie à trois dimensions* (1817); *Traité de géométrie descriptive* (1822; 4th ed., 1828); *Histoire des machines à vapeur* (1830). For a list of the memoirs of Hachette, consult *The Catalogue of Scientific Papers of the Royal Society*, vol. iii (London, 1869). For a biographical sketch, consult Arago, *Œuvres*, vol. iii (Paris, 1855).

HACHETTE, JEANNE LAÎNÉ (c.1454-?). A French heroine. So little is known of her family that it is impossible to say whether she was the daughter of an officer named Fourquet by whom she was confided to the care of Dame Mathieu Lainé, or was in truth the child of the latter and her husband, a simple workman of Beauvais. In 1472, when she was about 18 years old, Charles the Bold of Burgundy invaded France and endeavored to take Beauvais by storm. As the town was garrisoned by but 300 men, the inhabitants, men and women, defended the walls and succeeded in repelling the first assault of the Burgundians. The second assault, however, was more determined, and a standard bearer had succeeded in reaching the top of the rampart and had planted his flag, when Jeanne struck him dead with a hatchet (*hachette*) and captured the banner. This so disheartened the assailants that they again withdrew, and as reinforcements soon after entered the city, Charles decided to raise the siege. King Louis XI not only rewarded Jeanne by marrying her to the man of her choice and decreeing that they and their descendants should be free from the payment of all taxes, but excused the other citizens from the payment of the poll tax. gave many privileges to the women of Beauvais, and instituted an annual procession to take place on the day of St. Angadreme, the patroness of the city, in which the flag captured by Jeanne was carried by some woman of her family. In 1851 a statue was erected to her memory in the principal square of Beauvais.

HACHETTE, LOUIS CHRISTOPHE FRANÇOIS (1800-64). A French publisher, born at Rethel in the Ardennes. He began to prepare himself to be a teacher, but having been dismissed, owing to his politics, in 1822, entered a school of jurisprudence. This he quitted in 1826 to become a

publisher in Paris, with the avowed object of issuing books to improve pedagogies and to elevate the general intelligence of the people. This aim he pursued throughout his life, and the numerous series of works that he published in every department of knowledge gave him not only a national but a world-wide reputation as a moral educator and as a disseminator of wholesome literature. Noteworthy among his publications are scientific and miscellaneous libraries, editions of various classics, dictionaries of modern languages, dictionaries of universal reference, and *Le Journal pour Tous*, a weekly periodical founded in 1855. He was the author of several pamphlets on the economic condition of the poor and their betterment and was greatly interested in the establishment of coöperative friendly societies among the industrial classes. He was also one of the early promoters of international copyright.

HACHIOJI, hū'chē-ō'jē. A town of Japan, situated on the island of Nippon, 23 miles by rail from Tokyo (Map: Japan, F 6). It is an important centre of the silk industry. It has a rapidly increasing population of 35,000.

HACK'BERRY (variant of *hagberry*, *hagberry*, from *hag*, AS. *haga*, Dutch *haag*, Ger. *Hag*, fence, coppice + *berry*), also called **SUGAR BERRY**, **NETTLE TREE**, **HOOP ASH**, and **HAGBERRY**. A number of trees and shrubs which belong to the nettle family, the species of which are distributed throughout the Northern Hemisphere. The best-known species are *Celtis occidentalis* and *Celtis mississippiensis* of the United States. The former ranges from Canada to Tennessee and westward to the Pacific. It is a large tree, which attains a height of 120 feet or more and 3 feet in diameter. In habit of growth the tree somewhat resembles the white elm, but the bark is rougher, and the branches are nearer the horizontal. It is of rapid growth and is well adapted to park and general planting. The wood is heavy, rather soft, and coarse-grained. The heartwood is brown, the thick sapwood yellow. It is adapted to about the same uses as the elm. The second species is a somewhat smaller tree of more southern range. *Celtis australis*, sometimes called lotus tree and nettle tree, is a species common in the Mediterranean region and found in India. It attains a height of 60 feet or more, but is not hardy in the north. Its wood is extensively used for furniture, carving, etc., and its drupelike fruits are edible. *Celtis bungeana*, a North China species, with dark-green glossy leaves, is a hardy tree in northern latitudes.

HACK'EE (in imitation of the cry of the animal). A name for the chipmunk (q.v.), found in the books of Richardson, Godman, Audubon, and other early writers, and perhaps once in popular use in the Southern States, but now rarely heard. The same may be said of "chickaree," a name given to the red squirrel (*Sciurus hudsonicus*), according to Audubon, on account of its chattering note.

HACK'ENSACK. A village and the county seat of Bergen Co., N. J., 14 miles north of Jersey City, on the Hackensack River, and on the New Jersey and New York, and the New York, Susquehanna, and Western railroads (Map: New Jersey, E 2). It is primarily a residential town and has the Johnson Public Library, Hackensack Hospital, county courthouse and jail, and an Old Ladies' Home. The principal industrial establishments are silk mills,

a jewelry factory, and a wall-paper factory. The government is vested in a board of commissioners, elected from the village wards for a term of three years. Hackensack was settled by the Dutch, about 1640, near a village of the Hackensack Indians, and in 1678 a company of Huguenots settled near here on what was known as the French Patent. Washington stopped here on his retreat across New Jersey in 1776, and the place was subsequently occupied by the British and Hessians. Hackensack was incorporated in 1868. Pop. 1900, 9443; 1910, 14,050; 1914 (U. S. est.), 16,011; 1920, 17,667.

HACK'ER, FRANCIS (?-1660). An English regicide. He was a zealous supporter of Parliament and later of Cromwell during the Civil War and the Protectorate and distinguished himself in several battles. He commanded the soldiers who guarded Charles I during his trial, had charge of the execution, and signed the executioner's order. During the Scottish War he commanded a regiment under Cromwell and later represented Leicestershire in the Parliament of Richard Cromwell. After the Restoration he was sent to the Tower and was hanged on Oct. 19, 1660. Consult *The Speeches and Prayers of Some of the late King's Judges* (London, 1660).

HACK'ET, JOHN (1592-1670). An English ecclesiastic. He was educated at Trinity College, Cambridge, and was ordained in 1618. He remained loyal to the King during the Civil War, but was permitted to stay in England until the Restoration in 1660 placed the Stuarts again on the throne. The next year he became Bishop of Coventry and Lichfield. Among his publications are *Loyola* (1648), a Latin comedy of small merit, and a life of Archbishop Williams (1693). Consult Plume, *Life of Hacket*, reprinted with additions by Mackenzie Walcott, B.D. (London, 1805).

HACK'ETT, HORATIO BALCH (1808-75). An American biblical scholar, born in Salisbury, Mass. He graduated at Amherst in 1830 and studied theology at Andover and in Germany. He was (1835) professor of Latin and Greek at Brown University and in 1839 was chosen to the chair of biblical literature in the Newton Theological Institution, where he remained for 30 years. In 1870 he was made professor of New Testament Greek in the Rochester Theological Seminary. He was one of the most distinguished biblical scholars in the Baptist church and a notable exegetist. His works include an edition with notes of Plutarch's *De Sera Numinis Vindicta* (1844); *Illustrations of Scripture Suggested by a Tour through the Holy Land* (1855); a translation of *Philemon* (1860); *Christian Memorials of the War* (1864); an edition of *Ravlinson's Historical Illustrations of the Old Testament* (1873); and other translations for the American edition of Lange's *Commentary*. With Ezra Abbot he edited the American edition of Smith's *Bible Dictionary* (1868-70). Consult Whittemore, *Memorials of Horatio Balch Hackett* (1878).

HACKETT, JAMES HENRY (1800-71). A noted American comedian. He was born and brought up in New York City. After his early marriage to an actress, Miss Lee-Sugg, and a failure in business, he went upon the stage, first in 1826, and rapidly earned a prominent position, especially in eccentric characters. Among his impersonations best known were Justice Woodcock, Sylvester Daggerwood, Mons. Morbleu, Dromio, Rip Van Winkle, Nimrod Wildfire,

Sir Pertinax McSycophant, and, above all, Falstaff, in which in this country he had no peer. He played with success in England and in all parts of the United States, besides managing at different times several theatres. Before his death he made a fortune. He was the author of *Notes and Comments on Shakespeare* (1863). Consult Ireland, *Actors and Actresses of Great Britain and the United States*, edited by Matthews and Hutton, vol. iii (New York, 1886).

HACKETT, JAMES KETELTAS (1869-1926). An American actor and manager, son of James Henry Hackett. He was born at Wolfe Island, Ontario, and graduated from the College of the City of New York in 1891. He first appeared in 1892 and after several engagements became, early in 1896, leading man at the Lyceum, a position which he held till 1899. Later he became one of the few independent managers in this country. His greatest successes were in *The Prisoner of Zenda* (1896), its sequel, *Rupert of Hentzau* (1898), and *The Pride of Jennico* (1900). Other plays in which he appeared are: *Don Caesar's Return* (1901); *The Crisis* (1902); *The Walls of Jericho* (1906); *Samson* (1909); *The Grain of Dust* (1912). In 1897 he married the actress Mary Manning and in 1911 Beatrice Mary Beckley. Consult Strang, *Famous Actors of the Day in America* (Boston, 1900), and William Winter, *The Wallet of Time* (2 vols., New York, 1913).

HACKETTSTOWN. A city in Warren Co., N. J., 58 miles west of New York City, on the Delaware, Lackawanna, and Western Railroad, the Morris Canal, and on the Musconetcong River (Map: New Jersey, C 2). It is the seat of Centenary Collegiate Institute, rebuilt in 1901, and contains a State fish hatchery and public libraries. The industrial establishments include silk and embroidery mills, leather factories, and saw mills. The water works are owned by the city. Pop., 1900, 2474; 1910, 2715.

HACKLÄNDER, hak'län-dër, FRIEDRICH WILHELM VON (1816-77). A mediocre German novelist and dramatist, born at Bartscheid. He won a wide reputation by his *Bilder aus dem Soldatenleben* (1841) and *Das Soldatenleben im Frieden* (1844). The keen observation and lively humor of the first of these books brought him an invitation to accompany Baron von Taubenheim to the Orient, as a result of which he wrote *Daguerreotypen* (1842), later known as *Reise in dem Orient* (1846), and *Pilgerzug nach Mekka* (1847), a collection of Oriental legends and tales. From his experiences in the Piedmont campaign resulted the *Bilder aus dem Soldatenleben im Krieg* (1849-50). In 1855 he founded the popular weekly, *Ueber Land und Meer*. Of his other works, the more noteworthy are: *Der geheime Agent* (1850), a very popular and often translated comedy; *Wachtstubenabenteurer* (1845), scenes of military life; *Handel und Wandel*, a humorous novel (1850); *Namenlose Geschichten* (1851). Hackländer left an autobiography, *Der Roman meines Lebens* (Stuttgart, 1878). His complete works appeared in 60 volumes (1855-74). Consult Morning, *Erinnerungen an Hackländer* (Stuttgart, 1878).

HACK'LE, HECK'LE, or HATCH'ELL (from Dutch *hekel*, heckle, from Dutch *haak*, hook). An instrument for cleaning, sorting, and straightening the fibres of raw flax, hemp, and jute preparatory to spinning. See FLAX.

HACK'MANN, HEINRICH (FRIEDRICH) (1864-

). A German Orientalist, born in Osna-bruck and educated at the universities of Leipzig and Göttingen. He was lecturer at Göttingen in 1890-94, pastor of a German church in Shanghai in 1894-1901 and (after two years' travel in Asia) of the Denmark Hill German Church, London, in 1904-10, and in 1913, after another long stay in the Orient, became professor of the history of religion in the University of Amsterdam. Among his published works are: *Tom Omi bis Bhomo* (1905; 2d ed., 1907); *Missionsarbeit in China einst und jetzt* (1906); *Buddhismus* (1905; Eng. trans., 1910); *Welt des Ostens* (1912), which appeared in English as *A German Scholar in the East* (1914).

HACK'MATAK. See LARCH.

HACK'NEY. A metropolitan borough of London (q.v.) in the County of London, 3 miles northeast of St. Paul's (Map: London, D 8). It was formerly a favorite suburban village residence of London citizens and in its fashionable days is said to have given its name to hackney coaches. Pop., 1901, 210,110; 1911, 222,533.

HACO. See HAKON.

HAD'AD. One of the chief deities of ancient Syria and Assyria, apparently of Aramæan origin. The name of this deity occurs in several compound names in the Bible, viz., Hadadezer (2 Sam. viii. 3 et al.). Ben Hadad (1 Kings xv. 18 et al.), and Hadad-Rimmon (Zech. xii. 11); is found in the name Bar Hadad (q.v.) in the inscription of Zakir, King of Hamath; and is mentioned by Microbius (*Naturalia*, i. 23. 18). The god is identical with Adad, who appears among the great gods of Babylonia and Assyria. Through cuneiform documents it is likewise clear that Hadad-Adad was a storm god, who was also known by various epithets, such as Ramman (thunderer), Bir, and Dadda, though in Syria he is a solar deity. Hadad also appears in the Old Testament as the name of various kings or princes of Edom (Gen. xxxvi. 35; 1 Chron. i. 50; 1 Kings xi. 14).

HADADEZER, had'ad-ë'zër. King of Zobah, an Aramæan state, in the eleventh century B.C. (2 Sam. viii. 3). Zobah is probably identical with the Assyrian *Zubiti*, which seems to have been situated north of Damascus and east of Hamath. Hadadezer is said to have been a son of Rehob. His name is apparently identical with Hadadidri (Hadad is my help), which occurs in an Assyrian inscription of Shalmaneser III (800-825 B.C.). According to 2 Sam. viii. 3-12, Hadadezer was defeated by David, although the Aramæans of Damascus came to his assistance, and the gilded armor of his servants was carried to Jerusalem. Vessels of bronze were also captured in the cities of Betah and Berotai, which belonged to Hadadezer. The location of these towns cannot be determined at present. After the battle Toi, King of Hamath (q.v.), sent his son Joram to congratulate David, because he had himself been at war with Hadadezer. A later narrative, found in 2 Sam. x. 15-19, gives an account of a second campaign by David ending with a defeat of Hadadezer at Helam (probably Alima, east of the Jordan). One of Hadadezer's servants named Rezon fled from his master and became the founder of a new dynasty at Damascus (1 Kings xi. 23). Consult: Winckler, *Geschichte Israels* (Leipzig, 1895); the commentaries on Samuel by Klostermann (Nördlingen, 1887), Henry Preserved Smith (New York, 1899), Budde (Tübingen, 1902), Nowack (Göttingen, 1902); and Well-

hausen, *Israelitische und jüdische Geschichte* (7th ed., Berlin, 1914).

HADAMARD, á'dá'már', JACQUES (SALOMON) (1865-). A French mathematician, born at Versailles. In 1884 he entered the Ecole Normale, where he became licentiate, fellow, and finally doctor of science in 1892. He became professor at Bordeaux in 1897, then lectured at Paris, and later held professorships at the Collège de France and the Ecole Polytechnique. His mathematical researches cover a wide field, but he is known more especially for his work on the theory of functions and the theory of numbers, on the integration of differential equations of mechanics and physics, and on the latest problems of the functional calculus. He is author of more than 200 memoirs published in various scientific journals and also of *Leçons de géométrie élémentaire* (2 vols., 1898-1901); *Leçons sur la propagation des ondes et les équations de l'hydrodynamique* (1903); *Leçons sur le calcul des variations* (1910).

HA-DANI, hū-dī'nē. A Jewish traveler of the ninth century. See **ELDAD HA-DANI**.

HAD'DAN, ARTHUR WEST (1816-73). An English ecclesiastical historian, born at Woodford in Essex. He was educated at Brasenose and Trinity colleges, Oxford, where he afterward became a fellow. He was ordained a priest in the Established church in 1842. The High Church revival at Oxford, which occurred during his residence there, enlisted his warmest support, and in 1869 he published his *Apostolic Succession in the Church of England*, which was reprinted in 1879 and in 1883 and remains the best work on the subject. Among his other publications are *Councils and Ecclesiastical Documents* (1869-73).

HAD'DINGTON. The capital of Haddingtonshire, Scotland, on the banks of the Tyne, 16 miles east of Edinburgh (Map: Scotland, F 4). It is an important grain market and possesses the second largest corn exchange in Scotland. Other industries include brewing, tanning, milling, and coach building. Noteworthy buildings are the old Abbey Church, the Lucerna Laudoniae (Lamp of Lothian), the county buildings, town hall, and the Knox Memorial Institute. Haddington is a very ancient royal burgh, its charter dating from the eleventh century. It owns its water works. King Alexander II (born 1198), John Knox, John Brown and his grandson Samuel Smiles, and Mrs. Jane Carlyle, who is buried in the ruined choir of the parish church, were natives of Haddington. Pop., 1901, 3992; 1911, 4140.

HAD'DINGTONSHIRE, or **EAST LOTHIAN**. A maritime county in southeastern Scotland, bounded north and east by the Firth of Forth and the North Sea, south and southeast by Berwickshire, and west by Midlothian (Map: Scotland, F 4). Area, 267 square miles. In the southern part are the Lammermuir Hills, rising to the height of 1732 feet. The chief river is the Tyne, which flows northeast across the county into the sea at Tynningham. Haddingtonshire has enjoyed high agricultural fame since the seventeenth century, but a large area is under timber. Coal is mined at various points. The principal towns are Haddington (the capital), Dunbar, and North Berwick. Pop., 1911, 43,253.

HAD'DO (American Indian). A local name on Puget Sound for the humpbacked salmon.

HAD'DOCK. A fish (*Melanogrammus aegle-*

finus) of the cod family. It resembles the common cod very much, but can readily be distinguished by the black lateral line, that of the common cod being white. It has three dorsal and two anal fins, and a barbel at the symphysis of the lower jaw. There is a black spot behind each of the pectorals, these spots sometimes extending so as to meet on the back. A legend ascribes these spots to the finger and thumb of St. Peter and says the haddock is the fish from the mouth of which he took the tribute money.

This valuable fish is abundant on both coasts of the north Atlantic southward to France and North Carolina, but does not range so far north as the cod, though abundant about Iceland. They consort with the cod, but seem to be much more gregarious and swim about in large schools. Some years they are far more rare at the fishing grounds than in others. As they live very largely on mollusks, they are likely to be numerous on the clam banks; and in their feeding and habits generally they closely resemble the cod, varying mainly in the practice of keeping close to the bottom. In April they approach the shore and spawn. They remain near the shore about six weeks and then return to deep water. An ordinary female will produce annually more than a million eggs, resembling those of the cod, and to be treated in the same way in fish culture. The haddock fishery is of great importance on both coasts. This species, which usually weighs about six pounds, is especially salable in the markets of Boston and Philadelphia and is one of the easiest to transport in ice. They are also smoked successfully, after the Scottish method, which produces "finnan haddie" (Finland haddock). See **PLATE OF CODFISH AND ALLIES**.

HADDOCK, SIR RICHARD (1629-1715). An English admiral, son of William and grandson of Richard Haddock, both of whom were officers in the English navy. He commanded ships in various actions during the wars with Holland from 1657 to 1674 and in the battle of Solebay (May 28, 1672) fought his ship, the *Royal James*, so gallantly that when he was presented to the King after his return to England, the latter, as a mark of favor, took off the cap he was wearing and put it on Haddock's head. He was knighted in 1675 and in 1690, after the battle off Beachy Head, was made admiral, and, in conjunction with Henry Killigrew (q.v.) and Sir John Ashby, joint commander of the fleet.

HAD'DON, ALFRED CORT (1855-). An English ethnologist. He was born in London and was educated at Christ's College, Cambridge. In 1880-1901 he was professor of zoölogy in the Dublin Royal College of Science and then was chosen fellow of Christ's at Cambridge. In 1900-09 he was Cambridge lecturer in ethnology and in 1904-09 lectured on ethnology in the University of London. Among his published works are: *Evolution in Art* (1895); *Study of Man* (1897); *Head Hunters, Black, White, and Brown* (1901); *Magic and Fetishism* (1906); *The Races of Man and their Distribution* (1909); *History of Anthropology* (1910), with Quiggin; *The Wanderings of Peoples* (1912).

HADDON, WALTER (1516-72). An English philologist, born in Buckinghamshire. He was invited to enter Cardinal College, Oxford, but preferred Cambridge, to which he had been elected from Eton. Together with Cheke, he labored for the reform of the ecclesiastical laws, and in 1571 the result of their work was published under the title *Reformatio Legum Ecclesi-*

asticarum. He was appointed master of Trinity Hall in 1551-52 and soon afterward succeeded Owen Oglethorp as president of Magdalen College, Oxford. This appointment, however, was at variance with the founder's statutes, and Queen Mary, soon after her accession to the throne in 1553, caused Oglethorp to be reinstated. His sympathies were with the cause of Protestantism, and in 1563, by direction of the government, he answered a letter published by a Portuguese priest named Jerome Osorio da Fonseca exhorting Queen Elizabeth to become a Roman Catholic. This was the beginning of a controversy which continued until his death. During his lifetime he enjoyed a great reputation as a writer of Latin prose; but later critics have not held his works in as much esteem as did his contemporaries. Consult the article of Thompson Cooper in the *Dictionary of National Biography*, vol. xxxiii (London, 1890).

HADDONFIELD. A borough in Camden Co., N. J., 6 miles southeast of Camden, on the West Jersey and Seashore Railroad (Map: New Jersey, C 4). It contains the Shepherd's Home, Bancroft Training School, Hopkins Lake and Park, and a public library. The borough is a residential suburb of Philadelphia, has some farming interests, and a pottery. One of the water plants is owned by the municipality. Haddonfield adopted the commission form of government in 1913. Pop., 1900, 2776; 1910, 4142.

HADDON HALL. A fine specimen of the English baronial mansion, situated 2 miles southeast of Bakewell in Derbyshire, England. It was originally in the possession of the Avenel family, but in the twelfth century passed into the hands of the Vernons and, by the romantic marriage of Dorothy Vernon with Sir John Manners, became in the sixteenth century the seat of the Rutland line.

HADEN, SIR FRANCIS SEYMOUR (1818-1910). An English surgeon, one of the best etchers of the nineteenth century. He was born in London, Sept. 16, 1818, the son of a wealthy physician. He was educated at University College, London, and at the medical schools of the Sorbonne, Paris, where he took his degree, and Grenoble. He was highly successful in surgical practice, became a member of the Royal College of Surgeons of England in 1852 and a fellow in 1857 and distinguished himself by his studies in ovariectomy and by public-spirited enterprises, such as founding the hospital for incurables, London. He is, however, best known as an etcher and an authority on etching. While a student at the Sorbonne, he studied drawing at the night classes of the government school of art, as an aid to surgery, and while traveling in Italy he acquired the water-color technique from Duval le Camus, a French painter. He first etched in 1843, but did not take up etching as a life work until 1858, when his brother-in-law Whistler came to London. Thereafter he was rarely without a copperplate or sketching block to be used whenever the opportunity offered. The best known of his 251 plates are: "Thames Fisherman" (1859); the large "Shore Mill Pond" (1860); "Sunset in Ireland" (1863); "La belle Anglaise" (1864); "River in Ireland" (1868); "Breaking up of the Agamemnon" (1870), the most popular of all; "Calais Pier" (1874), after Turner; "Windor" (1878). These are equalled and in many cases excelled by other works—by several, e.g., in the series *Etudes à*

l'eau-forte (1865-66). His early figure pieces show the influence of Whistler, but his landscapes are highly individual. Thoroughly true to nature, they show complete mastery of line and virile technique and, at best, a true feeling for style. Sometimes, indeed, the unity of design is impaired by undue emphasis of disconnected detail. He was awarded the Grand Prix at Paris in 1889 and 1890, was a member of the Académie Nationale des Beaux-Arts and the Société des Artistes Français; a corresponding member of the Institute; and was knighted in 1894. Haden has done more perhaps than any other to promote etching in Great Britain. He was thoroughly schooled in the old masters of the art and the first to classify critically the work of Rembrandt in his *The Etched Work of Rembrandt Critically Considered* (1877) and other paintings. His publications include *About Etching* (London, 1878-79) and the *Art of the Painter-Etcher* (1890). He lectured widely in England and in 1882 in the United States. The last years of his life were spent in a delightful Elizabethan country seat at Woodcote (Hampshire), where he died June 1, 1910. His wife was a Miss Whistler, of Baltimore, sister of the famous painter, and his dissensions with his irascible but lovable brother-in-law were well known. Haden was also a draftsman and aquarellist of great ability. Most of his etchings are in the United States, the most important collections being those belonging to the New York Public Library, the Albright Art Gallery, Buffalo, and Harris B. Dick, New York. In 1910 the British Museum acquired a representative collection made by the artist himself.

Bibliography. The first catalogue of Haden's etchings was published, with the artist's co-operation, by Sir W. M. Richard Drake (London, 1880); the most complete by H. N. Harrington, under the title *The Engraved Work of Sir Francis Seymour Haden* (Liverpool, 1910). For an appreciation and biography, consult: Weitenkampf, *International Studio*, vol. xlii (New York, 1910); Hind, in *Die graphischen Künste*, vol. xxxiv (Vienna, 1911); articles by Keppel and Harrington, in Carrington, *Prints and their Makers* (New York, 1912).

HADERSLEBEN, hä'ders-lä'ben. The capital of the district of the same name in the Prussian Province of Schleswig-Holstein, situated on the Hadersleben Fiord, 32 miles north of Flensburg (Map: Prussia, C 1). Its church of St. Mary, originally erected in the thirteenth century and rebuilt in the fifteenth, is a handsome edifice; the war monument, and the memorial to Kaiser Wilhelm I are noteworthy. The town has a gymnasium dating from the sixteenth century, a seminary for teachers, and one for clergymen. It manufactures machinery, chewing tobacco, and vehicles. Hadersleben obtained municipal rights in 1292. It suffered greatly from the wars between Schleswig and Holstein. Pop., 1900, 9201; 1910, 13,046.

HADES, hä'dez (Gk. *ᾍδης, Haidēs*, or *Ἄδης*, or *ᾍδης, Aīdēs*, from *ἄ, a*, priv. + *ἰδέν, idein*, Lat. *videre*, Skt. *vid*, to see. Etymologically Hades is either the 'Unseen' or 'He that makes invisible'). 1. In Greek mythology, originally, as in Homer, the god of the lower world. (See *PLUTO*.) In later writers the word is also used to denote the realm of Hades, called by the earlier poets "House of Hades" (*δῆμος ᾍδης*). The Greek conceptions of this region varied greatly. In the common belief it was in the

depths of the earth, while another view, seen, e.g., in the *Odyssey*, placed the home of the dead in the far west, the region of night and sunset. Entrances to the realm of Hades, when conceived of as in the earth, were set at various places, as at Cumæ (q.v.) in Italy, or on the promontory of Tænaron in Laconia. Wherever situated, it was a gloomy region, with its wide gates ever open to receive newcomers, but closely guarded by Cerberus (q.v.) against any who would return. Here also was the joyless asphodel meadow, where the shades wandered in sadness. Early also arose the belief in the rivers of the lower world, Styx, Acheron, Cocytus, and Pyriphlegethon, and the ferryman Charon (q.v.). Over against these views must be placed that of the abode of happiness for the favored (see ELYSIUM) and of punishment for the wicked. (See TARTARUS.) Consult: Rohde, *Psyche* (Freiburg, 1898); Farnell, *Cults of the Greek States*, vol. iii (Oxford, 1907); Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911). See GREEK RELIGION.

2. In the Septuagint and the Greek New Testament the word signifies the realm or abode of the dead. Other ancient peoples had corresponding terms. With the Egyptians the abode of the dead was Amentet (the west; see AMENTHES); the Babylonians called it Aralu (perhaps a cave); the Hebrews spoke of it as Sheol. The general idea among all these was the same—that of an undefined mysterious locality under the earth to which in some unexplained way the souls of the dead go, there to exist for all time to come. But as to details, no one of these ancient peoples possessed a generally accepted, consistently worked out theory. Besides the changes due to the progress of thought from age to age, in the same period many different conceptions were current, difficult if not impossible to combine into one consistent doctrine. This fact is well illustrated by the course of Hebrew and Christian thought on the subject.

The Hebrew word "Sheol," which the Greek version rendered by "Hades," comes, according to some scholars, from a root meaning 'hollow'; in this view "Sheol" meant the supposed great cavern or hollow under the earth where the dead abode. The term often indicates simply the grave. Another term similarly used in the Old Testament is *bor* (pit). The grave and Sheol proper are not, however, the same. The word "hell," so frequently used in the Authorized Version, originally meant much the same as "Sheol." Sheol was thought of as deep down (Deut. xxxii. 22; Ps. lxxxviii. 6, 11; Job xi. 8; Ps. lxxxvi. 13; Prov. xv. 11). The dead, though their bodies crumbled to dust in the graves, here continue a bodiless, shadowy sort of existence. They find themselves grouped according to earthly relationships, so that one who dies is "gathered to his fathers." They retain in some way their general appearance at the time of death (cf. the realistic narrative 1 Sam. xxviii. 8-14). They also may be possessed of unusual knowledge, if the gift of prognostication was theirs in life, so that there was a morbid curiosity to inquire of the dead through those who had "familiar spirits"—i.e., whom the "spirit" of the dead used as a medium of communication. Such conceptions were quite prevalent in early Israel; the Hebrews shared them with the old Semitic world about them. The state was a permanent one, looked upon as the normal consequence of a life lived out to its full length.

To go to Sheol before one had filled out his days was a misfortune, a calamity: but not, apparently, because the condition there was supposed to be in itself unhappy, or affected by the time of one's death. A violent death, however, seemed to endanger one's peace in Sheol (cf. Num. xvi. 30, 33; 1 Kings ii. 6, 9; Ps. lv. 15). Yahwe was said to "save from Sheol" when He delivered from impending death (cf. Psalms, *passim*). In Sheol all were supposed to meet on a common level, good and bad alike (cf. 1 Sam. xxviii. 19). It was a gloomy, unattractive place. There was no escape from it: we read of the bars of Sheol (Job xvii. 16). It had its divisions; we hear of those who are assigned to its "utmost parts" (Is. xiv. 15-19; Ezek. xxxii. 23). No vital connection with Yahwe belonged to the existence in Sheol. In it there was no remembrance of Yahwe, no praise, no work, no desire, only a negative existence (Ps. vi. 5, lxxxviii. 5-12; Eccl. ix. 5-10). As in Babylonia occasionally a hero in antiquity was conceived of as escaping from the nether world by being translated (see ENKIDU; GILGAMESH), so in Israel an Enoch (Gen. v. 24) or an Elijah (2 Kings, ii. 1, 11) was thought of as being taken up into heaven without having tasted death. In the Book of Job the idea is once suggested of a possible return from Sheol because of God's longing for the work of His hands (xiv. 14), but it is resolutely brushed aside, since the author does not believe that, if a man dies, he can live again. Through the influence of Persian thought, however, the conception of a resurrection becomes familiar and meets us in Dan. xii. 2; Isa. xxvi. 19, and then in the apocryphal literature. (See APOCRYPHA; RESURRECTION.) Hades came to be thought of as definitely divided into two main parts, each capable of subdivision—one the place of the righteous dead, the other that of the wicked. From the abode of the righteous a resurrection to a new blessed life was thought possible or probable; the wicked were doomed to stay in their already unhappy abode or to meet with a further punishment in Gehenna, i.e., the place of fiery torment. In close connection with Gehenna was the great Abyss, in which the evil angelic spirits met their due reward. In such developments the influence of Greek mythology is perceptible. But Ecclesiasticus, the Psalms, Ecclesiastes, and the notices concerning the Sadducees show how strongly entrenched the older views were, and how slowly they gave way to the foreign conceptions.

The New Testament writings reflect the later ideas and use them to illustrate their teachings. Hence we find Jesus, in the parable in Luke xvi. 19-31, speaking of Hades, where the rich man was tormented, and of "Abraham's bosom," where Lazarus is comforted. He is represented as referring to the "everlasting fire" prepared for the devil and his angels and for wicked men (Matt. xxv. 41), and to "Paradise," where the repentant thief would be with Him after death (Luke xxiii. 43). But such statements do not contain definite doctrine. The same may be said of other New Testament references to the post-mortem condition of the soul, such, e.g., as are found in Rev. i. 18; vi. 8; etc. The bulk of the positive teaching of the New Testament has reference to the resurrection and its implication—the positive and blessed fellowship of repentant souls with their Heavenly Father. In later thought the modified Hades conception sur-

vived in the idea of a purgatory, the abode between death and the final judgment of those who were not hopelessly lost and yet not ready for entrance into heaven. Consult: Salmond, *Christian Doctrine of Immortality* (3d ed., Edinburgh, 1897); Alger, *A Critical History of the Doctrine of a Future Life* (New York, 1871); Charles, *Critical History of the Doctrine of Future Life* (London, 1897); Carlo Pascal, *Le credenze d'oltretomba nelle opere letterarie dell'antichità classica* (Catania, 1912). See ABADON; ABYSS; ESCHATOLOGY; GEHENNA; HELL; IMMORTALITY; PURGATORY.

HADFIELD, SIR ROBERT A. (1859-). An English metallurgist. A great iron and steel manufacturer, with works at Sheffield, he owed much of his success to his discovery in 1883 of gamma nonmagnetic manganese steel, the first alloy to be both ductile and hard. He received medals and awards from England, France, and the United States, notably the Bessemer gold medal for 1904 from the Iron and Steel Institute, the Elliott-Cresson gold medal of the Franklin Institute, Philadelphia, and medals of the Société d'Encouragement pour l'Industrie Nationale.

HADIK VON FUTAK, há'dík fón fú'ták, ANDREAS, COUNT (1710-90). An Austrian general, born on the island of Schütt (formed by the Danube, between Pressburg and Komorn), of an ancient noble family of Hungary. He distinguished himself in the wars against France and Prussia by his bravery and strategical skill. He was advanced to the rank of general in 1747. In the second year of the Seven Years' War he was decorated with the cross of the Maria Theresa Order and raised to the nobility. After the treaty of peace (1763) he became Governor of Transylvania. He was commander in chief of the Austrian army during the Turkish campaign of 1789, but was compelled by illness to resign his command to Laudon. His diary contains much interesting information on the military history of the eighteenth century. In 1888 an Austrian regiment was named after him.

HADING, á'dän', JANE (1859-). The stage name of Jeanne-Alfrédine Tréfourat, a French actress, born at Marseilles. Her first appearance on the stage, she has recorded, was when she was three years old. At the age of 14, after dramatic studies at the Conservatoire of her native city, she began her career in Algiers and Cairo. She first appeared in Paris in 1870, when she sang in *La petite mariée* and *La belle Lurette*. She was engaged in 1885 at the Gymnase, under the direction of M. Victor Koning, whom she afterward married (1884) and divorced (1887). She established her popularity by her enormous success in Ohnet's *Le maître de forges*; in *Frou Frou* (1886) she added still further to her reputation. She contributed to the success of M. Lavedan's *Prince d'Aurec* in June, 1892, and afterward joined the Comédie Française. Sardou chose her for the title rôle of his *Marcello* in 1896. She appeared in many parts of Europe and in South America, as well as in the United States, where she became best known by her tours with Coquelin in 1888 and 1894.

HADITH (Ar. *hadith*, tradition, from *hada-tha*, to occur). The general designation in Arabic for a story or tradition, but more specifically applied to the traditions about Mohammed, the prophet's sayings and doings, which, as a complement to the Koran, form, together with it,

the supreme authority for all religious and legal questions of the Mohammedans. Originally the traditions were transmitted orally; but the danger of their being entirely forgotten gradually led to their being written down in the first centuries after Mohammed. The earlier collections, however, possess only individual authority and make no claim to systematic arrangement or comprehensiveness. Such collections are known as *musnads* (genealogical chains), from the fact that each tradition is traced back to its ultimate authoritative source. Eight of such *musnad* collections are known to us, though many more were produced. The higher class of Hadith literature, however, is represented by collections termed *musannaf* (systematized), in which the traditions are divided according to subjects and treated with reference to their ritualistic, historical, and ethical import. The attempt is made to carry each utterance of the prophet back from one source to another, until a contemporary of Mohammed is reached, and if the chain is complete the tradition is considered to be of the first class; the value of the defective traditions varies again according to the number of links missing, and the names of those who have transmitted the traditions. It will be seen that in this way the door is opened for almost endless variety of opinions as to the exact value of this or that tradition. The principal and most authoritative collections of traditions are those of Bukhari, Muslim, Abu Da'ud, Tirmidhi, Nasa'i, and Ibn Maja. Of these again, which were all produced in the ninth century, the most important code is the *Sahih* of Bukhari (810-870), who, it is said, spent 16 years of his life in traveling through the length and breadth of the land for the purpose of collecting such traditions, and who singled out, from a number of 60,000, about 7270 as alone genuine. Besides numerous editions published within the last 50 years in the Orient, a standard European edition of the *Sahih* was published by Krehl, *Le recueil des traditions musulmanes, par . . . al-Bokhari* (Leyden, 1862-68). Every generation, almost, produced collections of traditions aiming to fill out gaps or to determine the value of traditions. The enormous Hadith literature was discussed critically and at length by Goldziher, in his *Mohammedanische Studien*, vol. ii (Halle, 1890). Buhl (in *Orientalische Studien Theodor Nöldeke gewidmet*, Giessen, 1906) employed the same method in sifting the testimony concerning the battle of Badr and the Abyssinian hegira. Recently a most searching criticism of the Hadith has been made by Henri Lammens, his principal publications being: "Qoran et Tradition, comment fut composée la vie de Mahomet," in *Recherches de Science Religieuse*, vol. i (Paris, 1910); *Fatima et les filles de Mahomet, notes critiques pour l'étude de la Sira* (Rome, 1912); and *Le berceau de l'Islam*, vol. i (ib., 1914). Lammens maintains that the *Sira*, or the biography of the prophet, such as is found in Ibn Ishak and others, has no independent value as an historical source, but is drawn from the *Tafsir*, or interpretation of the Koran, and the *Hadith*; that the exegetical and dogmatic interest was older than the historical; that the vast *Hadith* material consists of either exegetical developments of hints in the Koran or inventions of a dogmatic and juridical nature, and that little reliance can be placed on it. Becker, in *Archiv für Religionswissenschaft*, vol. vv (Leipzig, 1912), and in "Principielles zu Lam-

mens Sirastudien," in *Der Islam*, vol. iv (Strassburg, 1913), has pointed out that the skepticism of Lammens, though great, does not go far enough, as it leaves him with a somewhat naïve faith in all the bad stories told about Mohammed, Fatima, Ali, and the home life of the prophet, even where motives and tendencies explaining them are quite obvious. Nöldeke has also protested against this excessive skepticism, "Die Tradition über das Leben Muhammeds," in *Der Islam*, vol. v (Strassburg, 1914). See SUNNA; MOHAMMEDANISM; KORAN.

HADJEMIS, háj'e-miz. A name applied to the Iranian population of that part of Persia between Ispahan and Teheran, including also the Talych and Mazanderani of the shores of the Caspian. See PERSIA, *Ethnology*.

HADLEY. A town, including several villages, in Hampshire Co., Mass., 3 miles northeast of Northampton, on the Connecticut River and on the Boston and Maine Railroad (Map: Massachusetts, B 3). It is in an agricultural region and has two public libraries. There are manufactories of brooms and broom tools. The government is administered by town meetings. Pop., 1900, 1789; 1910, 1990. Settled as Norwotock in 1659, Hadley was incorporated under its present name (from Hadley, England) in 1661. The regicides Goffe and Whalley were concealed here for some years after 1664; and there is a tradition that in 1675 the former suddenly appeared, put himself at the head of the people, and saved the town from an Indian attack. Consult Judd, *History of Hadley* (new ed., Northampton, 1905).

HADLEY, ARTHUR TWINING (1856-). An American educator and economist. He was born at New Haven, Conn., the son of Prof. James Hadley. Graduating from Yale in 1876, he afterward studied political science there (1876-77) and at the University of Berlin (1878-79), receiving the degree of Ph.D. from the latter institution. He was tutor in Yale College (1879-83), university lecturer on railroad transportation (1883-86), commissioner of labor statistics for Connecticut (1885-87), professor of political science at Yale (1886-98), and president of Yale after 1899. In 1906 he was appointed Roosevelt professor in the University of Berlin for 1907-08. He was president of the American Economic Association in 1897-99 and was elected a member of the American Academy of Arts and Letters. The publication, in 1885, of his *Railroad Transportation: Its History and its Laws*, at once gained him the position of an authority on the subject; in the same year he was summoned as expert witness before the Cullom Senate Committee, which drafted the Interstate Commerce Law. He prepared the *Connecticut Labor Reports, Report on the Labor Question* (1885), and *Report on the System of Weekly Payments* (1886); and wrote: *Economics* (1896); *Education of the American Citizen* (1901); *The Relations between Freedom and Responsibility in the Evolution of Democratic Government* (1903); *Baccalaureate Addresses* (1907); *Standards of Political Morality* (1907); *Some Influences in Modern Philosophic Thought* (1913). He contributed numerous essays on political and economic subjects to scientific and popular periodicals, and is the author of the articles on transportation in Lalor's *Cyclopædia of Political Science*.

HADLEY, HENRY K. (1871-). An American composer, born at Somerville, Mass.

In Boston he studied with George W. Chadwick and Stephen A. Emery, but subsequently completed his musical education in Vienna. Upon his return to America in 1895 he was appointed instructor of music at St. Paul's School, Garden City, Long Island. In 1911 he became conductor of the San Francisco Symphony Orchestra. He wrote four symphonies, of which the second won the Paderewski prize in 1901; two symphonic poems, *Lucifer* and *Salome*; orchestral suites, vocal pieces for solo and chorus, instrumental trios, quartets, etc., over 150 songs, three concert overtures, and two comic operas.

HADLEY, HERBERT SPENCER (1872-). An American lawyer and politician, born at Olathe, Kans. He graduated at the University of Kansas in 1892, studied law at Northwestern University, and in 1894 began to practice in Kansas City, Mo. He was elected prosecuting attorney for Jackson Co., Mo., in 1901, and in 1904 Attorney-General of that State. In 1906 he became widely known through his successful attack on the Standard Oil Company, when he forced prominent officials of the corporation to take the stand. He followed this by attacks on other large trusts. Through his efforts a two-cent-per-mile passenger fare was secured. From 1909 to 1912 he was Republican Governor of Missouri. He was a member of the committee of governors who invited Theodore Roosevelt to run for President in 1912 and acted as floor leader for the Roosevelt forces in the Republican National Convention. He published in 1907 *Railroad Rate Regulation*.

HADLEY, JAMES (1821-72). An American scholar, born at Fairfield, N. Y. An accident in boyhood made him hopelessly lame and deprived him of all hope of an active life. He graduated from Yale College, first in his class, in 1842, and in 1844 he was made tutor in Middlebury College. In 1845 he was appointed tutor at Yale and in 1848 became assistant professor of Greek. In 1851 he was elected professor to succeed Dr. Woolsey and continued to hold this office until his death. Although he had taken a theological course at New Haven immediately after graduation, Professor Hadley devoted himself to the study of languages. In addition to Greek, he was familiar with Sanskrit, Hebrew, Arabic, Latin, Gothic, Armenian, Gaelic, Swedish, Early English, and the principal modern languages. He was the author of *The History of the English Language* in the introduction to the earlier editions of Webster's Dictionary. He published a *Greek Grammar* (1860), based on that of Curtius' *Schulgrammatik*, which, as revised by Prof. F. D. Allen, of Harvard University (1884), has maintained a place with that of Goodwin as a standard reference book in American schools and colleges. An *Essay on the Greek Accent* was republished in Curtius, *Studien zur griechischen und lateinischen Grammatik*. Ex-President Woolsey edited a posthumous volume of Hadley's lectures on *Roman Law* in 1873, and in the same year Prof. W. D. Whitney edited a second volume of 20 *Essays, Philological and Critical*. Consult Porter, *The New Englander*, vol. xxxii (New Haven, 1873), and A. T. Hadley, *Biographical Memoirs of the National Academy of Sciences*, vol. v (Washington, 1905).

HADLEY, JOHN (1682-1744). An English mathematician and physicist. He became a fellow of the Royal Society in 1717, a member of its council in 1726, and its vice president in

1728. It is by his improvements in the reflecting telescope (1719-20) that he is best known. By means of the improved instrument Hadley and his friend Bradley made important discoveries relative to the satellites of Jupiter and Saturn. He also suggested (1730) a valuable improvement to the quadrant. See GODFREY, THOMAS.

HADOW, hăd'ô, WILLIAM HENRY (1859-). An English musical scholar and composer, born at Ebrington (Gloucestershire). After the completion of his general education at Oxford he went in 1882 to Darmstadt to study music. He returned two years later and continued the practical study of music with C. H. Lloyd in Oxford. From 1890 to 1899 he lectured at the University on the history of music. He published two volumes of *Studies in Modern Music* (1892, 1894), a *Primer of Sonata Form* (1896), and a *Croatian Composer* (1897). He is the editor of the scholarly "Oxford History of Music" (1901-06), of which he wrote the fifth volume, *The Viennese Period* (1904). As a composer, he cultivated the field of chamber music with predilection and success.

HADRACH, hă'drăk or hă'drăk. In Zech. ix. 1 "the land of Hadrach" is mentioned with Damascus and Hamath. The city of Hadrach is probably identical with Hazrak, referred to several times in the inscription of Zakir, King of Hamath and La'ash (c.800 B.C.). It appears to have been delivered by Zakir from the power of Bar Hadad II of Damascus. Asurdan III (775-755 B.C.) attacked it on three of his expeditions, and Tiglath-pileser IV (745-728 B.C.) mentions it in connection with his war upon Azriyau of Ya'di in 738 B.C. Rabbi Jose, in the second century A.D., speaks of it as near Damascus; Cyril of Alexandria, as between Epiphania (Hamath) and Damascus; and the Karaite lexicographer, David ben Abraham, in the tenth century, as near Damascus. It has not been clearly identified with any modern locality. Consult: Delitzsch, *Wo lag das Paradies?* (Leipzig, 1881); Neubauer, *La géographie du Talmud* (Paris, 1868); Pognon, *Inscriptions sémitiques de la Syrie, de la Mésopotamie, et de la région de Mossoul* (ib., 1907).

HADRAMAUT, hă'dră-măŭt'. A region of south Arabia, along the Gulf of Aden, between Mahra on the east and Yemen on the west (Map: Turkey in Asia, F 8). Its area is about 100,000 square miles. Along part of the coast is a narrow coastal plain which rises in terraces to the mountainous border of a table-land 30 miles inland. This strip of mountains attains 8000 feet. The table-land behind slopes to the north and finally disappears in the great desert of the interior. Hadramaut is mostly barren. In its valleys, of which the Wadi Doan is the best known, the vegetation is often very luxuriant, and a number of important communities are found. The population is estimated at 500,000 and includes a race of Bedouins. The chief towns are Keshin, Terim, and Shibam, in the interior, and Makalla, a considerable port. A part of the country is under the protection of England.

HADRIA. See ATRI.

HADRIAN (PUBLIUS ÆLIUS HADRIANUS) (76-138). A Roman Emperor (117-138 A.D.). He was born, according to some authorities, in Rome, according to others in Italica in Hispania Bætica. Under Nerva and even more during the reign of Trajan, who was his guardian, and

with whom he was connected by marriage, he filled high offices in the state. He accompanied the Emperor in his wars against Decebalus (q.v.), where he distinguished himself by his bravery; and in 117, when Trajan set out on his return to Italy from the East, he was left behind as commander of the army and as governor of the Province of Syria. When the intelligence reached Antioch that Trajan had died in Cilicia on his journey home, Hadrian was proclaimed Emperor by the army (Aug. 11, 117 A.D.) and by the Senate. The state of the Empire at the time was extremely critical. Insurrections had broken out in Egypt, Palestine, and Syria; Mesia in the east and Mauritania in the west were both invaded by barbarian hordes, while the Parthians had once more defied the Roman power and had won several successes over the Imperial forces. Hadrian, perceiving the advantage of a peaceful policy, wisely resolved to limit the boundaries of the Roman dominion in the East and concluded a peace with the Parthians, surrendering to them all the country beyond the Euphrates. A conspiracy against his life was repressed by the Senate. In 118 Hadrian returned to Rome and established his authority by liberality towards the people, in shows of various kinds and by liberal support of poor children, and by his considerate attitude towards the Senate. The Roxolani, who had made an inroad into Mesia, were by large gifts induced to retire. In 119 he set out on his long travels, visiting Gaul, Germany, Britain (where he built the famous wall extending from the Solway to the Tyne), Spain, Mauritania, Egypt, Asia Minor, and Greece. He returned to Rome 126 or 127 A.D., and received the title of *pater patriæ*, after which he resumed his travels through the Empire. He spent the years 132 and 133 in Athens, for which city he had a great predilection. At this time occurred the great rising of the Jews under Bar-Cochba. After once more visiting Syria Hadrian returned to Italy and spent the last years of his life at Rome and Tibur (Tivoli). During the severe illness which caused his death, July 10, 138, at Baie, he was subject to violent outbursts of cruelty, to which, as well as to jealousy and pleasure, he was naturally addicted. After the death of Lucius Ceionius Commodus, whom he had adopted under the name of Lucius Ælius Verus, he appointed Titus Aurelius (afterward the Emperor Antoninus Pius) his successor. During his reign the army was vigorously disciplined and reorganized, while as a civil ruler he merits high praise for the just and comprehensive view he appears to have taken of his duties as a sovereign and for the many reforms he instituted in governmental matters, not only in Rome, but in the districts through which he traveled. To him is attributed, more than to any other, the consolidation of the monarchical system of Rome. Hadrian divided Italy into four districts, in charge of men of consular rank, to whom he intrusted the administration of justice. He erected numerous splendid edifices, the chief of which were, in Rome, the temple of Venus and Rome, the mausoleum called the *Moles Hadriani* (now called Castel Sant' Angelo), the Ælian Bridge leading to it, and the magnificent villa at Tibur. At Athens (q.v.) he completed and dedicated the famous temple of Zeus, the Olympieum. (See also HADRIAN, ARCH. OF.) He likewise laid the foundations of several cities, the most important of which was

Hadrianopolis (Adrianople). Hadrian was a lover of fine arts, of poetry, philosophy, and rhetoric. Consult: Merivale, *History of the Romans under the Empire* (8 vols., New York, 1890); Schurz, *De Mutationibus in Imperio Ordinando ab Imperatore Hadriano Factis* (Bonn, 1883); Lanciani, *Ancient Rome in the Light of Recent Discoveries* (Boston, 1889); Plew, *Quellenuntersuchungen zur Geschichte des Kaisers Hadrians* (Strassburg, 1890); Bury, *The Students' Roman Empire* (New York, 1893); Gregorovius, *The Emperor Hadrian* (Eng. trans., London, 1898); Schultess, *Bauten des Kaisers Hadrian* (Hamburg, 1898); Kornemann, *Kaiser Hadrian und der letzte grosse Historiker von Rom* (Leipzig, 1905); Weber, *Untersuchungen zur Geschichte des Kaisers Hadrianus* (ib., 1908); Spartianus, *The Life of the Emperor Hadrian* (New York, 1908). For Hadrian's writings, consult Teuffel, *Geschichte der römischen Literatur* (6th ed., Leipzig, 1913).

HADRIAN, ARCH OF. A well-preserved triumphal arch at Athens, southeast of the Acropolis. It was built of Pentelic marble, by Hadrian, and divided the ancient city of Theseus from Hadrianopolis, the new city of Hadrian. The arch is 59 feet in height and 44 in width, with a single archway 20 feet wide, surmounted by an attic with three openings. The arch may be on the site of a gate in the earlier wall, leading out to the Olympieum and the fountain Callirrhoe. The inscriptions fronting the new and the old city are still in place. The arch is figured in E. A. Gardner, *Ancient Athens* (New York, 1902), and in Weller, *Athens and its Monuments* (ib., 1913).

HADRIAN, TOMB OR MAUSOLEUM OF (Lat. *Hadrianum* or *Moles Hadriani*). The massive building in Rome now known as the Castel Sant' Angelo. It was erected in 136 A.D. by the Emperor Hadrian, together with the Ælian Bridge (Ponte Sant' Angelo), which gave access to it. The tomb was situated in the gardens of Domitia, on the bank of the Tiber. It consisted of a basement about 247 feet square and about 35 feet high, surmounted by a circular mass of masonry about 210 feet in diameter and 70 feet high. The whole was built of concrete with travertine walls and was faced with Parian marble. The form of the structure above the circular mass cannot be certainly determined. The tomb was adorned with statues and surrounded by a gilt bronze railing with gilt peacocks, two of which are preserved in the Vatican gardens. The front of the basement had panels bearing the names of the members of the Imperial family buried in the tomb. The entrance to the burial chambers was in the front, facing the bridge. The structure was fortified in the time of Honorius and was the centre of the factional strife during the mediæval and modern history of Rome. The castle was held by the popes from the time of Boniface IX and about 1500 was connected with the Vatican by a subterranean passage. The ancient structure is almost concealed by the works of fortification which have been added to it and has been despoiled at various times. The marble tombstones were used by Gregory XIII in the construction of his Gregorian Chapel in the Vatican, and the mausoleum supplied the materials with which the Sistine Chapel was built. The gilt angel sheathing his sword, and with outstretched wings, on the pinnacle of the structure, is a modern work, taking the place of previous statues destroyed or stolen

during the Middle Ages. It commemorates the appearance of the Archangel Michael to Gregory the Great during a plague (509); the Archangel was seen, it is said, sheathing his sword, as sign that the plague was to end. Consult Baedeker, *Central Italy and Rome* (15th Eng. ed., Leipzig, 1909), and Platner, *The Topography and Monuments of Ancient Rome* (2ded., New York, 1911).

HADRIAN'S VILLA. A magnificent country place laid out and built by the Emperor Hadrian near Tibur (Tivoli). It covered an area of several square miles, and its different parts bore the names of famous scenes and buildings which Hadrian had visited in his travels. It contained gardens, theatres, a stadium, apartments, baths, colonnades, terraces, and many artificial landscape features, carried out with lavish use of costly materials, which were subsequently used in the construction of other buildings. The ruins, in great part preserved, have for centuries yielded important works of ancient art, now in the various museums of Rome. Consult: Gusman, *Hadrien et la villa imperiale di Tibur* (Paris, 1904); Baedeker, *Central Italy and Rome* (15th Eng. ed., Leipzig, 1909); Lanciani, *Wanderings in the Roman Campagna* (Boston, 1909).

HADRIAN'S WALL. See ROMAN WALL.

HADROME, häd'röm (from Gk. ἡδρός, *hadros*, thick). The water-conducting portion of a vascular bundle. It includes the vessels, tracheids, and wood parenchyma, but not the fibrous cells. Where the fibrous cells are lacking altogether, as is generally the case in monocotyledons, the hadrome and xylem are identical. See LEPTOME; MESTOME.

HADROSOURUS (Neo-Lat., from Gk. ἡδρός, *hadros*, thick + σαῦρος, *sauros*, lizard). A gigantic fossil lizard of the dinosaur group, found in the Cretaceous sandstones of Wyoming. The shape of the animal was very peculiar. With a length of 35 feet, it had a small head, short feebly built forelegs and strong hind limbs, and heavy tail. Its jaws were broadened laterally to form a flattened bill like that of a duck. Portions of thick rhinoceros-like hide were found associated with the skeleton. The animal is considered to have been an amphibian, feeding on succulent marsh plants, for which habit its flattened beak seems to have been peculiarly adapted. See DINOSAURIA.

HADRUMETUM (Lat., from Gk. Ἀδρουνήτος, *Hadrounētos*, or Ἀδρουνήτων, *Hadrounētōn*). An ancient city on the African coast of the Mediterranean on the Gulf of Hammamet (Tunis), long a prosperous agricultural and trading centre. A Phœnician colony which claimed to be of much earlier date than Carthage, in course of time it became subservient to Carthage and fell along with it under the power of the Romans. On the subdivision of the Roman Province of Africa Propria, it became the capital of Byzacium, or Africa Byzacena. By Trajan it was made a colony—*Colonia Concordia Ulpia Traiana Augusta Frugifera Hadrumetina*. From the devastation inflicted by the Vandals, in 434, it was restored by Justinian, and in consequence it bore for some time the name of Justinianopolis. Its site is occupied in part by the city now called Susa (q.v.). Since 1863 excavations by the French have revealed extensive remains of both the Punic and the Roman towns. Consult: Cagnat, *Explorations archéologiques en Tunisie* (Paris, 1885); *Revue Archéologique* (ib., 1884; 1897); *Bulletin de la*

Société Archéologique de Sousse (Sousse, 1903-); *Atlas archéologique de Tunisie* (Paris, 1893-99)—the fourth part gives a plan of Hadrumetum.

HAECKEL, hæk'l, ERNST (1834-1919). A German zoölogist and natural philosopher, born at Potsdam. He studied medicine and the natural sciences at Berlin, under Johannes Müller, and at Jena. After taking his medical degree at Berlin, he practiced medicine for a year, and then, having decided to devote himself to the natural sciences, he studied marine life in Heligoland, Messina, and Naples. In 1861 he became privatdocent, in 1862 professor extraordinarius, and in 1865 professor of zoölogy at Jena. He made numerous scientific journeys—to the Canary Islands, to Norway, the Adriatic, the Red Sea, Corsica, Sardinia, Ceylon, and Java. He published: *Die Radiolarien* (1862); *Die Hydromedusen* (1865); *Entwicklungsgeschichte der Siphonophoren* (1869); *Moneren und andere Protisten* (1870); *Die Kalkschwämme* (1872). The last-named work is an important monograph upon calcareous sponges, in which an attempt is made to arrange them in a natural system; the proposition being that the layers forming the body wall are also homologized with the ectoderm and endoderm of the gastrula. This is the basis laid for the celebrated gastræa theory. Other investigations are: *Arabische Korallen* (1876); *Das System der Medusen* (1880-81); *Reports on the Radiolaria, on the Deep Sea Medusæ, on the Deep Sea Keratosa, on the Siphonophora Collected by the Challenger* (1882-88); *Plankton-Studien* (1890). Haeckel's philosophical writings were first inspired by Darwin's *Origin of Species*. In 1866 appeared *Die generelle Morphologie der Organismen*, which was the first attempt to apply the general doctrine of development to the whole field of morphology, and also to found a classification of animals and plants based upon the doctrine of their common relationship. In it he formulates the celebrated "biogenetic" law, already stated by Von Baer, Agassiz, and Fritz Müller. In 1868 appeared *Natürliche Schöpfungsgeschichte*, translated into English as the *History of Creation*, which is a popular exposition of the doctrine of evolution and has had the widest circulation and done more to popularize Darwinism in Germany than any other book. *Ueber die Entstehung und den Stammbaum des Menschengeschlechtes* (1870) and *Anthropogenie* (1874) treat specially of the descent of man. In *Die Gastræatheorie* (1874) he traces the phyletic history of all the great groups of the animal kingdom and finds for all of them a common ancestor in the hypothetical gastræa. (See GASTRÆA THEORY.) Haeckel's influence upon contemporaneous thought has been very great. As a popular scientific writer and lecturer, he has spread the knowledge of the principles of Darwinism throughout Germany and Europe, while his speculations on the phyletic history and ancestry of the various groups of animals, and his attempts to classify them so as to express their relationships and common descent, although often erroneous, have stimulated investigation and led the way to the correct interpretation of phenomena. He is one of the best-known exponents of the monistic philosophy, which he has advocated in most of his speculative writings. His most important contribution to it is *Die Welträtsel. Gemeinverständliche Studien über monistische Philosophie* (4th ed., 1900;

Eng. trans., *The Riddle of the Universe*, 1902). *Die systematische Phylogenie* (1894) is the last of his contributions to general evolution. Among books of travel Haeckel wrote *Indische Reisebriefe* (1882) and *Aus Insulinde*, the latter having first appeared in 1883, and later in an English translation entitled *A Visit to Ceylon*. More popular, beautifully illustrated works are *Kunstformen der Natur* (1904) and *Wanderbilder* (1905). His latest contributions to evolution and especially with reference to man are *Anthropogenie* (5th ed., 1903); *Ueber unsere gegenwärtige Kenntniss vom Ursprung der Menschen* (1898), the English edition *The Last Link* appearing in the same year; *Der Kampf um den Entwicklungsgedanken* (1905), with the English version called *Last Words on Evolution* (1906). In 1904 appeared a supplement to the *Riddle of the Universe* entitled *Die Lebenswunder*. Consult O. J. Lodge, *Life and Matter: A Criticism of Haeckel's Riddle of the Universe* (New York, 1905), and W. Bülsche, *Haeckel: His Life and Work* (London, 1906).

HÆDUL. See **ÆDUL**.

HÆMANGIOBA LAVERA'NI. See **SPOROZOA**.

HÆMANTHUS, hæ-män'thus. See **BLOOD-FLOWER**.

HÆMATEMESIS, hēm'a-tēm'é-sis (Neo-Lat., from Gk. *haima*, *haima*, blood + *ēmesis*, *emesis*, vomiting, from *ēmeiv*, *emein*, to vomit). Vomiting of blood. A symptom of ulcer or cancer of the stomach or of the esophagus, hemorrhage from the lining of the stomach (as in alcoholism, poisoning, yellow fever, or purpura hæmorrhagica), or cirrhosis of the liver. The blood may be fresh or clotted, or mixed with ingesta or with mucus. The treatment of this symptom is rest on the back, small pieces of ice swallowed, and absolute avoidance of solid and sometimes even liquid food, and of alcoholic drinks. It is a symptom of so much importance and gravity that medical aid should be at once obtained.

HÆMATIN, hēm'a-tin (from Gk. *haima*, *haima*, blood), $C_{77}H_{22}N_4FeO_6$, or, according to some chemists, $C_{72}H_{22}N_4FeO_6$. A bluish-black substance obtained, together with a proteid, when the oxyhæmoglobin of blood is treated with acids or alkalis or is acted on by the gastric or pancreatic juice. It is chemically very stable, the caustic alkalis, hydrochloric and nitric acids, having no effect on it, and it does not decompose even at as high a temperature as 180° C. It is insoluble in water and in the ordinary organic solvents, but dissolves readily in alkaline solutions. By the action of sulphuric acid it is transformed into hæmatoporphyrin, a substance that contains no iron and has also been obtained by decomposing chlorophyll (q.v.), the green coloring matter of plants. Pure hæmatin may be prepared from hæmin by boiling with acetic acid, washing with water, alcohol, and ether, dissolving in dilute potash, and precipitating with hydrochloric acid; the hæmatin thus precipitated is carefully washed with hot water and dried at 130°-150° C. Hæmatin may also be obtained directly from blood, the following being a convenient method of preparation: defibrinated blood is mixed to a thin paste with potassium carbonate, the paste is evaporated to dryness on a water bath, and the residue is extracted with boiling alcohol; the solution thus obtained is made acid by carefully adding sulphuric acid, is filtered, again made alkaline by

adding an excess of ammonia, and then evaporated to dryness; on washing the residue with boiling water and drying at 130°-150° C., a fairly good specimen of hæmatin is obtained.

HÆMATOCELE, hēm'ā-tō-sēl (from Gk. αἷμα, *haima*, blood + κήλη, *kēlē*, tumor). A tumor containing blood.

HÆMATOXYLIN, hēm'ā-tōks'i-lin (from Gk. αἷμα, *haima*, blood + ξύλον, *syilon*, wood). A chromogen (a term used by chemists to denote certain nearly or quite colorless substances which under certain influences yield well-marked colors) obtained by extracting logwood (*Hæmatoxylon campeachianum*) with ether. Hæmatoxylin is best prepared by finely powdering the crusts that separate out of a strong logwood extract on standing, and treating the powder with ordinary ether; the resulting ethereal solution is evaporated to dryness, and water poured over the residue, hæmatoxylin then gradually separating out in crystalline form; these crystals may be purified and completely decolorized by recrystallizing them from water to which a small amount of acid sodium sulphite has been added. The composition of hæmatoxylin is represented by the formula $C_{16}H_{14}O_3H_2O$, and in its pure state it occurs in transparent glistening colorless prisms. It has a sweet and nonstringent taste, is sparingly soluble in cold water, but dissolves readily in boiling water, alcohol, and ether. The aqueous solution is not affected by the air, but if a very small quantity of ammonia is added, it assumes an intense reddish-purple color. This color is due to a decomposition, of which a substance $C_{16}H_{12}O_6$, termed *hæmatein*, is one of the products. The compound resulting from the union of hæmatein and ammonia is represented by the formula $C_{16}H_{12}O_6 \cdot 2NH_3$. Hæmatoxylin is used in the arts for producing blue and black colors. The commercial *hæmion* is an impure form of hæmatoxylin. Logwood (q.v.) contains about 12 per cent of hæmatoxylin. The chemical constitution of hæmatoxylin was established by W. H. Perkin about 1908. The formula which Perkin found to represent correctly the molecular structure of the substance had already been proposed by Pfeiffer in 1904 and is as follows:

HÆM'ATOZO'A. See SPOROZOA.

HÆM'ATU'RIA (Neo-Lat., from Gk. αἷμα, *haima*, blood + οὖρον, *ouron*, urine). The appearance of blood in the urine. It is a symptom of disease of the kidneys, bladder, or prostate gland (tumor, stone, tubercle, syphilis, hypertrophy, etc.) in most cases. The treatment depends upon the condition present. Rest is important. The presence of blood may be recognized in the urine by the color, which is red or

smoky, depending on the quantity and the time it has been mixed with the urine; by means of the spectroscope, which shows a dark band between D and E; by the use of the microscope, which reveals the presence of blood corpuscles in the urine; and by certain chemical tests.

Hæmoglobinuria is a condition in which the hæmoglobin of the blood is set free and is excreted in the urine. It occurs in yellow fever, scarlatina, diphtheria, malaria, scurvy, and purpura; it may follow transfusion or severe burns; and certain drugs or chemicals, e.g., chlorate of potassium, carbolic acid, and sulphureted hydrogen, may produce the phenomenon. See RBD WATER.

HÆMODYNAMOMETER (from Gk. αἷμα, *haima*, blood + δύναμις, *dynamis*, power + μέτρον, *metron*, measure). An instrument for determining the pressure of the blood in the arteries and veins of the living body. The pressure of the blood is measured, as in the barometer, by the column of mercury that it balances. The instrument has been improved in various ways, and a contrivance added by which the oscillations of the mercury are inscribed in the form of an undulating curve on a cylinder made to revolve by clockwork. Recently instruments have been introduced by means of which the blood pressure can be determined in the human subject with facility and precision; these are of great clinical value. See SPHYGMOGRAPH.

HÆMOGLO'BIN (from Gk. αἷμα, *haima*, blood + Lat. *globus*, ball). An important substance found in red blood corpuscles, and having the property of readily taking up oxygen from the air and just as readily giving it up to the tissues of the body. The chemical nature of hæmoglobin is as yet little understood, and even its true chemical composition is unknown. The compound of hæmoglobin with oxygen, called oxyhæmoglobin, may be converted into hæmoglobin by keeping its concentrated aqueous solution for some time in a sealed tube. Crystalline hæmoglobin has a dark-red color, which differs somewhat with the direction from which the crystals are viewed. The crystals are very soluble in water, and combine readily not only with oxygen, but also with nitric oxide, carbon monoxide, and probably with carbon dioxide. When treated with acids or alkalies, hæmoglobin is decomposed, yielding (1) a proteid called globin, and (2) a colored substance known as reduced hæmatin, or hæmochromogen, which is readily converted, by oxidation, into hæmatin (q.v.).

Oxyhæmoglobin and probably hæmoglobin itself vary in chemical composition and in certain physical properties according to the source from which they are obtained. The preparation of a considerable quantity of oxyhæmoglobin from the blood of certain animals is a matter of some difficulty. To obtain oxyhæmoglobin from dog's blood, the latter is defibrinated, strained, shaken with ether, and cooled, the oxyhæmoglobin separating out in the form of a crystalline mass; it may be purified by recrystallizing from very little cold water, a small amount of alcohol being added to the aqueous solution. The crystals of oxyhæmoglobin have a bright scarlet color like that of arterial blood. Their constituent elements are carbon, hydrogen, oxygen, nitrogen, sulphur, and iron. Nothing, however, is known of the chemical structure of oxyhæmoglobin, and its molecular weight appears to be at least as high as 13,000.

Carbon-monoxide hæmoglobin may be obtained

by passing carbon-monoxide gas through an aqueous solution of oxyhæmoglobin. The highly poisonous action of carbon monoxide is due to the formation of this stable compound in the blood, by which the latter loses its capacity for carrying oxygen. Caustic soda solution produces, in blood containing carbon-monoxide hæmoglobin, a brilliant red precipitate; in normal blood the precipitate is of a brownish-green color. The presence of carbon monoxide in blood may thus be readily demonstrated by means of this test.

HÆMOGLOBINURIA. See **HÆMATURIA**.

HÆMON. In the Theban legend, son of Creon, King of Thebes. See **ANTIGONE**, 1.

HÆMOPHILIA, hēm'ō-fil'ī-ā, or **HÆMATOPHILIA**, hēm'ā-tō-fil'ī-ā (Neo-Lat., from Gk. *αἷμα*, *haima*, blood + *φιλία*, *philia*, friendship, from *φιλεῖν*, *philein*, to love). A constitutional disease, almost always hereditary, and characterized by a tendency to uncontrollable hemorrhage from slight wounds or even spontaneously. Various theories have been advanced to explain the hemorrhagic diathesis, but that of Sahli is now universally adopted as most in accordance with the facts. Sahli believes the disease to be due to a chemical alteration in the walls of the blood vessels, resulting in marked deficiency or absence of the fibrin ferment normally secreted when the wall of a vessel is cut or injured. Fibrin ferment is formed by the union of thrombogen and thrombokinase in the presence of calcium, and clotting of the blood is dependent upon it. Hæmophilia is more common in males than females, although the tendency is generally transmitted through the female line of descent. People who suffer from this condition are termed "bleeders." The prognosis is poor, most cases terminating fatally in childhood, and only about one-eighth of the patients reaching the adult age. The treatment is chiefly protective. Bleeding calls for the local application of cold and styptics. Preparations of the thyroid gland, suprarenal capsules, and the salts of calcium are often given with favorable effect; and the injection of normal human serum will control bleeding in many cases. In an emergency diphtheria antitoxin may be injected. The resulting anæmia is treated with iron. For a full treatise on this interesting condition, consult article by Pratt in Osler's *Modern Medicine*, vol. iv (New York, 1908; 2d ed., 1914). See **BLEEDING**.

HÆMOPTYSIS (Neo-Lat., from Gk. *αἷμα*, *haima*, blood + *πτύσις*, *ptysis*, expectoration, from *πτύειν*, *ptyein*, to spit). Raising blood from the lungs or respiratory passages by coughing. The blood may come from the blood vessels of the larynx, of the bronchi, or of the pulmonary vesicles. If the last alternative be true, the cause may be tuberculosis; or the bleeding may take the place of menstruation. In tuberculosis it generally follows breaking down of the lung tissue, or ulceration through the wall of a large blood vessel, though it may be the first symptom of disease noticed. It is not necessarily fatal and in most cases should cause no alarm as to immediate evil results. Indeed, where there is incipient tuberculosis, an early hemorrhage is even beneficial in that it at once relieves congestion and especially, by sharply calling attention to a diseased condition, induces the patient to place himself under proper treatment. It occurs most frequently in cases of slowly progressing tuberculosis. Bleeding

from the lungs may occur without obvious cause, may be due to traumatism, pneumonia, pleurisy, rupture of an aneurism, to heart or liver disease, or to purpura. Rest and administration of morphine constitute the immediate treatment. Styptics, such as gallic and tannic acids, are of no use, and alcohol and other stimulants are to be avoided. In all cases of coughing up of blood the cause should be at once accurately ascertained, and suitable treatment promptly instituted, as the hope of permanent and complete cure in tuberculosis is largely bound up in prompt and systematic treatment while the disease is in the early stage. See **BLEEDING**.

HÆMORRHOIDS. See **PILES**.

HÆMUS. The ancient name for the Balkan Mountains.

HÆRETICO COMBURENDO (Lat., for burning the heretic). An ancient writ of the English law, directing the execution of the sentence of burning a legally convicted heretic at the stake. While the trial of the charge of heresy was exclusively the function of the ecclesiastical courts, the punishment of the person convicted was assumed by the civil authority. The authority of the sheriff to execute the sentence was derived from the writ which issued in the name of the King from the royal court (*curia regis*) and later from the Court of King's Bench.

Death by burning was not a form of punishment for civil offenses in England, but was reserved for spiritual offenses, such as heresy, witchcraft, possession by the devil, and the like. The writ was last employed in the ninth year of James I, and was abolished by Act of Parliament in 1677 (20 Car. II, c. 9). It was never in use in the United States; though heresy and witchcraft were both punished in some of the Colonies, the former by exile and the latter by death, burning was never resorted to. See **HERESY**.

HÆBERING, hā'ring, THEODOR VON (1843-). A German Protestant theologian, born in Stuttgart and educated at Tübingen and Berlin. He was pastor at Calw (1876-81) and at Stuttgart (1881-86) and became professor at Zurich in 1886, at Göttingen in 1889, and at Tübingen in 1895. He wrote: *Ueber das Bleibende im Glauben an Christus* (1885); *Zu Ritschls Versöhnungslehre* (1888); *Zur Versöhnungslehre* (1893); *Die Lebensfrage der systematischen Theologie* (1895); *Die Gerechtigkeit Gottes bei Paulus* (1896); *Das christliche Leben* (1902; 2d ed., 1906; Eng. trans., 1909, 1914); *Verständnis der Bibel* (1904); *Der christliche Glaube* (2d ed., 1912; Eng. trans., 1913).

HAFENREFFER, or **HAFFENREFFER**, hā'fen-rēff'ēr, MATTHIAS (1561-1619). A German Lutheran theologian, born at Kloster Lorch, Württemberg. He studied philosophy and theology at Tübingen and in 1596 was appointed professor of theology and director of the theological seminary there. In 1617 he succeeded Andreas Osiander as chancellor of the university and as provost of the cathedral. As a theologian, Hafenreffer was an orthodox Lutheran and an opponent of Calvinism, although, unlike several of his contemporaries, he did not indulge in acrimonious polemics. His principal publication, the *Loci Theologici* (1600; frequently reprinted), was used as the official textbook of Lutheran dogmatic theology in Württemberg and Sweden, supplanting Heerbrand's *Compendium*.

His *Templum Ezechielis* was equally popular in its day.

HAFFKINE, háf'kín, WALDEMAR MORDECAI WOLFF (1860-). A Russian bacteriologist in the service of the government of India. He was born in Odessa, was educated at Berdiansk College and the University of Odessa, worked in the Odessa zoological museum, was an assistant in physiology in the Geneva Medical School in 1888-89, and Pasteur's assistant in Paris in 1889-93. In 1893 he began his important bacteriological work in India. The method of inoculation against cholera which he had discovered he himself used in 1893-94, treating 42,000 persons in 28 months with no bad effects. In 1897 he introduced into India an effective and successful system of inoculation against the plague. But in 1902 the method of manufacture was slightly changed (principally by the omission of carbolic acid), and nearly a score of natives inoculated with the new mixture died of tetanus. In 1907 Professor Haffkine was entirely exonerated and again took up his work, as there was nothing to prove that his laboratory had been at fault. Consult the letter of eminent British and American pathologists in the *Times* (London) of July 29, 1907, and Haffkine's *Protective Inoculation against Cholera* (1913).

HAFFKINE'S SERUM. See PLAGUE.

HAFFNER, háf'nér, PAUL LEOPOLD (1829-99). A German prelate, born at Horb, Württemberg, and educated at Tübingen. He was ordained in 1852, was professor of philosophy and theology at Mainz (1855-66), and in 1886 was appointed by the Pope Bishop of Mainz, in which capacity he secured from the Hessian government a revision of the ecclesiastical laws. In 1888 he was chosen as the leader of the pilgrims who visited Pope Leo XIII on the occasion of his jubilee. Haffner founded several Catholic societies and wrote the work entitled *Grundlinien der Philosophie* (1881-83), besides many other books on German literature and theology.

HAFID, há'féd, MULAI (1873-). Sultan of Morocco from 1908 to 1912. He was educated at the University of El Azaar in Cairo, and for several years was Viceroy of southern Morocco. In August, 1907, he proclaimed himself Sultan and took the field against his half brother, Abdel-Aziz, who then held the throne. Eventually he won the contest, and his authority was recognized by the European powers before the close of 1908. He was deposed and succeeded by another brother, Mulai Yussuf, in August, 1912. See Morocco.

HAFIZ, há'fíz (?-c.1388). A Persian poet of Shiraz, and one of the greatest names in lyrical poetry. The time when he flourished corresponds to the period of Chaucer's fame in the West; but it was not in the field of narrative poetry that Hafiz was great; he poured forth his spirit in the song of the nightingale and the rose, springtime and love, wine and delight. The date of his birth is not precisely known, but it must have been about the first quarter of the fourteenth century of our era. Hafiz's full name is given as Shams-ud-Din Muhanmad, or Mohammed (the sun of religion); added to this is his title Hafiz (of retentive memory), given to one who knows the Koran and its interpretation by heart. His proficiency in various branches of knowledge brought him under the notice of the reigning house of Muzaffer, and not only was he appointed teacher in the house of the royal family, but a special college was

founded for him. His spirit of independence, however, stood in the way of his worldly advancement, and notwithstanding many offers of princely favor, he remained during his whole life in the humble condition of a dervish. Although the burden of his poetical compositions is beauty in every form, we occasionally find also the praise of Allah and the Prophet, and reflections upon the instability of life and its joys; through all of them runs, however, a contempt of all professional piety and mock humility. These poems are of such sweetness that the poet has also received the name of Shakarlab (Sugarlip); and his contemporaries speak of his having drunk from the fountain of life, a draft of which was brought to him by Khizr (the Mohammedan Elijah) himself.

Hafiz was married and appears to have reached a happy old age. The time of his death is variously given, but 1388 A.D. is the date now generally assigned. The enmity, however, which had been provoked by the freedom of his manners, and his more than Sufistic contempt for the outward forms of godliness, broke out undisguisedly at his death. The ministers of religion refused to repeat the usual prayers over the dead body, and, after long altercations between the members of his family and his enemies, it was agreed that the question, according to the usual customs of the East, should be decided by lot. Verses selected at random from Hafiz's own handwriting were thrown into an urn, and one drawn out by a child to settle the question. The result was favorable, whereupon he was buried with great honor. Hence, perhaps, arose the custom, common in Persia, of consulting verses from Hafiz at random as an oracle. His tomb, situated about 2 miles to the northeast of Shiraz, has been sumptuously adorned by princes and nobles and is still resorted to by pilgrims from all parts of Persia.

How far some of the Ghazals (see GHAZAL) of Hafiz are intended as an allegorical and mystical revelation of things divine in the manner of Sufism (q.v.), as is declared by Hafiz's admirers, is a question which has at different times been raised before ecclesiastical and critical courts. No doubt there is much in them that is Anaerontic, but it is equally certain that considerable weight must be given also to the Oriental interpretation of them as symbolic and mystical. The language and imagery of human love were largely employed in the East for the expression of union with the *Soul* and the *Spirit Divine*. The two passions often commingle in the expression of ecstasy; and parallels, e.g., in the early seventeenth-century English poets, like Donne, Vaughan, and Crashaw, might be noticed with profit in regard to this much-mooted problem. A style brilliant yet clear, imagery gorgeous yet clothed in pure and unaffected diction, undulating melody and classical harmony—these are the chief characteristics of Hafiz's Anaerontic lyrics, which have not only become the national poetry of his country, but are even appealed to as an oracle on most important questions of peace and war. The number of their commentators is legion; the most valuable notes, however, are those of Shamii, Suru, Sidi. The *Divan*, or collection of the writings of Hafiz, was first made after his death, by his friend Mohammed Gulandam. The *Divan*, in Hammer-Purgstall's translation, inspired many of the poems in Goethe's *Westöstlicher Divan*. Lithe-

graphed editions abound, e.g., Calcutta, 1826; Bombay, 1828, 1841, 1883; Cawnpore, 1831; Bulak, 1834 and 1840; Constantinople, 1841; Lahore, 1888; Tashkend, 1895 and 1908. The best early edition, printed by Abu Talibkhan, appeared at Calcutta, 1795 (reprinted 1826). The most valuable edition is by H. Brockhaus (Leipzig, 1854-56), with a part of Sudi's Turkish commentary. Consult also Rosenzweig, with German metrical translation (3 vols., Vienna, 1850-64). Notice also the *Nami Press Hafiz* with a *Glossary* (Lucknow, 1899). Of older translations into European tongues, mention may be made of Rewitzki in Latin (Vienna, 1771); Richardson, Jones, Ouseley, Hindley, Rousseau, Bicknell (1876), in English; and by Hammer-Purgstall (1813) and Daumer, in German. Easily obtainable are: McCarthy, *Ghazels of Hafiz* (New York, 1893); Bell, *Poems from the Divan of Hafiz* (London, 1897); Leaf, *Versions from Hafiz* (ib., 1898); Payne (ib., 1901); Le Gallienne, *Odes from the Divan of Hafiz* (Boston, 1905). But most important is the valuable translation with extensive commentary, by H. Wilberforce Clarke (London, 1891). Consult also: Ouseley, *Persian Poets* (ib., 1846); Ethé, in *Grundriss der iranischen Philologie* (Stuttgart, 1896); Horn, *Geschichte der persischen Litteratur* (Leipzig, 1901); Veit, *Platens Nachbildungen aus dem Dican des Hafiz* (Tübingen, 1908).

HAFNER, hūf'nēr, PHILIPP (1731-64). An Austrian farce writer, born in Vienna. His principal productions are the following: *Der alte Odoardo und der lächerliche Hanswurst* (1755); *Die reisenden Komödianten* (1774), a comedy full of wit and humor; *Dramatische Unterhaltungen unter guten Freunden* (1774). His collected comedies were published by Joseph Sonnleithner in 1812 (Vienna).

HAGAR. According to the Book of Genesis (xvi. 9-21) handmaid of Sarah, concubine of Abraham, and mother of Ishmael. Sarah, having remained barren up to an advanced age, gave Hagar to Abraham for a concubine after he had been in Canaan 10 years, in the hope of establishing a family of her own (Gen. xvi. 1-3; cf. Gen. xxx. 3-9). Afterward she repented of her action and treated Hagar cruelly, so that Hagar fled into the desert, but returned on being comforted by an angel, and bore Abraham a son who was called Ishmael (q.v.). After the birth of Isaac Sarah urged Abraham to drive Hagar and Ishmael away, and, though reluctant to do so, the patriarch at God's command complied. The bondwoman and her son went again into the desert, where they were almost spent with famine when an angel appeared and prophesied greatness for Ishmael, and God showed Hagar a well of water. Hagar is said to be a "Mizrite," which is generally interpreted as "Egyptian," though some scholars think that it refers to the southwest part of Negeb (q.v.), while others, less probably, assume that it refers to a country in northwest Arabia. Many scholars hold that Gen. xvi and xxi. 9-21 are duplicate narratives of the same event; and this is not improbable. But the common assumption that the former was drawn from a source using the divine name "Yahwe," the latter from one employing the name "Elohim," is rendered very doubtful by the Greek version, the etymology of Ishmael (xvi. 11), where the original text read "El hath heard" and the name of the deity of the place "El roi" (xvi.

13). The story of the relationship of Hagar to Sarah, of the birth of Ishmael, of Sarah's treatment of Hagar and her son, and of the final dismissal of the pair appears to many scholars as an admirable illustration of the manner in which tribal conditions are portrayed under the guise of history. Hagar, they think, personifies a tribe that at one time stood in close relationship to some of the Hebrew clans. Rivalry ensued, and the result was a separation, which is pictured as a dismissal on the part of the clan regarding itself as the superior. Interpreted in this way, the various features of it seem to become clear. The opposition between Israelites and Ishmaelites leads the Hebrew writers so to construct genealogical traditions as to make Ishmael the son of the "handmaid," whereas Isaac is the offspring of the real wife, Sarah. As a justification for the separation of two nations having so much in common as Israel and Ishmael, it is represented (1) that Hagar, though the inferior, attempted to gain the supremacy, and (2) that Ishmael, the "inferior" offspring, failed to recognize the superiority of Isaac. The separation, which no doubt was voluntary on the part of the Ishmaelites, is therefore portrayed as a deliberate act of dismissal on the part of Abraham, in whom the genealogical traditions of Hebrews and Arabs are thus made to unite.

The story of Hagar and Ishmael was well adapted for homiletical and allegorical elaboration, and hence both in the New Testament and in Rabbinical literature the subject is frequently introduced. Hagar is contrasted with Sarah allegorically by St. Paul (Gal. iv. 22 et seq.), who makes Hagar, the bondwoman, represent the earthly Jerusalem, Sarah, who is free, the heavenly, and contrasts Ishmael and Isaac in a similar way. A Jewish tradition identifies Hagar with Abraham's second wife, Keturah (Gen. xxv. 1), and another makes her the daughter of Pharaoh. The Mohammedans look upon Hagar as Abraham's true wife and upon Ishmael as the favorite son. Consult the commentaries on Genesis by Dillmann, Gunkel, Holzinger, and Delitzsch, and for further amplification of the Hagar-Ishmael tradition in Jewish and Mohammedan writings, Grünbaum, *Neue Beiträge zur semitischen Sagenkunde* (Berlin, 1901); Beer, *Das Leben Abrahams nach Auffassung der jüdischen Sage* (Leipzig, 1859); Weil, *Biblical Legends of the Mussulmans* (trans., London, 1846).

HAGAR, STANSBURY (1809-). An American ethnologist and lawyer, born in San Francisco, Cal. He graduated at Yale in 1832, at the New York Law School in 1837, and became an investigator of native American archaeology and ethnology. For this purpose he made studies in Peru, among the Cherokee Indians of North Carolina and the Micmacs of Nova Scotia, and in various European museums.

HAGARTY, hāg'ar-tī, SIR JOHN HAWKINS (1816-1900). A Canadian jurist. He was born in Dublin, Ireland, and was educated at Trinity College. He came to Toronto, Canada, in 1835, was called to the bar in 1840, and, soon attaining a large practice, in 1850 became a Queen's counsel. He was made a judge of the Court of Common Pleas in Upper Canada (Ontario) in 1850, a judge of the Court of Queen's Bench in 1862, Chief Justice of the Common Pleas in 1868, Chief Justice of the Queen's Bench in 1878, and president of the Court of Appeal and

of the Supreme Court of Judicature, with the title of Chief Justice of Ontario, in 1884. He was knighted in 1897 on the occasion of Queen Victoria's diamond jubilee. Judge Hagarty was also a member of the law faculty of Trinity University, Toronto. He was a man of fine literary culture and wrote some pamphlets and poems of considerable merit. As a criminal judge, he was especially well known. He retired from the bench in 1897 and received on that occasion a highly appreciative address from the bench and bar of Ontario.

HAGBERG, häg'bëry', KARL AUGUST (1810-64). A Swedish writer on aesthetics and linguistics. He was born at Lund, studied at Upsala, where he became instructor of Greek in 1833, and, after two years in Germany and in France, where he became personally acquainted with Hugo and Lamartine, was appointed in 1840 professor of modern languages and of aesthetics at Lund. There he spent 11 years in the preparation of his excellent translation of Shakespeare (12 vols., 1847-51; many later editions), and on its publication was named a member of the Swedish Academy, a post in which he made great contributions to the lexicon of that body. Hagberg's later years were devoted to the study of old Norse dialects. In 1859 he was elected to a chair at Lund for instruction in Norse. Besides a sketch of modern French thought, *Om den nya fransyska vitterheten* (1837), Hagberg wrote little.

HAGBERRY. See HACKBERRY.

HAGDEN. See SHEARWATER.

HAGEDORN, hä'ge-dörn, FRIEDRICH VON (1708-54). A German poet. He was born in Hamburg, studied law in Jena, and was secretary to the Danish Minister at London in 1729-31. In 1733 he became secretary to the "English Court," a Hamburg trade association of English merchants. His poetry is of a varied character—sentimental, satirical, didactic—but all is marked by good taste and careful elaboration. He has been credited with originating the modern German *Gesellschaftslied*, or glee, and was the first of several German fable writers of the eighteenth century. He is best known for his graceful songs, many of which were set to music, and for his humorous fable in verse *Johann der muntere Seifensieder*. There is an edition of his works, with a biography and critique, prepared by Eschenburg (5 vols., 1800). Consult: Schuster, *Friedrich von Hagedorn und seine Bedeutung für die deutsche Litteratur* (Leipzig, 1882); Eigenbrodt, *Hagedorn und die Erzählung in Reimversen* (Berlin, 1884); Witkowski, *Die Vorläufer der anakreontischen Dichtung und Friedrich von Hagedorn* (Leipzig, 1889); and Muncker's introduction to Hagedorn's poems in vol. xlv of Kürschner's *Deutsche National-Litteratur* (Berlin, 1892).

HAGELADAS, or **AGELADAS** ('Aγελάδας or 'Αγελάδας) (c.540-460 B.C.). A Greek sculptor, of Argos, famous for his representations of gods and, especially, of victors at the Olympian games. Prominent among his works were a statue of Zeus Ithomatas, fashioned for the Messenian exiles whom the Athenians established at Naupactus, in 459 B.C.; statues of Zeus and Heracles made for the city of Ægium, in Achæa; and a group of horses and captive women dedicated by the Tarentines to commemorate a victory over the Messapians, a people in the southeastern part of Italy. An ancient tradition, questioned by some scholars in recent

times, declares that Hageladas was teacher of Phidias, Myron, and Polyclitus: in support of the tradition consult E. A. Gardner, *A Handbook of Greek Sculpture* (London, 1911). Consult also the article "Hageladas," by Pfuhl, in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. vii (Stuttgart, 1912).

HAGEN, hä'gen. The capital of the district of the same name in the Prussian Province of Westphalia. 44 miles from Cologne. It lies in a deep wooded valley where the Ennepe joins the Volme. It is an important industrial centre manufacturing machinery, castings, steel, forgings, wire, tinware, railway and telegraph supplies, iron safes, screws, vehicles, heating and ventilating apparatus, gymnastic and fire-fighting apparatus, cotton and print goods, paper, tobacco, liquors, and leather. In the neighborhood are alabaster and chalk quarries. It has a Gymnasium, an industrial school, and an industrial museum. The Folkwang, or art museum, has an excellent collection of Japanese and Chinese paintings as well as works by Millet, Watts, Manet, Rodin, and Meunier. There are electric street railways. Hagen is mentioned as early as the eleventh century, when it belonged to the Archbishop of Cologne. It received municipal rights from Friedrich Wilhelm I of Prussia. Pop., 1900, 50,812; 1910, 88,605.

HAGEN, or **HAGEN VON TRONEGE**, hä'gen fön trö'ne-ge. One of the most powerful creations of old German myth. His early life is spent as a hostage at the court of Attila, from which he escapes with Gunther. He carries out Brunhild's vengeance by murdering Siegfried and is finally captured by Dietrich von Bern and taken before Kriemhild, who slays him with Siegfried's sword when he refuses to disclose the Nibelungen treasure.

HAGEN, FRIEDRICH HEINRICH VON DER (1780-1856). A German philologist, born at Schmiedeburg and educated at Halle (1797-1800). In 1810 he became assistant professor of German literature at the University of Berlin, then just established. In the following year he was called to Breslau and in 1821 was recalled, as full professor, to Berlin, where he was four times dean of the philosophical faculty. He did much to stimulate interest in Germanic literature, though his critical methods have gradually been superseded. Besides his important text editions of the *Nibelungenlied* (1810), of the elder *Edda* (1812), and of the works of *Gottfried von Strassburg* (1823), his principal works include: *Erzählungen und Märchen* (2d ed., 1838); *Nordische Heldenromane* (1814-28); *Tausend-und-ein Tag: Morgenländische Erzählungen* (1838); *Ueber die ältesten Darstellungen der Faustsage* (1844); *Das Heldenbuch* (1855); the great collection of *Minnesinger* (5 vols., 1838-56), still exceedingly useful to scholars; the *Gesamtabenteuer* (3 vols., 1850), a collection of old German tales in verse.

HAGEN, GOTTHILF (1797-1884). A German hydraulic engineer. He was born and educated at Königsberg, Prussia, and at first devoted himself to astronomy. In 1816, on behalf of the Berlin Academy of Sciences, he observed at Kulm the total eclipse of the sun, and in 1831 was appointed instructor at the Prussian Artillery and Engineering School, and also taught hydraulic engineering at the Academy of Architecture. He designed and directed the construction of the naval harbor at Wilhelmshafen, on the

Jade estuary (completed 1869), and now one of the principal fortified naval stations on the North Sea. In 1869 he was appointed director in chief of the building department of Prussia. His principal publications are the following: *Handbuch der Wasserbaukunst* (1841-65), an exhaustive work which has passed through several editions; *Grundsätze der Wahrscheinlichkeitsrechnung* (1841; 3d ed., 1882; supplement, 1884); *Ueber Form und Stärke gewölbter Bogen* (2d ed., 1874); *Ueber die gleichförmige Beicung des Wassers* (1876).

HAGEN, JOHANNES GEORG (1847-). An Austrian mathematician and astronomer, born at Bregenz. He was educated at the Gymnasium Feldkirch and at the University of Münster and Bonn, and he studied theology in England in 1875-80. He became a member of the Society of Jesus. From 1880 to 1888 he taught mathematics and physics at Prairie du Chien, Wis., and from 1888 to 1906 he was director of the Georgetown University Observatory. In 1906 he was called to Rome to take charge of the Vatican Observatory. His publications include: *Synopsis der höheren Mathematik* (3 vols., 1891-1905); *Index Operum Leonardi Euleri* (1896); *Atlas Stellarum Variabilium* (6 series, 1899-1908); *Beobachtungen veränderlicher Sterne von Heis und Kruger* (1903); *La rotation de la terre* (1911); *Die veränderlichen Sterne* (1913).

HAGEN, KARL GOTTFRIED (1749-1829). A German physician and apothecary, born at Königsberg, Prussia. He was appointed professor of medicine at the University of Königsberg in 1779 and professor of chemistry, physics, and natural history in 1807. His lectures, which he continued until his death, exercised a far-reaching influence. His best-known work is *Lehrbuch der Apothekerkunst* (1805; 8th ed., 1820).

HAGEN, OTTO VON (1817-80). A German forester, born at Ilsenburg and educated at Berlin and at the Academy of Forestry in Eberswalde. In 1863 he was appointed chief of the Prussian department of forestry and curator of the Academy of Forestry at Eberswalde, and in 1868 was made curator of the Academy of Forestry at Münden. In 1880 he was appointed ministerial director of forestry, under the Minister of Agriculture. His chief work was in connection with the reorganization of the system of forest management in the provinces of Schleswig-Holstein, Hanover, and Hesse-Nassau. His principal work is entitled *Die forstlichen Verhältnisse Preussens* (1867; 3d ed., 1894).

HAGEN, THEODOR (1842-). A German landscape painter, born at Düsseldorf. He was the pupil of Andreas and Karl Müller at the Düsseldorf Academy and afterward of Oswald Achenbach. In 1871 he was appointed professor, and in 1877 director, of the art school at Weimar, but resigned both positions in 1880. At the exposition of 1891 in Berlin he was awarded a gold medal. His landscapes are homely and simple, painted with straightforward naturalism, interesting light effects, and fine sentiment. Among the best are: "View of Kanderthal, Switzerland"; "A Storm"; "A Village in Spring"; "Saint-Gotthard"; "View of Scheveningen"; "View of Zons near Düsseldorf" (Dresden Gallery); "The Fleet" (Hamburg Gallery).

HAGENAÜ, hä'ge-nou. Capital of the district of the same name in Lower Alsace, Germany, situated on the Moder, 18 miles north of Strassburg (Map: Germany, B 4). It has

two notable churches, St. George and St. Nicholas. Other notable institutions are a Gymnasium, museum, and public library. It makes woolen yarn, chinaware, shoes, sparkling wine, and beer; many hops are raised. Near by is the Hagenouer-Wald, with its artillery ranges. The town was founded in the twelfth century by Conrad III. It was strongly fortified by Frederick Barbarossa, and in 1164 obtained a constitution and special privileges. It became a free town in 1257 and in the fourteenth century was at the head of the league of Alsatian free towns. By the Treaty of Westphalia, Hagenau passed to France, and its fortifications were destroyed in 1673. In 1871 it came into the possession of Germany. Pop., 1900, 17,993; 1910, 18,868.

HAGENAÜ, REINMAR VON. See REINMAR VON HAGENAÜ.

HAGENBACH, hä'gen-bäg. KARL RUDOLF (1801-74). A German Church historian. He was born March 4, 1801, at Basel, where his father was professor of anatomy and botany. After being professor extraordinary at Basel (1824), he became full professor in 1828. He lectured to public audiences and afterward published several courses of lectures on the nature and history of the Reformation, on the early history of the Church, and on the Church history of the eighteenth and nineteenth centuries, which were gathered into a collected edition (1869-72) and after his death edited by F. Nippold (Leipzig, 1885-87). The portion relating to the history of the Reformation in Germany and Switzerland was translated by E. Moore (Edinburgh, 1878-79) and that on the eighteenth and nineteenth centuries by J. F. Hurst (New York, 1869). Two other of his popular yet scholarly works have been translated—*A Text-Book of the History of Doctrine* (orig. Leipzig, 1840; 6th ed. by Benrath, 1888; trans. from the 5th ed., Edinburgh, 1880); and his *Theological Encyclopedia and Methodology* (orig. Leipzig, 1833; 12th ed. by Reischle, 1889; worked over by Crooks and Hurst, New York, 1884; new ed., 1891). He was an admired preacher (*Predigten*, Basel, 1858-75) and a poet (*Gedichte*, Basel, 1846). He edited the *Kirchenblatt für die reformierte Schweiz* (from 1845 to 1868); also the valuable series of biographies of the reformers of the Reformed church, with selections from their writings (*Leben und Schriften der Väter und Begründer der reformierten Kirche*, 10 vols., Elberfeld, 1857-62), to which he contributed the lives of Ecolampadius and Myconius (1859). He died in Basel, June 7, 1874. Consult his brief autobiography in *Erinnerungen an K. R. Hagenbach* (Basel, 1874) and the fuller sketch by Eppler (Gütersloh, 1875).

HAGENBACH, PETER VON (?-1474). Grand Bailly of Alsace. He was a soldier and lawyer under Charles the Bold of Burgundy, who appointed him Grand Bailly of Alsace, where his cruelties caused general protest from the neighboring Swabian and Swiss communities and may be said to have led to the war between Switzerland and Burgundy which resulted in the complete ruin of Charles. Consult Kirk, *History of Charles the Bold* (London, 1863-68), and Barante, *Histoire des ducs de Bourgogne* (Paris, 1824-26).

HAGENBECK, hä'gen-bäk, KARL (1844-1913). A German trainer of animals and circus manager. He was born at Hamburg, where his

father in 1852 established a considerable trade in animals. The business, which in 1866 passed into the hands of the son, was greatly enlarged by him. In order to obtain animals from Africa and other countries several transports were annually sent out from Hamburg. Hagenbeck traveled through Europe, giving ethnological exhibitions representing the life of the various races of Africa, Oceania, and of the Far North. In 1886 he visited the United States, where he conceived the idea of organizing a circus. During the Chicago Exposition (1893) he revisited America, bringing with him about 1000 animals, including lions, tigers, bears, leopards, and wild boars. In 1907 he opened at Stellingen, a suburb of Hamburg, his remarkable zoological garden, covering about 36 acres, and containing a very large collection of mammals and birds, most of them shown in surroundings which closely reproduced their natural habitats. A unique feature was the placing of the large mammal groups in outdoor inclosures with no box or gratings in sight, the animals being confined by means of broad moats filled with water. Hagenbeck, who was styled "the Moltke of menagerie owners," was the first showman to train large carnivorous animals of different species to perform together. His methods and many of his adventures are described in his book, *Beasts and Men* (London, 1909).

HA'GER, ALBERT DAVID (1817-88). An American geologist, born in Chester, Vt., and educated in the public schools of his native town. He was appointed assistant naturalist of Vermont in 1856, assistant State geologist under Edward Hitchcock from 1857 to 1861. State geologist from 1861 to 1870, and Vermont commissioner to the Paris Exposition of 1867. From 1870 to 1877 he was State geologist of Missouri and in the latter year was appointed librarian of the Chicago Historical Society. He published *Geology of Vermont* (2 vols., 1861, with Prof. Edward Hitchcock) and other reports of surveys in his native State and in Missouri.

HAGER, hā'gēr, HANS HERMANN JULIUS (1816-97). A German writer on pharmacy, born at Berlin. Both as editor of the *Pharmazeutische Centralhalle* at Berlin and as an author, he did much to advance pharmaceutical science. His exposition and published analyses of secret remedies are especially valuable. His more important publications include: *Handbuch der pharmazeutischen Rezeptirkunst* (1850; 5th ed., 1890); *Manuale Pharmaceuticum* (vol. i, 6th ed., 1891; vol. ii, 3d ed., 1876); *Anleitung zur Fabrikation künstlicher Mineralwässer* (2d ed., 1870); *Erster Unterricht des Pharmacuten* (2 vols., 4th ed., 1885); *Handbuch des pharmazeutischen Praxis* (3 vols., 8th ed., 1885); *Das Mikroskop und seine Anwendung* (11th ed., 1912).

HAGERMAN, hā'gēr-man, JAMES (1848-1913). An American lawyer. He was born in Clark Co., Mo., and was educated in public and private schools and at the Christian Brothers College, St. Louis, Mo. He was admitted to the Missouri bar in 1866 and practiced at Keokuk, Iowa, until 1884; was general attorney of the Atchison, Topeka, and Santa Fe Railway Company in 1884-86 and general solicitor of the Missouri, Kansas, and Texas system from 1887 to 1904, and served as general counsel after 1904. He was elected president of the St. Louis Bar Association in 1899 and of the American Bar Association in 1903.

HA'GERSTOWN. A city and the county seat of Washington Co., Md., 78 miles west-northwest of Baltimore, on the Baltimore and Ohio, the Cumberland Valley, the Norfolk and Western, and the Western Maryland railroads (Map: Maryland, D 1). It was the seat of Kee Mar College for women and contains Washington County Free Library and a hospital; while in the vicinity are Fort Frederick and the battlefields of Antietam and Gettysburg. Hagerstown is of considerable commercial importance, owing to its facilities as a railroad centre. The industrial establishments include railway and machine shops, flour, silk, and knitting mills, pipe-organ, cigar, match, furniture, automobile, ice, and fertilizer factories, metal works and foundries, bicycle, spoke, and bending works, carriage and wagon factories, boiler works, etc. The city, under a revised charter of 1895, is governed by a mayor and a unicameral council. An electric-light plant is owned by the city. Hagerstown was settled about 1740 and laid out in 1762 by Jonathan Hager. It was first known as Elizabethtown and was incorporated in 1791. The present charter was received in 1848. During the Civil War it figured prominently as a base of operations. Pop., 1900, 13,591; 1910, 16,507; 1914 (U. S. est.), 17,749; 1920, 28,066.

HAGERUP, hā'gēr-rup, GEORG FRANCIS (1853-1921). A Norwegian jurist and statesman, born at Horten, near Christiania, son of a naval officer. He was educated at Christiania, Munich, Leipzig, and Paris; in 1879 he became lecturer and in 1885 professor of law in the University of Christiania. He was prominent in politics as a leader of the Right, was Minister of Justice in 1893-95 in Stang's cabinet, headed the coalition ministry of 1895-98, and was Premier again in 1903-05 during the middle part of the crisis between Norway and Sweden. In 1906 he became Minister at Copenhagen. He took part in several cases of international arbitration, was a member of The Hague Arbitration Court after 1903, was a delegate from Norway to the second Peace Congress, and acted as a member of the committee for the award of the Nobel peace prize.

HAGFISH, or HAG (ME. *hagge, hegge*, from AS. *hagtes*, witeh, MDutch *haghetisse*, OHG. *hagacussa*, Ger. *Heze*, hag, witeh; apparently connected with provincial Eng. *hag*, AS. *haga*, Dutch *haag*, Ger. *Hag*, inclosure, coppice). Any of several species of roundmouths (see CYCLOSTOMI) that live parasitic upon fishes and structurally are closely related to the lamprey (q.v.). They are eel-shaped in form, and individuals of the genus *Bdellostoma* may reach a length of 3 feet. The common hag, or slime eel (*Myxine glutinosa*), may grow to be 18 inches long and is found on both coasts of the north Atlantic south to Cape Cod. The mouth is formed by a mere membranous ring with a single tooth on its upper part, while the tongue is furnished with two rows of strong teeth and also performs the office of a piston in the use of the mouth as a sucker. Around the mouth are eight tentacles. The skin is smooth and capable of secreting an enormous amount of mucus. There is only a membranous caudal fin. The eyes are very rudimentary and sunk beneath the skin. The six gill pouches empty separately internally into the pharynx, but externally by a single tube. There are no bones; the skeleton is membranous and cartilaginous. The eggs are large, are inclosed in a horny case, and bear

hooked processes at each end for attachment to weeds, etc. Myxine is hermaphroditic; the young animal produces sperms and, later in life, ova. By means of the mouth the hags bore their way into the body of fishes, especially halibut

HAGFISH (*Myxine glutinosa*).

1. Outline of the hag, showing the two ventral openings (*h*) by which the water escapes from the gills. 2. Anterior portion of the body laid open on the ventral side to show the branchial sacs. *e*, gullet laid open, showing on each side the six apertures by which the water is conducted to the corresponding branchial pouches (*g*); *d*, one of the efferent ducts by which the water is conducted away from the branchial pouches; *cd*, common efferent duct on the left side, opening on the ventral surface by a branchial pore (*p*, or *h* of Fig. 1); *ga*, special canal developed on the left side only, and leading from the gullet into the common branchial duct; *n*, unpaired nostril, with its "barbels"; *m*, mouth.

and flounders, consuming them, leaving only the entrails, skeleton, and skin; hence another common name is "borer."

The hag on the west coast of America (*Polistotrema stouti*) is hated by the fishermen because of its destruction of fishes caught in nets and its ugly appearance. It is about 14 inches long. See MYXINE, and Plate of LAMPREYS AND DOGFISH.

HAGGADA, häg-gä'dä (Heb., narration, from *higgäd*, to narrate). The free rabbinical interpretation of Scripture, chiefly for homiletical purposes. Haggada is thus contrasted to *Halacha* (q.v.), 'rule,' which represents the authoritative interpretation of biblical laws for practical purposes. The Haggada developed side by side with the Halacha, and the two tendencies are found combined in the great compilation of rabbinical theology known as the *Talmud* (q.v.). But while the Haggadic sections in the Talmud are considerable, the great bulk of the Haggadic interpretation of the Old Testament is to be found in a number of separate compilations known as *Midrashim*. (See MIDRASH.) The oldest of these collections, adapted to the order of the biblical books, in which the interpretations run parallel with the text, are: (1) the *Mechilta*, a collection of Haggadic interpretations to the Book of Exodus; (2) the *Siphra* to Leviticus; (3) *Siphre* to Numbers and Deuteronomy. Far more extensive, however, is the collection known as the *Midrash Rabbah*, or 'Great Midrash,' comprising the Haggada to the entire Pentateuch and to the five scrolls (read on the various festivals of the year), Esther, Ruth, Lamentations, Ecclesiastes and Song of Songs. By the side of the compilation (concluded c.900 A.D.) may be mentioned the *Pesikta* to various sections of the Old Testament and the *Tanachuma* to the Pentateuch. On the basis of this Midrashic literature, a large number of works were

produced through the Middle Ages to our own days, containing selections from the earlier compilations as well as additions and amplifications. Among these may be mentioned the *Midrash hagadol*, 'the Great Midrash,' a Yemenitic compilation now being published by Dr. S. Schechter for the Cambridge University Press. *Haggada shel Pesach* is the name of ritual, partly in Hebrew, partly in Aramaic, used on the first two evenings of the Passover, which contains, besides a brief description of the Exodus, extracts from the Scripture, the Mishna, Tosephta, Mechilta, Siphra, and the two Talmuds, and some liturgical pieces, all bearing more or less directly on the oppression in Egypt and the deliverance. Originally within very small compass, it has been extended to its present larger size by subsequent centuries. Two *Piutim*, or religious poems, were added in the eleventh century, and four more Hebrew and Aramaic songs (the last originally a German *Volkssied*) as late as the fourteenth century. Consult: Winter and Wünsche, *Die jüdische Litteratur* (Trier, 1894); Karpeles, *Geschichte der jüdischen Litteratur* (Berlin, 1886); Steinschneider, *Jewish Literature* (Eng. trans., London, 1857); Chénery, "Legends from the Midrash," in Loewy, *Miscellaneous of Hebrew Literature* (London, 1877); Bacher, *Die Aggada der Tannaiten* (2 vols., Strassburg, 1884-90).

HAGGAI, häg-gä-i (probably 'born on a feast day'). A Jewish prophet of the postexilic period and contemporary with the prophet Zechariah, with whom he was associated (Ezra v. 1; 3 Esdras vi. 1, vii. 3). He prophesied in Jerusalem. The date of his work is fixed by his own writing (chap. i. 1, 15; ii. 1, 10) in the second year of Darius Hystaspis (520 B.C.). Concerning his own history nothing is known. The inference drawn from his work (ii. 3), that he had in his youth seen the former temple in its glory, may be correct, in which case the prophecies that we have from him would represent compositions produced in his old age. The Book of Haggai consists of four discourses, the delay in the rebuilding of the sanctuary furnishing the general motive. The prophet is represented as appearing before Zerubbabel and Joshua, the high priest, and strongly urging the reestablishment of the sanctuary, pointing at the same time to the famine in the land as the divine punishment for the culpable neglect of the people, who thought only of their own houses and not of that of God. His words made a deep impression, and the building was commenced (chap. i). The second discourse, about a month later, predicts a still greater glory for the new temple than had belonged to the former (ii. 3-9). Two months later he had to renew his reproaches against their inertness, and his promises of a blessed future (ii. 10-19). The fourth discourse (ii. 20-23), delivered on the same day, is directed to Zerubbabel, and, while foretelling great revolutions and political changes, promises that Zerubbabel shall remain a "signet" in the hands of God—an implication apparently that Zerubbabel is to become King. The style of Haggai is prosaic and labors under an uncommon tameness and poverty of expression, principally apparent in the frequent repetition, within the short space of two chapters, of certain words and phrases, which could not well have been purposely retained for the sake of ornamentation. There is hardly any parallelism; but the prophet has endeavored to im-

with a certain vivacity to his writing by means of interrogation. The diction itself is, generally speaking, pure and clear. The contrast between Hagai and Zechariah, who have much in common, and the older prophets of the type of Jeremiah and Isaiah, is striking. Whereas the latter are concerned chiefly with ethical problems, the interest of the former is largely central in the temple and the cult. They reflect in this respect the tendencies of the postexilic period. Consult the general commentaries on the Minor Prophets (q.v.); Perowne, "Haggai and Zechariah," in the *Cambridge Bible for Schools and Colleges* (Cambridge, 1886); Tony André, *Le Prophète Aggée* (Paris, 1895); Mitchell, *Haggai and Zechariah* (New York, 1912).

HAGGARD, SIR HENRY RIDER (1856-1925). An English novelist, born at Bradenham Hall, Norfolk. He spent some time in South Africa (1875-79), where he became Master of the High Court in the Transvaal. On his return to England he practiced law. After two moderately successful experiments in fiction, he produced *King Solomon's Mines* (1885) and *She* (1886), which won him instant fame by a certain kind of imaginative power and by their novelty of scene. In 1912 he was knighted. His later novels include *Jess* (1887); *Illan Quatermain* (1888); *Cleopatra* (1889); *Montezuma's Daughter* (1894); *The People of the Mist* (1894); *Swallow: A Story of the Great Trek* (1899); *Elissa: A Zulu Idyll* (1900); *The Brethren* (1904); *Ayesha or the Return of She* (1905); *Queen Sheba's Ring* (1908); *Red Eve* (1911); *Child of Storm* (1913). He studied the rural conditions of England and the Salvation Army colonies in England and the United States, and published *Rural England* (1902); *A Gardener's Year* (1905); *The Poor and the Land* (1905); *Report on the Salvation Army Colonies* (1905).

HAGGART, JOHN GRAHAM (1836-1913). A Canadian statesman. He was born and educated in Perth, Ontario, was for some time mayor of this town, several times was an unsuccessful Conservative candidate for the Ontario Legislature, and in 1872 was elected a member of the House of Commons. Appointed (1888) Postmaster-General in the administration of Sir John A. Macdonald, he remained in that office until 1892, in the administration of Sir J. J. C. Abbott, and was then Minister of Railways and Canals in the administrations of Sir John Thompson, Sir Mackenzie Bowell, and Sir Charles Tupper, until the defeat of the Conservative party in 1896. In 1892 also he was elected chairman of the Liberal Conservative Union of Ontario. Haggart was considered by many influential Conservatives to be best fitted for the premiership after the death of Sir John Thompson. During his administration of the railways and canals department the Sault Ste. Marie Canal was completed, the last link in the chain of canals connecting the Great Lakes with the St. Lawrence. In 1912 he retired from political life.

HAGENMACHEB, hä'gen-mäc'ër, GUSTAV ADOLF (1845-75). A Swiss explorer of Africa, born on the island of Limmatau, near Brugg, Switzerland. In 1865 he went to Egypt and made his caravan to travel to Khartum, where he arrived as a merchant in 1866. In 1869 he sailed through Abyssinia and proceeded to Harar and thence to Massowah. In 1872 he was the commissioner of Egypt at the World's

Fair, Vienna, where his exhibition of Sudanese products attracted general attention. In the fall of the same year he went to Cairo. There he resided until 1874, when he was appointed the representative of Consul Munzinger at Kassala; thence, by order of the Khedive, he undertook a tour through Somaliland. In the following year he proceeded as far as Galabat. He accompanied Munzinger during the campaign against the Galla tribe, taking with him his wife and two children. On the return journey the family were murdered by the natives.

HAGGIN, JAMES B. (1827-1914). An American capitalist, born at Harrodsburg, Ky. He practiced law at St. Joseph, Mo., and later at Natchez, Miss., until 1849. He then went to California, acquired a large fortune in mining enterprises, organized the "silver trust" with other large capitalists, and became owner of the interests of Marcus Daly in the Anaconda Copper Company. He also had a large ranch and notable stock farms in Kentucky.

HAGHE, häg, LOUIS (1806-85). A Belgian lithographer and water-color painter, active chiefly in England. He was born at Tournay, and learned drawing from his father, an architect, and at the Academy of Tournay. His right hand being deformed from birth, he drew with the left. At the age of 17 he made drawings for De Jonghe's *Vues pittoresques de la Belgique* and soon afterward went to England. At London he formed a partnership with William Day, producing a series of lithographic works of the highest merit. Among these were Vivian's *Spanish Scenery*, Atkinson's *Views in Afghanistan*, Robert's *Sketches in the Holy Land, Syria, Idumea, Arabia, Egypt, and Nubia*, and lithographs of his own drawings of old Flemish interiors. From 1852 he devoted himself to painting in water colors and was president of the Society of Painters in Water Color from 1873 till 1884. Haghe displayed a predilection for old Flemish interiors, but also painted Italian subjects and scenes from English history. Among the best are the "Council of War at Courtray" (1854), in the National Gallery, and the "Audience Chamber at Bruges," which are remarkable for their harmony of color, fidelity in detail, and richness of architectural decoration. There are good examples of his work in the South Kensington (21 aquarelles), British, and Bethnal Green museums. He obtained the gold medal for lithography at Paris in 1834, and was a member of the Belgian and Antwerp academies.

HAGI, hä'gë. A town in the Japanese Prefecture of Yamaguchi, situated on the east coast of Nippon, near the south end of the island (Map: Japan, B 6). In feudal times it was the residence of the daimios of Choshu and played a prominent part in the abolition of feudalism. Pop., about 25,000.

HAGIA SOPHIA, hä'gi-ä sö-fë-ä (Holy Wisdom, i.e., Wisdom of God). The name of a Christian church in Constantinople, now a Mohammedan mosque, called by the Turks Aya Sofia and by Europeans generally *Santa Sophia*, or St. Sophia, which is a mistranslation of the Greek original. See SAINT SOPHIA.

HA'GIOGRAPHIA. See BIBLE.

HAGN, hä'gn, LUDWIG VON (1820-98). A German genre painter. He was born in Munich and was educated at the military school there, but, preferring the life of an artist to that of a soldier, he studied at the Munich Academy, at

Antwerp under De Bloch, and at Berlin, where he was influenced by Menzel. He lived at Paris in 1853-55 and also in Italy, returning permanently to Munich in 1868. He depicts the graceful comedies of real life in rococo or baroque settings, often with great distinction of color. His chief works include "Conversation" (Orangerie, Potsdam); "Unwelcome Wooing" (1851, Schwerin Gallery); "Musical Morning Entertainment" (1859, Pinakothek, Munich); "Italian Garden Scene" (1868, Schack Gallery, Munich); "Audience with Pope Leo XIII" (1880); and "Corpus Christi Procession in the Seventeenth Century" (1881), for the Munich City Hall.

HAGONOY, ʔgô-nôʔ. A town of Luzon, Philippines, in the Province of Bulac n, founded in 1581. It lies on the left bank of the Nayo Grande River, 10 miles west of Bulac n. It manufactures textiles. Pop., 1903, 21,304.

HA'GOOD, JOHNSON (1829-98). An American soldier, born at Barnwell, S. C. He graduated in 1847 at the South Carolina Military Academy, and at the outbreak of the Civil War became colonel of the First South Carolina Volunteers. In 1862 he was made a brigadier general in the Confederate army. He served on the South Carolina coast and commanded Battery Wagner in the siege of Charleston. At the siege of Petersburg he commanded a brigade in the trenches, and subsequently he fought at Weldon Road, in the operations north of James River and at Fort Fisher. He was elected comptroller general in 1876 and governor in 1880.

HAGUE, CAPE OF THE. See CAP DE LA HAGUE.

HAGUE, h g, ARNOLD (1840-1917). An American geologist, born in Boston. He graduated in 1863 at Sheffield Scientific School (Yale), studied at G ttingen, Heidelberg, and the Freiberg School of Mines, and in 1867 was appointed assistant geologist of the United States Geological Exploration of the Fortieth Parallel. From 1877 to 1878 he was government geologist of Guatemala, and from 1878 to 1879 government agent for the examination of mines in northern China. He was appointed a geologist of the United States Geological Survey in 1879 and in 1883 was assigned to the Yellowstone Park division. He was elected a member of the National Academy of Sciences in 1885 and was president of the Geological Society of America in 1910. His publications include: *The Volcanoes of California, Oregon, and Washington Territory* (1883); *The Volcanic Rocks of the Great Basin* (1884); *The Volcanic Rocks of Salvador* (1886); *Geology of the Eureka District* (1892); *Geology of the Yellowstone National Park* (1899); *Atlas of Yellowstone National Park* (1904); *The Origin of the Thermal Water in the Yellowstone National Park* (1911); *Geological History of the Yellowstone National Park* (1912).

HAGUE, GEORGE (1825-). A Canadian banker, born at Rotherham, Yorkshire, England, where he was also educated. He emigrated to Canada in 1854 and was for 20 years in the employ of the Bank of Toronto (1856-76), but afterward was general manager of the Merchants' Bank (1877-1902). He was first president of the Canadian Bankers' Association, of which he was one of the founders, and of the Montreal Good Government Association, a governor of McGill University, and of the Montreal Diocesan College. He gave liberally to many charitable institutions. Several of his papers

on banking and kindred subjects have been published. He also wrote: *Personal Reminiscences of the Late E. H. King* (1896); *Canadian Banking; Free Thought and Kindred Topics; Some Practical Studies in the History and Biography of the Old Testament; Banking and Commerce* (1908).

HAGUE, h g, THE (Dutch's *Gravenhage*, the count's hedge). The seat of the government of the Netherlands and residence of the sovereign, pleasantly situated in the Province of South Holland, about 15 miles northwest of Rotterdam and 3 miles from the North Sea (Map: Netherlands, C 2). It is intersected in all directions by canals and shaded avenues of linden trees and is famed above all other Dutch cities for its broad, handsome streets, palaces, government and municipal buildings, and stately houses. Of these edifices the picturesque town hall is the most interesting from an architectural standpoint. The most notable church is the Groote Kerk, or church of St. James, a Gothic structure of the fifteenth and sixteenth centuries, with a lofty hexagonal tower. The palace of justice is a handsome building in the Dutch Renaissance style. In the Mauritshuis, rebuilt in 1704, is located the renowned picture gallery, containing about 450 canvases, largely of the best Dutch period and especially rich in Rembrandts. Among the most celebrated pictures are Rembrandt's "School of Anatomy" and "Presentation in the Temple," Ruysdael's "View of Haarlem," Paul Potter's well-known "Bull," and Rubens's "Portrait of Ophovius." The municipal museum and the house of Baron Steengracht also have fine collections of paintings, the former containing corporation pieces by Ravesteijn.

The royal library possesses more than 500,000 volumes and a valuable collection of more than 40,000 coins and medals and over 300 cameos. In the centre of Willems-Park rises the magnificent national monument commemorating the restoration of Dutch independence in 1813. It was unveiled in 1869 and is surmounted by the "Nederlandsche Maagd"—the virgin personification of Holland. Other monuments are the equestrian statue of William I of Orange before the royal palace, and the bronze figure of Spinoza, erected opposite the house in which he lived. Still other museums and monuments merit attention.

The government buildings are handsome, and their archives include state papers over four centuries old. From an historic point of view the most interesting buildings of The Hague are the Gevangenpoort, or the prison gatehouse in which Oldenbarnevelt, the brothers De Witt, and many others distinguished in the history of Holland were confined; and the Binnenhof, in which Oldenbarnevelt was executed, and which, together with the Buitenhof, forms an irregular mass of public buildings of various ages, inclosed by moats and approached by drawbridges. These edifices are situated in the wealthy central quarter of the town around the attractive Vyver (fish pound)—an ornamental lake, with an island. The fish market is one of the most interesting in Europe. The suburbs are particularly beautiful with their meadows, gardens, woods, and villas. The so-called zoological and botanical garden is almost exclusively a pleasure park, and a fine road and five tramways lead to the celebrated watering place of Scheveningen on the coast. The far-famed royal villa of Huis

ten Bosch (The House in the Wood), situated on the outskirts of the city in the midst of a noble and much frequented park forest (het Haagsche Bosch), has costly and dainty apartments filled with fine art objects and rare examples of interior decoration, including tapestries, embroideries, and grisailles. The Orange Room, an octagonal hall decorated with paintings by Jordaens and others, especially attracts the visitor. Consult *Guide to The Hague*, published by the Sixth International Congress of Navigation (The Hague, 1894), and Karl Baedeker, *Belgium and Holland* (15th ed., Leipzig, 1910).

The city is provided with good educational institutions, comprising public schools, a gymnasium, a drawing school, the Royal School of Music, and an educational institute of the Freemasons. There are many learned societies, the most notable being The Hague Society for the Defense of the Christian Religion, founded in 1785. Others are the Witte Society, the Physics Society, the artists' association called Pulchri Studio, and the Netherland-India Institute. The Hague is a residential city, conspicuous for fashionable life. Its prosperity depends chiefly on the court and nobility and on the throngs of foreigners that visit the city and Scheveningen. The manufactures are neither important nor varied, consisting chiefly of articles of luxury, such as gold and silver work and porcelain. There are some gun casting and brass and copper molding; and carriages and furniture are also manufactured. But little trade is carried on. In 1911 there were in the city 1393 factories and workshops subject to the factory laws; these had 15,814 employees. The city is the starting point of the railway system of Holland and has steam and electric trams. The Hague, like other Dutch towns, has increased rapidly in population. The figures were 81,303 in 1863; 212,211 in 1900 (including Scheveningen); 270,109 in 1910, and 294,693 in 1913. Two-thirds of the inhabitants are Protestants. The death rate is low; from 15.3 per thousand in 1904 it decreased to 12.5 in 1911.

The Hague was originally a hunting seat of the counts of Holland. Under William II (1250) it became a princely residence and prospered thereafter to such an extent as to become, in the sixteenth century, the seat of the States-General and of the Stadholder of Holland. In the seventeenth and eighteenth centuries The Hague was the diplomatic capital of Europe. Here were concluded the triple alliance of England, Sweden, and the Netherlands against France (1668) and the triple alliance of England, France, and Holland for the preservation of the Treaty of Utrecht (1717). Between May 18 and July 29, 1899, the city was the seat of The Hague Peace Conference (see PEACE MOVEMENT). As a result of the conference, a Permanent Court of Arbitration was established, with a bureau at The Hague. A magnificent Palace of Peace, designed by the French architect L. M. Cordonnier, has been erected to house the Arbitration Court, Mr. Andrew Carnegie contributing \$1,500,000 towards the expenses of construction. Another conference was held at The Hague in 1907. Curiously enough, The Hague possessed no municipal rights till the time of Louis Bonaparte, having remained for centuries the most magnificent "village" in Europe. In 1909 the municipal revenues amounted to 10,140,000 florins and the expenditures to 17,049,000 florins.

HAGUE CONFERENCE (1922). See VOLUME XXIV.

HAGUE PEACE CONFERENCE. See PEACE MOVEMENT.

HAGUE TRIBUNAL. See PEACE MOVEMENT.

HAHN, hün, AUGUST (1792-1863). A German Protestant theologian. He was born at Grossosterhausen, Saxony, March 27, 1792, studied at Leipzig, and in 1819 was appointed professor extraordinary of theology at Königsberg and edited some of the Syrian church fathers. In 1826 he removed as professor of theology to Leipzig, where he came into great prominence as the author of a treatise, *De rationalismi, qui dicitur, vera indole et qua cum naturalismo continetur ratione*, and also of an *Offene Erklärung an die evangelische Kirche zunächst in Sachsen und Preussen*, in which he endeavored to convince the rationalists that it was their duty at once to withdraw from the national church. In 1833 Hahn was called to Breslau as theological professor and consistorial counselor, and in 1844 he became general superintendent of the Province of Silesia. He edited the Hebrew Bible (1831) and wrote, among other works, *Bibliothek der Symbole und Glaubensregeln der apostolisch-katholischen Kirche* (1842; 2d ed., by G. L. Hahn, 1878).

HAHN, CARL VON (1848-). A German-Russian explorer and educator. He was born at Friedrichstal, near Freudenstadt, and was educated at Tübingen. In 1872 he became tutor to the family of the Grand Duke Michael, Governor-General of the Caucasus, in 1874 entered the Russian service, in 1896 was ennobled and became director of the first Russian secondary school in Tiflis. He wrote important books on the Caucasus in German and Russian, notably *Aus dem Kaukasus* (1892); *Kaukasische Reisen und Studien* (1896); *Bilder aus dem Kaukasus* (1900); *Erster Versuch einer Erklärung kaukasischer geographischer Namen* (1910); *Neue kaukasische Reisen und Studien* (1911).

HAHN, FRIEDRICH VON (1823-97). A German jurist, born in Hamburg. He became a lecturer at Jena in 1850 and professor in 1862. In the conferences held at Nuremberg and Hamburg in connection with a general code of commercial law for Germany, he took a prominent part. He was appointed to the Court of Appeal at Jena in 1862 and to the Supreme Court of the Empire in 1870. From 1891 until his retirement in 1893 he was president of the Senate of the Supreme Court. His chief publication is his *Kommentar zum allgemeinen deutschen Handelsgesetzbuch* (Brunswick, vol. i, 4th ed., 1894; vol. ii, 4th ed., 1891-93).

HAHN, JOHANN MICHAEL (1758-1819). A Swabian Theosophist, founder of the Michelians, numerous in Württemberg. He was born at Altdorf and had visions at the age of 17, and again in his twentieth and twenty-second years. After the last of these he began to proclaim his beliefs, both by writing and by speech, and gained many followers. But neither he nor they became Separatists. In 1782 he traveled to Switzerland and met Lavater, Pfenninger, and Jung-Stilling. Unlike most of the visionaries of his country, Hahn held that regeneration was a slow growth. His views were largely tinged with the teachings of Böhme and of Oetinger. He held the belief in a double fall of man; the mystic belief that the work of Christ is not merely for but within man; and the millennial

view of the second advent, and of the final beatitude of all souls, even of the fallen angels. His works were published posthumously at Tübingen (1819 et seq.). Consult Palmer, *Die Gemeinschaften und Sekten Württembergs* (Freiburg, 1877), and Staudenmeyer, *Michael Hahn* (Wilferdingen, 1893).

HAHN, LUDWIG (1820-88). A German historian, born at Breslau and educated there and at Berlin. After several years of service as private tutor in Paris, as assistant in the department of education at Breslau, and as a school official at Stralsund, he became chief counselor of the government in the literary bureau, and retired in 1883. He wrote: *Das Unterrichts-wesen in Frankreich* (1848); the very popular *Geschichte des preussischen Vaterlands* (24th ed., 1895) and *Leitfaden der vaterländischen Geschichte* (5th ed., 1904); *Friedrich der Grosse* (2d ed., 1865); *Kurfürst Friedrich I. von Brandenburg* (1859); *Zwei Jahre preussisch-deutscher Politik, 1866-67* (1868); *Der Krieg Deutschlands gegen Frankreich* (1871); *Kaiser Wilhelms Gedenkbuch* (5th ed., 1880); *Fürst Bismarck*, a collection of speeches, state papers, letters, etc., of the Chancellor (1878-81, the fifth and last volume by Wippermann); *Zwanzig Jahre 1862-82*, a study of Bismarck's influence (1882); *Wilhelm, der erste Kaiser des neuen deutschen Reichs* (1888).

HAHN, REYNALDO (1874-). A French composer, born at Caracas (Venezuela). In 1885 he entered the Paris Conservatory, where he studied under Dubois, Lavignac, and Massenet, who took a special interest in him. His works include a symphonic poem *Nuit d'amour bergamasque*, excellent incidental music to Daudet's *Obstacle*, Croisset's *Deux courtisanes*, Mendes's *Scarron*, Racine's *Esther*, and Hugo's *Angelo*; the operas *L'Île du rêve* (1898) and *La Carmélite* (1902); a ballet *Fête chez Thérèse* (1910). His songs and piano pieces enjoy great popularity and are among the sanest and most characteristic of modern French compositions.

HÄHNEL, hä'nel, ERNST (1811-91). A German sculptor, born at Dresden. He studied architecture there and, from 1830, at Munich. Under the influence of Schwanthaler and Riet-schel, he turned his attention to sculpture, which he also studied at Rome. In 1838, through the architect Semper, he received a commission to supply sculptures for the Royal Theatre of Dresden. The most important of these, a frieze representing a "Bacchanalian Procession," was destroyed when the theatre was burned, but survives in plaster cast, and the statues of Sophocles, Aristophanes, Shakespeare, and Molière were saved and used on the new building. For the Dresden Museum he executed many reliefs and six statues in sandstone, the most famous being a Raphael, of which there are marble replicas in the National Gallery, Berlin, and the Leipzig Museum. His best-known works include a bronze statue of Beethoven at Bonn (1845), the colossal statue of Charles IV at Prague (1848), the bronze image of Frederick Augustus II at Dresden (1867), and Field Marshal Schwarzenberg at Vienna (1867). For Leipzig he executed a bronze statue of Leibnitz (1883) and a group, "Eve Protecting Abel from Cain"; for the Vienna Opera House, five ideal statues; and the two admirable Pegasus groups. Although Hähnel's tendencies were classical, his portrait statues and busts evince high power of characterization. His art represents a transition

from the Classical to the Romantic school. As professor at the Dresden Academy, he had many pupils. His works have been published in photographic reproduction (Dresden, 1882-87).

HAHNEMANN, hä'ne-män, SAMUEL (1755-1843). The founder of homœopathy. He was born at Meissen, Saxony, the son of a painter of Dresden china. After obtaining a primary education with difficulty, at the age of 20 he left Meissen, with 20 crowns as his fortune, and went to Leipzig, to prosecute his medical studies. Here he maintained himself by translating works from Latin, French, and English into German. Two years later he went to Vienna, where, under the direction of Dr. Quarin, he pursued his studies, but a year afterward was obliged to seek funds through employment as physician and librarian at Hermanstadt. He was graduated in medicine from the University of Erlangen in 1779. Subsequently he retired to Saxony and settled in Dresden in the year 1784. His attention at this time was given to the study of the toxicology of arsenic and of mercury. After spending four years in Dresden, where he had for a time the direction of a large hospital, he returned in the year 1789 to Leipzig. In the following year, while translating Cullen's *Materia Medica* from English into German, he became interested in the similarity of the effects of quinine and some other drugs upon the healthy body with the result of certain diseases for which these drugs are used. In other words, he discovered independently Hippocrates' old "law of similars." With intense interest he searched medical literature for confirmation of his belief in a new principle of cure which he at once began to advocate, viz., that drugs which produce certain symptoms in the healthy body will cure a disease which exhibits similar symptoms. In *Hufeland's Journal*, in 1796, he published his first important paper, entitled "An Attempt to Find a New Principle for the Discovery of the Healing Power of Medicine, with Observations on Existing Methods." About 1800 he promulgated the principle of "potentization" or "dynamization" of drugs, by trituration of minute amounts of dry drugs with inert material, or dilution and vigorous shaking of minute quantities of liquid drugs, claiming for such preparations increased strength from the new arrangement of molecules. "Dynamization," he claimed, imparted a spirit-like force to the dose. In 1810 Hahnemann published his *Organon der rationellen Heilkunde*, which was translated into many languages, and in which he expounded his new system, which he called *homœopathy*. Between 1810 and 1821 he published, at Leipzig, his *Materia Medica*, under the name *Reine Arzneimittellehre*, in six volumes. In this work he set forth his observations of the effects of drugs upon healthy people. About the same time he founded at Leipzig a school which soon attracted students from all over the country. In 1828, in his work on chronic diseases, written at Köthen, he discussed the disease known as the itch and reached the conclusion that all diseases are modifications of the itch. The discovery that the itch insect, *Sarcoptes scabiei* (*Acarus scabiei*), is the cause of scabies beyond a doubt, caused a change in the belief of homœopaths all over the world, and an abandonment of what had been called the first principle of homœopathy.

As Hahnemann's system involved the administration of medicines each by itself and in minute doses, there was no longer any need of the

apothecary's intervention between the physician and the patient. In consequence of this, the apothecaries' company brought to bear upon Hahnemann an act forbidding physicians to dispense their own medicines, and with such effect that he was obliged to leave Leipzig. The Duke of Anhalt-Köthen appointed him his physician and invited him to live at Köthen. Thither, accordingly, he removed in the year 1821, and there he prepared various new editions of his *Organon* and new volumes of his *Materia Medica* for publication. In 1835 he left Köthen and settled in Paris, where he enjoyed a great reputation till his death, which took place in the year 1843. On the centenary of his birth, in 1855, a statue was erected to his honor at Leipzig, at the expense of his disciples in Germany, France, England, and other countries, with the concurrence of the local authorities, who supplied the site in one of the public places in their handsome town. His principal work, besides those already mentioned, is *Fragmenta de Viribus Medicamentorum* (1805). Consult his *Life and Letters*, by Bradford (Philadelphia, 1895). See HOMOGOPATHY.

HAHN-HAHN, hân'hân, IDA, COUNTESS VON (1805-80). A German novelist, born at Tres-sow. Her unhappy married life and divorce (1829) are reflected in her *Ulrich* (1841) and *Zwei Frauen* (1845), written under the influence of the emancipatory ferment of Gutzkow, Laube, and Heine, and the early novels of George Sand. She became a Roman Catholic in 1850, wrote several proselytizing books, became a novice (1852), took part in the founding of a convent at Mainz, and died there. Her clever but superficial talent had great though passing vogue, during which several of her books were translated into English. For her life, consult: Marie Helene (Leipzig, 1860); Haßner (Frankfort, 1880); Alinde Jacoby (Mainz, 1894).

HAHNKE, hân'ke, WILHELM VON (1833-1912). A German soldier, born in Berlin. He received his military training as a member of the Prussian cadet corps, entered the Prussian army in 1851, and in 1866 was on the staff of the Crown Prince, Frederick William, during the campaign in Bohemia. During the Franco-Prussian War he was a major on the general staff, in the headquarters of the Crown Prince, and by 1881 had risen to be major general, commanding the first brigade of infantry guards. In 1890 he became general of infantry, from 1888 to 1901 was chief of the military cabinet, in 1890 was appointed commander in chief in the Marches and Governor of Berlin, and in 1905 became general field marshal. In 1907 he received the order of the Black Eagle and in 1909 was made Governor of Berlin.

HAIDA, hî'dâ. A remarkable group of tribes constituting the Skittagetan linguistic family, formerly occupying the 30 villages on the Queen Charlotte Islands, British Columbia. They are a seafaring people, traveling and fishing in large canoes, hewn from logs of cedar, carved with symbolic figures. The women are skillful in weaving mats and baskets in twined work, and the men in carving from black slates miniature figures of their totemic designs, totem posts, house fronts, and articles of daily use. They were a warlike race and extended their raids along the coast as far as the mouth of the Columbia River. Their houses are built of cedar planks hewn out, and in front of each im-

mense totem poles have carved on them the heraldic emblems of the family dwelling within. Women and men tattoo their bodies and wear labrets. The contact with civilization has reduced the population from 7000, in 1840, to 530, living in Masset and Skidegate villages. Consult: Swanton, *Haida Texts and Myths* (Washington, 1905); *Contributions to the Ethnology of the Haida* (New York, 1905-09); id., *Haida Texts* (ib., 1908); id., *Haida Songs* (Leyden, 1912).

HAIDARABAD, hî'dër-â-bîd'. A native state and a city of British India. See HYDERABAD.

HAIDEE, hî-dê'. A Greek girl in Byron's *Don Juan*.

HAIDEE, MADEMOISELLE. See AÏSSÉ.

HAIDINGER, hî'dîng-ër, WILHELM VON (1795-1871). An Austrian mineralogist, geologist, and physicist. He was born at Vienna and studied with Mohs at Graz and at Freiburg. After living for a time in Edinburgh he returned to Austria, where he was interested with his brother in a porcelain factory at Elbogen. In 1840 he was appointed to take charge of the Imperial Mineralogical Collections at Vienna, and a few years later he commenced his lectures on mineralogy. In 1849 he was chosen as the director of the newly founded Geological Institute, and in 1865 he was knighted. He published many books on mineralogy and crystallography, but is best known perhaps for the discovery of the phenomenon known as *Haidinger's brush*, by means of which plane polarized light can be detected. This consists of a pale-yellow brush with curved arcs on either side, shaped like the branches of a hyperbola. The plane of polarization coincides with the axis of the brush, and on either side there is a violet or bluish patch. This phenomenon is supposed to be caused by the polarizing structure of the eye. While in Edinburgh, Haidinger translated Mohs's *Grundriss der Mineralogie* and then published it in enlarged and improved form under the title of *Treatise on Mineralogy* (3 vols., 1825). In addition to many volumes and papers on mineralogy and other allied departments of science, Haidinger is the author of *Handbuch der bestimmenden Mineralogie* (1845) and supervised the construction of a geological map of the Austrian Empire (1845).

HAIDUKS, hî'duks (Hung. *hajdu*, drover, pl. *hajduks*). A term formerly applied among the Balkan Slavs to the bandit mountaineers, who, like the Greek *klephts*, were generally Christians and opposed to Turkish rule. Such bands—each one having a chief, the *haram basha*—were found among the Serbs and Bulgarians from the beginning of Turkish rule. Those who killed Turks only were regarded by their people as patriots rather than as bandits. They were popular heroes and did much to bring on the final struggle for independence. In Hungary this designation was applied to a class of mercenary magyar foot soldiers. As a reward for their services in the struggle against the Hapsburgs, Stephen Bocskay, Prince of Transylvania, granted them, in 1605, the privileges of nobility and a large stretch of territory as their own possession. The Haiduk district remained independent of the local authorities, and under the direct administration of the national government, until after the revolution of 1848. Haiduks adopted Calvinistic Protestantism early in the Reformation. In 1876 this dis-

trict was enlarged by incorporating portions of two adjoining districts into a new administrative division known as the Haiduk County, with Debreczin for its capital. In Hungary and Poland the term is also applied to the domestics of the great houses. In France in the eighteenth century it was given to the outriders of the carriages of the rich. These outriders wore Hungarian costumes and carried swords until prohibited by royal ordinance, in 1779, from bearing this mark of military rank. Consult Rosen, *Die Balkanhaiduken* (Leipzig, 1878).

HAIFONG, See HAIPHONG.

HAIG, SIR DOUGLAS. British Marshal. For his biography see VOLUME XXIV.

HAIGHT, HAT, CHARLES COOLIDGE (1841-1917). An American architect and sculptor. He was born in New York City and in 1861 graduated from Columbia College (A.M., 1864). In 1862-64, during the Civil War, he was a captain of United States Volunteers. He became a member of the National Sculpture Society, of the Architectural League, and of the American Institute of Architects. In 1906 he received the honorary degree of A.M. from Yale University.

HAIL (AS. *hagol*, Icel. *hagl*, OHG. *hagal*, Ger. *Hagel*, hail; probably connected with Gk. *κάχλη*, *kachlēa*, pebble). Round, compact masses of ice that fall from the clouds to the earth, usually with rain. When these masses are as large as $\frac{1}{4}$ of an inch in diameter or larger, they are often spoken of as hailstones; when they are quite small and perhaps accompanied by rain, they are known as sleet. Hailstones occur of all sizes from $\frac{1}{4}$ of an inch in diameter up to 3 inches in diameter; usually comparatively few hailstones fall at any one place, but cases are recorded in which the ground has been covered to a depth of several inches and all vegetable life destroyed. The larger hailstones have a rather complex structure, being mostly composed of concentric layers of solid transparent ice and snowy-white or soft ice. In most cases the larger stones have a nucleus, which is either a foreign substance, such as a bit of gravel or a small pebble, or some larger object, such as those that are carried up from the earth by tornadic winds; or the centre is composed of a mass of snow, in whose interstices is held some gas, presumably air or oxygen, powerfully compressed within the central cavity. When this cavity is opened under water, the inclosed gas is seen to expand, and, according to Jaenir, the gas seems to be held therein under a pressure of as much as 50 atmospheres.

The external surface of a hailstone is sometimes of beautiful regularity, as though it had grown by accretion of small particles during a slow and steady motion through the atmosphere, but this regularity is quite rare. More frequently the larger stones are irregular aggregations of masses of ice; of course, however, such masses may have their shapes greatly altered when they strike the ground. The largest stones whose records are trustworthy have not exceeded two pounds in weight. Stones of 2 and 3 inches in diameter, weighing 12 and 16 ounces, occur annually in Europe, India, and America. Consult the *Monthly Weather Review* for August, 1878.

A hailstorm is usually characterized by the formation of very high cumulus clouds, strong surface winds, considerable lightning and thunder, and heavy rain. It appears possible that hail may be formed either in the front of an

advancing cool wave or in connection with a local thunderstorm or tornado. The former gives us the smaller hail and sleet; the latter gives us the larger and destructive hailstones. In the latter case it is quite common for the area of destructive hail to cover long, narrow strips of country as though it belonged on one side of the path of progression of some special cloud or vortex.

Protection against hail has been sought from time immemorial by different methods characterized by the gradual progress of our knowledge as to how hail is formed. In most ancient days the church bells were rung and the saints invoked. The lightning rod is called *paragrêle* in France, and in recent years elaborate gigantic installations called "electric niagaras" have been erected there as protection against hail. The Bureau Central Météorologique has shown very clearly that no form of lightning rod has any effect upon the formation of hail. (Consult Angot in *Monthly Weather Review* for March, Washington, 1914.) More recently the belief and practice of the peasants of Styria and northern Italy spread through Austria and southern France to the effect that a special form of cannonading may, by bombarding the clouds, prevent hail, the theory being that if hail is formed by a process of crystallization in still air, then the cannonading by disturbing the stillness would prevent the hail. But all these ideas are delusions, and the bombardment has no appreciable effect upon the hailstorms. (Consult an elaborate and convincing report by Pernter in *Meteorologische Zeitschrift* for March, Brunswick, 1907.) The most rational method of counteracting the injury done by hail is by adopting a method of hail insurance by which the losses of a few persons are distributed among many. The total amount of damage done by hail and lightning is summed up statistically in the annual reports of the Chief of the Weather Bureau and in the special reports in the *Monthly Weather Review*.

The method of formation of hail is as yet but little understood. It seems to be demonstrated that when a rising mass of air cools to the dew point and below, it begins to form a cloud; as it continues to ascend, it cools to a temperature where hail is formed or rather hail and rain simultaneously. Higher than this it cools to a temperature where snow is formed. The ordinary hail may be formed in the second region, but the large hailstones of complex structure must have been carried up and down many times from the rain region to the snow region forward and backward until they become too large and heavy to be held up any longer. In accordance with these ideas it is found that a very large proportion of the destructive hail occurs between 10 A.M. and 4 P.M., and a very small proportion between 6 P.M. and 8 A.M. Consult Von Bezold, *Thermodynamics of the Atmosphere* (originally published at Berlin, 1888 and 1889; translated in full in Abbe, *Mechanics of the Earth*, Washington, 1891), and Ferrel, *Recent Advances in Meteorology* (ib., 1886).

In the *Monthly Weather Review* for September, 1900, is given a table showing the annual frequency of hailstorms for a unit area of 100 miles square, as derived from the records of each State in the Union. In addition to the table, records made in the States of Connecticut, Rhode Island, Massachusetts, Maryland, Delaware, and in the District of Columbia, may be summed up

into one average—i.e., 3.0 per cent. This table is as follows:

Alabama.....	3.96	Nebraska.....	5.78
Arizona.....	1.99	Nevada.....	2.62
Arkansas.....	5.08	New Hampshire.....	2.68
California.....	2.54	New Mexico.....	1.98
Colorado.....	5.92	New York.....	6.30
Florida.....	2.10	North Carolina.....	5.22
Georgia.....	3.39	North Dakota.....	3.82
Idaho.....	4.26	Ohio.....	10.74
Illinois.....	8.44	Oklahoma.....	3.74
Indiana.....	9.84	Oregon.....	4.30
Indian Territory.....	2.58	Pennsylvania.....	6.18
Iowa.....	8.44	South Carolina.....	5.72
Kansas.....	6.28	South Dakota.....	4.06
Kentucky.....	7.16	Tennessee.....	5.70
Louisiana.....	5.04	Texas.....	1.44
Maine.....	1.84	Utah.....	3.06
Michigan.....	5.64	Vermont.....	6.40
Minnesota.....	4.48	Virginia.....	0.36
Mississippi.....	4.62	West Virginia.....	7.94
Missouri.....	8.78	Wisconsin.....	6.28
Montana.....	1.78	Wyoming.....	1.16

HAIL COLUMBIA. A song written in 1798 by Joseph Hopkinson for the benefit of a young actor and sung to the tune of the *President's March* (1788), composed by Fyles in honor of President Washington. Though not of a high order, it appealed to the popular taste and continues to maintain its position as one of the representative patriotic songs of the United States.

HAILES, LORD. A Scottish judge and writer. See DALRYMPLE, DAVID.

HAILEYBURY. Chief town in Timiskaming District, Ontario, Canada, on Lake Timiskaming and on the Timiskaming and Northern Ontario Railway, 107 miles north of North Bay (Map: Ontario, K 0). It is the seat of a Roman Catholic bishop and has a general hospital. Its industrial establishments include saw mills and a brickyard. The town owns its water and sewerage systems. Pop., 1911, 3874.

HAILEYBURY COLLEGE. An English public school situated at Hailey, Hertfordshire, 19 miles north of London. This school is often called New Haileybury, in distinction from the older and more famous school which it succeeded. Old Haileybury, or more properly the East India College, was a training school for young men entering the service of the East India Company. It was founded by the company in 1806 and, occupying first Hertford Castle, moved to the building erected for it at Hailey by Wilkins in 1809. Here it carried on its work till, after a career of almost exactly half a century, it ceased to exist (Jan. 31, 1858). During that time many of the most distinguished men connected with Indian history and administration were members of the college. Among the professors are to be found the names of Malthus, the political economist; Sir James Stephen, Sir James Mackintosh, and William Empson, master of the college and later editor of the *Edinburgh Review*. Lord Lawrence, Sir Bartle Frere, Sir Charles Trevelyan, Sir William Muir, John Muir, Dean Merivale, Sir Richard Temple, and Sir M. Monier-Williams may be instanced among its students. The great days of the school seem to have been in the principalship of Dr. Batten (1815-37), when many of those most famous in the Mutiny days were in Haileybury. It was indeed in that trying time that the value of the school and its training was best seen, and the proud tradition of the school is the part its men took in the suppression of that rising. Its importance rests on even broader grounds than this. In the influence it has had on Indian administration by its spirit and traditions; in the

model which it set for the training of men for both Indian and colonial service, now carried on elsewhere; in the impetus it gave to Oriental studies in England, as well as in the vigorous and varied intellectual life it enjoyed during the greater part of its career—the East India College deserves a high place among English educational forces of the nineteenth century. The fall of the East India Company after the Sepoy Mutiny brought with it the suspension of its great training school. The Indian Civil Service was reorganized under government control, and the training of men for that service fell into other hands. For some four years the buildings at Haileybury stood vacant.

New Haileybury. Owing to the exertions of certain gentlemen of Hertfordshire, chief among whom was the publisher Stephen Austin, of Hertford, a sum was subscribed to buy the estate and found a public school on the premises. This was accordingly done, and the school was incorporated by royal charter and was opened in September, 1862, as Haileybury College. This foundation, beginning with an enrollment of some 50 scholars, was successful from the start. The estate has increased from the original 55 acres of the East India College to nearly double that area; the number of students has grown to 500, all boarders, and many new and handsome buildings have been added to the great quadrangle of the old school. Of that earlier foundation more has been inherited by the new than the estate and buildings; for while it is no longer a training school for the Indian service, much of the old atmosphere and tradition remains, giving it a tone and character which mark it off to some extent from other schools. The school is conducted on the usual lines of an English public school. For the East India College, consult Monier-Williams, *Memorials of Old Haileybury College* (Westminster, 1894); for the new school, consult L. S. Milford, *Haileybury College, Past and Present* (London, 1909). A. L. Lowell, *Colonial Civil Service* (New York, 1900), devotes more than 100 pages to Haileybury College to show its value in securing good and fit men for colonial offices.

HAILLAN, a'yān', BERNARD DE GIBARD DU (c.1535-1610). A French historian, born in Bordeaux. He occupied a number of political offices before Charles IX appointed him historiographer of France, in which position he was confirmed by Henry III, who liked him so well, despite his vanity and selfishness, that he made him genealogist of the Order of the Holy Ghost and gave him a pension of 1200 crowns. His chief work is *L'Histoire générale des rois de France jusqu'à Charles VII inclusivement* (1570), which ran through many editions.

HAILMANN, hāl'mān, WILLIAM NICHOLAS (1836-). An American educator, born in the Canton of Glarus, Switzerland. He studied in the Gymnasium at Zurich, Switzerland, and in 1855 entered the Medical College at Louisville, Ky. Between 1856 and 1883 he taught in, or was director of, several American secondary schools; thereafter he was in succession superintendent of public schools at La Porte, Ind., National Superintendent of Indian Schools (1894-98), superintendent of instruction at Dayton, Ohio, head of the department of psychology, Chicago Normal School (1904-08), and professor of the history of education at the Cleveland Normal Training School. His publications include: *Outlines of a System of Object*

Teaching (1866); *History of Pedagogy* (1870); *Kindergarten Culture* (1872); *Letters to a Mother* (1876); *Early Education* (1878); *Primary Helps* (1884); *Primary Methods* (1887); *Application of Psychology to Teaching* (1887); *Place and Development of Purpose in Education* (1899). He also translated Fröbel, *The Education of Man* (1890); and edited the *Erziehungsblätter* (1870-83), *The Kindergarten Messenger and New Education* (1876-83), *The English Language* (1902).

HAIL TO THE CHIEF. The boat song occurring in the second canto of Scott's *Lady of the Lake*. The air, by Sir Henry Rowley Bishop, is frequently played on public occasions to announce the approach of a person of prominence.

HAILTZUK, hîl'tsuk. A group of tribes of Wakashan stock, occupying the coast islands of British Columbia from Gardner Channel to Rivers Inlet. The chief tribes are the Bellabella, China Hat, Nohuntsitk, Somehulitk, and Nikeno. In language and customs they are almost identical with their neighbors and kinsmen, the Kwakiutl (q.v.).

HAINBURG, hîm'bûrk. See HAINBURG.

HAIMO, or **HAYMO**, hî'mô (c.778-853). An Anglo-Saxon ecclesiastic, Bishop of Halberstadt. A monk at Fulda, Haimo taught at Hersfeld and in 840 became Bishop of Halberstadt. His friend and fellow student, Rabanus Maurus (q.v.), wrote him a book of advice in his new office, *De Universo*. He was scholarly and spiritual, fond of allegory and mysticism. His works, mostly commentaries on the Scriptures, are published under the designation "Haymon Halberstatensis," in vols. cxvi-cxviii of Migne, *Patrologia Latina* (Paris, 1844).

HAIMONSKINDER, hî'môns-kî'n'dër. A popular German romance which appeared at Cologne in 1004 under the title *Ein schöne und lustige Histori von den vier Heymonskindern*. It was largely an adaptation of a version current in the Netherlands and based on a French original. A previous German adaptation (1535) was based directly on the prose romance *Les quatre fils Aymon*. Consult L. Jordan, *Die Sage von den vier Haimonskinder* (Erlangen, 1905). See **AYMON**.

HAIM'SUCKEN, or **HAMESUCKEN** (from AS. *hām*, Goth. *haims*, OHG. *heim*, Ger. *Heim*, home + AS. *sacu*, contention, guilt, lawsuit, from AS., Goth. *sacan*, OHG. *sahhan*, to contend). A Scottish law term, denoting the offense of feloniously assaulting a man in his own house or lodgings. This is an aggravation of the ordinary offense of assault and involves severer punishment. English and American law make no distinction based on the place where an assault is committed. The term was, however, employed in early English law to describe the offenses comprehended under the term "housebreaking." See **BURGLARY**.

HAINAN, hî-nân'. A large island in the China Sea, situated south of China and forming a department of the Chinese Province of Kwangtung (Map: China, J 8). Its area is estimated at 16,000 square miles. It is separated from the mainland by Hainan Strait, 10 miles wide. There are several densely wooded mountain chains in the interior, with rich valleys between. The coasts are level and well watered, and the chief rivers are navigable for flatboats. The flora is very abundant and includes the areca palm, coconut tree, the banana tree, and various other tropical plants. Among

the fauna are the tiger, rhinoceros, wild hog, deer, and several species of monkey. The climate is hot, but somewhat tempered on the coast by the wind. Earthquakes are very frequent. The chief products are sugar cane, cotton, tobacco, coconuts, and coconut products. The population of the island is estimated at 2,000,000, consisting partly of Chinese along the coast, whose immigration to the island began in 1370 (when it was incorporated in the Province of Kwangtung), and the aborigines. The latter resemble somewhat the Malays and are of small stature and far from prepossessing in appearance. They live a very primitive life, and as they solely inhabit the almost unknown interior, they are practically independent. The capital of Hainan is the city of Kiungchow; pop., over 50,000. Its seaport is the treaty port Hoihow, 3 miles distant; pop., about 36,000. Imports for 1912 amounted to Hk. Tls. 2,052,081. Exports (1912, Hk. Tls. 2,390,070) consist mainly of pigs, poultry, eggs, and provisions. (Haikwan Tael = \$0.721.) There are few resident foreigners.

HAINAULT, or **HAINAUT**, â'nô' (Flem. *Henegouwen*). A western province of Belgium, lying southeast of Flanders (Map: Belgium, B 4). Its area is 1,437 square miles. The province may be said to belong to the region of the Ardennes and is well watered by the Scheldt, the Sambre, and their tributaries. The canals are numerous. The soil is very fertile, and agriculture flourishes. Wheat, flax, and fruits are principally grown. Horse breeding is an important industry. Hainault is very rich in coal deposits, yielding about three-fourths of the total output of Belgium. Over 90,000 people are employed in the coal mines. Iron, marble, and plaster are also exported, and the production of pig iron, steel, and glass is extensive. The textile manufactures are likewise well developed. More than one-half of the population are occupied industrially. The inhabitants numbered 807,467 in 1895, 1,232,807 in 1910, and (est.) 1,247,242 in 1912, being one of the most densely populated districts in Belgium, having over 850 inhabitants to the square mile. The capital is Mons. Hainault was a county in the latter part of the Middle Ages. Together with the County of Holland, it was made over to Burgundy by Countess Jacqueline in 1433. Subsequently it shared the fortunes of the Belgian Netherlands. Portions of it were annexed to France in the seventeenth century.

HAINBURG, hîm'bûrk, or **HAIMBURG**, hîm'bûrk. An ancient town in Lower Austria, situated on the right bank of the Danube, 38 miles east-southeast of Vienna (Map: Austria-Hungary, E 2). It is surrounded by old walls and abounds in Roman antiquities, though the main part of the town has been rebuilt since the fire of 1827. It is supplied with water by an ancient aqueduct; the Rathaus contains a Roman altar. The old ruined castle is identified with the castle of Heimbûrk, mentioned in the *Nibelungen* as the border fortress of the Huns. Outside of the town lie the ruins of the castle of Rottenstein. Hainburg has a military engineering school, one of the largest Imperial tobacco factories of Austria (2300 hands), a needle factory, and a saw mill. The town was destroyed by Matthias Corvinus in 1482 and by the Turks in 1683, when most of the inhabitants were killed. Pop. (town). 1900, 6225; (district), 1910, 15,200.

HAINES. An incorporated town on Lynn Canal, Alaska, adjoining Fort William H. Seward. It has a Presbyterian mission and hospital. The inhabitants, numbering 445 in 1910, live largely by fishing, supplying adjacent canneries.

HAINES, or HAYNES, JOSEPH (?-1701). An English actor and writer. After completing his studies at Queen's College, Oxford, he was for a time secretary to one of the ministers of state, but was soon dismissed because of indiscretion, and became a dancer on the stage. He played Benito in the *Assiguation*, a part which it is supposed Dryden wrote expressly for him, but his fame rests principally upon his ability in reciting prologues and epilogues, many of which were from his own pen.

HAIPHONG, or HAIFONG, hī'fong'. The chief port of Tongking, opened in 1876 to foreign residence and trade under a treaty made by the French with the King of Annam (Map: French Indo-China, E 2). It is situated on the right bank of the Kua-Kam, a branch of the Songkoi (or Red River), at a point where a canal leads out of it at right angles towards the Songkoi. The banks of the river are low and of alluvial mud, from which the city was reclaimed at tremendous expense and labor. It is the port of Hanoi, the capital of Tongking, distant 145 miles by water, but only 60 in a direct line. Entrance to the port is obstructed by two bars, the outer one of sand and the inner of mud; formerly accessible only to vessels drawing up to 18 feet, it now can accommodate them up to a draft of 24 feet. Ships anchor about $\frac{1}{4}$ of a mile from the town, in 40 to 60 feet of water. The harbor has a small dock, some fine wharves, and godowns. In 1912, 397 vessels of 460,000 gross tons entered the port. The town lies on both sides of the canal, in the midst of a rice swamp extending around it for miles. The native town consists of houses of mud, bamboo, and matting. Previous to the arrival of the French there was scarcely a hut. On the other side of the canal is the "Concession," or French settlement, with broad streets lined on both sides with trees and lighted with electricity, a fine boulevard, good houses, spacious warehouses, extensive shops, many pleasant bungalows, and a hotel, theatre, church, public garden, and race course, all erected on swampy land filled in with mud dug from the creek which surrounds it. It has the appearance of a prosperous and clean city. A cotton mill with 25,000 spindles employs over 600 persons. The city is connected with Saigon by cable. Haiphong is the highest point to which vessels drawing 14 feet can ascend. There are several newspapers published. The railway to Hanoi was opened February, 1901, and there is a regular service of river steamers communicating with that city. Population numbers about 18,500, which includes about 1000 Europeans, 5500 Chinese, and 12,000 Annamites.

HAIR (AS. *hūr*, Icel. OHG. *hær*, Ger. *Haar*; probably connected with OChurch Slav. *kosmā*, Lith. *kosa*, hair, and perhaps with Lat. *carere*, to card wool). The characteristic covering of mammals, an epidermal outgrowth, the formation and structure of which are quite different from either scales or feathers. Hairs are not entirely wanting in any mammals, though they vary greatly in abundance, some animals being completely and densely clothed in them, while others possess them only on limited parts of the

surface, as in man, and others, as adult whales, have only a few bristles near the mouth. Hairs of two distinct kinds occur in many mammals—one of which is stiff, straight, and smooth; the other curly, soft, and often minutely rough. It is this roughness of the outer surface which makes the processes of felting and skinning possible. When both kinds of hairs are present, the soft ones, usually called "wool," are much more abundant than the straight ones; but the latter give the smooth outer coat to the body and are therefore sometimes called "contour" hairs. Unlike feathers, hairs are uniformly distributed over the body, except in special cases, where particular regions are left bare. Hairs vary

GROWTH OF A HAIR.

Diagrammatic longitudinal section through the "root" of a hair. *sc*, Stratum corneum; *sm*, stratum Malpighii; *cp*, dermis; *ap*, arrectores pili; *f*, adipose tissue; *f'*, outer longitudinal layer, and *f''*, inner transverse layer, of dermic coat (both composed of connective tissue); *sch*, hair shaft; *m*, medulla; *r*, cortex; *o*, cuticle of shaft; *ws*, external root sheath; *ws'*, internal root sheath, which reaches above only as far as the point of entrance of the ducts of the sebaceous glands; *hbd*, sebaceous glands; *hp*, hair papillae containing vessels; *gh*, hyaline layer which lies between the inner and outer hair sheaths, i.e., between the root sheath and the follicle. (Wiedersheim.)

greatly in size and color; the longest hairs occur among the ungulates, especially in the tails of such species as the horse, while the shortest hairs of any mammal are usually on the face. In man the shortest hairs are found upon the eyelids, where they barely project above the follicles containing them. The color of hairs depends upon the amount of pigment they contain, the amount of air in the intercellular spaces, and the character of the external surface.

Hairs arise as outgrowths of the epidermis and contain no dermal tissue. The original epidermal thickening pushes down into the dermis as a solid hair germ, around which the dermis forms a hair follicle. The hair germ soon differentiates into two distinct parts, a peripheral and a central. The former gives rise to the external root sheath and becomes the inner, epidermal coat of the hair follicle, from the outer dermal portion of which it is separated by the

so-called hyaline layer. The central part of the hair germ gives rise to the hair shaft itself and to the inner root sheath, which closely invests the base of the shaft. The latter consists of a central medulla or pith, a cortex, and an outer cuticle; the pith is made up of a loose, dry tissue with large intercellular spaces filled with air; the cortex is a dense layer containing the pigment; the cuticle is the covering of the hair, and may be smooth or more or less rough, and ornamented with scales and other projections. At the base of the shaft and inclosed by the swollen or bulbous base is the hair papilla, which is well supplied with blood vessels and thus furnishes the nourishment necessary for the growth of the hair. When a hair is shed, a new hair may arise in the same follicle from a new hair papilla. Each hair follicle is provided with nerves, smooth muscles, and sebaceous glands, the latter keeping the hair oiled. By means of the muscles (arrectores pili) the hairs can be moved independently, but the movement of large numbers of hairs in unison is accomplished by the movements of the striped muscles of the skin. Sensations of cold or of fear cause an involuntary contraction of these muscles in man, causing the feeling of an erection of the hair on the head in terror, or "gooseflesh" in cold. In the lower animals this effect is produced by ill health. Horsemen have a very graphic expression for it, saying of the coat of an animal out of condition, that it "stares."

An infant's hair (called lanugo, from *luna*, wool) is shed soon after birth and replaced by a new covering. The short downy hairs on the human body are rudimentary remains of complete hairy covering in ancestors of the race. Loss and repair appear to go on continuously up to a certain time, when baldness occurs with the majority. Each hair is said to live from two to four years. The grayness of hair in advanced life results from a deficient secretion of pigment and perhaps an increase of air in the medulla of the hair. Well-authenticated cases are on record in which the hair has grown gray or white in a single night, from the influence of fear, distress, or any variety of strong mental excitement.

With respect to the quantity of hair that grows on the human body, there are great differences in different races. The Mongols, and other northern Asiatics who are similar to them, are noted for the deficiency of their hair and for scanty beards, and the same character is ascribed to all the American Indians; while, on the other hand, among the Ainos of Japan or in the Kurilian race there are individuals who have hair growing down the back and covering nearly the whole body. The northern Asiatics and the American Indians have generally straight, lank hair, while Europeans have it sometimes straight and flowing and occasionally curled and crisp. Negroes present every possible gradation from a completely crisp or what is termed woolly hair to merely curled and even flowing hair; and a similar observation holds regarding the natives of the islands in the great Southern Ocean.

The length to which the hair of the head may grow normally, especially in women, is very considerable. A North American Indian of the Crow tribe is said to have had hair that was 10 feet, 7 inches in length. About 1878 there was exhibited in New York City a family of Russians who were almost covered with long

hair. Their foreheads, noses, and cheeks were so shaggy that their eyes could scarcely be seen, and their ears were concealed by the hair that grew from them. Cases occasionally occur where there is an abnormal abundance of hair of considerable length in women, on parts where the hair is usually little more than down. A well-known case is that of Julia Pastrana, whose ears and all parts of the face except the eyes were covered with hair of different lengths. The beard was tolerably thick, the hairs composing it being straight, black, and bristly, the part of it which grew on the sides of the chin hanging down like two plaits. The upper portion of the back of the neck and the hinder surface of the ears were covered with hairs. On the shoulders and legs the hairs were as abundant as they are occasionally seen on very powerful men. See BEARD; WIG.

On the other hand, there may be a deficiency or even entire absence of hair. The effect may be more or less general or localized and may be either congenital or acquired. It is stated that about 90 per cent of cases of baldness (q.v.) are due to seborrhœa, which causes an excess of dandruff. This widespread affection is due to bacterial infection. The symptoms consist in the presence of small grayish-white greasy scales, falling of the hair, and more or less itching, with usually a red scalp. The primary site of the disease is, in most cases, the scalp; not infrequently, however, it extends to the face, chest, and back (seborrhœal eczema). Unless treatment is instituted, the disease results in permanent baldness, by interfering with the nutrition of the hair and by destroying the roots and papillæ of the hair. Seborrhœa is communicable, and therefore the use in common of combs and hairbrushes should be discouraged. The treatment consists in avoiding much water as well as avoiding frequent shampooing, and the local application of sulphur, carbolic acid, chloral, resorcin, some salt of mercury, or some other parasiticide, either in the form of an ointment or a lotion.

The services of hair in animal economy are various, though there is reason to believe that the primary use was the maintenance of a uniform body temperature by preventing loss of heat by radiation. Hair is an excellent nonconductor of heat, especially in the form of wool. Its warmth-conserving quality is largely due to the air entangled among it. The widespread use among men of the skins of mammals in the form of fur is ample evidence of their value as nonconductors. In the form of bristles and spines, which are simply excessively stiff hairs, hair often serves a protective purpose, as in the hedgehog and porcupine. In other cases the hair becomes fused with dermal plates and helps to form a defensive armor, as in the armadillo and pangolin. And finally in entering into the composition of some horns, as in the rhinoceros, hair reaches the extreme of its defensive uses. In many animals, notably the cats, hairs may become organs of touch of great sensitiveness, especially in the region of the mouth. Such hairs, known as vibrissæ, are supplied with special nerves to fit them properly for their purpose. Whether claws and hoofs are to be regarded as modified hair is still an unsettled question. For chemical composition, see table under HORN. Consult: Walsh, *The Hair and its Diseases* (London, 1902); Wiedersheim, *Comparative Anatomy of Vertebrates* (New York,

1897); W. A. Kidd, *The Direction of Hair in Animals and Man* (ib., 1904); Mueller, *Hair* (ib., 1913).

HAIR, DISEASES OF THE. See **HAIR; BALDNESS.**

HAIR, IN PLANTS. See **TRICHOME.**

HAIR/BIRD'. A local name in the Eastern United States for the chipping sparrow (*Spizella passerina*), in reference to the fact that its nest is now made almost entirely of horsehairs. See **SPARROW.**

HAIR/CLOTH'. A fabric of horsehair, woven on a warp of cotton, linen, or worsted, and formerly much used in upholstering furniture. The long hair from horses' tails is chosen for the purpose. The hair is drawn, straightened, and assorted, then woven on power looms. This material is now little used for upholstery, but is extensively employed by tailors and dress-makers as a stiffening fabric for interlinings, its superiority to other materials used for the purpose being that it is unaffected by moisture. Haircloth is also employed for sieves for expressing oils, etc.

HAIR/DRESSING. An important part of costume (q.v.). The most ancient picture monuments show coverings for the head which must certainly be wigs (see **WIG**) and others where it is doubtful whether the natural hair, long and elaborately curled and crimped, or an artificial imitation of it, is intended. Hairdressing is sometimes entirely decorative in intention, and sometimes traditional or symbolic in character, intended to convey the idea of personal dignity, of having attained a certain age, of a certain rank in the community, of bravery, like the curious ring worn by Zulu warriors, in which the short curling hair in a circle as large as the top of the head allows and stiffened with gum, forms a very obvious coronet. A religious form of hairdressing is the tonsure or partial shaving of the head common in many lands, which in the form used by the Roman Catholic monks is familiar to us (see **TONSURE**) and may be regarded as an attached and a permanent kind of crown.

Hairdressing in Ancient Times. The Egyptian hairdressing, as shown in the mural sculptures and paintings, was extremely elaborate and varied. The hair was divided into many tresses, each thickly plaited, or into two very broad and flat braids, one on each side of the head, while the hair behind was cut short; or into long parallel braids of great number, which were again grouped in masses, one mass falling in front of the shoulder on either side and the larger mass behind. Wigs were evidently very common.

Among the Greeks the statues and bas-reliefs which we have of the sixth century B.C. and before show a very elaborate style of dressing the hair common to both men and women. The heads even of athletes show the hair crimped and curled, retained by a broad band, in front of and below which the little curls are arranged in corkscrews, or in

curls made spiral at the end and fixed close to the forehead, evidently retained by some very tenacious cosmetic. One most beautiful head-dress of which the date can be nearly fixed is that of the Apollo in the eastern pediment of the temple of Zeus at Olympia. The hair, radiating in all directions from the crown of the head, is generally rippled; it is retained by a band above the ears and falls below this band in short, curling locks parted so as to leave the ear free. At the same epoch, however, viz., about 450 B.C., the portrait statues, or those which may seem to be so, have the hair in a less elaborate style, worn naturally as in many heads of both old and young men of the great period of Greek art, and the heads of women of the same periods have the hair not very long and gathered at the nape of the neck or retained by a broad fillet, a stephane, or the like, and falling on the neck, but not below the shoulders. In the fourth century B.C. and later the head-dress of men becomes less and less a matter of moment. The hair is worn in its natural curls or cut very short, and it is evidently the purpose of the sculptor to insist upon the form of the head, which the hair is not allowed to conceal. At the same time the head-dress of women becomes more and more elaborate. Among the Roman hairdressers this Greek tendency continues. The typical head of a man of family has short-cut hair, while the head-dress of women, though charmingly simple and natural, and setting off the head well during the years of the later Republic and the early Empire, is shown as extremely fantastic in the busts and medals of women of the Imperial court.

Hairdressing in Later Times. Towards the end of the Middle Ages in the latter part of the fourteenth century, men and women alike, of the wealthier classes, began to have elaborate coiffures, sometimes wrought into a glossy ring 2 or 3 inches in diameter reaching diagonally from above the forehead, touching the ears and to the nape of the neck, or in two great puffs concealing the ears, or, in the case of women, beneath a broad cushion or elaborate hat (see **HAT**), which seems to be supported by a volume of crimped and curled hair below. The well-known portraits of Henry IV (died 1610) and his Minister, the Duc de Sully, show this fashion carried into later times. The beard is combed out and curled with great nicety, gummed in a radiating form like a fan below and on both sides of the lower lip, and the mustache in like manner is curled and rolled upward from the mouth, the whole evidently held in place by some glutinous medium. The hair, when abundant, is also rolled back from the forehead and temples in a way which is very effective and reminds one of the "Pompadour" style of hair dressing which has been in fashion for women during several epochs since. During the boyhood of Louis XIV, and in England during the reign of Charles I, the long hair, perfumed and carefully adjusted, was not allowed to blow freely in the wind, but was tied with ribbons into long and heavy locks. The fact that Louis

EGYPTIAN HAIRDRESSING.

FIFTEENTH CENTURY.
(The Netherlands.)

XIV in his youth had unusually long and abundant hair seems to have been the main cause of the introduction of long curled wigs, by means of which his courtiers thought to ape the natural gifts of their master, and which the master himself adopted when the loss of his own hair made it seem expedient.

SIXTEENTH CENTURY.
(England.)

The use of wigs was well established by 1680. The coiffure of women during the last two-thirds of the seventeenth century was extremely tasteful and well adapted to the head and face, varying, as it did very largely, according to the age, complexion, and stature of the wearer. The

curling hair lying on the neck and bare shoulders, and covered by a crêpe veil which we associate with the simpler dress of court ladies and the costume of the richer bourgeoisie, was followed by, or alternated with, lighter and shorter curls which seem to blow in the wind. Towards the close of the century the tall headdresses of lace and starched cambric begin to come in, but these are mere modifications of the veil, and the hair is not very elaborately dressed, being gracefully combined with the loose cap which covers the back of the head and arranged in ringlets around the forehead and cheeks, while the stiff, upright, fan-like plaits of the "tower" tend rather to elongate the head and increase the apparent stature than to form in themselves a mere headdress. In the first part of the reign of Louis XV, with all the fantastic elaboration of costume, the enormous panier or expanded skirt, the loose sleeves and collar and the rest, the head is generally dressed very simply, and it is obviously the purpose of the whole toilet to make the head seem very small in proportion. But as the gown decreased the coiffure expanded, and by 1750 was a huge edifice of curls stiffened with wire, hair-cloth, etc., and arranged to carry a little cap or hat entirely removed from the scalp and adorned with feathers and flowers. Seldom has hairdressing been so rich and fantastical. During the reign of Louis XVI the headdress of women grew still more fantastic, and we read of one in which a model of a ship of war was carried in the place of the hat upon this structure of curls and crinoline. These extravagances were gradually abated. In the first part of the nineteenth century women dressed their hair very simply, letting it fall at the sides in a series of ringlets, and gathering it around the back of the head with a ribbon. Somewhat later the side curls were done away with, and the hair was arranged on the top of the head with elaborate and fantastic headdresses and much use of false hair. *Chignon* was the word used to describe the hair when dressed in a large roll, and especially when arranged over a cushion, or other support.

1750 (England.)

W. Rhead, *Chats on Costume* (New York, 1906). See also BEARD.

HAIR DYE. A substance employed for changing the natural color of the hair to a preferred one and for hiding the approaches of age as indicated by the presence of gray hairs. Usual methods consist in washing the hair with a solution of some metallic salt known to have the effect of darkening its color. These are the salts or oxides of silver, mercury, lead, and bismuth. Peroxide of hydrogen is used to produce a golden tint. The most perfect mode of dyeing the hair, however, is that of previously preparing it by a complete soaking with a solution of sulphide of potassium. The strength of this solution must depend on the depth of tint intended to be given; the stronger the solution the darker the color will be. When thoroughly wetted, the hair is allowed to dry partially; and while still damp it is to be again thoroughly wetted with a solution of nitrate of silver, also proportioned in strength by the same rule as in the case of the solution first applied. This makes a very permanent dye, which only requires renewing as the new growth of hair becomes conspicuous. The fashion of dyeing the hair is very ancient and belongs as much to savage as to civilized nations, but in the case of the former vegetable dyes have been chiefly used; the ladies of China and other Eastern countries also resort to dyeing, the juice of the petals of *Hibiscus trionum* and probably other species of hibiscus being in general use with them. Many hair dyes cause disease; some kill the hair, and it assumes the appearance of mouse fur.

The detection of stained hair is sometimes an object of medicolegal investigation. Lead may be detected by boiling the hair in dilute nitric acid and then applying the tests for lead (q.v.) to the acid solution; while the presence of silver may be shown by digesting the hair in dilute hydrochloric acid or chlorine water, when the resulting chloride of silver may be dissolved out with a solution of ammonia and submitted to the ordinary tests for silver (q.v.).

HAIR EEL. See HAIRWORM.

HAIR GRASS (so called from the slender form). A name applied to several species of grasses, the members of which have loosely paniced flowers. The species are natives of temperate and cold climates. The tufted hair grass, or turf hair grass (*Deschampsia cespitosa*), common in most pastures and meadows of middle and northern Europe, is a beautiful grass when in flower, but forms coarse tufts 2 to 4 feet high. It has very rough leaves, which, if drawn quickly across the hand, inflict considerable wounds, whence the plant sometimes receives the name of "cutting grass." If other herbage is within reach, cattle reject it. It is sometimes used for thatching ricks of hay or grain and in some places for making mats. Soils upon which it grows luxuriantly usually need draining. It is sometimes tolerated, in order to add to the bulk of marsh or bog hay, but is carefully eradicated wherever agricultural improvements take place. For its extirpation drainage is requisite above all things; but the

digging out of the tufts is also practiced, and other grasses are sown instead. This grass is, however, sometimes sown to form cover for game, particularly hares; and in marshy situations, for snipes and wild fowl. It is the "windlestrae" of the Scotch. *Muhlenbergia capillaris*, *Agrostis scabra*, and various species of *Aira* are also known as hair grass.

HAIRLESS DOG. Races of dogs whose skins are almost completely devoid of hair have been known since ancient times and in widely separated parts of the world. The Chinese have a variety which they cook and eat as a delicacy. This Oriental hairless dog is of a small greyhound-terrier type, mostly entirely destitute of hair. One variety has a few straggling hairs on the body and a tuft at the tip of the tail. In east India the mountaineers of Coimbaton use a dog they call the "polygar" in the chase of the bear and wild boar, which is wholly destitute of hair. It is fierce and unmanageable except by its keeper and in this respect differs from all other known hairless dogs. In Central Africa there is a naked dog of greyhound type, about 14 inches tall and with a slender body about 22 inches long, and much retracted in the flanks. A few hairs are found near its tail, around the mouth, and on the legs. Its skin is black. Renger gives reasons for believing that when America was discovered by Europeans a hairless dog was domesticated, which was distinct from the hairless dog found preserved in the ancient Peruvian burial places, described by Tschudi under the name of "Inca dog." Other hairless dogs exist in the Philippine Islands, the Antilles, and the Bahamas. A large naked dog is figured by Clavigero as one of the indigenous animals of ancient Mexico. In the native language it was called by a name translated into "servant dog." The small edible dogs of the Mexicans, which the Spaniards spoke of as "very tender and delicate food," undoubtedly were the puppies of this breed. Their Indian equivalent title was "sucker," because, doubtless, they were taken from their mother to be eaten before they had ceased to nurse.

Hairless dogs, called "Mexican hairless," are often shown in the pet-dog classes at the dog shows. They are very like shaved black and tan terriers, but lack the keen eye of that dog. They are mostly of a blue or brownish color, entirely devoid of hair except a few straggling single ones here and there on the body and tail, and sometimes a small tuft on the head. The skin, as a rule, is wrinkled, and generally harsh to the touch.

HAIR MANUFACTURES. The difference between hair and wool is that the surface of the former is smooth and hard, while the latter is covered with overlapping scales so that it can be felt easily. The hair of animals is woven into fabrics, made into brushes, and used as a stuffing for upholstery. *Horsehair* is woven into hair-cloth (q.v.). It is also twisted into thick yarn and woven into sacking in Anatolia and Rumelia. *Cow hair* is used by the masons as a binder for plaster. It is also worked up into a rough yarn and woven into carpets to substitute a portion of sheep's wool, and in Norway is made into socks by the peasants. *Pig's hair* is similarly employed in China; and among the natives of the Hudson Bay Territories dog's hair is used for the same purpose. The *goat's hair* of Tibet and Persia, and the *camel's hair* used in weaving, belong rather to the true wools, and will be treated of under Wool. The shorter kinds of

horsehair from the manes and tails, also cow hair and the softer kinds of pig hair, are twisted into ropes, which, after being boiled and then thoroughly dried in an oven, are pulled to pieces. The hair retains the twist given it and is then used for stuffing seats of chairs, etc.

Brushes of Hair are of various kinds: some are made of the stiff hairs from the backs of pigs, and others are made of the soft hair of the camel and other animals. The hairs for the first kind are usually called bristles. They are chiefly used in the manufacture of hair and clothes brushes, tooth and nail brushes, house-sweeping brooms, the larger kinds of painters' brushes, etc. The second kind are chiefly employed in the manufacture of the fine brushes or hair pencils used by painters and artists. The best bristles come from Russia. Besides the camel, hairs are yielded for this purpose by the badger, sable, goat, dog, etc. See BRUSH AND BROOM.

Human Hair is sometimes employed for ornamental purposes, as chains and artificial flowers, but its principal use is to supply natural deficiencies, and for this purpose it is made up into wigs, toupees, and switches. See Wig.

The greater part of the hair used in Great Britain and the United States is imported through French dealers, who collect it from the peasant girls of Holland and Germany as well as of their own country. The light colors are usually obtained from the former countries, and the dark shades from Brittany. This does not arise from the circumstance that these countries yield the finest heads of hair, but because the poverty of the people causes its sale to be a matter of importance. The girls sell all but the front hair and then wear a handkerchief or *coiffe* to hide their shorn locks. At the annual French fairs regular meetings are arranged, where the purchases are made. According to the thirteenth census, whose statistics were published in 1913, there were in the United States, in 1909, 250 establishments engaged in the cleaning, bleaching, curling, and other preparation of human hair, yak hair, mohair, and other hairs, and in manufacturing them into articles of adornment. The product, which in 1909 was valued at \$11,216,175, included ornamental hair work, puffs, rats, refined yak hair, rolls, theatrical and other wigs, toupees, transformations, turbans and turban pads, waves and wavy hair for switches and wigs. In 1913 there were imported into the United States 1,520,342 pounds of human hair, valued at \$2,530,504, and human hair cleaned and manufactured valued at \$198,134.

HAIR POWDER. A powder usually made from pulverized starch, scented with violet or some other perfume, and at one time largely used for powdering hair or wig. (See Wig.) The fashion came into vogue at the French court during the reign of Charles IX (end of the sixteenth century), and during the two succeeding centuries it was largely used in England, France, and other European countries by both men and women of the higher and middle classes. During the age of Louis XIV hair and wigs were filled with it. To make the powder hold, the hair was usually greased with pomade. In England in 1795 a tax of \$5 was put on the use of hair powder, and at one time yielded \$100,000 per annum. The French Revolution, which tended to simplify fashion, hastened the return to natural and unpowdered hair. At the present

day powder continues to be used by some of the footmen of nobility and royalty as part of their livery; and occasionally, at public or private *bals costumés*, ladies and gentlemen appear with their heads powdered. At the time of the abolition in 1869 of the English tax on hair powder, it was paid by about 800 persons. See HAIRDRESSING.

HAIR SEAL. Any seal not a fur seal. More especially, however, the term designates the typical, or true, seals of the family Phocidæ. See SEAL.

HAIR SPRING. See BALANCE AND BALANCE SPRING; WATCH.

HAIR/STREAK'. A butterfly of the family Lycaenidæ and commonly one of the genus *Thecla*. The hairstreaks may be distinguished from the "coppers" and "blues" of the same family by the fact that the radius of the fore wing is only three-branched. They are brown, with very fine stripes on the lower surface of the wing; hence the common name. A few species are blue or green. Some of the stigmata are filled with scent scales, known as "andriconia." There are more than 50 species of hairstreaks in North America. The largest species (*Thecla halesus*), found in the southeastern part of the United States, expands 2 inches. The male is bright blue and black; the female has more black than the male. The commonest species in New England is *Thecla calanus*, a small, dark-brown form. The larvæ of the more common of the hairstreaks feed on the oak; others feed upon wild plum, the hop plant, *Astragalus*, *Hosackia*, and other plants, and some are especially fond of the unopened flowers. See Colored Plate of BUTTERFLIES, AMERICAN.

HAIR/TAI'. (so called from the attenuated tail). A fish of the spiny-rayed family Trichiuridæ, characterized by the compressed and elongated body, the posterior end of which gradually tapers into a fine filament. The dorsal fin is long and low, and composed of spines and rays almost hidden in the skin. There are no caudal or ventral fins, and the skin bears no scales. They are voracious fishes of the high seas, principally confined to the tropics and growing to a considerable length. Compare CUTLASS FISH; THREADFISH.

HAIR/WORM'. Any of the long, thread-like nematode worms of the parasitic order Gordioiden. (See GORDIUS.) In these nematodes the body cavity is lined by a distinct epithelium; there is a simple large ventral nerve trunk, and the reproductive organs are arranged metamerically and are separate from the gonoducts. The group includes a small number of species, which are parasitic in locusts and other insects in the asexual, but free and mobile in the sexual, stage. They inhabit moist situations, are sometimes found on the leaves of plants, but more frequently in stagnant pools and in mud, through which they work their way with great ease. They often twist themselves into complex knots, whence their name "Gordius," from the celebrated Gordian knot, and many of them are sometimes found thus twisted together; but they are also often to be found extended in the water. The eggs are laid in long chains in the water, and the young which hatch from them swim about until they reach some aquatic larvæ into which they bore and encyst. When this insect is eaten by some minnow or other small fish, the cyst is dissolved, and the young Gordius lives parasitically in the intestine of its new

host until it reaches sexual maturity, when it bores its way out of the cyst, passes into the intestinal cavity of the fish, and from thence is carried out with the feces into the water. When fully grown, a large hairworm may be nearly 3 feet long. One popular name is "hair eel"; and a notion still prevails even among educated people that it is nothing else than a horsehair, which has somehow acquired life by long immersion in water, and which is destined in time to become an eel, or, as some say, a snake. They are often seen in fresh-water pools or horse troughs, whence they are supposed by the ignorant to be transformed horsehairs. A popular notion prevails in Sweden that the bite of the Gordius causes whitlow. Most hairworms in their last stage live in ground beetles and locusts, turning in the intestines of their host, and finally passing out of the anus. Consult Villot, "Monographie des Dragonneaux," in *Archives de zoologie experimentale*, vol. iii (Paris, 1874).

HAITI, hâ'tè, *Fr. pron.* à'tè', also called SANTO DOMINGO, or HISPANIOLA. One of the four islands of the Greater Antilles, the second in area and population, and the only island of the West Indies besides Cuba that is politically independent. The name of the island requires special comment because the usage is not uniform. Haiti is the name given to it by the Caribs, who inhabited it, the word signifying "mountainous" or "high land." When Columbus discovered Haiti, he renamed it Hispaniola (Hispaniola); colonized by the Spaniards, the name of Santo Domingo was given to its most important port, and in the course of time the English, French, and even the Spaniards came to know the whole island by the name of its capital and chief settlement. Early in the nineteenth century, at the suggestion of some leading geographers, the original name (Haiti) came again into use and is now commonly employed to designate (1) the whole island, 20,506 square miles, and (2) the independent republic which occupies the western four-elevenths of the island's area, 9242 square miles. The name Santo Domingo (q.v.) is now properly applied only to the republic occupying the eastern seven-elevenths of the island (officially, *República Dominicana*), or the Dominican Republic.

Separated from Cuba by the Windward Passage and from Porto Rico by the Mona Passage, both frequented by vessels to and from the Caribbean Sea, the island extends from lat. 17° 37' to 20° N. and from long. 68° 20' to 74° 28' W. (Map: West Indies, L 5). It is about 400 miles long and varies in width from 24 to 165 miles. The island is covered with forested mountain chains and isolated mountain masses, interspersed with fertile valleys. The highest point of the island and of the West Indies, Loma Tina, rises to over 10,000 feet, and the average altitude of the Sierra del Cibao is about 7000 feet. The coasts are mostly elevated and greatly indented, forming numerous natural harbors. The rivers, although numerous, are naturally short and swift, most of them having their sources in the mountains. A few of them are navigable for small boats; their mouths are generally obstructed. There are several large lakes in the western part of the island, one of them, Enriquillo, being evidently connected with the Caribbean Sea, judging from the specific gravity of its water and its tides. The principal formations are sandstones and schists, the crys-

talline zone being found chiefly in the centre of the island. Tertiary deposits are found in some of the mountain chains. The minerals are supposed to be abundant, and some gold is found in the streams. The climate is hot and muggy in the low-lying parts of the island (as at Port-au-Prince), the temperature during June, July, and August frequently rising to about 95° F., but rarely above this. The mean annual temperature in the Port of Santo Domingo is a little cooler than in Port-au-Prince. In the mountains the climate is much cooler, the average for the summer months being about 77° F. There are two rainy and two dry seasons, differing in their duration in different parts of the island. The rainfall is heaviest in May and June. Although there are no active volcanoes, earthquakes occur not infrequently and are occasionally very disastrous. Haiti has a remarkably rich flora. Most tropical products are found on the island, and many species are indigenous, such as rice, cotton, cacao, ginger, arrowroot, tobacco, and different kinds of fruit. Valuable timber—mahogany, cedar, and logwood—is found in abundance on the mountain slopes. The fauna is relatively poor, and most of the domestic animals are of foreign origin.

The Republic of Haiti, the first of the negro republics, comprises the western part of the island and with the adjacent islands of Tortuga, Gonave, and Vache covers an area of 10,200 square miles (or, as estimated by others, 11,090 square miles). The country is almost exclusively agricultural and has a soil exceedingly well adapted for cultivation. The principal product during the French occupation was cane sugar, of which over 176,000,000 pounds were exported in 1791. Coffee was also cultivated in those days, but only on a limited scale. At present coffee ranks first in the exports of the country. In 1891 the exports amounted to 78,000,000 pounds; in 1899, 61,600,000 pounds. The exports during the year ending Sept. 30, 1913, were: clean coffee, 54,730,591 pounds (as against 75,714,406 pounds in 1911-12); pickings (triage), 2,326,235 pounds; coffee in parchment, 536,954 pounds. The cultivation of coffee is carried on by primitive methods, and large plantations, equipped with improved machinery, are a thing unknown in the Republic. Sugar is grown only in quantities sufficient to meet the domestic demand. While the agricultural possibilities of Haiti are large, the backward condition of agriculture clearly shows that they are not fully utilized. This is due to lack of capital, high export duties, the roadless condition of the country, frequent revolutions, and the unprogressive character of the people. Many kinds of fruit that are cultivated in Jamaica and find a ready market in the United States could easily be grown in Haiti, which has the same advantages in point of distance as Jamaica. Cotton, grown extensively in colonial times, now receives only scanty attention, and little is available for export. The same is also true of indigo. The cocoa yield was 3453 metric tons in 1912, but only about 1900 tons in 1913. Logwood is exported in considerable quantities, although the exploitation of the forests is hindered by the lack of transportation facilities. The commerce of Haiti for the year ending Sept. 30, 1913, had a total value of \$28,449,075, of which sum \$9,876,555 represented imports (chiefly from the United States), and \$17,285,485 exports. The principal articles of export were

coffee, logwood, lignum vitæ wood, cocoa, hides and skins, cotton, and cottonseed. Small quantities of copper, lead, and zinc were also exported. The United States takes only a small portion of the exports, which go mostly to France, Germany, and Great Britain. Two-thirds of the coffee, the principal article of export, goes to France. Very little of the coffee comes to the United States, as Brazil coffee is cheaper and gives a larger profit to importers. The United States supplies about 65 per cent of the imports, consisting chiefly of provisions, flour, and textiles. Haiti has 15 ports, most of which are open to foreign commerce. The most important of them are Port-au-Prince, the capital, Aux Cayes, Jacmel, and Gonaïves. The roads of Haiti are so poor that travelers from one port to another almost invariably go by sea. At the end of 1912 the Republic had 140 miles of railways.

Haiti has a republican form of government, and its present constitution, adopted in 1889, is an outgrowth of the original instrument of 1805, which has passed through numerous changes and modifications in consequence of the political upheavals to which the Republic has been subjected. The President is elected for seven years by the Senate and Chamber of Communes in joint session. He is assisted by a cabinet of six members, nominated by himself. The Chamber of Communes consists of 99 members elected directly by the people for three years, each commune being represented in proportion to its population. The Senate has 39 members, chosen by the Chamber of Communes for six years, from two lists, one submitted by the President and one by the Electors. The Twenty-eighth Congress began its regular session on April 23, 1914. The administrative divisions of the Republic are modeled after those of France. The country is divided into five departments, subdivided into arrondissements and communes, and the latter into sections or districts. The laws of the Republic are based on the Code Napoléon and the forms of legal procedure are the same as in France. Foreigners, and especially white foreigners, are prohibited from owning real estate and are otherwise discriminated against. The constitution provides for a system of free elementary schools, but this provision is hardly observed, the number of schools in the rural districts being far from adequate. There are altogether about 400 free elementary schools and 5 public lycées. There is a University of Haiti, and a normal school for girls was recently opened. The revenue of the country is derived almost exclusively from import and export duties, a part of the latter being a guaranty for several debts. The expenditures for 1913-14 were estimated at \$8,127,000, and the revenues at \$6,282,000. The public debt in 1912 amounted to \$12,763,000 and 119,286,000 francs, besides an unfunded debt of \$7,077,000. By a law sanctioned on March 1, 1914, the nation acknowledges the debt of the revolution, and the Secretary of the Treasury is authorized to make an inventory of same. A reform of the country's finances is now being carried out, the new unit of value to be a silver gourde of the fineness and value of an American quarter dollar. The military strength of the Republic is 12,060 men, chiefly infantry. The navy consists of six small vessels.

No accurate figures for the population of the Republic are available, as no census has ever been taken in the country. An ecclesiastical

enumeration of 1905 placed it at about 1,425,000, which is less than some earlier estimates. It was estimated at 2,500,000 at the end of 1912. According to general estimates, about 90 per cent of the total population is black, and the remaining 10 per cent consists chiefly of mulattoes, including a few Europeans. The mulattoes form the aristocracy of the Republic and occupy a prominent position in state affairs as well as in the professions. The negroes are, as a rule, inferior in intelligence to the mulattoes, and the relations between them are those of mutual contempt and hatred—a fact which has played a prominent part in the political affairs of the Republic and hindered considerably its development. The state religion is Roman Catholic, although religious freedom is guaranteed by the constitution, and the Protestant churches also receive considerable support from the state. In its social and intellectual life Haiti is full of incongruities. The higher classes, who mostly receive their education in France and in many cases travel extensively, do not in any essential respect differ from Europeans of the same class. The peasantry, on the contrary, seem to show a retrograding tendency in spite of a century of practical self-government and freedom. A large number of the lower classes, especially in the rural districts, practice *voodoo* worshiping, and, according to some authorities, the practice is occasionally accompanied by human sacrifices and acts of cannibalism. Marriage ties are very loose, and polygamy prevails to some extent. The current language is French, but the peasantry speak a dialect. The capital is Port-au-Prince (q.v.). There are United States consuls at Port-au-Prince and Capé Haïtien, and consular agents at Gonaïves, Aux Cayes, Jacmel, Jérémie, and Petit Goâve.

History. The island of Haiti was discovered by Columbus in 1492. In 1496 Bartholomew Columbus founded Santo Domingo, the first European town in the New World. The natives, who were very numerous, were quickly exterminated in the contact with the conquering race, and negroes were imported from Africa to take their place as laborers. The blacks soon came to form the vast majority of the population. After the colonization of the mainland Haiti was neglected, and in the seventeenth century a colony of French buccaneers were allowed to make their headquarters at the western end of the island. A result of this occupation was that part of the island was ceded to France by the Treaty of Ryswick (1697). A prosperous and wealthy French colony grew up, but the large negro population, and especially the turbulent and discontented class of free mulattoes, were a constant source of disquietude to the planters, who would not allow civil rights to any portion of the colored population. During the French Revolution, at a time when there were dissensions among the white population, the negroes and mulattoes, encouraged by the reception accorded to their appeals by the people of France, rose against their oppressors. The insurrection, which broke out in 1791, was marked by the most bloody excesses. In 1793 the commissioners of the French Convention proclaimed the freedom of the blacks. At this time invasions by the British took place. The blacks were rallied, organized, and led to victory by Toussaint L'Ouverture (q.v.), who was recognized by them as generalissimo of their forces in the island, and who expelled the British in 1798.

Three years previously Spain had ceded the eastern part of the island to France, and this was now included by Toussaint, who now reigned as dictator in practical independence, within his sphere of authority. In 1801 Napoleon Bonaparte sent a force under General Leclerc to subdue the island. Toussaint was captured and deported to France, where he died in prison (1803). His place was filled by other leaders, and the French were finally expelled in December, 1803. The victorious general, Dessalines (q.v.), declared Haiti independent and assumed the title of Emperor (1804). He was assassinated in 1806. Then for some years the northern part of Haiti was held by Christophe (q.v.), a negro, who in 1811 assumed the royal title, while Pétion (q.v.) established a mulatto republic to the south. Upon the death of Christophe in 1820, the power was seized by Boyer, the successor of Pétion, who then proceeded to the conquest of the eastern part of the island, which had been reoccupied by Spain, but had revolted, and formed a republic. The whole island was ruled with wisdom and firmness by Boyer (q.v.) as President until his overthrow in 1843. France recognized the independence of Haiti in 1825. In 1844 the eastern part declared its independence, forming the Republic of Santo Domingo. In the west—the Republic of Haiti—a series of struggles between the blacks and mulattoes for political ascendancy lasted for many years. In 1840 the negro President Soulouque proclaimed himself Emperor as Faustin I, and for 10 years ruled in a despotic manner, attempting more than once to annex the Republic of Santo Domingo to his dominions. The Republic was restored at the beginning of 1859 by the mulatto Geffrard, who held power till 1867. In 1888–89 civil war raged between the generals Légitime and Hippolite, who were rival candidates for the presidency. The latter was victorious and ruled with unlimited authority till his death, in 1896. He was succeeded by General Simon Sam, who was President until May, 1902, when he was forced to resign. Civil war ensued between Boisrond-Canal, head of the provisional government, and M. Firmin, Haitian Ambassador at Paris, who established a rival government at Gonaïves, in the northern part of the island. In October, 1902, Firmin was overthrown, and in December General Nord Alexis was proclaimed President by the army. The administration of Nord Alexis was very turbulent, a revolution breaking out in 1908, which he tried to suppress by summary methods. Then Gen. Antoine Simon started a revolt and occupied Port-au-Prince, Nord Alexis fled, and Simon assumed the presidency. Simon in turn faced revolution in 1911, was penned up in Port-au-Prince, and finally escaped to **Jamaica**. Then followed a period of revolutionary disorders. Dictator followed dictator and the economic and financial conditions became very bad. Attempts on the part of President Wilson to solve the financial difficulties failed, and in 1915 the American government adopted a policy of armed intervention. By terms of a treaty negotiated in September, 1915, and put into force in February, 1916, the United States assumed a virtual protectorate over Haiti. In 1920 serious charges against the occupation of Haiti were made in the press of the United States. The charges included murder and brutality on the part of the American marines, disrespect for the Haitian government, and dis-

regard for the treaty of 1916. For a complete account of Haitian-American relations see article UNITED STATES.

HAJDU-BÖSZÖRMÉNY, hĕ'du bĕ'sĕr-mă-ny'. See BÖSZÖRMÉNY.

HÁJEK OF LIBOČAN, hă'yĕk ŭv lĕ'bô-chăn, VÁCLAV (?-1553). A Bohemian chronicler. He wrote in the Czech language a *Chronicle of Bohemia* (1541), which was translated into German by Johann Sandel (1596) and was long considered one of the best sources of Bohemian history. Modern criticism, however, has found it to be very inaccurate. Consult Palacký, *Würdigung der alten böhmischen Geschichtschreiber* (Prague, 1830-69).

HAJJ, hăj (from Ar. *hajja*, to make a pilgrimage). An Arabic word, applied specifically to the pilgrimage to the Kaaba (q.v.), or sanctuary of Mecca, which every Mohammedan whose means and health permit is bound to perform once at least in his life. The original sense of the word appears to be "circuit," and points to the ancient custom of passing around a sanctuary as one of the rites connected with a visit to a sacred spot. The word also exists in Hebrew (*hag*), and while referring originally to the pilgrimage to the sanctuary at Jerusalem in the fall of the year, is generalized as the designation of any of the three great festivals—Passover, Pentecost, Tabernacles—as provided for in the Pentateuchal codes. As concerns the Arabic institution, it appears that many generations before Mohammed a sanctuary in Mecca had acquired considerable popularity among the Arabs. This was due in part to the position of Mecca on the highway leading from Syria to Yemen, and in part to the fact that Mecca was visited annually by many thousands on their way to Okaz, where a great fair was held, which brought Arabs from all parts together. Far more sacred, however, than the sanctuary at Mecca was a mountain, Arafat, outside of the city, and the visit to this mountain, which was the real goal of the ancient Arabic Hajj, was combined naturally with a circuit around the Kaaba. The care of the latter at the time of Mohammed was in the hands of his family, the Koreish, and this circumstance may account for the devotion of the prophet to the old sanctuary

—a devotion which, though inconsistent with his general religious doctrines, he was unable to throw off. With increasing years his fondness for the Kaaba, which he designated as the *Beit Allah* (house of Allah), increased, and his visit to it the year before his death led to the institution of the pilgrimage as one of the five cardinal duties of every Mohammedan. (See MOHAMMEDANISM.) The visit to the Kaaba may be made at any time, but the full rites of the Hajj, including the visit to Arafat, can only be carried out in the twelfth month of the Mohammedan Calendar, known as Dhu'l Hajjeh, or month of pilgrimage. The pilgrims have to set out for their journey one or two months before, according to the respective distances they have to traverse. They first assemble at several variously appointed places near Mecca in the beginning of the holy month, and the commencement of the rites is made by bathing and assuming the *ihrām*, or sacred habit, which consists of two woolen wrappers—one around the middle, the other around the shoulders; the head remains bare, and the slippers must cover neither the heel nor the instep. It is enjoined that the pilgrims, while they wear this dress, shall be particularly careful to bring their words and thoughts into harmony with the sanctity of the territory they now tread—a territory in which even the life of animals is to be held sacred from attack. After assuming the sacred garb the pilgrim must not shave any part of his body, anoint his head, pare his nails, or bathe until the end of the pilgrimage. Arriving at Mecca, the pilgrims proceed at once to the temple and begin the holy rites there by walking first quickly, then slowly, seven times round the Kaaba, starting from the corner where the black stone is fixed. (See KAABA.) This ceremony (called *ta'awuf*) is followed by the *sai*, or running, likewise performed first slowly, then quickly, between the two mounts Safa and Merwa, where before Mohammed's time the two idols Asaf and Nayelah had been worshiped. These ceremonies, accompanied by prayers, are repeated daily. The next rite takes place on the ninth of the month and consists in the *wukuf*, or standing in prayer and listening to a sermon on the mountain of Arafat. The whole of the succeeding night is spent in holy devotions at Mozdalifa, between Arafat and Mina. The next morning, by daybreak, the pilgrims proceed to the valley of Mina, where they throw seven stones at each of three pillars for the purpose of putting the devil to flight. The pilgrimage is completed with the slaughtering of the sacrifices—a sheep, goat, cow, or camel, according to the pilgrim's means—on the same day and in the same place. The sacrifice over, they shave their heads and cut their nails, burying the latter on the same spot. After remaining three more days at Mecca they take leave of the Kaaba, making the seven circuits and drinking water from the holy well Zemzem. Most Mohammedans combine with the Hajj a visit to Mohammed's grave at Medina—some three days' journey from Mecca. The return of the holy caravans is watched everywhere with the most intense anxiety and is celebrated—as is also the departure—with great pomp and rejoicings. Henceforth the pilgrim never omits to prefix the proud title of Hajji to his name. It is permitted to those who through bodily infirmity are incapacitated from performing the holy journey themselves to send a substitute, who acts

as their representative in almost every respect, but this substitute has no share whatever in the merits and rewards belonging to the Hajj.

The number of pilgrims who assemble at Mecca varies greatly from year to year. It has often exceeded 100,000. Sir Wilfrid Blunt (*Future of Islam*, London, 1883) estimated the number in 1880 at about 93,000. The fanaticism of Mohammedans rigidly excludes all nonbelievers from the sacred soil of Mecca. Consequently the few Christians who have succeeded in visiting the place have done so in disguise and at the risk of their lives. As early, however, as the first decade of the sixteenth century an Italian, Ludovico di Varthema, witnessed the ceremonies and described them in his book of travels (Bologna, 1510; Eng. trans. by J. W. Jones, ed. with notes by G. P. Badger in the "Hakluyt Society Publications," vol. xxxii, London, 1863). In 1604 Johann Wild, an Austrian, was captured and forced to go to Mecca. He described his experiences in *Neue Reysbeschreibung eines gefangenen Christen* (Nuremberg, 1623). The first Englishman to enter the sacred city was Joseph Pitta, of Exeter, a sailor, who was captured by Algerine pirates in 1678 and held as a slave for 15 years, during which time he made the pilgrimage in company with one of his masters. His narrative was published at Exeter in 1704. During the nineteenth century the pilgrimage was performed by the following: the Spaniard Domingo Badia y Leblich, commonly known as Ali-Bey (1807; *Voyage d'Ali-Bey en Afrique et en Asie*, Paris, 1814); Seetzen (1809), whose journal was published after his death by Kruse and Fleischer (Berlin, 1854-59); Burckhardt (1814-15; *Travels in Arabia*, London, 1829); G. Finati (1814; *Travels*, ed. by G. A. Bankes, ib., 1830); Wallin, the Swedish explorer (1845; *Resanteckningar från Orienten*, Helsingfors, 1863); Burton (1853; *Personal Narrative of a Pilgrimage to El-Medina and Meccah*, 3 vols., ib., 1855, several later editions); Bicknell (1862); Von Maltzan (1864; *Meine Wallfahrt nach Mekka*, 2 vols., Leipzig, 1865); Keane (1880; *Six Months in Mecca and My Journey to Medina*, London, 1881); Snouck-Hurgronje (1884-85; *Mekka*, 2 vols. and a third of illustration, The Hague, 1888-89); Courtellemont (1894; *Mon voyage à la Mecque*, Paris, 1896); A. J. B. Wavell (1911; *A Modern Pilgrim in Mecca and a Siege in Sanaa*, London, 1912). Others are known to have visited Mecca, though accounts of their experiences have not been published. The most thorough and accurate descriptions of the pilgrimage ceremonies are those given by Burckhardt and Burton. Snouck-Hurgronje gives an account of life in Mecca, a history of the city drawn from original manuscript sources, and details regarding the various classes of the present population, and the arrangements made for receiving and taking care of the pilgrims, based upon a residence in Mecca of more than six months—a longer time than any other European has ever spent there. His illustrations are from photographs. Consult, besides the works already mentioned: Salih Soubhi, *Pèlerinage à la Mecque et à Médine* (Cairo, 1894); August Müller, *Der Islam im Morgen- und Abendland* (Berlin, 1885-87); Snouck-Hurgronje, *Het Mekkaansche Feest* (Leyden, 1880); Hogarth, *The Penetration of Arabia* (London, 1905). See MECCA.

HAJJI, hāj'jī, *Ar. pron.* hāj'jē (Ar. *hajji*, pilgrim, from *hajja*, to make a pilgrimage). An

Arabic word, signifying one who has performed the Hajj (q.v.), or pilgrimage to Mecca. It is a title of honor prefixed to a person's name as an indication that this religious duty, obligatory upon every Mohammedan, has been performed.

HAJJI BABA OF ISPAHAN, hāj'jē bā'bā ūv is'pā-hān', THE ADVENTURES OF. A romance by J. J. Morier (1824). It is an Oriental *Gil Blas*, revealing a world of humorous insight into life in Persia. The Persian Minister to England is said to have remonstrated in behalf of his government against its satire and plain speaking.

HAJJI KHALFAH, hāj'jē kāl'fā, MUSTAFA IBN ABDALLAH KATIB TCHELEBI (c.1600-58). A celebrated Turkish historian and bibliographer. He was born at Constantinople about the end of the sixteenth century and died there in September, 1658. From 1622 till 1633 he was employed in the Turkish army and had an excellent opportunity of acquiring information regarding matters of history, geography, etc. He made the pilgrimage to Mecca, whence his name Hajji (q.v.). In 1635 he was at Constantinople studying and collecting material for his encyclopedia. In 1648 he was appointed second assessor in the army bureau of provisions. From this position he got his second name, Khalifah (assessor). His works are written in Turkish and Arabic. They include, besides smaller works: (1) the celebrated *Kashf al-zunūn fi asanī'l-kutub wa'l-funūn* (Names of Books and Sciences), written in Arabic, of which Flügel has given a Latin translation with the text, under the title *Lexicon Bibliographicum et Encyclopaedicum a Mustapha-ben-Abdallah* (Leipzig, 1835-58). In this work is given a definition of each science; the titles, contents, language, dates of composition, and translation of more than 25,000 works are specified; also the names of the authors and dates of their death. It is the most complete catalogue in existence of works written in Arabic, Persian, and Turkish; (2) *Takvīm al-ta'arikh*, written in Turkish, of which there is an Arabic translation and an Italian translation by Rinaldo Carti (Venice, 1607), a history of the world from the creation of Adam to 1655, containing notices of 150 dynasties, principally Asiatic; (3) *Fadhakka*, a history of the Ottoman Empire from 1505 to 1655; (4) *Tuhfat al-kibar fi asfar al-bihar*, a history of the maritime wars of the Turks, which has been translated into English by Mitchell (London, 1831); (5) *Jihan nama*, Oriental geography, written in Turkish, translated into Latin by Norberg (Lund, 1818). Consult Brockelmann, *Geschichte der arabischen Literatur*, vol. ii (Berlin, 1902).

HAJJUG. See HAYYUG.

HAKATA, hā'kā-tā. Formerly a separate city of Japan, now forming a part of Fukuoka (q.v.) (Map: Japan, B 7).

HAKE (abbreviation of provincial Eng. *haked*, from AS. *haod*, OS. *haud*, OHG. *hahhit*, Ger. *Hecht*, pipe, from AS. *haca*, bar, Norw. *hake*, hook; connected also with AS. *hōc*, Eng. *hook*, so called from the hooked shape of the lower jaw). A fish of the family Merluccidae, closely allied to the cods. Several species are known—all large voracious marine fishes, inhabiting moderate depths, and of little value. The European hake (*Merluccius merluccius*) is common on all the coasts of Europe and, though its flesh is coarse and flaky, is extensively utilized by salting and drying, in which condition it is known as stockfish. It reaches a length of 3 or 4 feet. The American silver hake (*Merluccius*

bilinearis), of the New England coast, and the Pacific hake (*Merluccius productus*) are also eaten, but are not well liked. The habits of hake are like those of the cod, and they are abundant on the "banks" off the northern shores of the United States, where they are caught in the same way and at the same time as the common cod. The average weight is about 5 pounds; the maximum weight falls under 20 pounds. This fish is generally eaten in the fresh condition and does not "take salt" as well as the common cod, but is smoked and dried sometimes. The annual yield in the United States is about 50,000,000 pounds, valued at \$1,115,000. The spawning season lasts from January to June. See FISHERIES, and Plate of CODFISH AND ALLIES.

The name is also given in New England to various codlings of the genus *Urophycis*, as the squirrel hakes (*Urophycis chuss* and *tenuis*), but they are not of much value except for their sounds, or air bladders.

HAKKE, EDWARD (fl.1579). An English satirist. He held a number of political offices in Windsor and from Oct. 10, 1588, till March 29, 1589, represented that town in Parliament. He was a staunch Puritan, and most of his works are satires directed against clerical and other abuses of the day. The best known is *Newes Out of Powles Churcheyarde*, which appeared in 1567. Probably no copy of this edition is now in existence, but a reprint was issued in 1579, and this has been reproduced among the *Isham Reprints* (1872). Many of Hake's other works either have been lost or are very rare.

HAKKE, hā'ke, KARL VON (1768-1835). A German soldier, born at Flatow in Brandenburg. He began his military career as an ensign in the guards, took part in the battles connected with the French Revolution, in 1809 was appointed to a post in the War Ministry, and in 1810 became chief of the War Department. In 1813 he attracted much attention by his efficient preparations for war, subsequently commanded a brigade in Bülow's corps with rank of major general, and took a distinguished part in the battle of Waterloo. From 1819 to 1833 he was Minister of War, in which capacity he carried out important schemes of reorganization.

HAKKE, THOMAS GORDON (1809-95). An English poet, called "the parable poet." He was born at Leeds, was educated at Christ's Hospital, and traveled on the Continent. He studied medicine and settled as practitioner in, East Anglia, where he formed a friendship with George Borrow. Afterward he visited Canada and the United States and finally settled in London, where he became the physician and lifelong friend of Rossetti. His poems display marked originality and talent, but are frequently obscure, owing to their subtlety and symbolism. They comprise: *Poetic Lucubrations* (1828); *Madelaine, with Other Poems and Parables* (1871); *Parables and Tales* (1872); *New Symbols* (1875), his best work; *Legends of the Morrow* (1878); *The Serpent Play, a Divine Pastoral* (1882). Consult *Select Poems*, ed. by Meynell with a portrait by Rossetti (London, 1894), and Hake, *Memoirs of Eighty Years* (ib., 1892).

HAKKE'S DAME. The British codling. The term "hake" is used very confusingly. In the eastern United States the species of *Urophycis* are the fishes usually called hake, while the true hake (*Merluccius*) is known as silver hake, or whiting; and the corresponding species of

England (*Phycis blennioides*) is called hake's dame, or forkbeard.

HAKKEWILL, GEORGE (1578-1649). An English clergyman and author. He studied at St. Alban Hall, Oxford, and afterward was elected a fellow of Exeter College. He was one of the two clergymen appointed in 1612 to preserve Prince Charles "from the inroads of popery." Boswell says that Johnson studied his writings for their style. His works include: *The Vanitie of the Eie. First beganne for the comfort of a gentlewoman bereaved of her sight and since upon occasion enlarged* (2d ed., 1608; 3d ed., 1615; and another impression, 1633); a Latin treatise against regicides (1612); and *Apologie . . . of the Power and Providence of God* (1627).

HAKIM IBN ALLAH, hā'kim ibn āl'lā, also called AL-MOKANNA (the veiled). Founder of a Mohammedan sect in the eighth century, and leader of a revolt against Mahdi, the third Abbaside Caliph (775-785 A.D.). He came from Merv in Khorassan and began his career as a private soldier, soon became captain, and subsequently headed a band of his own. In one of his fights he lost an eye and henceforth wore a veil. Hakim's religious teaching was that God enters the body of men at various times—e.g., Adam and Noah—and that He had entered his body. He claimed to perform miracles and is said on one occasion to have caused the moon to appear out of a wall; hence he is sometimes called "moon maker." His alleged miracles gained him numerous adherents, and with them he captured many strongholds. For a time the armies sent against him were defeated, but finally Mahdi dispatched Said al-Harashi, who took city after city and compelled Hakim to withdraw to Kash, where he was surrounded. In this predicament Hakim poisoned his soldiers and burned himself to death. The story of the veiled prophet has been put into poetical form by Moore in *Lalla Rookh*. Consult Weil, *Geschichte der islamitischen Völker* (Stuttgart, 1866), and Müller, *Der Islam im Morgen- und Abendland* (Berlin, 1885). See MOHAMMEDAN SECTS.

HAKKAS, hāk'kaz (Chin., stranger families). An interesting class of people found in different provinces of southern China, but chiefly in Kwangsi, Kwangtung, Kiangsi, and Fukien, whence they have spread to Formosa, Hongkong, Hainan, and even to the Straits Settlements. Their origin is unknown, but for some unaccountable reason they appear to have been for centuries the object of the most persistent and inveterate hostility and persecution at the hands of the native, or *punti*, part of the population of the provinces in which they settled after their migrations from abodes farther north, chiefly Kwangtung. Hence they live in communities by themselves. In some districts they form the entire population, as in Kiayingehou, Kwangtung; in others they form two-thirds of the population. They are a hard-working, thrifty people, engaged in agriculture, and as quarrymen, stonemasons, porters, barbers, etc. In dress and in customs they differ from the Chinese. The women are handsome, do not bind their feet, and are not secluded like the Chinese women. Their language is a Chinese dialect which should be classed with the southern dialects (Canton, Fukien, etc.) inasmuch as in it the old finals *p*, *k*, and *t*, lost in the Mandarin dialect, are preserved.

Tradition and their family records and registers place them in Shantung and other northern parts of China about the middle of the third century B.C. It has been suggested that they may be the descendants of the aboriginal tribes found in northern China when the Chinese themselves arrived in the country from their original home.

They seem to have incurred the displeasure of the first universal Emperor of China (c.250 B.C.), and a bloody persecution followed, in which some of the clans were wiped out. The remnant fled to the mountains, whence most of them began their wanderings southward in search of a permanent home, but persecution met them everywhere. Sometimes they were permitted to settle down quietly and remain undisturbed for generations, as, e.g., under the Han dynasty, when some of them attained to high office—a circumstance, however, which led to fresh outbreaks, more slaughter, and renewed migrations. During the Tang dynasty (seventh, eighth, and ninth centuries) they settled in the mountains of Fukien and the borders of Kwangtung, where they were when Kublai Khan and his Mongol armies undertook to conquer China. Large numbers of the Hakkas joined the Imperial army and fought for the native dynasty with the utmost bravery. During the disturbances incident to the expulsion of the Mongols and the establishment of the Ming dynasty (1368), fierce persecutions again broke out and large numbers moved to Kwangtung, whence smaller colonies have made their way into the adjoining regions. Kiatingchou, which is entirely Hakka, is noted for its scholars, many of whom compete successfully with the other Chinese in the public examinations. Hung Siu-t'ian, the originator and leader of the Taiping Rebellion, and all his principal generals, were Hakkas.

Bibliography. The literature of the subject is not extensive, but is interesting. Consult: Eitel, "Ethnographical Sketches of the Hak-ka Chinese," in *Notes and Queries on China and Japan*, vol. i (Hong Kong, 1867, and reprinted in the *China Review*, vol. xxi, London, 1894-95); "An Outline History of the Hakkas," in *China Review*, vol. ii, and in the same volume, Pitou, "On the Origin and History of the Hakkas" (London, 1873-74); Lechler, "The Hakka Chinese," in *Chinese Recorder* (Shanghai, 1878); Dyer Ball, *Easy Sentences in the Hakka* (2d ed.) and *Hakka Made Easy* (Hongkong, 1896); id., *Things Chinese* (4th ed., New York, 1904); *First Lessons in Reading and Writing the Hakka Colloquial* (Basel, 1869); Schaub, "Proverbs in Daily Use among the Hakkas," in *China Review*, vol. xxi (London, 1894-95); S. H. Schaank, *Het Loeh-Poeng Dialect* (Leiden, 1897); Vömel, *Der Hakkadialekt* (Foung Pai, Leiden, 1913); Mac-Iver, *An English-Chinese Dictionary in the Vernacular of the Hakka People* (Shanghai, 1905).

HAKLUYT, hăk'loo't, RICHARD (c.1553-1618). An English writer on geography and history. After some preparation at Westminster School, he entered Christ Church College, Oxford, in 1570 and graduated A.B. in 1574, and A.M. in 1577. Soon after receiving the latter degree he was delivering public lectures on geography and the construction and use of maps, spheres, and nautical instruments. In 1582 he published *Divers Voyages Touching the Discovery of America*, which attracted considerable attention and probably secured his appointment as chap-

lain to the English Ambassador at Paris in 1583. There he collected all available information respecting French and Spanish voyages, and in 1584 wrote *A Particular Discourse Concerning Western Discoveries*, first printed in 1877, in the collections of the Maine Historical Society. In 1587 he published a translation of the journal of the French explorer René de Laudonnière. The following year he returned to England and busied himself in preparing for publication his *Principall Navigations, Voiajes, and Discoveries of the English Nation*. This appeared in one volume in 1589, but it met with such popular success that Hakluyt proceeded to collect material for a new and enlarged edition, which was published in three volumes in London in 1598-1600. In 1602 Hakluyt was made prebendary of Westminster and in the following year archdeacon. He lent his influence to solicit a patent for the colonizing of Virginia from the King and was one of the adventurers in the London or South Virginia Company. Besides his published works, he left a large collection of manuscripts. Hakluyt's *Voyages* were reprinted in 1809-12, in rearranged form by Edmund Goldsmith at Edinburgh in 1889-90, and in London, 12 volumes, in 1904-06. His best monument is the society that bears his name. Consult an account of Hakluyt in the introduction by J. W. Jones to the society's edition of the *Divers Voyages Touching the Discovery of America* (London, 1850); also an article by Froude in *Short Studies on Great Subjects*, vol. i (ib., 1807); and *Voyages of Elizabethan Seamen: Select Narratives from Hakluyt's Principall Navigations*, edited by Payne (Oxford, 1893, 1900). See HAKLUYT SOCIETY.

HAKLUYT, RICHARD, "of the Middle Temple" (about 1580), a cousin of Richard Hakluyt. He was exceedingly influential in arousing English interest in the colonization of the New World. It was, indeed, at his lodgings and as a result of conversations with him that his cousin received the inspiration which has made their name synonymous with the history of the beginnings of Greater Britain. In 1585 he drew up some extremely valuable "Inducements" for those who were contemplating the voyage to America, and two years later he was among those chiefly instrumental in sending Frobisher to the Northwest. From 1578 onward he was in constant communication with nearly every adventurer who made the American voyage, and his correspondence, preserved by his cousin, furnishes many important details regarding these early undertakings. There are many evidences that his sound judgment and wise counsel gave him a leading position among the English Imperialists of his generation.

HAKLUYT SOCIETY. An association, named for Richard Hakluyt and organized in December, 1846, for the purpose of "printing and distributing among its members the most rare and valuable voyages, travels, and geographical records, from an early period of exploratory enterprise to the circumnavigation of Dampier." Between 1847 and 1913, 165 volumes were issued under the editorial supervision of eminent authorities in geographical science, containing original or contemporary accounts of travels and exploration in all parts of the world. Notable publications were: *Select Letters of Columbus* (1849 and 1870); Raleigh's *Guiana* (1848); Hakluyt's *Divers Voyages* (1850); Galvano's *Discoveries of the World* (1862);

Garcilasso de la Vega's *Royal Commentaries of the Incas* (1869 and 1871); Pigafetta's account of Magellan's voyage (1874); *The Observations of Sir Richard Haklins* (1877); *Commentaries of the Great Alfonso Dalboquerque* (4 vols., 1870-84); *The Journal of Christopher Columbus* (1893); *The Letters of Amerigo Vespucci* (1894); *Danish Arctic Expedition* (1897); *Early Dutch and English Voyages to Spitzbergen in the Seventeenth Century* (1904).

HAKODATE, hä'kō-dä'tä, or **HAKODADI**, hä'kō-dä'dä. The northernmost of the old treaty ports of Japan, opened in 1859, situated at the south end of the island of Yezo (Map: Japan, G 3). It lies at the foot of a bald rock and has a fortified and extensive, almost landlocked, harbor. It is a well-built, well-kept town, but of little architectural interest. The chief buildings are the Japanese Club, the town hall, and the naval school. There is also an American mission school. It has water works and a tram line and is connected with Tokyo by telegraph. The total length of railways in the Hokkaido District is 900 miles. The commerce of the port is steadily increasing—in 1912, imports, \$170,115, and exports, \$1,336,560; total, \$1,512,675. Exports consist mainly of fisheries products, charcoal, sulphur, and timber. Pop. (est.), 90,000, with about 400 foreigners. Hakodate was almost destroyed by fire in 1907, which caused a loss of 50,000,000 yen. The city was rapidly rebuilt, with many permanent improvements.

HAKON, hä'kōn. The name of several kings of Norway. See HAAKON.

HAL, hāl. A town of Belgium, in the Province of South Brabant, on the river Seine and the Charleroi Canal, 9 miles southwest of Brussels (Map: Belgium, C 4). The fourteenth-century church of St. Mary, formerly dedicated to St. Martin, is a pure Gothic edifice, containing a miraculous wooden image of the Virgin and visited on that account by numerous pilgrims. The town has an episcopal institute and manufactures of paper, porcelain, and other articles. Pop., 1900, 12,284; 1910, 14,305.

HALACHA, hä-lä'kä (Heb., rule of procedure, from *halak*, to go). The general term for the Jewish oral law, which runs parallel with the written law contained in the Bible and is supposed to be, like this, of divine origin. Its relation to the ordinances contained in the Pentateuch is that of an amplified code to the fundamental religious and civil maxims. The theory being that the oral law was handed down through a long chain of highest authorities (Sinaitic revelation, Moses, Joshua, elders, Great Synagogue [Ezra], etc.), it could only be treated and further developed by the foremost men of each generation, who through their eminence in learning belonged to a kind of aristocracy of mind (*halakamin*, wise men), towering above the multitude (*hediotim*, laymen). Their decision on all ordinances involved in contradictory traditions was final, because it was believed to spring from a deeper apprehension of Scripture. An elaborate system of interpretation of the biblical texts was devised, which, frequently sacrificing the spirit to the letter, attached great weight to certain special letters, words, and even signs in the Old Testament, which, seemingly superfluous where they stood, were supposed to point to the injunction under discussion. Halacha embraces the whole field of juridicopolitical, religious, and practical life, down to its most mi-

nute and insignificant details. Originally, as already said, the oral law par excellence, it began to be written down when, as was natural, various opinions and traditions arose as to the correct practice, and the danger of sectarianism was imminent. The first collection of laws was instituted by Hillel, Akiba, and Simon ben Gamaliel; but the final redaction of the general code, the *Mishna* (q.v.), is due to Jehudah Hanasi, about 220 A.D. Elements of this oral law that did not find a place in the *Mishna* are called *Baraitas* and have been preserved in the Talmud; others are found in the *Tosephtas*. Of an earlier date with respect to their contents, but committed to writing in later times, are the three Haggadic books (Midrashim): *Siphra*, or *Torath Kohanim* (a Haggadic amplification of Leviticus), *Siphre* (of Numbers and Deuteronomy), and *Mechilta* (of a portion of Exodus). The rabbis of the Mishnaic period are called the *Tanaim*. These were followed by the *Amoraim*, who, by discussing and further amplifying the *Mishna*, became the authors of the *Gemara* (q.v.). The *Halacha* was further developed in subsequent centuries by the *Saboraim*, *Geonim*, and the authorities of each generation. See HAGGADA; MIDRASH; TALMUD.

HALAE SAXONUM. See HALLE.

HALAS, hä'lōsh, or KIS-KUN HALAS. A town of Hungary, situated near the Lake of Halas, in the County of Pest-Pilis-Solt-Kis-Kun, about 80 miles south-southeast of Budapest (Map: Hungary, F 3). The chief industry is agriculture and the cultivation of the vine. Pop., 1900, 19,800; 1910, 24,381.

HALBE, hāl'be, MAX (1865-). A German dramatist, born in Guettland, near Danzig, and educated at the universities of Heidelberg, Berlin, and Munich. With Hauptmann and Hartleben (qq.v.), he was connected with the founding of the Berlin Freie Bühne in 1889; and in Munich in 1895 he was one of the founders of the Intimes Theater für dramatische Experimente. His dramatic work was strongly influenced by Ibsen and Hauptmann, but has much original strength. His principal plays are: *Ein Emporkömmling* (1889), a study of a self-made man and his son; *Freie Liebe* (1890; 2d. ed., 1903); *Diegang* (1892); *Der Amerika-fahrer* (1894); *Jugend* (1893; 25th thousand, 1911), which, with *Mutter Erde* (1897; 8th ed., 1906), is probably his best-known work; *Nin Meteor* (1900); *Haus Rosenhagen* (1901; Eng. trans., in *Poet Lore*, vol. xxi, 1910); *Der Strom* (1904); *Die Insel der Seligen* (1905), a comedy; *Der Ring des Gauklors* (1911); *Freiheit* (1913). He wrote some fiction also: *Frau Mesock* (1897); *Der Ring des Lebens* (1909; 4th thousand, 1910), a collection of stories; *Die Tat des Dietrich Stöbäus* (1910; 5th thousand, 1911). Consult the sketch by Grumann in *Poet Lore*, vol. xxiii (Boston, 1912).

HALBERD, hāl'bērd, or **HALBARD** (from OF. *halebarde*, Fr. *hallebarde*, Ger. *Hellebarte*, from MHG. *helmbarde*, halberd, from *helm*, *halm*, Ger. *Hel*, handle, AS. Eng. *helm*, tiller + MHG. *barte*, Ger. *Barte*, axe; connected also with OHG. *bart*, Ger. *Bart*, AS. Eng. *beard*). A weapon employed in mediæval warfare, consisting originally of an axe blade balanced by a pick and having a pike head at the end of the 6-foot shaft; but there were many different forms, and some were highly ornamented and bore little resemblance to an axe or pike. It was used by the Germans, Swiss, and Danes previous to the

thirteenth century and up to the sixteenth century was borne by sergeants of foot and artillery and companies of so-called halberdiers. The "huscarles" of Canute were armed with the halberd. The Swiss were the first to change from the halberd to the pike and similar weapons. In the famous battle of Morat (1476), in which the Swiss overthrew Charles the Bold of Burgundy, halberds and pikes were used by the former. The English used the halberd previous to the Tudor period, but, as it was an expensive weapon, the halberdiers were restricted to a select corps for the protection of the "colors." In France the halberd was very little used. Consult Ashdown, *Arms and Armour* (New York, 1909).

HALBERSTADT, hăl'bēr-shtăt. An episcopal city, capital of the district of the same name in the Prussian Province of Saxony, situated on the Holzemme, 28 miles southwest of Magdeburg (Map: Germany, D 3). It is an ancient town with some fine specimens of fifteenth and sixteenth century wood architecture. On the Dom-platz, a large central square, the cathedral of St. Stephen, rebuilt after the fire of 1179 and restored in 1871, is a magnificent structure of the early Gothic style, with good reliefs, wood sculptures of the thirteenth century, a number of pictures, and many antiquities in its treasury. Opposite it the church of Our Lady, constructed in 1140, contains fine reliefs and mural paintings. Other buildings are the town hall, a Gothic structure of the fourteenth century, and the market. Halberstadt has a Gymnasium founded in the ninth century, a teachers' seminary, two fine libraries (one with 40,000 volumes), a collection of portraits by Gleim, a number of private collections of paintings, coins, and antiquities, and a theatre. The manufactures of the town comprise sugar, spirits, beer, cigars, leather, soap, bagging, rubber goods, paper, machinery, and gloves. It has also large railway shops. Halberstadt became the seat of a bishopric as early as 804 and obtained municipal rights at the end of the tenth century. The bishopric of Halberstadt was secularized in 1648 and given as a principality to Brandenburg. Pop., 1900, 42,810; 1910, 46,481.

HALBERTSMA, hăl'bért-smă, TJALLING (1841-). A Dutch gynecologist, born at Sneek. He studied medicine at Leyden (1858-63), where he received his degree, and then at Tübingen, Vienna, and Paris. He was professor at Groningen (1866-67) and then went to the University of Utrecht. Besides many contributions to medical journals in Holland and abroad, and an essay on English contributions to gynecology (1867), Halbertsma wrote: *Ovariectomy* (1873); *Craniotomy* (1874); *Ueber die Aetiology der Eclampsia Puerperalis* (1882).

HALBIG, hăl'bik, JOHANN (1814-82). A German sculptor. He was born at Donnersdorf in Lower Franconia and was educated at the Polytechnic School and at the Academy of Fine Arts in Munich. In 1845 he was appointed professor of sculpture in the Polytechnic Institute, Munich, in which city is a great part of his work. His most notable production is the colossal group of a quadriga and lions on the triumphal arch (1847). He also carved the lions of the Pinakothek and statues of Roma and Minerva in the palace gardens. He made 18 colossal statues representing the leading German provinces of Kehlheim; 60 busts for the

Pinakothek (Munich); a statue of King Maximilian II for Lindau (1854); a monument of Platen at Ansbach (1858); the monument of Marshal Cachahiba d'Argolo in Bahia, Brazil; a statue of King Louis I for Kehlheim. Among the most important of his later works are a statue of Frauenhofer in Munich (1866); an equestrian statue of King William I of Württemberg for Cannstatt (1876); the "Emancipation" group of sculpture in New York (1867-68); and the "Passion" group at Oberammergau (1875). His work is characterized by its decorative quality, is carefully executed, and true to nature.

HALCYON DAYS (Lat. *halcyon*, influenced by popular confusion with Gk. ἅλς, *hals*, salt + κύων, *kyeín*, to conceive, from Gk. ἀλκυών, *alkyōn*, ἀλκυών, *halkyōn*, kingfisher; connected with Lat. *alcedo*, kingfisher). A name given by the ancients to the seven days which precede and the seven days which follow the shortest day of the year. The reference is to a fable that during this time, while the halcyon bird or kingfisher was breeding, there always prevailed calms at sea. From this the phrase "halcyon days" has come to signify times of peace and tranquillity.

HALCYONE, hăl-sī'ō-né. A Greek divinity. See **ALCYONE**.

HALDANE, hăl'dān, JAMES ALEXANDER (1708-1851). A Scottish clergyman, brother of Robert Haldane (q.v.). He was born at Dundee and educated at Edinburgh University. After some years on the sea he retired with his wife to Edinburgh (1794) in order to devote himself to religious work. He distributed tracts, organized Sabbath schools, and preached extensively in the villages and large towns of Scotland. He left the Church of Scotland in 1799 and founded a Congregational church in Edinburgh, the first in Scotland, and was ordained pastor. From 1801 till his death in Edinburgh, Feb. 8, 1851, he acted as pastor of Leith Walk Tabernacle, Edinburgh, without salary. In 1808 he embraced Baptist sentiments, a change which split the Scottish Congregational body. He wrote several controversial works against the Irvingites, Erskine of Linlathen, and others; also *Early Instruction Commended in a Narrative of Catherine Haldane* (his daughter, who died at the age of six), with an *Address to Parents on the Importance of Religion* (12th ed., 1801); *The Atonement* (1845; 5th ed., 1877); *An Exposition of Galatians* (1848). For his life, consult Alexander Haldane, *Memoirs, etc.* (London, 1852).

HALDANE, JOHN SCOTT (1860-). A British physiologist. He was born in Edinburgh, was educated at the University of Edinburgh and at Jena, and became fellow of New College, Oxford, and university reader in physiology. He was founder and joint editor of the *Journal of Hygiene*, wrote much on the physiology of respiration, and served on royal commissions, etc., on colliery explosions, deep-diving work (attaining a depth of 210 feet), and other questions of public health related to respiration. He devised the method of estimating the volume of the blood from its oxygen capacity.

HALDANE, RICHARD BURDON HALDANE, first Viscount (1856-). A British statesman and philosophical writer, grand-nephew of Robert and J. A. Haldane, born at Cloanden, Perthshire. He was educated at the universities of Edinburgh and Göttingen, was called to the bar in 1879, and became queen's counsel in

1890. He was Gifford lecturer at St. Andrews University in 1902-04 and became rector of Edinburgh University in 1905. He wrote *Life of Adam Smith*; a translation of Schopenhauer's *World as Will and Idea*; *Education and Empire* (1902); *The Pathway to Reality* (1903); *The Conduct of Life, and other Addresses* (1914). He entered on his political career in 1885 as member of the House of Commons for Haddingtonshire, for which he was continuously returned, the last time in 1910. He was Secretary for War in 1905-12, was created Viscount in 1911, and became Lord High Chancellor in 1912. In 1913 he spoke before the American Bar Association at Montreal, Canada, and was the first Lord Chancellor to visit the United States while in office; his address was published in 1914 as *The Higher Nationality*.

HALDANE, ROBERT (1764-1842). A philanthropist and preacher, brother of James Alexander Haldane. He was born Feb. 28, 1764, in London. He inherited a large property, but, having a passion for the sea, after studying but a short time in Edinburgh University, he entered the navy, where he served with honor (1780-83). He had high hopes of social reform from the French Revolution, but was disappointed in its outcome. Meantime he had become profoundly interested in religion and resolved to devote his life and fortune to its advancement, and in 1790 he selected India as a field for missionary operations; but as the East India Company refused to sanction the enterprise, it had to be given up. He then resolved to work at home. In company with Rowland Hill and others, he was very successful in awakening throughout Scotland a deep interest in the subject of religion. The unusual methods of work which they adopted excited the opposition of the Scottish General Assembly. Field preaching was forbidden, and other features of the revival were disapproved. Haldane seceded from the Established church (1799) and entered the Congregational body, and at his own cost erected tabernacles for public worship in many of the large towns of Scotland. In 1808 he adopted Baptist views, engaged in personal labors to promote religion in the south of France and in Switzerland (1816), and in 1817 removed to Montauban. By his work in Geneva a new impulse was given to evangelical Christianity, and an important theological school was established. In 1819 he returned to Scotland. Previously (1798) his attention had been directed to missionary work in Africa, and, as a beginning, he had 30 children brought to England from Sierra Leone to be educated. He wrote: *The Evidence and Authority of Divine Revelation* (1816; 2d ed., 1834); *The Books of the Old and New Testament Proved to be Canonical, and their Verbal Inspiration Maintained and Established* (1830; 7th ed., 1877); *Exposition of Romans* (1835; 2d ed., 1874). For his life, consult Alexander Haldane, *Memoirs*, etc. (London, 1852).

HALDEMAN, HAL'de-mán, BRUCE (1862-). An American newspaper publisher. He was born at Knoxville, Tenn., and was educated at the University of Virginia. From 1885 to 1895 he served in various capacities from reporter to managing editor of the Louisville *Courier Journal* and the Louisville *Times*. In 1902 he became president of the companies publishing these two papers and in 1910 he was elected president of the American Newspapers Publishers' Association.

HALDEMAN, SAMUEL SETHMAN (1812-80). An American naturalist and philologist, born at Locust Grove, Lancaster Co., Pa. He studied for two years at Dickinson College, was made assistant in the Geological Survey of New Jersey in 1836, and from 1837 to 1842 was engaged in similar service in Pennsylvania. He became professor of the natural sciences at the University of Pennsylvania in 1851 and in 1855 was called to a similar chair in Delaware College. From 1869 until his death he was professor of comparative linguistics in the University of Pennsylvania, he being the first to occupy the chair in that institution, and during this period made a careful study of Indian dialects. In 1876 he was elected president of the American Philological Association. In addition to numerous papers on scientific and philological subjects, he published: *Elements of Latin Pronunciation* (1851); *Taylor's Statistics on Coal* (2d ed., 1855); *Analytical Orthography: An Investigation of the Sounds of the Voice and their Alphabetic Notation* (1860); *Tours of a Chess Knight* (1864); *Affixes in their Origin and Application, Exhibiting the Etymologic Structure of English Words* (1865); *Pennsylvania Dutch* (1872); *Outlines of Etymology* (1877); *Word Building* (1881).

HALDIMAND, SIR FREDERICK (1718-91). A British soldier and administrator. He was born in the Canton of Neuchâtel, Switzerland, Aug. 11, 1718, and was early in the Sardinian army and under Frederick the Great. But he was in the Swiss Guard at The Hague in 1756, when, together with his friend and fellow countryman, Col. Henry Bouquet, he went to the British Colonies in America. During the French and Indian War he commanded, under Lord Loudoun, a regiment of Germans, Swiss, and other foreigners. They called themselves the Royal Americans. Haldimand successfully defended Oswego and thus saved Niagara (in 1759), was with General Amherst at the capitulation of Montreal (1760), was military governor at Three Rivers, for six years was in charge of the English garrison at Pensacola, Fla. (1767-73), and then in command at New York for about a year during Gage's leave of absence. He supported that general through the siege of Boston and was recalled to advise the British ministry upon American affairs, but was sent out again as Governor of Canada (1778-84). General Haldimand held down with a firm hand the French-Canadian sympathizers with the American Revolution and welcomed and cared for the many thousands of Loyalists who sought refuge in Canada during and after the war. He represented Great Britain in the Vermont negotiations with the Allens and others, and he left behind him a mass of most valuable official correspondence relating thereto, as well as to the general history of America for the latter half of the eighteenth century. These papers, called the Haldimand collection, were bequeathed to the British Museum by Sir Frederick's grand-nephew (1858), and have recently been copied for the Dominion Archives at Ottawa. Sir Frederick died in his native land, June 5, 1791. Consult McLlwraith, *Sir Frederick Haldimand* (Toronto, 1904).

HALE, BENJAMIN (1797-1863). An American educator. He was born at Newbury, Mass., graduated at Bowdoin College (1818), studied theology at Andover, and entered the Congregational ministry in 1822. The next year he be-

came a tutor at Bowdoin and from 1827 to 1835 was professor of chemistry and mineralogy at Dartmouth. In 1828 he was ordained to the priesthood of the Protestant Episcopal church. From 1836 to 1858 he was president of Geneva (now Hobart) College. He published: *Scriptural Illustrations of the Liturgy* (1835); *Liberty and Law* (1838); *Education in its Relations to a Free Government* (1838). Consult Douglass, *Life of Benjamin Hale* (1883).

HALE, CHARLES REUBEN (1837-1900). An American Protestant Episcopal bishop, born at Lewiston, Pa. He graduated at the University of Pennsylvania (1858), was a chaplain in the Union army (1863), and after varied service in Pennsylvania, New York, and Maryland became dean of Davenport, Iowa (1886), and Assistant Bishop of Springfield (1892), with the title of Bishop of Cairo. A High-Churchman in his theology, Bishop Hale was a prominent sympathizer with the Greek church; was secretary to the Russo-Greek Committee in 1871, and acted as clerk to the Commission on Correspondence with the hierarchs of the Eastern churches and of the Old Catholics (1874). His writings include: *A List of All the Sees and Bishops of the Holy Orthodox Church of the East* (1872); *The Mozarabic Liturgy, and the Mexican Church* (1876); *Russian Missions in China and Japan* (1878); *Order for Holy Communion, Arranged from the Mozarabic Liturgy* (1879); *The Universal Episcopate* (1882); *A Visit to the Eastern Churches in the Interest of Church Unity* (1886); *The American Church and Methodism* (1889).

HALE, EDWARD EVERETT (1822-1909). An American author, philanthropist, and Unitarian clergyman, son of Nathan Hale (1784-1863). He was born in Boston, Mass., April 3, 1822, was educated at the Boston Latin School, graduated at Harvard in 1839, and received an honorary degree 40 years later. After a short period of tutoring he studied theology and was pastor of the church of the Unity at Worcester from 1846 to 1856. He then became pastor at the South Congregational Church of Boston and took an active interest in all the philanthropic movements of his city and time. He became pastor emeritus of this church in 1901 and in 1903 was appointed chaplain of the United States Senate. He was a member of the National Academy of Arts and Letters. A collected edition of his works, in 10 volumes, was completed in 1901, but it represents only a small portion of his literary work. He contributed voluminously to magazines and newspapers and edited several of them; e.g., the *Christian Examiner*, and *Old and New* (1869-75), a magazine of which he was founder, and which finally was merged into *Scribner's Monthly*. He also took great interest in history and especially in Spanish-American affairs, contributed to Winsor's great coöperative histories, edited Lingard's *England* (1853), and wrote a *Chautauquan History of the United States* (1887); a *Life of Washington* (1887); *Franklin in France*, with his son, E. E. Hale, Jr. (1887-88); and other kindred works. With his sister, Susan Hale, he wrote several volumes of travels. In *A New England Boyhood* (1893) and in *James Russell Lowell and his Friends* (1889), he gave his reminiscences of New England and New Englanders of the past. But he is perhaps best known for his fiction, and especially for one short story, the famous and effective *Man With-*

out a Country, published anonymously in the *Atlantic Monthly* in 1863. Another short story, *My Double, and How He Undid Me*, published in the same periodical in 1859, also attracted great attention. But his most influential book is his *Ten Times One is Ten* (1870), which, with *In His Name* (1873), led to the formation of many charitable organizations—Lend-a-Hand clubs, King's Daughters, etc. He wrote also *Kansas and Nebraska* (1854); *If, Yes, and Perhaps* (1868); *The Ingham Papers* (1869); *His Level Best and Other Stories* (1870); *Sybaris and Other Homes* (1871); *Philip Nolan's Friends* (1876), a romance of the early Southwest; *The Kingdom of God* (1880); *Christmas at Narragansett* (1885); *East and West* (1892); *For Fifty Years* (1893), poems; *Ralph Waldo Emerson* (1899). His *Memories of a Hundred Years* appeared in 1902; *We, the People* (1903); *Prayers in the Senate* (1904); *Foundations of the Republic* (1906). He died at Roxbury, Mass., June 10, 1909. No adequate biography of him has been written. Consult: *Works* (10 vols., Boston, 1899-1901); A. S. Garver, in *American Antiquarian Society Proceedings*, vol. xx, pp. 60-69 (Worcester, 1909); H. C. Vedder, *American Writers of To-day* (New York, 1910).

HALE, EDWARD EVERETT, JR. (1863-). An American writer and professor of English, son of Edward Everett Hale. He was born in Boston and graduated from Harvard University in 1883 and as Ph.D. from the University of Halle in 1892. He was instructor and assistant professor of English at Cornell University in 1886-90, fellow at Harvard in 1890-92, and professor of English at the Iowa State College in 1892-95. In 1895 he accepted the chair of English at Union College. Besides editing college and school texts and contributing to the *Dial* after 1893, he published: *Constructive Rhetoric* (1896); *James Russell Lowell* (1899); *Dramatists of To-day* (1905; 6th ed., 1911); *Seaward* (1910); and contributed to the *NEW INTERNATIONAL ENCYCLOPEDIA*.

HALE, EUGENE (1836-). An American legislator, born at Turner, Me. He studied law at Portland and was admitted to the bar in 1857. He was sent to the Maine Legislature in 1867, thence to the Forty-first Congress in 1868, and was four times reelected. During his congressional career he served on the Committee on Appropriations and during his last term was chairman of the Republican Congressional Committee. Hale was a delegate to the Republican conventions of 1868, 1876, and 1880, and strongly urged the nomination of Blaine in the last two. He declined the Post-office portfolio in Grant's second cabinet (1874), and, after service in Grant's "private commission" for the canvass of the presidential vote in Louisiana (1876), refused the post of Secretary of the Navy offered him by President Hayes in 1877. In 1871 he married Mary Chandler, daughter of Senator Chandler, of Michigan. He was elected to the Senate in 1881 to succeed Hannibal Hamlin and was reelected for four successive terms. During the first two years of President Taft's administration he, with Senator Aldrich, was majority leader of the Senate. He retired in 1911, after a longer service than that of any other Senator then in office.

HALE, GEORGE ELLERY (1868-). An American astronomer, born in Chicago. He was educated at Massachusetts Institute of Technology (1890), at the Observatory of Harvard

College (1889-90), and at Berlin (1893-94). In 1890 he was appointed director of the Kenwood Astrophysical Observatory. He was professor of Astrophysics at Beloit College (1891-93), associate professor at the University of Chicago until 1897, and full professor (1897-1905). He was director of the Yerkes Observatory in 1895-1905, and became director of the Solar Observatory of the Carnegie Institution at Mount Wilson, Cal., in 1904. Hale made special study of spectroscopy and invented the spectroheliograph, with which he made his discoveries of the solar vortices and magnetic fields of sun spots. He was coeditor of *Astronomy and Astrophysics* in 1892-95 and after 1895 editor of the *Astrophysical Journal*, in which he published the results of much of his work. He is also author of many numbers of the *Contributions* of the Mount Wilson Observatory.

HALE, HORATIO (1817-96). An American ethnologist. He was born in Newport, N. H., the son of Mrs. Sarah J. Hale (q.v.), graduated at Harvard in 1837, and accompanied, as philologist, the United States exploring expedition under Wilkes. He made a careful study of the languages and customs of the Pacific islands and published the results of his investigations in his *Ethnography and Philology* (1846). After his return he made a study of the Indians of Canada. He studied in Europe (1846-55), and in the latter year was admitted to the Chicago bar, but soon removed to Clinton, Ontario, where he resided until his death. He was a member of many learned societies and in 1886 was president of the anthropology section of the American Association for the Advancement of Science. His writings include: *Indian Migrations as Evidenced by Language* (1883); *The Iroquois Book of Rites* (1883); *The Development of Language* (1888).

HALE, JOHN PARKER (1806-73). An American statesman and orator, born in Rochester, N. H. He studied at Phillips Exeter Academy, graduated at Bowdoin College in 1827, and three years later was admitted to the bar. His political career began in 1832, when, as a strong Jacksonian Democrat, he was elected to the New Hampshire State Legislature. In 1834 he was appointed by President Jackson United States district attorney for New Hampshire, was reappointed by Van Buren in 1838, and served until removed by Tyler in 1841. His nomination and election to Congress in 1842 followed naturally. Once in Congress, however, he soon asserted his independence and spoke and voted against the adoption of the "gag rule" (q.v.), intended to put a stop to antislavery petitions. He still remained a staunch Democrat, however, supported Polk and Dallas in the campaign of 1844, and was renominated without opposition. Before the congressional election, however, Texan annexation having been adopted by the Democratic party as one of the main features of its programme, the New Hampshire Legislature, in December, 1844, passed resolutions instructing its Senators and Congressmen to favor that policy. Hale, however, came out with a public statement opposing annexation on antislavery grounds. The Democratic State Convention was thereupon hastily reassembled at Concord. Hale was branded as a traitor to the party, and his name was stricken from the ticket. In the subsequent election he ran as an independent candidate, and as neither he, the regular candidate, nor the Whig candidate obtained

a majority of the votes cast, the district was unrepresented. In the face of an apparently invincible Democratic majority, he set out to win the State over to the antislavery cause, addressed meetings in every town and village in New Hampshire, carrying on a remarkable canvass known as the "Hale Storm of 1845," and was rewarded with seeing the State choose a Legislature in which the Whigs and Independent Democrats had a majority of the votes. He himself was elected to the Lower House and was chosen Speaker and in 1847 was elected to the United States Senate. True to his convictions, he alone refused to vote in favor of the resolution tendering the thanks of Congress to Scott and Taylor for their victories in the Mexican War. In 1849 he was joined in the Senate by Chase and Seward, and in 1851 by Sumner, as coadvocates of the antislavery cause. He was nominated for the presidency by the Liberty party in October, 1847, but withdrew in favor of Van Buren, whom he supported in the campaign of 1848. In 1851 he was counsel for the rescuers of the slave Shadrach in Boston. At the national convention of Free Soil Democrats, held at Pittsburgh in 1852, Hale was nominated for President, and George W. Julian, of Indiana, for Vice President. The ticket polled 157,685 votes. At the expiration of his senatorial term in 1853, Hale was succeeded by Charles G. Atherton; but after two years, which he spent in law practice in New York, the Legislature of New Hampshire having again an antislavery majority, he was elected to fill the vacancy caused by Senator Atherton's death. In 1858 he was reelected, as a Republican, for a full term and served until 1865, completing, in all, a service of 16 years in the Senate. During the Civil War he consistently supported President Lincoln's policy, and upon his retirement from the Senate he was appointed Minister to Spain, where he remained for four years.

HALE, SIR MATTHEW (1609-76). A distinguished English lawyer and judge, born at Alderley in Gloucestershire, Nov. 1, 1609. His paternal grandfather was a wealthy tradesman, while his mother was a member of the noble family of Poyntz of Acton. Left an orphan at the age of five, he was placed under the care of the Puritan vicar of Wotton-under-Edge, who prepared him for college. He entered Magdalen Hall, Oxford, at 16; at the age of 20 he was enrolled as a member of Lincoln's Inn and entered upon the study of the law with great zeal and industry. During this period he is said to have worked 16 hours a day, reading and rereading all the yearbooks, reports, and law treatises in print, delving into the records of the Tower of London and other repositories of antiquarian law. He also devoted considerable time to investigations in Roman law, in mathematics, in physics, chemistry, history, philosophy, medicine, and theology. Called to the bar in 1637, he quickly gained a large practice and soon became prominent also in public affairs. While a Puritan in principle, he was not a partisan by nature, nor was he an antiroyalist. As long as possible he maintained a position of neutrality between the opposing factions in the state. Upon the triumph of the Parliamentary party under Cromwell he signed the Solemn League and Covenant, sat in the Assembly of Divines at Westminster, labored to bring about a settlement between the King and Parliament, and after the execution of Charles I threw in his lot

with the Commonwealth. Although, as a member of the Commons, he spoke in favor of subordinating "the single person" to Parliament, the Protector made him a judge of the Court of Common Pleas in 1653. He declined a reappointment by Richard Cromwell. Having taken an active part in the restoration of Charles II, that monarch appointed him Chief Baron of the Exchequer in 1660 and made him Knight. Eleven years later Hale was made Chief Justice of the King's Bench, then the highest judicial office in England—a position which he held until failing health forced him to resign in February, 1676. Upon his withdrawal from public life he retired to his native Alderley, where he died the following Christmas.

Hale's fame as a lawyer and a judge is very great. Lord Campbell accounts him "the most eminent judge who ever filled the office of Chief Baron." His authority upon legal questions was deemed well-nigh infallible during the latter years of his life. His *Analysis of the Law* furnished Blackstone with an outline for his *Commentaries*. The other legal publications of Sir Matthew Hale which are most highly esteemed are: *De Jure Maris*; *Commentary to Fitcherbert's Natura Brevium*; *A History of the Common Law*. He bequeathed many valuable manuscripts to Lincoln's Inn, where they are still treasured. Consult: Burnet, *Life and Death of Sir Matthew Hale* (London, 1682); Williams, *Life of Hale* (ib., 1835); Campbell, *Lives of the Chief Justices* (Boston, 1873); *Dictionary of National Biography*, vol. xxiv (London, 1890).

HALE, NATHAN (1755–76). A Revolutionary patriot, who met his death under circumstances that have made him famous in American history. He was born at Coventry, Conn., June 6, 1755, graduated with high honors at Yale in 1773, taught school at East Haddam from October, 1773, to March, 1774, and afterward at New London until soon after the outbreak of the Revolutionary War, when (July 1, 1775) he became first lieutenant in a Connecticut regiment, commanded by Charles Webb. For a short time he was engaged on recruiting duty at New London, then served at the siege of Boston, and on September 1 became a captain lieutenant. On Jan. 1, 1776, he was formally commissioned a captain in the regular continental service. In March, 1776, he started with Heath's brigade for New York, where soon afterward (according to a doubtful tradition) he, with several picked men, captured by night a British provision sloop protected by the man-of-war *Asia*. While in the vicinity of New York he served as a member of a small harassing body known as Knowlton's Rangers. Early in September he volunteered to visit Long Island and New York, to secure some much-needed information concerning the enemy. Entering the British lines disguised as a Dutch school-teacher, he obtained the desired information and was about to return, when, on the night of September 21, he was recognized and captured. On the following morning he was hanged as a spy, having previously, it is said, been denied the use of a Bible or a visit from a minister, and having had the letters which he had written to his mother and his fiancée destroyed before his eyes. His last words were: "I only regret that I have but one life to lose for my country." There are statues of Hale in Hartford, Conn., and in City Hall Park, New York—the former by Gerhard and the latter by Macmonnies. The best biography is that by John-

ston (New York, 1901). Consult also: Lossing, *The Two Spies, Nathan Hale and John André* (ib., 1886); Brown, *Nathan Hale, the Martyr Spy* (ib., 1899); Holloway, *Nathan Hale, the Martyr Hero* (ib., 1899); W. O. Partridge, *Nathan Hale, The Ideal Patriot* (ib., 1902).

HALE, NATHAN (1784–1863). An American journalist, the nephew of Nathan Hale the patriot, and the father of the Rev. Dr. Edward Everett Hale. He was born at Westhampton, Mass., graduated at Williams College in 1804, studied law, and in 1810 was admitted to the bar in Boston. In 1814, with Henry D. Sedgwick, he began to edit the *Weekly Messenger*. In the same year Hale also bought the *Boston Daily Advertiser*, the first daily journal in New England. By means of it he first introduced regular editorial comment as a feature of American journalism. He is also credited with having been the first newspaper publisher in New England to adopt steam power presses. The *Advertiser* was originally Federalist in politics, and when that party went out of existence naturally gave its support first to the Whig and then to the Republican party. Hale opposed the Missouri Compromise in 1820 and the Kansas-Nebraska Bill in 1854 and was a vigorous advocate of the colonization of Kansas by "Free State" settlers. For many years he was a member of the State Legislature. He was one of the founders of the *North American Review* (1815) and of the *Christian Examiner* (1823).

HALE, PHILIP (1854–). An American music critic. He was born at Norwich, Vt., and from childhood was remarkable for his musical talent. He graduated at Yale in 1876 and was admitted to the bar at Albany in 1880. After his graduation his musical studies kept pace with his reading in law, Dudley Buck being his teacher. He was in Europe from 1882 to 1887, during which period he studied the organ with Haupt, Faiszt, Rheinberger, and Guilmant; composition with Urban, Bargiel, Rheinberger, and Guilmant; and the pianoforte with Raif and Scholz. Returning to the United States, he held the following appointments: 1879–82, organist of St. Peter's, Albany; 1887–89, at St. John's, Troy; 1889, of First Religious Society of Roxbury, Mass.; and 1887–89, conductor of the Schubert Male Chorus Club. From 1889 to 1903 he was musical critic of the *Boston Journal*; 1897–1901, editor of the *Musical Record*; 1901–03, of the *Musical World*. After 1900 he wrote the analytical notes of the programmes of the Boston Symphony Orchestra and after 1903 was connected with the staff of the *Boston Herald* as editorial writer and musical editor.

HALE, SALMA (1787–1866). An American historian and politician, born in Alstead, Cheshire Co., N. H. He learned printing in the office of a paper in Walpole, N. H., and at the age of 18 became editor of the *Walpole Political Observatory*. In 1813 he moved to the neighboring town of Keene, where he studied law, but was not admitted to the bar until 1834. He was elected to Congress as a Republican (Democrat) in 1816, but declined a reelection. During the following years he held several local political offices and was secretary to the Boundary Commission appointed to determine the northeastern frontier of the United States. He interested himself in the causes of temperance, education, abolition, and Unitarianism, and while in Congress opposed the Missouri Compromise. His works include: *A History of the*

United States for Schools (1821), which won a \$400 prize and gold medal offered by the American Academy of Belles Lettres of New York; *The Annals of the Town of Keene* (1826); a number of other books, orations, and articles in newspapers and periodicals, as well as one or two translations.

HALE, SARAH JOSEPH (BUELL) (1788-1879). An American editor and author, born in Newport, N. H. After the death of her husband, in 1822, she turned to literature and throughout the rest of her life was constantly engaged in writing and editing. She took charge of the *Boston Ladies' Magazine* in 1828 and conducted *Godey's Lady's Book* after its consolidation with the former in 1837. She advocated the social and intellectual advancement of women and is said first to have suggested Thanksgiving Day as a national holiday. She was also active in raising money to complete the Bunker Hill Monument. She published many volumes of poems, some of which had great contemporary popularity, and edited several anthologies. She also published: *Northwood* (1827); *Sketches of American Character* (1830); *Traits of American Life* (1835); *Grosvenor: A Tragedy* (1838); *Alice Ray* (1840), a romance in rhyme; *The Judge: A Drama of American Life* (1854); *Woman's Record, or Sketches of Distinguished Women from the Creation to the Present Day* (1853). She edited *The Letters of Madame de Sévigné* (1850), *The Letters of Lady Mary Wortley Montagu* (1856), and other works.

HALE, WILLIAM BAYARD (1809-). An American journalist, born at Richmond, Ind. Educated at Boston and Harvard universities and at the Episcopal Theological Seminary, Cambridge, Mass., from 1829 to 1839 he was rector at Middleboro, Mass., and then for a year rector at Ardmore, Pa. He was managing editor of the *Cosmopolitan Magazine* (1900), editor of *Current Literature* (1901), special correspondent for the *New York World* (1902), managing editor of the *Philadelphia Public Ledger* (1903-07), editor of the *New York Times* "Saturday Review of Books" (1906-08), Paris correspondent of the *New York Times*, and on the staff of the *World's Work* (1909). His writings include: *The Eternal Teacher* (1895); *The Making of the American Constitution* (1896); *Phillips Brooks, a Memorial; The New Obedience* (1898); *A Week in the White House with Theodore Roosevelt* (1908); *Woodrow Wilson: The Story of his Life* (1912).

HALE, WILLIAM GARDNER (1849-). An eminent American Latinist, born in Savannah, Ga. He graduated from Harvard University in 1870 and studied at the universities of Leipzig and Göttingen (1876-77). He served as tutor in Latin at Harvard from 1874 to 1876 and from 1877 to 1880. In 1880 he was appointed professor of Latin at Cornell University, and in 1892 accepted appointment as head of the Latin department in the University of Chicago. His publications include: "The Cum-Constructions: Their History and Functions," in *Cornell Studies in Classical Philology* (1887-89); "The Sequence of Tenses in Latin," in *American Journal of Philology*, vols. viii-ix (1887-88); *The Anticipatory Subjunctive in Greek and Latin* (1894); *A Latin Grammar* (1903), with C. D. Buck; various papers in classical journals; and several school books in Latin. He took a prominent part in establishing the American School of Classical Studies at Rome and was its first director

(1895-96). He received the degree of LL.D. from Union College in 1893, from Princeton University in 1896, from St. Andrews and Aberdeen in 1907. In 1892 he was elected president of the American Philological Association.

HÁLEK, hál'ek, VÍTEZSLAV (1835-74). A Bohemian poet, born at Dolíněk and educated at Prague. He devoted himself to journalism, but his talent was poetic and more especially lyric, and his collected lyrics, *Upřírodě* (In Nature, 1872-74) and *Večerní písně* (Evening Songs, 11th ed., 1891), rank him with Neruda, as among the foremost of the modern Czech poets. He also wrote the epic poems: *Krásná Lejla* (1849); *Alfred* (1858); *Mejrima a Husejn* (1859); *Goar* (1864); *Cerný prápor* (The Black Flag, 1867); *Dědicové Bílé Hory* (The Heirs of the White Mountain, 1869); *Děvče z Tater* (The Tatra Maiden, 1871); *Pohádky z naší vesnice* (Tales from our Village, 1873), in which lyric and epic mingle. His plays, *Carevič Aloksaj, Zaviš z Falkenštejna*, and *Král Rudolf*, were fairly successful. A complete edition of his works, including some fiction, was published at Prague (1878-87), with a biography.

HALEN, hál'en, or HALEM, hál'ém, DON JUAN VAN, COUNT OF PENACAMPOS (1790-1864). A Spanish general and patriot of Belgian descent, born on the Isla de León. He entered the navy when he was 15 and was present at the battle of Trafalgar. He took part in the rising against the French at Madrid (May 2, 1808) and at Ferrol was captured, but joined the French army and became an artillery officer under Joseph Bonaparte (1809). In 1813 he went to Barcelona in Suchet's staff, joined a Spanish patriotic society, and treacherously surrendered Lérida, Monzón, and Mequinenza. Two years afterward he was accused of complicity in a conspiracy against Ferdinand VII and was imprisoned, but almost immediately released and made a lieutenant. Again, in 1817, he was involved in Torrijó's plot, was put in the prison of the Inquisition, but escaped and fled to Russia where he entered the army and served in the Caucasus. In 1821 he returned to Spain and fought under Mina for the Constitutionalist party. He took part in politics and was prominent in the Belgian revolution of 1830, being placed at the head of the insurgent forces, but soon after the expulsion of the Dutch from Brussels he quarreled with De Potter and resigned. Once more in Spain (1834), he was appointed Cordova's adjutant and served with success against the Carlists (1836). In 1840 he was made captain general of Catalonia. In 1842 he put down the uprising in Barcelona, but the opposition to Espartero had grown too strong in 1843, and he escaped to England in July. He returned to Spain in 1850 and in 1854 became president of the Supreme Navy and Army Court. He wrote: *Relación de su cautividad en los calabozos de la Inquisición, su evasión y emigración* (1827); *Memoires* (1827); *Les quatre journées de Bruxelles* (1831).

HALES, hálz, ALEXANDER OF. See **ALEXANDER OF HALES.**

HALES, JOHN (1584-1656). A Church of England divine. He was born at Bath, April 19, 1584, educated at Oxford, became fellow of Merton (1605), fellow of Eton (1613), canon of Windsor (1639), but was ejected by the Parliamentary committee from his canonry (1642) and his Eton fellowship (1649). He died at Eton, May 19, 1656. In 1618-19 he was present

in the Synod of Dort (q.v.) and has given an interesting account of it. The discussions changed him from Calvinism to Latitudinarianism. His learning, popularity, and practical sense were so admired by his contemporaries that they thought posterity could not possibly forget him, and his first editor issued his works under the caption *Golden Remains of the Ever Memorable Mr. John Hales* (London, 1659); a fuller collection appeared in Glasgow (3 vols., 1765). His most famous single work is his *Tract Concerning Schism and Schismatics*, written in 1630, but not printed till 1642.

HALES, STEPHEN (1677-1761). An English physiologist and inventor. He was born at Bekesbourne, Kent, and died at Teddington, Middlesex, in 1761. He entered Corpus Christi College, Cambridge, in 1696, was elected fellow in 1702, and, having taken holy orders, was presented about 1710 to the perpetual curacy of Teddington. He was a fellow of the Royal Society and trustee for the Colony of Georgia. He was the author of *Statistical Essays*, the first part of which was published under the title of *Vegetable Staticks, or an Account of Some Statical Experiments on the Sap of Vegetables* (1727), and which rapidly acquired so high a reputation as to be translated into French, German, Dutch, and Italian, and may be considered the starting point of our true knowledge of vegetable physiology. A second part of this work, under the title *Hæmostaticks* and treating of the circulation of the blood, appeared in 1733. In addition to valuable researches in botany and physiology, he contributed numerous memoirs to the *Philosophical Transactions* on ventilation, on the method of keeping water fresh, on electricity, on the analysis of the air, etc. Ventilating machines which he invented were introduced into London prisons and were found most efficacious in diminishing mortality among the prisoners. His system was also adopted in France with similar good results. He wrote a number of essays on the evils of the drinking of spirits, which were extremely popular and widely circulated in the cause of temperance. In his experiments with gases he collected them over water—a method which was extensively employed by Priestley and other workers in the field.

HA-LEVI, hā-lā'vê, JUDAH. A Jewish poet and scholar of the eleventh and twelfth centuries. See JUDAH, BEN SAMUEL.

HALÉVY, a'lā'vê, JACQUES FRANÇOIS FROMENTAL (1799-1862). A celebrated French dramatic composer, born in Paris, of Jewish parentage. After a little preparatory study he entered the solfège class of the Paris Conservatory in 1809. The following year he undertook the study of the pianoforte under Charles Lambert and in 1811 of harmony under Berton. Five years in the study of counterpoint under Cherubini followed, after which in 1819 he won the Prix de Rome with a cantata, *Herminie*. His time in Italy was devoted principally to operatic composition, and after considerable difficulty he succeeded in having the result of his labors, the opera *L'Artisan*, presented in Paris in 1827. The public, however, received it coldly and refused the composer any recognition until, in 1834, his successful treatment of Hérold's unfinished opera, *Ludovic*, which he completed, won general commendation from critics and public alike. *La Juive*, produced in 1835, marked his first triumph and was followed six months later by the equally successful *L'Éclair*. *Guido et*

Ginevra (1838) met with but an indifferent reception, a fate which pursued *Les treize* (1839) and *Le Drapier* (1840). With *La reine de Chypre* (1841) his first success was repeated. He held many important positions, beginning as a teacher at the conservatory in 1827, and being appointed at the same school professor of theory in 1833 and of composition in 1840. He also served as accompanying pianist at the Théâtre Italien (1827) and as *chef du chant* at the Grand Opéra (1829). Among his pupils were Gounod, Victor Massé, Bizet, Bazin, and Henri Duvernoy. As a composer, he suffered from Meyerbeer's overshadowing popularity, although he is regarded as possessing a far greater depth of sentiment than his more successful confrère. Certain it is that he did not consult the public, and in consequence his music was frequently misunderstood. His masterpiece is undoubtedly *La Juive*, which is deservedly recognized as a classic. He was elected permanent secretary of the Académie des Beaux-Arts in 1854. He died in Nice, but was buried in Paris. For his life, consult Léon Halévy, *F. Halévy, sa vie, ses œuvres* (Paris, 1863), which contains a full account of all his numerous compositions.

HALÉVY, JOSEPH (1827-). A French Orientalist, born at Adrianople, Turkey. He studied at Jewish colleges in Adrianople and Bucharest and attracted some attention by his Hebrew verse. In 1868 he was commissioned by the Alliance Israélite Universelle to study conditions among the Falashas of Abyssinia and in 1869-70, under the direction of the Académie des Inscriptions, traveled in Yemen, where he obtained copies of 686 inscriptions, chiefly Sabæan and Himyaritic, later published in his *Rapport sur une mission archéologique dans le Yémen* (1872). He was appointed adjunct professor of Ethiopic at the Ecole des Hautes Etudes and assistant librarian of the Asiatic Society. As an Assyriologist, he is known for his contention that the Sumerian people and literature never existed, and that their so-called writing was a cryptography invented by the Babylonian priests to lend greater secrecy to their compositions. Halévy also became prominent as a biblical critic. His publications include further: *Voyage au Nedjran* (1873); *Études sabéennes* (1875); *Études berbères, épigraphie lybique* (1875); *La prétendue langue d'Accad, est-elle touranienne?* (1875); *Recherches critiques sur l'origine de la civilisation babylonienne* (1876); *Mélanges de critique et d'histoire relatifs aux peuples sémitiques* (1883); *an Essai sur l'origine des écritures indiennes* (1886); *Précis d'Allographie assyro-babylonienne* (1912). A series of *Recherches bibliques*, published by him in the *Revue des Études Juives* from 1886 to 1892, was continued from 1893 in the *Revue Sémitique d'Épigraphie et d'Histoire Ancienne*, which he founded in the beginning of that year, and in which he published during 20 years a very large number of important articles dealing with epigraphy, philology, biblical interpretation, and history. He also wrote much for the *Revue Critique* and the *Journal Asiatique*.

HALÉVY, LÉON (1802-83). A French man of letters, born in Paris, brother of Jacques François Halévy the composer. He became a supporter of Saint-Simon and one of the founders of *Le Producteur*. In 1831 he was appointed adjunct professor of literature in the Ecole Polytechnique and from 1837 to 1853 was

chief of the bureau of historical monuments in the Ministry of Public Instruction. His works include: *Recueils de fables* (1844 and 1856) and *La Grèce tragique* (1846), both of which were crowned by the French Academy; *Vie de François Halévy* (1862); and several dramatic works, including *Le Czar Démétrius* (1829), *Electre* (1864), and *La mort de Nostradamus* (1875).

HALÉVY, LUDOVIC (1834-1908). A French dramatist, born in Paris. He achieved great popularity during the Second Empire for work in collaboration with Henri Meilhac (q.v.) in light comedy and by writing Offenbach's most popular librettos. Their first great success was *La belle Hélène* (1865), followed by *Barbe bleue* (1866); *La grande duchesse* (1867); *La Périchole* (1868); *Carmen* (1875); and *Le petit duc* (1878). They wrote also during this period farces of unusual levity and towards the close of the Empire essayed the serious though sensational drama in *Frou-Frou* (1869), one of the greatest theatrical successes of the century. From the literary point of view the best of their joint work is in realistic and farcical satires, such as *Tricoche et Cacolet* (1872), *La boule*, or, in still lighter vein, the sparkling, effervescing one-act play *Réveillon* and the clever but unsavory *Toto chez Tata*. Both Meilhac and Halévy worked also independently. Here Halévy devoted himself almost wholly to novelistic satire and idyllic sketches. Of the former, the best are the three astonishingly clever volumes on the Cardinal family: *M. et Mme. Cardinal* (1873); *Les petites Cardinal* (1880); *La famille Cardinal* (1883), whose head is a "corrupt Puritanic Prudhomme of vice." Of the latter, *L'Abbé Constantin* (1882) is world-renowned for its fresh charm, and the early part of *Oriquette* (1883) is hardly less winning in its picture of a theatrical Parisian gamine. In these single-handed works we easily discern the characteristic traits of Halévy's genius—taste, refinement, and pathos. He was elected to the Academy in 1884. The dramatic works (*Théâtre complet*) of Halévy and Meilhac were published in eight volumes (1900-02). Consult Matthews, *French Dramatists of the Nineteenth Century* (3d ed., New York, 1901), and H. d'Alméras, *Avant la gloire; leurs débuts* (Paris, 1903).

HALFA. A name for esparto (q.v.), a Spanish grass used in paper making. See FEATHER GRASS.

HALF APE. A book name for a lemur (q.v.).

HALF-BEAK. One of a group of syngnathous marine fishes, related to the pikes and needlefishes, and constituting the family Hemiramphidae, which are conspicuously distinguished by the shortness of the upper half of the beak-like jaw, the lower mandible being variously prolonged beyond it. (See Plate of NEEDLEFISH, PIKES, ETC.) All are small, about a foot in length, handsomely colored, and mostly remain near shore in warm latitudes. They swim near the surface, often in large schools, and feed on algæ; they are excellent to eat. The common Spanish name in the West Indies is balao (dancer), and some species are called pajarito and escribano; while one beautiful and rather peculiar form (*Ohridorus atherinoides*), abundant at Key West, Fla., is called hardhead.

HALF BLOOD. In English and American law, the relationship of persons who have one parent only in common, as half brothers, etc. When two persons have the same father, but not the same mother, they are said to be con-

sanguineous; when they have the same mother only, they are called uterine brothers or sisters. In the succession to real property in England the half-blood relations of the father's side succeed after the full-blood relations; and next the half-blood relations of the mother's side. This is a modification of the common-law rule, however, as by that law persons of the half blood were excluded entirely from the line of descent and were not capable of inheriting from each other. In Scotland, also, the half-blood consanguineous succeed to heritable estates in the same way, though not in identically the same order; but the half-blood uterine never succeed in any event. In England, as regards personal estate, the half blood on both sides succeed indiscriminately and share equally with the full blood. But in Scotland the half blood succeed to movable property only after all the full blood and their descendants are exhausted, and then the half blood by the father's side succeed in exclusion of the half blood by the mother's side, who do not come in until the succession reaches a distant point, viz., where the nearest relations are uncles and aunts paternal, or their descendants, in which case only the half-blood uterine after the mother's death take half the property, and the paternal relatives the other half.

The common-law disability of the half blood formerly existed in the United States, but has everywhere been wholly or partially removed by statute. In some States the modern English rule has been adopted, brothers or sisters of the half blood succeeding after those of full blood, while in others no distinction whatever is made between them. It is to be observed that the distinction between the whole and half blood exists only in determining the relationship of brothers and sisters to one another and for the purpose of determining the descent of property from one of these to the other, all children being equally related to a common parent. See CONSANGUINITY; DESCENT.

HALF BREEDS. A political nickname applied, in 1881 and the years immediately following, to members of a faction in the Republican party in the State of New York which favored the administration in the controversy between President Garfield and Senators Platt and Conkling (the Stalwarts, q.v.) and opposed the regular Republican candidate for the governorship of the State, Folger, thus bringing about the election of the Democratic candidate, Grover Cleveland. President Garfield was victorious, Senators Platt and Conkling resigned in order to be reelected and discredit the President, but were defeated by the Half-Breed candidates, Miller and Lapham. The name was given in derision, as denoting those who were but half Republican. The term was also used to some extent in other States.

HALF MOON, THE. The name of the ship in which Henry Hudson, commissioned by the Dutch East India Company, in 1609, undertook his voyage in search of the Northwest Passage, and in which he skirted the New England coast and sailed up the Hudson River.

HALF MOON, THE. A former tavern in Aldersgate, London, once the resort of many literary men. Its present designation, Shakespeare's House, is without foundation.

HALF PAY. See PAY and ALLOWANCES.

HALF SNIPE. The British jacksnipe (q.v.).

HALF TIMBER. A system of construction

in which the interstices of a heavy timber framing of uprights, horizontals, and braces are filled up with masonry of brick or rubble or with lath and plaster. It was much used in Europe in the Middle Ages and is still employed in England to some extent for country houses.

HALF TONE. See PHOTO ENGRAVING.

HALFWAY COVENANT. The designation given to a peculiar modification of church membership which arose in early New England. According to the view prevalent in the Congregational churches of New England at their foundation, the only proper members of a local church were men and women of personal Christian faith and experience and their minor children. The growth to maturity of the children of the first settlers raised the question of the permanent ecclesiastical status of such children. Were they still members, though lacking a personal Christian experience? The question was answered in the affirmative by many early New England ministers, by a ministerial convention which met at the request of Connecticut and summons of Massachusetts in 1657, and by a synod of the Massachusetts churches in 1662. It was held by them that such as were members themselves in infancy by reason of their parents' membership were still sufficiently members when of mature years, even if not of conscious Christian experience, to transmit the same degree of membership in turn to their children and to have their children baptized. To bring their children for baptism they must enter into a "covenant" with the church to submit to its discipline and give an intellectual assent, at least, to the main truths of Christianity. In the absence, however, of a personal Christian experience they were not fit to partake of the Communion. Hence the name "halfway," or halfway into full church membership. The ascription of a political significance to the system (increased access to the franchise) is without foundation. The system was the occasion of long controversy in New England; it was opposed by Jonathan Edwards and his disciples, and died out in the early part of the nineteenth century. Consult: Walker, *Creeds and Platforms of Congregationalism* (New York, 1893); Allen, *Jonathan Edwards* (Boston, 1889); Byington, *The Puritan in England and New England* (ib., 1896).

HALFIED, NATHANIEL BRASSEY (1751-1830). An English Orientalist, born at Westminster. He studied at Christ Church, Oxford, and afterward went to India, where, at the instance of Warren Hastings, he translated a digest of the Sanskrit law books, under the title *A Code of Gentoo Law, etc.* (1776). This work went through three editions and was translated into French in 1778. After his return to England in 1785 he was elected to Parliament (1790), of which body he continued a member until 1795. He afterward took a prominent part in the defense of the prophetic claims of Richard Brothers, whose teachings, bearing considerable resemblance to Oriental mysticism, had captivated him. His collection of Oriental manuscripts was purchased by the British Museum. His publications include: *A Grammar of the Bengal Language* (1778); *A Narrative of the Events . . . in Bombay and Bengal Relative to the Marhatta Empire* (1779); *Imitations of Some of the Epigrams of Martial* (1793).

HALIBURTON, hāl'bur'tn, HUGH. See ROBERTSON, JAMES L.

HALIBURTON, THOMAS CHANDLER (1796-

1865). A British-American humorist who wrote under the pen name of "Sam Slick." He was born at Windsor, Nova Scotia, and was educated at King's College in his native town. He was called to the bar in 1820, was raised to the bench of the Common Pleas in 1828, and became judge of the Supreme Court in 1842. In 1856 he retired from the bench and took up his residence in England. In 1858 he received the degree of D.C.L. from Oxford and in 1859 entered Parliament as Conservative member for Launceston. Haliburton is best known as the author of *Sam Slick*, the name of a Yankee clock maker and peddler, whose quaint drollery, unsophisticated wit, knowledge of human nature, and aptitude in the use of what he calls "soft sawder," have given him a fair chance of a long literary life. In a subsequent series the author brings Sam Slick to England as an attaché of the United States Legation. These sketches, begun in the *Nova Scotian* newspaper in 1835, appeared in three series (1837, 1838, 1840). Copied into other papers, they were for a long time popular in America and in England and were translated into several continental languages. Among Haliburton's other works are: *An Historical and Statistical Account of Nova Scotia* (1829); *The Letter-Bag of the Great Western* (1830); *Rule and Misrule of the English in America* (1851); *Traits of American Humor* (1852); *Nature and Human Nature* (1855). Consult *Memoir*, by Crofton (Halifax, 1889). See also CANADIAN LITERATURE.

HALIBUT (from ME. *haly*, Eng. *holy* + ME. *butte*, Eng. *but*, Ger. *Butte*, Swed. *butta*, flounder: so called as eaten especially on holy days). The largest and most important of the flatfish. This species (*Hippoglossus hippoglossus*) is elongated and rather thick in form (see Colored Plate with FISH AS FOOD) and lies on its left side, which is white, while the right side, uniform dark brown in color, with very small smooth scales, is uppermost and bears both the large eyes. The capacious mouth is symmetrically placed, as also are the ventral fins. Specimens sometimes reach huge size—7 or 8 feet in length—and weigh 400 pounds or more; but these are believed always to be females, and their flesh is poor. A weight of 75 pounds or less is more usual, and such fish are in better condition. Little ones are called "chicken halibut" by the New England fishermen. The halibut abounds in all northern seas at moderate depths, extending as far south as it can find water only a few degrees above the freezing point; hence it ranges farther in winter than in summer, infrequently to the region of New York on the eastern, and San Francisco on the western, coast; or to the English Channel in Europe. Formerly it was extremely numerous in Massachusetts Bay and on George's Bank, but since about 1850 has become scarce south of the Banks of Newfoundland, where it haunts the skirts of the Banks, and must year by year be followed into deeper and deeper water (300 to 500 fathoms) as those in the shallower places are depleted. The halibut are voracious and, despite their bulk, active and fierce; their principal food is believed to be mollusks and crustaceans of various kinds, but they chase and devour all sorts of fishes and sometimes follow the schools of Arctic capelin close inshore, or pursue fishes at the surface, disabling them with strokes of the tail as well as seizing them in their mouths. The halibut, in its turn, is preyed

upon by seals, the white whale, various large sharks, and, when young, by its own kind. The females become heavy with roe in the latter part of summer and then seek comparatively shallow water in which to spawn.

Halibut are caught by the same methods as are cod. (For particulars, see FISHERIES.) Two other closely related fishes are the arrow-toothed halibut (*Atheresthes stomias*) of the north Pacific, about 2 feet in length and largely caught and utilized in the Aleutian Islands; and the Greenland halibut (*Reinhardtius hippoglossoides*), which is yellowish brown, may reach a very large size, and inhabits the Arctic Atlantic, but not numerously.

HALICARNASSUS (Lat., from Gk. ἡλικαρνασσός). A Greek city of Caria, in the southwestern part of Asia Minor, on the north shore of the Ceramic Gulf. It was founded by a colony from Troezen and was one of the cities of the so-called Doric Hexapolis, from which confederacy, however, it was eventually excluded. The Ionian element in the population seems to have been large, for in the fifth century B.C. the official dialect was Ionic. (See IONIA; GREEK LANGUAGE.) Close to Halicarnassus was the Carian city Salmacis, which formed with it one community and later became its chief and almost impregnable citadel. By the Peace of Antalcidas (q.v.) the city came under Persian control. Under the Persian rule it passed to the dominion of the tyrant Lygdamis, whose daughter Artemisia (q.v.), while ruling for her infant son, commanded a squadron in the fleet of Xerxes (480 B.C.). With help from Samos the city threw off the Persian rule and became, with other Carian cities, for a time a member of the Athenian League. Later it again fell under Persian control, and in the fourth century we find it the capital of the rulers of Caria. The most celebrated of these was Mausolus, son of Hecatomnus, in whose honor his sister and wife, Artemisia, erected the great mausoleum (q.v.). Alexander the Great destroyed the lower town, but could not capture Salmacis. From that time the town was comparatively insignificant. Halicarnassus was the birthplace of two of the most eminent of the Greek historians, Herodotus and Dionysius, and of the poet Panyasis. Early in the fifteenth century the Knights of St. John erected here a strong citadel, to which they gave the name of the Petronion, in honor of St. Peter. From this is derived the modern name of the town, Budrun. The ancient walls can still be traced, and the site of several temples, the theatre, etc., has been surely determined. For an account of the discovery of the ancient remains of the city and of the disentanglement of the mausoleum, see MAUSOLEUM.

HALICARNASSUS, DIONYSIUS OF. See DIONYSIUS OF HALICARNASSUS.

HALIDON (hă'lŭ-don) **HILL.** A height of land in England, a short distance northwest of Berwick-upon-Tweed, noted as the scene of a bloody conflict between the English and the Scots, July 19, 1333. Edward III, in support of the claims of the fugitive Edward Baliol (q.v.) to the crown of Scotland, had advanced to the borders with a large army and laid siege to Berwick. The Scottish forces under the Regent of Scotland, Archibald Douglas, Lord of Galloway, surnamed "the Tyneman," marched to the relief of Berwick and found the English drawn up on the north side of Halidon Hill. Regardless of fatigue, the Scots immediately advanced

to the attack, suffering severely from the English archers while crossing the morass which skirts the base of the hill. They nevertheless struggled onward and succeeded in mounting the hill, but were thrown into confusion by a charge of the English and were totally routed. The English cavalry and the Irish auxiliaries committed great slaughter among the fugitives. According to the Chronicle of Lanercost, Archibald Douglas, "seven earls, 27 bannerets, and 36,320 foot soldiers" fell. The English loss was comparatively small. The town of Berwick immediately surrendered, and Edward Baliol for a short time regained possession of the throne. Consult Lang, *History of Scotland*, vol. i (London, 1900). See SCOTLAND.

HALIFAX. A town and county borough in the West Riding of Yorkshire, England, on the Hebble, 7 miles southwest of Bradford (Map: England, E 3). It has exceptional facilities for water and railway transportation, which contribute to the importance of its woolen and cotton industries. It also has iron, machine, and chemical works, and neighboring coal mines and stone quarries. There are numerous charitable institutions and public and private educational establishments, which include the Heath Grammar School, founded in 1585, and the Blue Coat School. The standard of municipal administration is high. The town maintains free libraries, markets, slaughterhouses, a fire-brigade station, and a cemetery; it owns its water, gas, and electric works, tramways, bathing establishments, paving-stone quarry, and has a modern system of refuse and sewage disposal. Halifax sends two members to Parliament. Mentioned in the twelfth century, it was an obscure hamlet until the fifteenth, when the settlement of Flemish artisan refugees inaugurated its growth and prosperity. It was long under manor rule and did not receive its charter of incorporation until 1848. Daniel Defoe wrote part of *Robinson Crusoe* in the old Rose and Crown Inn, which is still standing. Pop., 1901, 105,000; 1911, 101,556.

HALIFAX. The capital of Nova Scotia, Canada, on the southeast or outer coast of the peninsula, in lat. 44° 30' N. and long. 63° 35' W. (Map: Nova Scotia, F 4). It is built on the east slope of a small peninsula in Halifax harbor. The harbor is one of the finest in the world. It is entered from the south, extends northward about 6 miles, is about 1 mile in width, and terminates in a magnificent sheet of water called Bedford Basin. It is open at all seasons of the year and offers at all times an easy access and safe anchorage to vessels of any magnitude. It has two entrances, made by MacNab's Island, of which only the western is navigable for vessels of large tonnage. Halifax was for many years the chief naval station for British North America, with dockyards, a dry dock, and complementary establishments; but in 1906 the naval establishment and also the military of the Dominion were taken over and conducted by the Canadian government. The port is, however, still visited annually by ships of the British. The head offices of the Halifax and Southwestern Railway are situated here. Halifax is also the eastern terminus of the Canadian Pacific Railway and of the Intercolonial Railway of Canada and several provincial railways. The port has nearly all the foreign trade of the province and much of that of other ports of the Dominion, especially in winter, when the Gulf of St. Lawrence is frozen over and Montreal and

Quebec inaccessible for shipping. At Halifax the Canadian mails to and from Europe are landed and loaded during the winter season. The Atlantic terminal railway piers were for many years on the north water front of the city, but in 1914-15 there were being constructed, under contracts of some millions of dollars, railway extensions, piers, breakwater, and a union passenger depot, with railway yards, which transfer the ocean terminals to the south end of the water front and nearer the entrance to the harbor. The piers are sufficiently long for the largest transatlantic liners. The export trade of Halifax in agricultural produce, lumber, apples, and fish is large; but its share of the trade of the province has been somewhat reduced by the commercial development of Sydney and Glace Bay. The industrial establishments comprise iron foundries, machine shops, a cotton mill, soap, boot, and shoe manufactories, sugar refineries, and breweries. The value of the manufactured output for 1910 was \$12,140,409, as compared with \$6,927,552 in 1900, an increase of 75.25 per cent. The city is the seat of various foreign consuls, including consul generals of the United States and Cuba. It is an important military post, defended by 11 forts and batteries, one of which, the citadel crowning the hill on which Halifax is built, was formerly one of the strongest fortifications in America. Another fort in the western side of the harbor, between the entrance and the new terminal, was under construction in 1914. Halifax is now garrisoned by Canadian troops. The extensive and handsome barracks overlook the harbor. The city, with its suburbs, extends along the slope of a hill and covers an area 3 miles long by 1 mile wide. The principal edifices are the post office, customhouse, the province parliament building and library, government house, military hospital, admiralty house, lunatic and blind asylums, Victoria General Hospital, courthouse, theatre, city hall, Nova Scotia Technical College, Convent of the Sacred Heart, railway station, Children's Hospital, etc. A group of new buildings for Dalhousie University were constructed in 1914-15.

Halifax is the seat of the Anglican Bishop of Nova Scotia and Prince Edward Island, and of the Roman Catholic Archbishop of the diocese of Halifax, with their cathedrals. It also has numerous churches. Among its educational institutions are Dalhousie College and University, nonsectarian and well equipped with faculties of arts, sciences, law, engineering, and medicine; St. Mary's College (Roman Catholic); 29 public schools, including an academy and two high schools; the Presbyterian woman's college and conservatory of music, convents, and Presbyterian and Catholic theological colleges. The city is lighted by electricity, has street railways, public gardens, attractive parks, a fine water supply, and a modern system of sewerage. It has become a favorite summer resort, owing to the beauty of its surroundings, its sanitary conditions, bathing and fishing, and the bracing climate. The city and county send two representatives to the Dominion House of Commons and three to the Provincial Legislature. The city is governed by a mayor, elected annually, four controllers (of whom the mayor is chairman), elected biennially, and a board of 18 aldermen, elected triennially, six retiring each year. Founded in 1749, and named in honor of the Earl of Halifax, the contemporary President of the British Board of

Trade, it supplanted Annapolis in 1750 as the seat of government. During the Revolutionary War it was one of the chief British bases of supply. Pop., 1891, 38,495; 1901, 40,787; 1911, 46,619.

HALIFAX, CHARLES MONTAGU, EARL OF (1661-1715). An English statesman and financier. He was a grandson of Henry, first Earl of Manchester, and was born at Horton in Northamptonshire, April 16, 1661. He was educated at Westminster School and Trinity College, Cambridge. A laudatory poem on Charles II in 1685 first brought Montagu into public notice. Two years later appeared the parody on Dryden's *Hind and Panther*, entitled *The Town and Country Mouse*, of which he was joint author with Matthew Prior. He disappeared almost entirely from the field of literature after the appearance of his satire, save as the patron of Addison and other men of letters. He was elected to the Convention Parliament in 1689, where he voted for the declaration that James II had abdicated and that the throne was thereby vacant. He retained his seat in William III's first Parliament and was appointed in 1692 Commissioner of the Treasury. On December 15 of the same year he proposed in the House of Commons to raise 1,000,000 pounds sterling by way of loan—a measure which, adopted, made the beginning of the English national debt, but rendered feasible the reduction of taxes in time of war. In the spring of 1694 money was again wanted, and Montagu was ready to supply it. This time he did so by originating a national bank, a scheme for which had been laid before the government by William Paterson three years before. The capital was to be £1,200,000, and the shareholders were to be called the Governor and Company of the Bank of England. The bill for this was ultimately passed; the result was entirely successful, and Montagu became Chancellor of the Exchequer. His next work was the recoinage of 1695, which he carried out successfully, appointing Newton, of whom he was a life-long friend and patron, warden of the mint, and raising a tax on windows to pay the expense, instead of the obnoxious impost called hearth money. In 1697 he became First Lord of the Treasury, but soon, being unpopular on account of his arrogant manners, he was obliged to bestow upon himself the auditorship of the Exchequer and resign his higher offices. Harley insisted on his withdrawal from the Commons, and he became Baron Halifax. He was impeached in 1701 before the House of Lords for breach of trust while Chancellor of the Exchequer, and again in 1703, but the proceedings fell to the ground. During the whole of Anne's reign Halifax remained out of office, but was active in promoting the union with Scotland and the Hanoverian succession. On the Queen's death he was appointed a member of the temporary council of regency, and on George I's arrival became Earl and First Lord of the Treasury. His rule lasted only nine months, being terminated by his death, on May 19, 1715. For Halifax's literary activity, consult his *Life and Miscellaneous Works* (London, 1715); for his political career, consult: Burnet, *History of his own Time* (ib., 1724-34); Macaulay, *History of England* (New York, 1856-62); Ranke, *History of England* (Oxford, 1875); *Dictionary of National Biography*, vol. xxxviii (London, 1894).

HALIFAX, MARQUIS OF. See SAVILE, GEORGE.

HALIMOTE. See HALMOTÉ.

HALIOTIDÆ. See ABALONE.

HALIR, hällér, KARL (1859-). A Bohemian violinist, born at Hohenelbe. He studied at the Prague Conservatory and in 1874-76 with Joachim in Berlin. In 1888 he was appointed leader of the Court Orchestra at Weimar. In 1894 he settled in Berlin, where he became a member of Joachim's quartet and a teacher in the conservatory. Later he founded a quartet of his own, with Exner, Müller, and Dechert, which soon became world-famous. In 1907 he resigned his post as concertmeister in order to devote his entire time to concertizing and teaching. An American tour (1896-97) was extremely successful. Halir is in the front rank of modern European violinists and teachers.

HALITE (from Gk. *hals, hale*, salt). A mineral composed of sodium chloride. It crystallizes in the isometric system; the cube, which is the characteristic crystal form, often developing hollow faces. Halite is characterized by a perfect cubic cleavage; it has a vitreous lustre and is colorless when pure; yellow, red, brown, and purple shades are due to impurities. It is found in irregular beds in rocks of various ages, usually associated with calcite and gypsum, together with clay and sandstone; also forming salt springs, and in the water of the oceans and lakes. The principal deposits in Europe are at Wieliczka, Poland, and at Stassfurt, Germany; it is also found at various localities in the Carpathian Mountains, the Austrian and Bavarian Alps, in western Germany, the Vosges, and the Jura Mountains, and in Cheshire, England. In the United States it occurs in the following States, given in the order of their apparent importance: Michigan, New York, Kansas, California, Louisiana, Illinois, Utah, Ohio, West Virginia, Nevada, Pennsylvania, Virginia, Kentucky, Texas, and Wyoming. The rock-salt deposits of Petite Anse, New Iberia, and other localities in Louisiana, are well known. See SALT.

HALTHERIUM (Neo-Lat., from Gk. *hals, hale*, sea + *thērion, thērion*, dim. of *thēr, thēr*, beast). A fossil dugong, of which remains are found in rocks of Miocene age in Europe. See SIRENIA; DUGONG; MANATEE.

HALL, hāl. A town in the Austrian Crownland of Tirol, situated on the Inn, which is here navigable, 6 miles east of Innsbruck (Map: Austria-Hungary, B 3). The parish church, built in 1271, the fifteenth-century Rathaus, the Franciscan convent, and the Münzthurm are the chief buildings. About 9 miles north of the town is the Salzberg, with salt mines, from which salt in the form of brine is conveyed in wooden pipes to the pans of Hall. Hall also manufactures chemicals, felt hats, twine, flour, buttons, paper, cloth, and chicory. Pop. (town), 1890, 5800; 1900, 6200; (district), 1910, 21,770. Hall was a flourishing town in the Middle Ages, but has declined greatly on account of wars and earthquakes.

HALL, or SCHWÄBISCHE (shvā'bīsh)

HALL. An old town of the Kingdom of Württemberg, Germany, situated on the Kocher, 48 miles northeast of Stuttgart (Map: Germany, C 4). It is poorly built, but has some interesting ancient buildings. The church of St. Michael, constructed in 1427-1525, contains a fine altarpiece. The church of St. Catharine, on the left bank of the Kocher, dates from the fourteenth century. Hall has salt works and saline baths

and carries on a trade in grain and cattle. The manufactures include iron articles, machinery, cotton yarn, leather, etc. Hall, mentioned as early as 887, owed its importance in ancient times to its saline springs. It was raised to the rank of an Imperial town in 1276, and it was in its mint that the first coins known as *Hellers* were struck. It came into the possession of Württemberg in 1802. Pop., 1900, 9225; 1905, 9401.

HALL (AS. *heall, heal*, Icel. *höllr*, OHG. *halla*, Ger. *Halle*; probably connected with AS. *helan*, obsolete Eng. *heal*, OHG. *helan*, Ger. *hehlen*, Lat. *celare*, Gk. *καλύπτειν, kalyptein*, to hide, OIr. *celim*, I hide). A name given to a large inclosed space in the form of a single apartment, whether a separate structure or part of a larger building. The term is even used, by extension, of the feudal mansions or manor houses of which such a large room was the main part. Finally, in modern architecture, it has come to be applied to the central space which contains the staircase and gives access to other rooms, since in large houses this is often so spacious as to serve the social purposes of a hall.

In the history of architecture the term "hall" is applied to such interiors as the hypostyle hall of an Egyptian temple, the *apadāna* of a Persian palace, or the *tepidarium* of the Roman thermæ, and we call mediæval churches with nave and aisles of equal height, hall churches. But the origin of the term is both secular and northern. The earliest Saxon palaces of the kings seem to have consisted of one large hall, in which the King, his courtiers, and all his retainers dwelt together, and one other chamber, in which the King and his heartmen slept, while his retainers slept in the hall. The same custom prevailed among other early Norse and Germanic tribes. The Normans built their houses on the same plan, with the hall and one solar (q.v.) or sleeping apartment. The same arrangement prevailed during the twelfth and thirteenth centuries, with certain modifications, especially in the direction of multiplying the private rooms. Then and later the hall, while part of the group of manor buildings, was often a separate structure, with its independent roof, as at Stokesay and Oakham castles. In the fourteenth and fifteenth centuries, when the country was more settled and prosperous and manners had become more refined, more numerous rooms were necessary. The hall, however, still retained its place as the chief apartment. In it the King or the lord of the manor entertained his retainers and guests and performed all the acts of feudal life. At one end of the hall was a raised platform, or dais, on which the table of the lord of the manor was placed, and where his more honored guests sat. The retainers sat at a table in the lower part of the room. The halls were more frequently roofed with wood than vaulted, and these roofs were very carefully and elegantly constructed, as many still remaining show. The hall of the King's palace, now called Westminster Hall, built by William Rufus and restored by Richard II, is the finest example in England, being 300 feet long and 100 feet broad. Those in the Imperial and royal palaces of Germany, as at Goslar, are the earliest and best preserved of their class. In England, from the time of Henry VIII and on, with the increase of privacy in domestic life, the family end of the hall was screened from the more public portion by elaborately carved and

paneled screens, many of which still remain. The great "commons," or dining halls, of the English colleges (e.g., Trinity at Cambridge) and lawyers' "inns" (e.g., Middle Temple Hall, London), rival the great civic halls in the beauty of their timber ceilings, screens, and woodwork.

The use of such halls spread from feudal society to other branches of life, especially corporate life in the Gothic and Renaissance periods. There are three principal classes of such halls—the communal halls, the guild halls, and the college halls. The political organization of the free mediæval cities required large meeting places for their governing bodies; they sometimes occupied the entire ground floor, as at Udine, either open or inclosed; sometimes the second floor above a basement, as at Padua (the largest in existence). The entire structure was often most imposing, as at Siena, Perugia, Gubbio, Florence, Cremona. (See PALACE.) They fell into disuse with the fall of liberty in the Renaissance. The second class, the guild halls, without being generally as imposing in Italy (except those of the "schools" at Venice), attained great importance in Flanders and northern France. Here the "Halles" were the heirs of the great Roman markets. Each great corporation possessed one, and where the city was governed by them the communal belfry often rose from its summit, as in the halls of Ypres, Bruges, and Arras. Many of these great structures remain: the Butchers' Hall (Halle à la Viande) at Ghent, Ypres, and Antwerp; the Bakers' Hall (Halle au Pain) at Brussels; the Fishmongers' Hall (Halle aux Poissons) in many towns; the Cloth Hall (Halle aux Draps) at Ghent, Bruges, Louvain, and Brussels; the Bankers' Hall (Bourse) at Antwerp. The finest of all is the Cloth Hall at Ypres, built between 1201 and 1304. Some are open, on piers, especially in the south of France, as at Figeac and Cordes; others, in France also, are built entirely of wood, as at Villeneuve and Evron. Sometimes they are built around a court, as at Antwerp; but the usual type is an oblong stone structure with wooden timbered roof or vault, in one, two, or three aisles, often with a second-story gallery. The various colleges at Oxford and Cambridge and other universities had common halls, which were often of great architectural dignity and beauty, several of which remain almost unchanged. The history of the term, therefore, shows that it applies to a large meeting place, whether of a feudal family, a corporation, or an entire community.

In more recent times it has been logically applied to large places where any audience is gathered together, especially for musical and other entertainments, such as St. George's Hall in Liverpool or Carnegie Hall in New York. Some of the meeting places notable in our own history bear this name, such as Faneuil Hall in Boston and Nassau Hall in Princeton. The large buildings at American universities, whether dormitories or recitation buildings, even when they contain no large main apartment, are generally called halls. See GALLERY.

HALL, or **HOSTEL**. An institution in English universities fast dying out, chiefly by absorption into colleges. It was the earliest, and for a long time the only, organization for the support of students outside the foundations of the religious orders. For the establishment of a hall a few students by mutual agreement rented

a house, chose a principal, at first generally one of their number, later a master, and applied to the university for recognition. The halls were held on lease, the rent being fixed at intervals, generally, of five years by four taxers, two masters and two citizens, and houses once occupied by students could not be let to a layman so long as a clerk would take it. The halls were under the supervision of the university, which had the right of visitation and gradually acquired considerable authority over them. For centuries the halls greatly outnumbered the colleges, and even after the rise of colleges many halls remained as independent establishments, largely as the residences of wealthier students. Some received endowments and became not unlike small colleges; but most kept to the original idea of a hall, that of an independent self-governing community of students living at their own expense. The rise of colleges where support was given students was the deathblow to the hall idea, and many colleges owed their origin to the absorption of older halls. This process of absorption is still going on, and the halls are now almost extinct, even those now remaining being destined to union with neighboring colleges after a longer or shorter period. See ST. EDMUND HALL.

HALL, ANNA MARIA (née Fielding) (1800–81). An Irish novelist, born in Dublin. Her mother, left a widow, took her to London, where she was educated. In 1824 she married Samuel Carter Hall, editor and author. She is most favorably known by *Sketches of Irish Character* (1829); *Lights and Shadows of Irish Character* (1838); *Ireland* (1841–43), a book descriptive of Irish scenery; and *The Whiteboy* (1845). She was a prolific writer of books now mostly forgotten, which appeared during the half century of her literary life, and numbered some 50 titles. It is her Irish stories and novels, named above, that have most vitality. She succeeded in gaining popular favor by several plays. *The French Refugee* (1836), e.g., ran 90 nights at St. James's Theatre. She was an active and practical philanthropist. Unhappily a relentless and ever-present determination to edify her readers limited her audience and is likely in the future to limit it still more narrowly. Consult Hall, *Retrospect of a Long Life* (London, 1883).

HALL, ARTHUR CRAWSHAY ALLISTON (1847–). An American Protestant Episcopal bishop, born at Binfield in Berkshire, England. He was educated at Christ Church College, Oxford, and entered the Cowley Fathers, or Society of Mission Priests of St. John the Evangelist, a community bound to poverty, chastity, and obedience. In 1874 he became assistant pastor of the church of the Advent in Boston, and in 1882 minister to the mission church of St. John the Evangelist in the same city. He was recalled to England in 1891, was elected Bishop of Vermont in 1893, and was consecrated in February, 1894, after being released from the Cowley Order. He wrote: *Confession and the Lambeth Conference* (1879); *Meditations on the Creed* (1880); *Meditations on the Collects* (1887); *The Example of the Passion* (1882); *The Virgin Mother*; *Christ's Temptation and Ours*; *A Charge on Marriage and Divorce*; *Confirmation*; *Marriage with Relatives* (1901); *Use of Holy Scripture in Public Worship* (1903); *Relations of Faith and Life* (1905).

HALL, ASAPH (1829–1907). An American astronomer, born of Revolutionary stock in

Goshen, Conn. At 16 he became a carpenter, but in 1854 went to Central College, McGrawville, N. Y., and, in spite of indifferent teaching, learned some mathematics in the year and a half he spent there. He studied under Brünnow at Ann Arbor, where he made his first acquaintance with astronomy, and in 1857 went to Cambridge as assistant to Professor Bond at the pitiful salary of three dollars a week. He studied mathematics and German by himself and gradually advanced until he earned \$600 a year at the Cambridge Observatory. In 1862 he took a civil-service examination and became an aid, and a year afterward professor of mathematics, in the United States Naval Observatory. This position he held until 1891 and was sent on several expeditions—in 1869 to Bering Strait, in 1870 to Sicily to observe eclipses, in 1874 to Vladivostok to observe the transit of Venus, to Texas in 1882 for the same purpose, and to Colorado in 1878 on a solar-eclipse expedition. His greatest fame came from his discovery in 1877 of the two satellites of Mars, which he called Deimos and Phobos. In recognition of this discovery he received a gold medal from the Royal Astronomical Society and the award of the Lalande prize from the Paris Academy. In 1875 he was elected a member of the National Academy of Sciences and afterward was elected its president. He retired from the government employ in 1891 and four years later went to Harvard as professor of astronomy, where he remained until 1901. In the latter year he was president of the American Association for the Advancement of Science.

HALL, BASIL (1788-1844). A British naval officer, author, and traveler, born and educated in Edinburgh. He entered the navy in 1802, saw service on the coasts of China, India, and South America, was made post captain in 1817, and left the navy in 1823. The rest of his life was spent in travel, and scientific pursuits at home. The descriptions of his various voyages while in the navy, and of his subsequent travels, show a broad and keen observation and were well received, though his *Travels in North America* caused great indignation and met with much hostile criticism in the United States, because of his outspoken remarks upon American customs. His scientific work was mostly confined to personal experimentation and was of little permanent value. In 1842 his mental powers failed, and he died in confinement two years later. His most important writings are: *A Voyage to the West Coast of Corea and the Great Loo-Choo Island* (1818); *Extracts from a Journal Written on the Coasts of Chili, Peru, and Mexico* (1824); *Travels in North America* (1829); *Fragments of Voyages and Travels* (1831-33).

HALL, CARL CHRISTIAN (1812-88). A Danish statesman, born at Christianshavn. He became a lecturer on law in 1847 and professor in 1851 at the University of Copenhagen. In 1848 he was a member of the last Diet of the states, and thereafter was a member of the Folkething (national parliament) until 1881. His efforts united the great middle class in the "June Union," the forerunner of the Danish Liberal party. He advocated complete union with Schleswig. In 1854 he became Minister of Public Worship, and from 1857 to 1863, except for a short interval in 1859-60, he was President of the Council. As Premier and Minister of Foreign Affairs after 1858, he endeavored to

solve the Schleswig-Holstein problem by diplomacy. He resigned when Christian IX came to the throne, but in 1870-73 was again Minister of Public Worship in the Holstein-Holsteinborg cabinet. Apoplexy necessitated his retirement in 1881.

HALL, CHARLES CUTHBERT (1852-1908). An American Presbyterian clergyman and theologian, born in New York City. He was educated at Williams College, Union Theological Seminary, the Presbyterian College in London, and the Edinburgh Free Church College; was ordained in 1875, and succeeded Wendell Prime as pastor of the Union Presbyterian Church of Newburgh, N. Y. Two years afterward he became pastor of the First Presbyterian Church of Brooklyn, N. Y. *Qualifications for Ministerial Power* (1894) was the subject of Dr. Hall's Carew lectures at Hartford Theological Seminary. Long a director of Union Theological Seminary, he was chosen president of this institution in 1897. In 1902-03, and 1906-07, he lectured in India and the Far East, on the Barrows foundation of the University of Chicago. The results of his studies at this time appeared in: *Universal Elements of the Christian Religion* (1905); *Christian Belief Interpreted by Christian Experience* (1905); *Christ and the Human Race* (1906); *The Witness of the Oriental Consciousness to Jesus Christ* (1907); *Christ and the Eastern Soul* (1909).

HALL, CHARLES FRANCIS (1821-71). An American Arctic explorer. He was born at Rochester, N. H., and was for a time a blacksmith, a stationer, and a journalist. In 1860 he sailed in the *George Henry* to discover the remains of the Franklin party, the expense of the expedition being borne largely by Henry Grinnell (q.v.). For two years Hall lived among the Eskimos near Frobisher Bay, returning in 1862. In 1864 he published *Arctic Researches and Life among the Esquimaux*. In the same year he returned to the Arctic to renew his search for evidences of the fate of the Franklin expedition. It was not till the spring of 1866 that he met Eskimos at Cape Weyton, south of Boothia Felix, who had visited the deserted ships. He obtained from them silver bearing the crest of Franklin and other officers of the party. While searching for further evidence he did interesting geographical work by filling in the gap between Rae's farthest (1846) and Parry's farthest, in Fury Strait (1825), thus completing the mapping of the north coast of the continent. At last, after five years of toil, he met natives near the south shore of King William Land, in the summer of 1869, who gave him personal or traditional information of the fate of 79 men who died of starvation in King William Land. It is probable that the remaining 26 reached the coast of the mainland and perished. McClintock, Hall, Schwatka, and Gilder solved the fate of the Franklin party.

Hall's last expedition was in 1871, under the United States government, in the small naval vessel *Polaris*. He ascended the Smith Sound channels into the Polar Sea to 82° 11' N., the most northern point attained up to that time by a vessel. Unable to proceed farther, the expedition spent the winter of 1871-72 at Thank God Harbor, on the Greenland coast. In the fall Hall made a sledge journey north to Cape Brevoort and was the first to see the land on the west side of Robeson Channel and to determine approximately its extension to Cape Joseph

Henry 82° 48' N. Upon returning from this journey he was taken violently ill and died on Nov. 8, 1871. In returning homeward in the autumn of 1872, the *Polaris* was beset in the ice pack and during two months drifted helplessly southward. On October 15 a violent gale, disrupting the pack, threatened the destruction of the ship. While stores were being removed to the ice, the ship was suddenly driven from her moorings into open water. The ice-floe party of 19 drifted 1500 miles in 189 days and was picked up by the sealer *Tigress* off the coast of Labrador. They owed their safety to the heroic leadership of Capt. G. E. Tyson. The *Polaris* was beached in a sinking condition at Life Boat Cove, near Littleton Island, where the crew built a house and passed the winter. In the spring of 1873 the *Polaris* party retreated south in boats and were rescued at Cape York on June 22 by the Scottish whaler *Ravenscraig*. Though the expedition was unfortunate, its geographical results were very important. Hall completed the exploration of Kennedy Channel, discovered Hall Basin and Robeson Channel, extended both Greenland and Grinnell Land northward two degrees of latitude, and visited the unknown Polar Sea. He was not a scientist, but an Arctic pioneer, full of resources, and undaunted by obstacles, many of which he overcame by patient and untiring effort. The scientific results of the *Polaris* expedition were important. Consult: Davis's *Polaris North Pole Expedition* (Washington, 1876); Tyson's *Drift* (New York, 1874); Besse's *Die amerikanische Nordpolexpedition* (Leipzig, 1879).

HALL, CHARLES MARTIN (1863-1914). An American inventor, born in Geauga Co., Ohio. In 1885 he graduated from Oberlin College (A.M., 1893; LL.D., 1910). In February, 1886, he invented an electrolytic process for the reduction of aluminium (or aluminum), and in 1888 commenced the commercial manufacture of the metal with the Pittsburgh Reduction Company (now the Aluminum Company of America), of which he became vice president in 1890. The priority of his invention was upheld and his patent was sustained in the courts of the United States in 1893, and until 1912 his company had a monopoly on the production of the metal in this country. The new process changed aluminium from a metal as costly as silver to a common article of commerce, used largely for cooking utensils. Hall was awarded the Perkin medal for work in chemistry in 1911. See ALUMINIUM.

HALL, CHESTER MOOR (1703-71). An English scientist, inventor of the achromatic telescope. He was born at Leigh in Essex, was a student of the Inner Temple in 1724 and a benchman in 1763. He lived at New Hall, Sutton, and was often called "Moor of Moor Hall." From study of the structure of the human eye he arrived at the conclusion that achromatic lenses were possible; discovered two kinds of glass in 1729, of enough variation of dispersion; and in 1733 had made several telescopes. Though there seems no doubt of the priority of his invention, he took no pains to appear in the suit of Dollond v. Champness (1766). See ACHROMATISM.

HALL, CHRISTOPHER NEWMAN (1816-1902). An English Congregational minister, born at Maidstone, Kent, and educated at Totteridge, at Highbury College, and at the University of London. For 12 years he was pastor of the Albion

Congregational Church at Hull. In 1854 he succeeded Rowland Hill and James Sherman at Surrey Chapel, and in 1876 he went to Christ Church, Lambeth, a charge which he resigned in 1892. He became widely known in England as a total-abstinence agitator and as an evangelist. He was a friend of the North during the Civil War and in 1867 toured America with the intention of quieting differences between Great Britain and the United States. Dr. Hall's tracts were his best-known works, especially: *Come to Jesus* (1846); *It Is I* (1848); *Follow Jesus*; and many others, of which hundreds of thousands have been distributed. He wrote besides: *The Land of the Forum and the Vatican* (2d ed., 1859); a biography of his father, under the title *Conflict and Victory* (2d ed., 1874); *Lyrics of a Long Life*; and an *Autobiography* (1898).

HALL, EDWARD (c.1499-1547). An English historian, son of John and Catharine Hall, who seem to have been prominent in the Reformation and may have been the "John Hall and his wife," prisoners in Newgate, "for the testimony of the Gospel" (1555), mentioned by John Fox. Edward Hall was educated at Eton and at King's College, Cambridge, and studied law. He was a strong defender of the Tudors and carried his ideas of reform no further than the King, but supported the royal supremacy in Parliament, spoke in behalf of the Bill of Six Articles (1539), and was appointed (1541) a member of the commission to deal with all transgressors of that law. His *Union of the Noble and Illustre Families of Lancastre and York* (1542; and, the most complete edition, from the press of Richard Grafton, and with a preface by him, 1550) is especially valuable for the reign of Henry VII and the early years of Henry VIII. It was largely used by Shakespeare in his historical plays and was borrowed from by Grafton, Holinshed, and Stow.

HALL, EDWIN HERBERT (1855-). An American physicist, born at Gorham, Me. He graduated from Bowdoin College in 1875 and from Johns Hopkins University (Ph.D.) in 1880. After 1881 he taught physics at Harvard, where he became professor in 1895. He became a fellow of the American Academy of Arts and Sciences and a corresponding member of the British Association for the Advancement of Science. His publications include: *A Text-Book of Physics* (1891; 3d ed., 1903), with J. Y. Bergen; *Elementary Lessons in Physics* (1894; 1900); *The Teaching of Chemistry and Physics* (1902), with Alexander Smith; *College Laboratory Manual of Physics* (1904; rev. ed., 1913); *Elements of Physics* (1912); and various contributions to scientific journals on the thermal conductivity of iron and nickel, the theory of thermoelectric action, and on thermoelectric heterogeneity in metals.

HALL, FITZEDWARD (1825-1901). An American philologist, who was born at Troy, N. Y., but spent his mature years in England. He was educated at Walpole, N. H., Poughkeepsie, the Rensselaer Polytechnic Institute, and at Harvard, where he did not finish his course, as he was sent to India to look for a runaway brother. At Benares, in 1850, he was appointed to a post in the Government College, which became in 1853 an Anglo-Sanskrit professorship. In 1855 he was appointed inspector of public instruction for Ajmere and Mairwara and a year later for the Central Provinces. In 1860 he received the degree of D.C.L. at Oxford, and two

years later left India for London, where he became professor of Sanskrit, Hindustani, and Indian jurisprudence at King's College, received the post of librarian at the India Office, and in 1864 was made examiner in Hindustani and Hindi on the Civil-Service Commission. In 1880 he succeeded Max Müller as examiner in Sanskrit and from 1887 to his death was examiner in English also. His edition of the *Viṣṇupurāṇa*, containing Wilson's translation (5 vols., 1864-77), is marked by wide reading and by many quotations from unpublished manuscripts in his own possession. About 1870 he turned his attention to English philology, and published: *Recent Exemplifications of False Philology* (1872), an attack on Richard Grant White; *Modern English* (1873); "On English Adjectives in -able, with Special Reference to 'Reliable,'" in *American Journal of Philology* (1877); *Doctor Indoctus* (1880); and other volumes. The most lasting monument to his activity in English philology is his work on the *Oxford Dictionary* and on Wright's *English Dialect Dictionary*. A valuable library of a thousand Oriental manuscripts and many books he gave to Harvard University. From 1869 until his death he lived at Marlesford in Suffolk. His principal works in Sanskrit are: *Atmabodha* (1852); *Sāṅkhyapārāvachana* (1856); *Sūryasiddhānta* (1859); *Vāsavadattā* (1859); *Sāṅkhyasāra* (1862); *Daśarūpa* (1865); and in Hindi, a *Reader* (1870) and Ballantyne's *Hindī Grammar* (1868).

HALL, FRANCIS JOSEPH (1857-). An American Protestant Episcopal theologian, born at Ashtabula, Ohio. He graduated from Racine College in 1882 and studied at the General and the Western theological seminaries. Ordained in 1886, he was professor of dogmatic theology from then until 1913 at the Western Seminary and thereafter held the same chair at the General Seminary. He was also registrar of the diocese of Chicago from 1894 to 1913 and was church counsel in the trial of Dr. Crapsey in 1906. He is author of *Theological Outlines* (3 vols., 1892-95); *Historical Position of the Episcopal Church* (1896); *The Kenotic Theory* (1898); *Introduction to Dogmatic Theology* (1907); *Authority, Ecclesiastical and Biblical* (1908); *The Being and Attributes of God* (1909); *Evolution and the Fall* (1909); *The Trinity* (1910); *Creation and Man* (1912).

HALL, GERTRUDE (1803-1915). An American author, born in Boston. She was educated in Florence. Her work in verse includes: *Verses* (1890); *Allegretto* (1894); *The Age of Fairy Gold* (1899); *April's Sowing* (1900). In prose she wrote: *The Wagnerian Romances* (1910); *The Unknown Quantity* (1910); *The Truth about Camilla* (1913); and she translated Rostand's *Cyrano de Bergerac* and *Chantecler* and poems of Verlaine.

HALL, GRANVILLE STANLEY (1846-1924). An American educator. He was born at Ashfield, Mass., graduated at Williams College in 1867, and subsequently spent several years studying philosophy and psychology in Germany. He was professor of psychology at Antioch College, Ohio, from 1872 to 1876, and at various periods was lecturer on the same subject at Harvard and at Williams. He took his Ph.D. at Harvard in 1878. In 1881 he became professor of psychology at Johns Hopkins University, and in 1888 he was chosen president of Clark University, Worcester, Mass., where he

served also as professor of psychology. He received the degree of LL.D. from Michigan, Williams, and Johns Hopkins, and in 1892 was president of the American Psychological Association. An important contributor to educational literature, and a leading authority in that field, he founded, and became editor of, the *American Journal of Psychology* and edited also the *Pedagogical Seminary* (after 1892), the *American Journal of Religious Psychology and Education* (after 1904), and the *Journal of Race Development* (after 1910). Among his books are: *Aspects of German Culture* (1881); *Hints toward a Select and Descriptive Bibliography of Education* (1886), with John M. Mansfield; *The Contents of Children's Minds on Entering School* (1894); *Adolescence* (2 vols., 1904); *Youth: Its Education and Regimen* (1906); *Educational Problems* (2 vols., 1911). Consult G. E. Partridge, *Genetic Philosophy of Education: An Epitome of the Published Writings of G. Stanley Hall* (New York, 1912).

HALL, ISAAC HOLLISTER (1837-96). An American Orientalist, born at Norwalk, Conn. He graduated from Hamilton College in 1859 and from Columbia Law School in 1865. After 11 years at the New York bar he was appointed professor at the Protestant College of Beirut, where in 1876 he discovered a Syriac manuscript of the Philoxenian version of the Gospels, Acts, and, in part, the Epistles. This he published in 1884. He returned to America in 1877; distinguished himself by his studies of epigraphy, especially as the first to decipher the Cypriote inscriptions; in 1885 was appointed curator of the Metropolitan Museum of New York City, and in 1886 lectured on New Testament Greek at Johns Hopkins University. In 1887 he was elected president of the American Philological Association. In 1884 he deciphered "Antilegomena Epistles" from the Syriac manuscript discovered by the Rev. W. F. Williams, which he published (1886) in facsimile. He also compiled a *Critical Bibliography of the Greek New Testament as Published in America* (1884).

HALL, SIR JAMES (1761-1832). A British geologist and chemist, noted for his application of chemical tests to geological hypotheses. He was born in Haddingtonshire, Scotland, the eldest son of Sir John Hall, Baronet, and succeeded to the baronetcy in 1776. Having become interested in geology during the early part of his career, he associated intimately with James Hutton, then the most eminent name in that science, and was ultimately led to accept his uniformitarian theory of geology, which explains the phenomena of the earth's crust by steady and progressive natural changes. In testing the theory he traveled extensively, and studied the rocks in different parts of Scotland as well as in the Alps, in Italy, and in Sicily. He also had recourse, for the same purpose, to experiments in his laboratory, but owing to Hutton's disapproval of that method, did not publish the results until after the latter's death in 1797. These made good his contention in some respects against the opponents of Hutton's system. On some points, however, he differed from his master, explaining, e.g., the bowlders on the Jura and similar phenomena at Corstorphine by the supposed action of a sea flood instead of by the glacial theory which is now generally accepted. He was also deeply interested in the study of architecture and in 1813 published an *Essay on the Origin, History, and*

Principles of Gothic Architecture, whose ideas had already been presented in less elaborate form before the Royal Society of Edinburgh in 1797. He aims to prove that Gothic architecture is an evolution begun by reproducing in stone crude wattle buildings, and he constructed a miniature wattle-work cathedral in Gothic style to illustrate his argument. Hall took part in parliamentary life, representing the borough of Michael in Cornwall from 1807 to 1812. After his death, which occurred at Edinburgh in 1832, an account of a machine which he invented for the regulation of high temperatures was given before the Geological Society of London.

HALL, JAMES (1793-1868). An American journalist and author, born in Philadelphia. He studied law, but joined the army in 1812 and served at Lundy's Lane and Fort Erie, and went with Decatur to Algiers in 1815. Meanwhile he continued his legal studies and in 1820 he removed to Shawneetown, Ill., where he began practice at the bar and edited the *Illinois Gazette*. Later he was judge of the Circuit Court and then State treasurer, meanwhile editing at Vandalia, Ill., the *Illinois Intelligencer*. At Cincinnati he conducted the *Western Monthly Magazine* (1833-37) and was engaged in banking. Among his publications are: *Letters from the West* (1829); *Legends of the West* (1832); *Tales of the Border* (1835); *Life of W. H. Harrison* (1836); *History of the Indian Tribes* (3 vols., 1838-44), in collaboration with T. L. McKenney; *The Romance of Western History* (1847). His collected works were published in four volumes in 1853-56.

HALL, JAMES (1811-98). An American geologist and paleontologist, born in Hingham, Mass. In 1832 he graduated from the Rensselaer Polytechnic Institute, where he was assistant professor of chemistry and natural sciences (1832-54) and professor of geology (1854-76), retiring in 1876. In 1836 he was appointed to the Geological Survey of New York and was soon placed in charge of the work in the western part of the State. The report of the survey which appeared in 1843 laid the foundation for the proper classification of the Paleozoic formations in America and was the means of establishing the office of State geologist, with Hall as its occupant. He now devoted himself to a comprehensive study of the older fossil-bearing rocks and published his researches from time to time in various reports and monographs, which have come to be regarded as classics by students in this branch of geology. He was president of the American Association for the Advancement of Science in 1856, of the Geological Society of America in 1889, and was elected honorary president of the International Congress of Geologists at Washington in 1891. He received many honors from foreign scientific societies, including the Wollaston medal of the London Geological Society. Among his more important contributions to geology are the following: *Geology of New York*, part iv (1843); *Paleontology of New York* (8 vols., 1847-94); *Graptolites of the Quebec Group* (1865); and portions of the *Report of the Geological Survey of Iowa* (1858-59) and of the *Report on the Geological Survey of the State of Wisconsin* (1862).

HALL, JOHN (1829-98). An American clergyman, born of Scottish parentage at Market Hill, County Armagh, Ireland, and educated at

Belfast College. He was licensed to preach by the Belfast Presbytery in 1849, was a missionary in West Ireland for three years, held a pastorate for an equal period at the First Presbyterian Church in Armagh, and in 1858 accepted a call to St. Mary's Abbey, Dublin, where he remained for nine years, actively occupied in church work and in matters relating to popular education. In 1867 he came to America as a delegate from the General Assembly of the Presbyterian Church in Ireland, and shortly after his return was called to the pastorate of the Fifth Avenue Presbyterian Church in New York City, where he remained until his death. He was a member of the International Sunday-School Committee from 1872 to 1896, served as a trustee of Princeton University and a director of Union Theological Seminary, was Lyman Beecher lecturer on preaching at Yale, and from 1882 to 1891 was chancellor of the University of the City of New York (now New York University). Among his best-known writings are: *Family Prayers for Four Weeks* (1868); *Care Cast upon the Lord* (1869); *Papers for Home Reading* (1871); *Questions of the Day* (1873); *Preaching: Manner and Matter* (1874); *God's Word through Preaching* (1875); *You and Your Children* (1877); *Foundation Stones for Young Builders* (1881); *A Christian Home and How to Maintain It* (1883); *Light unto my Path* (1895). Consult T. C. Hall, *John Hall, Pastor and Preacher* (New York, 1901).

HALL, SIR JOHN (1824-1907). A New Zealand public official, born near Hull, England. He emigrated to New Zealand in 1852 and became a sheep raiser in Canterbury. He held various minor offices, became a member of the House of Representatives for Christchurch in 1855, and in 1856 was Colonial Secretary. He then served as a member of the Legislative Council from 1862 to 1866, when he was again elected to the House. He was Postmaster-General in 1866-69, Colonial Secretary in 1872-73, a member of the Executive Council in 1876, and for a third time a member of the House in 1879. From 1879 to 1882 he was Premier of New Zealand. During his premiership the triennial parliament bill and the universal suffrage bill were passed. In 1891 he was New Zealand delegate to the Australasian Federation Conference.

HALL, JOHN VINE (1774-1860). An English religious writer and advocate of total abstinence. He was born at Diss, Norfolk. When a young man, he fell into drunken habits, but after a hard struggle reformed and became a teetotaler. From 1814 to 1850 he was a bookseller at Maidstone. From 1854 till his death (1860) he devoted himself to religious and temperance work. His *Sinner's Friend* (1821) is said to have been translated into 30 languages and circulated in millions of copies. Consult his autobiography, *Conflict and Victory*, edited by his son the Rev. Newman Hall (London, 1874).

HALL, JOSEPH (1574-1656). An English bishop, remarkable for his learning, piety, and misfortunes. He was born July 1, 1574, at Ashby-de-la-Zouch, Leicestershire. He was educated at Emmanuel College, Cambridge, of which he became a fellow (1595). Entering the Church, he became, in 1617, dean of Worcester, was one of the English deputies to the Synod of Dort (1618-19), was consecrated Bishop of Exeter in 1627, and in 1641 was translated to Norwich. In the latter years of his life he was accused of

Puritanism and incurred the displeasure of Archbishop Laud. In 1641, having joined the prelates who protested against the validity of all laws passed during their forced absence from Parliament, he was committed to the Tower and threatened with prosecution for high treason; but was set at liberty at the end of seven months, on finding bail for £5000. On his return to Norwich he found his revenues sequestered and his property pillaged. He rented a small farm at Higham, near Norwich, to which he retired (1647), and died Sept. 8, 1656. His works, mostly of a controversial character, have been published, with autobiography, notes, etc., by Pratt (London, 1808); Peter Hall, a descendant of Joseph (Oxford, 1837-39); and Philip Wynner (ib., 1863). Of his other works, the most widely read are his devotional treatises (*Select Devotional Works*, 1830), in seven parts, of which a number have been separately reprinted. His poetical *Satires*, written at college, were praised by Pope. His poems were edited by Grosart (Manchester, 1879); his satires by Singer (1824). For his life, consult G. Lewis (London, 1886).

HALL, LYMAN (1725-90). A signer of the Declaration of Independence. He was born in Connecticut and remained there until his graduation from Yale College in 1747, after which he removed to the parish of St. John in Georgia. This parish was largely peopled by New Englanders, and to them is chiefly due Georgia's final decision to throw in her lot with the other Colonies. The people of this parish, disgusted with the indecision of their fellow colonists, endeavored to ally themselves with the Committee of Correspondence in Charleston, S. C., and when this proved infeasible decided to refrain from trading with the other colonists of Georgia and particularly with the people of Savannah. In 1775 they sent Hall as their delegate to Congress, where he was allowed to debate, but, being the only representative of Georgia, could not vote when the voting was done by whole Colonies. Soon afterward Georgia joined her sister Colonies and elected five delegates to the Congress, among them Hall. He was reelected in 1776 and again in 1780. He served as Governor of Georgia from 1783 to 1785, his administration being characterized by energy and efficiency.

HALL, MARSHALL (1790-1857). An eminent English physiologist and physician, born at Basford, Notts. At the age of 20 (having been previously apprenticed to a chemist) he entered on the study of medicine at the university of Edinburgh, where, in 1812, he took his degree of M.D. After three years' subsequent attendance at the leading schools of medicine on the Continent, he commenced practice in Nottingham in 1815 and rapidly obtained a high provincial reputation. In 1826 he removed to London, where his career as a physician was eminently successful. His name is well known in connection with the doctrine of the reflex function of the nervous system. He admitted that the phenomena of which he treated had been long known to physiologists; but he believed himself to have been the first to show their independence of sensation, to bring them together under one generalization, to establish with precision the laws of their production, to assign them their just rank in physiology, and to apply the doctrine to the elucidation of disease. His last bequest to the science of medicine and

the cause of humanity was the description of a simple and easily applied method of restoring suspended respiration, which has been the means of saving many from untimely death and is known as "the Marshall Hall method." It is briefly as follows: The insensible person is laid on his back. His mouth is opened, and the tongue, grasped with a towel or handkerchief, is pulled forward. The lower part of the body is then elevated for a moment, to let water in the larynx and mouth run out by gravitation. The body is then laid on its back, with the left arm bent backward and upward, and placed under the head. The body is then gently rolled over on the face, the tongue being held forward, and then rolled back again. The object kept in view is to compress the thorax and empty the lungs by means of the weight of the body. The manœuvre must be repeated once every four seconds, deliberately, and preferably by the watch; for rescuers are apt to be too hasty and to perform the manipulation incompletely through nervousness. This method of resuscitation has been largely superseded by the Sylvester and Satterthwaite methods. See **RESPIRATION**.

HALL, OWEN (real name, JAMES DAVIS) (1853-1907). An English dramatic author. He was educated at University College, London, and practiced as a solicitor in London from 1874 to 1886. In the latter year he gave up the law for journalism. He was editor of the *Bat* in 1885-87, assistant editor of *Galignani's Messenger* in 1888-90, and in 1899 founded and became editor of a weekly magazine known as the *Phoenix*. He is best known for his musical comedy librettos, such as *A Gayety Girl*, *An Artist's Model*, *The Gaiety*, *A Greek Slave*, *Florodora*, and *The Silver Slipper*.

HALL, ROBERT (1764-1831). A celebrated English Baptist preacher and writer. He was born at Arnesby, near Leicester, May 2, 1764, the son of a Baptist minister and the youngest of 14 children. He was feeble in body and precocious in intellect. At the age of 15 he was sent to a Baptist academy at Bristol. In 1781 he entered King's College, Aberdeen. Graduating M.A. in 1784, he became (1785) assistant Baptist minister and tutor in the academy at Bristol. He was a fluent, rapid, and impressive speaker, and was liberal, but not heterodox, in his religious views. In consequence of a disagreement with his colleague, he went, in 1790, to Cambridge, where, by his elaborate composition and vivid eloquence, he rose to the highest rank of British orators. He was not less distinguished for his writings and published discourses. His *Apology for the Freedom of the Press* (1793) and sermon on *Modern Infidelity* (1800) extended his reputation. In 1806 he resigned because of poor health, and in 1807 he settled in Leicester. He married in 1808, after a whimsical courtship, returned to Bristol in 1826, and died there Feb. 21, 1831. He was an indefatigable student, learning Italian at 60 that he might enjoy Dante. Nearly all his life he suffered from ill health and had at times attacks of insanity; yet few men have performed more intellectual labor. A complete edition of his works, with a memoir by Dr. O. Gregory, and observations on his character as a preacher by John Foster, was published in London, in six volumes (1831-33; 11th ed., 1853). His miscellaneous works are in Bohn's *Standard Library*. Another edition with a supplementary volume was published in New York (1857) and an edition of his *Work*

of the Holy Spirit appeared in London (1886). Consult his life, by Hood (London, 1881).

HALL, SAMUEL CARTER (1800-89). A British author and editor, born near Waterford, Ireland. He went to London in 1821, became a reporter of debates in the House of Lords in 1823, commenced a year later the study of law, though he never practiced, and had a varied experience as editor of magazines and books. In 1824 he married Anna Maria Fielding (see **HALL, ANNA MARIA**), who became well known as a skillful delineator of Irish life and customs. He edited the *London Art Journal* from 1839 to 1880, introduced during his period of supervision the engraving of sculpture and other innovations, and exposed the prevalent frauds in the sale of pictures alleged to be by the old masters. In 1880 he was granted a pension by Lord Beaconsfield. He frequently collaborated with his wife; rendered her valuable assistance in the preparation of her very popular *Ireland*, descriptive of picturesque Irish scenes; and he edited extensively, and notably *The Book of British Ballads* (1842) and *The Gallery of Modern Sculpture* (1849-54). The best known among his original works are: *Memoirs of Great Men and Women . . . from Personal Acquaintance* (1871); *The Trial of Sir Jasper: A Temperance Tale in Verse* (1873); *An Old Story: A Temperance Tale in Verse* (1875); *A Memoir of Thomas Moore* (1879); *Rhymes in Council*; *Aphorisms Versified* (1881); *Retrospect of a Long Life, from 1815 to 1883* (1883).

HALL, THOMAS CUMING (1858-). An American Presbyterian theologian, son of the Rev. John Hall (1829-98). He was born at Armagh, Ireland, graduated from Princeton University in 1879 and from Union Theological Seminary in 1882, and studied at Berlin and Göttingen in 1882-83. Ordained in 1883, he held pastorates at Omaha, Neb. (1883-86), and Chicago (1886-97), and in 1898 became professor of Christian ethics at Union Seminary. In 1914 he was chosen to be Roosevelt professor at the University of Berlin during 1915-16. He was decorated with the order of the Crown by the Emperor of Germany. His writings include: *The Power of an Endless Life* (1893); *The Social Meaning of the Modern Religious Movements in England* (1900); *The Messages of Jesus According to the Synoptists* (1901; 1908); *John Hall, Pastor and Preacher: A Biography by his Son* (1901); *Social Solutions in the Light of Christian Ethics* (1910); *The History of Ethics within Organized Christianity* (1910); *Historical Setting of the Early Gospel* (1912); *Religion and Life* (1913).

HALL, WILLIAM EDWARD (1835-94). An English writer on international law, born at Leatherhead. He was educated at University College, Oxford, where he took the degree of B.A. in 1856 and M.A. in 1859, and in the latter year won the chancellor's prize for a notable essay on *The Effect Produced by the Precious Metals of America upon the Greatness and Prosperity of Spain*. He studied at Lincoln's Inn, and was called to the bar in 1861, but turned his energies towards a study of modern history and international law. He traveled widely and became well known as an art collector, upon which subject he also wrote extensively. In 1867 he attracted public attention by the publication of an able treatise entitled *A Plan for the Reorganization of the Army*. In 1874 appeared his first work on international

law, *The Rights and Duties of Neutrals*. This was followed in 1880 by his great work, *International Law*, the publication of which marked an epoch in the literature of the subject and secured for its author at once recognition as one of the greatest living authorities in that branch of law. The book reached a fourth edition in 1895 and was accepted as a standard work in Europe and America as well as in England. He also wrote *A Treatise on the Foreign Powers and Jurisdiction of the British Crown* (1894). He was elected in 1882 a member of the Institut de Droit International and in 1891 was appointed one of the English commissioners for the settlement of the Newfoundland fisheries question with France.

HALL, WINFIELD SCOTT (1861-). An American physician and writer on physiology and sex hygiene, born at Batavia, Ill. In 1887 he graduated from Northwestern University (M.D., 1888; M.S., 1889), and there became professor of physiology in 1895 and junior dean of the medical faculty in 1901; he studied also at the University of Leipzig (M.D., 1894). He was professor of biology at Haverford College (Pa.) in 1889-93 and lectured on dietetics and physiology at training schools for nurses. In 1904-05 he was president of the American Academy of Medicine, and he became president of the Child Conservation League of America. Among his many books are: *Laboratory Guide in Physiology* (1896); *Anatomy of the Central Nervous System in Man and Vertebrates* (1899); *Intermediate Physiology and Hygiene* (1901); *Text-Book of Physiology, Normal and Pathological* (2d ed., 1905); *The Biology, Physiology, and Sociology of Reproduction, also Sexual Hygiene* (1906; 14th ed., rev., 1914); *Nutrition and Dietetics* (1910; 2d ed., 1913); *Father and Son* (1913).

HALLAM, ARTHUR HENRY (1811-33). An English essayist, son of Henry Hallam the historian. He was a young man of great promise and was educated at Eton, and at Trinity College, Cambridge. On graduating in 1832, he began the study of law; but the next year went abroad with his father, and died suddenly at Vienna. At Cambridge he formed a close friendship with Alfred Tennyson, to whose sister he was engaged to be married. Hallam's name has been rendered memorable through its connection with Tennyson's "In Memoriam," in which the poet employs the premature death of his friend as the starting point of the well-known elaboration of his views on life and death. Hallam's *Remains in Prose and Verse* were published in 1834. Consult F. M. Brookfield, *Cambridge Apostles* (New York, 1906).

HALLAM, HENRY (1777-1859). An English philosophical historian and critic. He was the only son of John Hallam, dean of Bristol and canon of Windsor, and was born in Windsor on July 9, 1777. He was educated at Eton, and at Christ Church, Oxford, where he graduated B.A. in 1799; studied law at the Inner Temple, of which society he became a bencher; and was in practice on the Oxford circuit until 1812, when an inheritance, through his father's death, together with a government sinecure, allowed him to follow his natural bent for historical study and literary work. His literary aptitude had been early exhibited by precocious productions in the *Musæ Etonenses* (1795), and his contributions to the *Edinburgh Review* and other periodicals soon brought him into prominence

among the most noted writers of the day. His first extended work, *A View of the State of Europe during the Middle Ages* (1818), was the result of 10 years' preparation, occasionally relieved by intervals of continental travel. His other important works are: *The Constitutional History of England from the Accession of Henry VII to the Death of George II* (1827), and *Introduction to the Literature of Europe in the Fifteenth, Sixteenth, and Seventeenth Centuries* (4 vols., 1837-39). Marked by conscientious and extensive research in original sources, by impartial analysis and criticism, together with ease and lucidity of style, these works long remained standard authorities, unsurpassed in their accuracy of details by the more extended modern works which have replaced them in the estimation of scholars. They went through several editions and were translated into the leading European languages. In politics Hallam was a Whig; his candor and general temperament, however, unsuited him for the conflicts of parties, and he took no active part in them, but he displayed a genuine interest in all questions of social improvement. He acted with the Wilberforce party for the abolition of slavery, as well as in other humane schemes, and was one of the original promoters of the Society for the Diffusion of Useful Knowledge. In 1830 he was one of the recipients of the two 50-guinea gold medals given by George IV for historical pre-eminence. Washington Irving received the other medal. Other honors included a D.C.L. degree, fellowship of the Royal, Antiquarian, and other learned societies, and trusteeship of the British Museum. Hallam's life was saddened by much domestic affliction, 10 out of his 11 children, and his wife, having died before him. One of his sons, Arthur Henry, was the A. H. H. of the "In Memoriam" of Tennyson.

HALLAM, ROBERT, BISHOP OF SALISBURY (c.1360-1417). An English ecclesiastic. Educated at Oxford, he was a prebendary of Salisbury Cathedral by 1394, and six years afterward was Archdeacon of Canterbury. After having been chancellor of Oxford University (1403-05), he was made Bishop of Salisbury in 1407 and Cardinal in 1411. He was the most prominent English representative at the Council of Constance, where he was a leader of the party which tried to assert the supremacy of the Papal Council over the Pope. He died while the council was in session, and is buried in the cathedral at Constance.

HALLBERG-BROICH, hăl'berg-broik, THEODOR MARIA HUBERT, REICHSFREIHER VON (1768-1862). A German soldier and author, known also by the pseudonym Eremit von Gauting, born in the Duchy of Jülich. He entered the military service of the Electorate of Bavaria and subsequently, after extensive travels, even as far as Persia, became so active a patriot in the German cause that he was imprisoned by the French invaders for eight months in Paris. In 1813 he organized the militia forces enrolled between the Rhine and the Maas and on Jan. 6, 1814, crossed the Rhine at Coblenz in command of 30,000 troops. His writings, marked by original viewpoints and a somewhat bizarre style, include: *Reise durch Skandinavien* (1818); *Reise durch Italien* (1830); *Frankreich und Algier* (1837); *Reise nach dem Orient* (2 vols., 1839); *Reise durch England* (1841); *Deutschland, Russland, Kaukasus, Persien* (2 vols., 1844). Consult Giffel, *Leben des preus-*

sischen Generals Freiherrn von Hallberg-Broich (Berlin, 1863).

HALLE, or **HALLE AN DER SAALE**, hăl'ē ān dēr zä'le (Lat. *Halæ Saxonum*). An important city in the Prussian Province of Saxony, situated on the right bank of the Saale and on a number of islets, in lat. 51° 29' N. and long. 11° 58' E., 21 miles by rail northwest of Leipzig (Map: Germany, E 3). Halle has broad promenades on the site of its ancient fortifications and abounds in mediæval buildings and monuments. There are nine Evangelical and two Roman Catholic churches and a synagogue. Among the prominent churches are the splendid edifice of St. Maurice, founded in the twelfth century and containing a fine choir and altar, and a pulpit with reliefs; the sixteenth-century Marktkirche, with its four towers; and the cathedral, consecrated in 1523. The chief secular edifices and monuments are the Rathaus, dating from the fifteenth century and recently renovated; the Rote Turm, a clock tower 276 feet high, dating from the fifteenth century; the neighboring statue of Roland; a statue of Handel, who was born here; the new Rathaus, built in 1893, in the Gothic style; the remains of the Moritzburg, the former residence of the archbishops of Magdeburg; the Archbishop's residence, adjoining the cathedral and containing some valuable collections of the provincial museum; and, lastly, the buildings of the famous university. (See HALLE, UNIVERSITY OF.) The interesting cemetery is like an Italian *campo santo* and has handsome arcades. Besides the university the educational institutions include a Gymnasium, the Francke Institutions, the provincial museum with prehistoric antiquities, the municipal museum devoted to art, and the municipal theatre. The Francke Institutions, founded in 1691 by August Hermann Francke, include eight schools of various grades, among them a Latin school (Gymnasium), a Realschule, a girls' high school, and a normal school. Halle has a zoological garden and important hospitals and is the seat of numerous historical, scientific, and economic societies.

It is a very important industrial town. At the head of the local industries for centuries has been the production of salt, which is obtained on an islet of the Saale, the yearly output amounting now to nearly 9000 tons. The workmen engaged in the salt works are known as Halloren and differ from the rest of the population in dialect and dress. In olden times they formed a separate guild, some of the privileges of which they still retain. The metal industries developed greatly during the second half of the nineteenth century, and Halle has now over 50 large establishments for the manufacture of machinery, besides numerous establishments for the production of other iron and copper articles. There are also many starch factories. Additional manufactures are chemicals, chocolate, cocoa, chicory, malt, sugar, beer, spirits, etc. There is a considerable publishing business. Sugar beets are raised in the vicinity, and there are brown-coal mines. The commerce, mostly in grain, sugar, machinery, and colonial goods, is quite extensive, a considerable part of the traffic being by river. The town has good railroad connections. There is an electric street railway.

Halle is administered by a chief burgomaster, a burgomaster, an executive board of 16, and a municipal council of 54 members. The city owns the water works, two gas plants, an electric

plant since 1900, and an abattoir. The population of Halle increased notably during the second half of the nineteenth century. This was in part due to its excellent facilities of communication; it is at the junction of six important railway lines. The population increased from 52,620 in 1871 to 71,484 in 1880, 101,401 in 1890, and 156,600 in 1900. The increase shown in the figure for 1900 was in some degree due to the annexation of suburbs. Of the population in 1900, 147,713 were returned as Evangelical, 6816 as Roman Catholic, and 1258 as Jewish. The area of the city in 1900 and in 1910 was 40 square kilometers (15.4 square miles); population, according to the census of the latter year, 180,843.

Halle, first mentioned about 800 as the castle of Halla and as a town in 1064, is of very ancient origin. It was presented by Otho I to the archbishopric of Magdeburg and began to grow in importance with the foundation of the monastery of Neuwerk in 1116. As a member of the Hanseatic League, it attained considerable commercial prominence and succeeded in freeing itself from the rule of the archbishops of Magdeburg. Its independence, however, was of short duration, owing to the internal conflicts between the common people and the patricians, which gave Archbishop Ernest an opportunity to regain the town in 1478. The Reformation became an issue in Halle in 1522, and in 1541 a Lutheran superintendent was appointed. By the Treaty of Westphalia the town came into the possession of Brandenburg. Taken by the French in 1806, it was annexed to Westphalia in the following year and passed to Prussia in 1813. Consult: Hertzberg, *Geschichte der Stadt Halle*, vols. i-iii (Halle, 1889-92); Schrader, *Geschichte der Friedrichs-Universität zu Halle* (Berlin, 1894); E. J. James, *Municipal Administration in Germany, as Seen in the Government of a Typical Prussian City, Halle* (Chicago, 1901); *Halle in der Gegenwart*, edited by Max Reinns (Halle, 1907).

HALLE, ál, ADAM DE LA. See ADAM DE LA HALLE.

HALLE, hăl'tě, SIR CHARLES (or KARL HALLE) (1819-95). A German-English pianist and conductor. He was born at Hagen in Westphalia, his father being the town kapellmeister, and was regarded when but a young child as a musical prodigy. After serious study with Rinck at Darmstadt, he went to Paris (1836), where he laid the foundation of all his subsequent success. He earned for himself a solid reputation during the 12 years of his stay there and was in friendly contact with Cherubini, Chopin, Liszt, and Kalkbrenner. The political disturbances of 1848 caused his removal to London, where he was enthusiastically received. It was in Manchester, however, that he gained his most enduring fame and did his best and most important work. He had been appointed director in 1853 of the Gentlemen's Concerts and in 1857 commenced a series of subscription concerts with his famous orchestra, which up to the time of his death was the greatest musical educational factor in the north of England. Although his greatest interests were in Manchester, he was closely connected with the musical life of London, in 1861 performing all Beethoven's sonatas in eight matinée concerts. In 1880 he also produced Berlioz's *Faust* in the same city. In 1888 he was made Knight by the Queen (Victoria) and the same year married

Madame Norman Neruda, with whom in 1890 and 1891 he made a tour of Australia. His compositions were entirely instrumental and included many orchestral arrangements and a method for the pianoforte. He died in Manchester. In 1896 his children published his autobiography under the title *Life and Letters of Charles Halle* (London).

HALLE, UNIVERSITY OF. A German university which came into existence through the rivalry between conservative Saxony and progressive Brandenburg, and because the Hohenzollerns desired to have a more centrally located Lutheran university than that at Königsberg. The new foundation was united with a Ritterakademie, already existing, and was formally opened in 1694, with over 700 students. Thomasius and A. H. Francke were the most influential in determining the progressive character of the institution, which has been called the first modern university. In the earlier half of the eighteenth century it was preëminently the chief resort for Protestant Germany, having 1500 students on the average; later on, Göttingen became a strong rival. From the beginning Halle was one of the leading theological schools of Germany—a distinction it has never lost, though it changed from its original pietism to a bold rationalism in the latter half of the eighteenth century. In the period of the Napoleonic wars the university was twice suspended for its strong Prussian utterances. In 1817 the old and honorable University of Wittenberg (founded 1502) was united with it. The main university building was erected in 1832-34; nearly all the others in the seventies and eighties; a building containing seminar rooms and an auditorium was added in 1902. Much attention is given to instruction in agriculture. Halle had in 1913 about 2900 students. The library, founded in 1696, contains over 263,932 volumes and 959 manuscripts, besides the Ponickau collection of books on Saxony and Thuringia, with 16,700 volumes and 35,000 pamphlets. Among the great names of Halle are those of Chr. Wolf, F. A. Wolf, Schleiermacher, Gesenius, Tholuck, Leo, and Bergk. Halle was also the seat of the scientific society Academia Naturæ Curiosorum, founded by J. B. Bausch in 1652 and now known as the Leopoldinisch-Karolinische Akademie. Consult W. Schrader, *Geschichte der Friedrichs-Universität zu Halle* (Berlin, 1894). See ACADEMY, passim.

HALLE, WILMA MARIA FRANCOISCA, LADY. See NERUDA, WILMA MARIA FRANCISCA.

HALLECK, FITZ-GREENE (1790-1867). An American poet, born at Guilford, Conn., July 8, 1790. He was educated in Guilford, and in May, 1811, became a clerk in the New York bank of Jacob Barker, where he remained for 20 years. On May 15, 1832, he became the confidential agent of John Jacob Astor in his commercial affairs and was appointed by him one of the original trustees of the Astor Library in New York. In 1849 he retired to his native place, where he spent the remainder of his life. Halleck wrote verses from his boyhood, but in his collected poems he included nothing juvenile. In 1819 he became associated with Joseph Rodman Drake (q.v.) in contributing the humorous series of "The Croaker Papers" to the *Evening Post*. The illness of Drake soon put an end to these papers, and Halleck commemorated his friend's death in the most beautiful and best known of his poems, beginning "Green be the

turf above thee" (1820). His longest poem, *Fanny*, published anonymously (December, 1819), is a satire on the literature, fashions, and politics of the time. It obtained a factitious popularity, but hardly repays reading. In 1822-23 Halleck visited Europe, and in 1827 published an edition of poems in one volume, among them the verses on "Alnwick Castle" and on "Burns." These, with "Marco Bozzaris" (1825), constitute his chief claim to remembrance as a poet of a slight though genuine lyric vein and of distinct capacity for society verse, who was yet artist enough to confine his production to a very moderate compass. He died at Guilford, Nov. 19, 1867. Consult Wilson, *The Life and Letters of Fitz-Greene Halleck* (New York, 1869), and *The Poetical Writings of Fitz-Greene Halleck*, edited by Wilson (ib., 1869).

HALLECK, HENRY WAGER (1815-72). An American soldier, the general in chief of the United States army from 1862 to 1864. He was born in Westernville, N. Y., on Jan. 16, 1815, studied for a time at Union College, and graduated at West Point in 1839. He then served for a year as assistant professor of engineering at West Point; was assistant to the board of engineers at Washington in 1840 and 1841; and from 1841 to 1846, except for a few months in 1845, when he was in Europe for the purpose of examining various public works, was assistant engineer in repairing the fortifications of New York harbor. Soon after his return from Europe he delivered a series of lectures before the Lowell Institute of Boston, which he published in 1846 as *Elements of Military Art and Science*, which in a new edition (1858) was much used during the Civil War as a training manual for volunteer officers. In 1847, during the Mexican War, he was sent to the Pacific coast and here served as aid-de-camp to Commander Shubrick from October, 1847, to June, 1848 (for part of this period serving as Lieutenant Governor of Mazatlán); was chief of staff during Lieutenant Colonel Burton's campaign in Lower California, and from August, 1847, to December, 1849, served as Secretary of State for California under the military governments of Generals Mason and Riley. In 1849 he was a member of the California Constitutional Convention and of the committee which drafted the State constitution. From December, 1852, to August, 1854, he was inspector and engineer of lighthouses, and from April, 1853, to August, 1854, was also a member of the board of engineers for fortifications on the Pacific coast. He resigned from the army on Aug. 1, 1854, became a successful lawyer in San Francisco, was elected president of the Pacific and Atlantic Railroad in 1855, and from 1850 until 1861 was director general of the New Almaden quicksilver mines. Soon after the outbreak of the Civil War he reentered the army (Aug. 19, 1861), with the rank of major general, and from Nov. 9, 1861, to March 11, 1862, commanded the Department of Missouri, which then embraced Missouri, Iowa, Minnesota, Illinois, Arkansas, and western Kentucky. In this capacity he quickly put a stop to the speculations of contractors, thoroughly trained the disorganized troops, dismissed hundreds of placemen, and in general substituted order and system for the chaos which had resulted from his predecessor's laxity and incapacity. He planned the Western campaign of 1862 and on April 11 assumed command in person at Pittsburg Landing (Shiloh). On May 30 his forces entered Cor-

inth. On July 11 he was appointed general in chief of the Armies of the United States and at once proceeded to Washington, where he served in this capacity until March 12, 1864, after which, until April, 1865, he was chief of staff of the army. He then was in command successively of the Military Division of the James, the Division of the Pacific, and the Division of the South until his death. As a soldier, he was a strict disciplinarian, an excellent organizer, and a skillful strategist; but his genius was more adapted to the map than to the field, and on many occasions he is considered to have exhibited both indecision and an inability to direct large movements. See the criticism in Rhodes, vol. iv. He published: *Bitumen: Its Varieties, Properties, and Uses* (1841); *A Collection of Mining Laws of Spain and Mexico* (1859); *International Law, or Rules Regulating the Intercourse of States in Peace and War* (1861; abridged ed. for schools and colleges, 1886); and a translation of Jomini's *Vie de Napoléon* (1864).

HALL EFFECT. See ELECTRICITY.

HALLEIN, hăl'īn. A town in Salzburg, Austria, 10 miles south of the city of Salzburg, on the right bank of the Salzbach, 1450 feet above sea level (Map: Austria-Hungary, C 3). Its institutions include a school of forestry and lumbering and a town museum. It is noted for its extensive salt works and saline baths and has also important cotton, needle, and button factories. The Dürnberg, a mountain (2388 feet), contains the largest salt mine in the Austrian Salzkammergut. The salt is conveyed from it in large wooden conduits to the works within the town. Good rock salt is also obtained from Dürnberg. It also manufactures bricks, pottery, cement, celluloid, lumber, tobacco and beer. Hallein dates from the tenth century. Pop. (town), 1890, 5200; 1900, 6800; (district), 1900, 22,398; 1910, 24,600.

HALLEL (Heb., praise). A part of the Jewish hymnal service. The term usually signifies the Egyptian Hallel, so called because of its connection with the Passover festival. This Hallel comprises Ps. cxiii-cxvii and is chanted in synagogues on the festivals of the Passover, Pentecost, Tabernacles, and the eight days of the Hannukah festival, or Feast of Lights, and also at the close of the meal on the first evening of the Passover. It is supposed that this Hallel, or a part of it, is referred to as having been sung by Jesus and his disciples at the end of their last meal together in Matt. xxvi. 30; Mark xiv. 26. Another Hallel, called the "great Hallel," was a general thanksgiving chant. Jewish authorities dispute in the Talmud as to what Psalms it should include. Some identify it with the usual Hallel (Ps. cxiii-cxviii); others make it Ps. cxx-cxxvi, cxxxv. 4-cxxxvi, or cxxxvi alone.

HALLELUJAH, hăl'lē-lō'yá, or **ALLELUIA** (Heb. *Halelu Yáh*, praise ye Yahweh). An ascription of praise to God derived from its use in certain Psalms and in general use as an expression of thankfulness. It is retained in the Greek and Latin liturgies in the original form, and was so also by the Church of England in the first Prayer Book of Edward VI, though it is now translated by "Praise ye the Lord." Being an expression of gladness and triumph, it was appropriate to seasons and festivals which expressed these emotions. In the Greek liturgy it is used through all the year,

but in the Roman Catholic church it is never used from Septuagesima to Easter; and in some mediæval office books the office of the Saturday before Septuagesima made a special mention of it, even personifying it, and taking a quaint and tender farewell of it: "Thou shalt go from us, O Alleluia; thou shalt return to us again in peace, O Alleluia." During the entire Easter season, on the contrary, and also in a slightly less degree during the octaves of Christmas, Epiphany, and Corpus Christi, it is used continually at the end of antiphons, introits, communions, and other parts of the service. The threefold repetition of it at the end of the mass, called the greater Alleluia, was in the Middle Ages sung by the deacon to a very prolonged melody, or neuma. See NEUMES.

HALLELUJAH VICTORY. The name given to the victory of the Britons over the Picts, at Mold, Flintshire, Wales, March 30, 430, from the war cry of the former, which had been suggested by St. Germanus, Bishop of Auxerre, on the eve of the battle.

HALLÉN, hál-lán', JOHAN ANDREAS (1846-). A Swedish dramatic composer, born at Göteborg. He was educated under Rheinberger, Reineke, and Rietz, and from 1872 to 1878 was conductor of the Göteborg Musical Union, although he had important interests in Berlin and resided there most of the time. He composed several important operas, which received their first presentation at the Royal Opera, Stockholm, of which in 1892 he became musical conductor; and also published numerous German and Swedish songs. His music, not generally known outside of Sweden and Germany, is exceedingly popular among the Swedish singing societies of the United States. His compositions include the operas *Harald der Viking* (1881); *Hexfillan* (1896); *The Treasure of Waldemar* (1897); *Walborgsmessa* (1902); several ballads for chorus and orchestra, symphonic poems, and choral rhapsodies.

HALLER, hál'lér, ALBRECHT VON (1708-77). An eminent physiologist, anatomist, botanist, and poet, born at Bern, Switzerland. Two years after the death of his father, an able lawyer, he went, in 1723, to the University of Tübingen, where he became the pupil of the anatomist Duvernoy. In 1725 he removed to Leyden, where he obtained the degree of M.D. in 1727. He then visited London, whence he proceeded to Oxford and afterward to Paris, where for six months he studied anatomy and botany; later he became the pupil of Johann Bernoulli, the celebrated mathematician, at Basel. He returned in his twenty-second year to his native city and commenced practice as a physician. The professor of anatomy, Meig, having fallen ill, Haller undertook the duties of his class; he likewise devoted much of his time about this period to the botany of the Alps and also published a descriptive poem, *Die Alpen*. In 1735 he was appointed physician to the hospital, and shortly afterward principal librarian and curator of the cabinet of medals; but in 1736 he left Bern to become professor of medicine, anatomy, botany, and surgery in the new university at Göttingen. For the next 18 years he devoted himself wholly to teaching and to original research. He took an active part in the formation of the Royal Academy of Sciences of Göttingen, and the memoirs of the society contain many of his papers. During the period from 1736 to 1753 he published 86 works on medical

subjects. He was appointed physician to the King of England in 1739. In 1753 he returned to Bern. Among his most important writings are his *Elementa Physiologia Corporis Humani* (1757-66)—by far the most important of his works—and his four *Bibliothecæ*, or critical catalogues of works on botany, surgery, anatomy, and medicine. Haller's eminence as a man of science was duly recognized in his own lifetime. He was ennobled by the Emperor of Germany in 1748, and the universities of Oxford and Utrecht in vain endeavored to obtain him as their professor. His name is especially connected with the doctrine of muscular irritability. (See MUSCLE.) While his name is indelibly recorded in the annals of science, it should also be remembered that by his work as a poet Haller greatly contributed to the movement which towards the end of the eighteenth century brought new life to German poetry. Others of his works were: *Icones Anatomicæ* (1743-50); *Opuscula Pathologica* (1755); *Opuscula Botanica* (1749). For his *Life*, consult Frey (Leipzig, 1879).

HALLERMUND, AUGUST, COUNT VON PLATEN. See PLATEN-HALLERMUND.

HALLES, ál, LES. A large building on the Grande Place of Bruges, Belgium, erected in the thirteenth century, now used as offices of the city government and as a market. Its massive belfry, 350 feet in height, is the subject of Longfellow's poem "The Belfry of Bruges." It contains a remarkable set of chimes dating from 1748.

HALLES CENTRALES, ál sán'trá'l'. The great central market of Paris, an enormous group of metal structures consisting of a system of pavilions planned to cover 22 acres. Between the pavilions are covered streets 48 feet in width, with a roof about 48 feet above the ground, intersected by an avenue 105 feet wide. Each pavilion is divided into 250 small shops, rented for 20 centimes a day, and beneath are cellars 12 feet in height.

HALLETT, BENJAMIN FRANKLIN (1797-1862). An American statesman and editor, born at Barnstable, Mass., son of Benjamin Hallet (1760-1849), the shipmaster and founder of sailors' Bethels. He graduated at Brown University in 1816 and was admitted to the bar, but turning to journalism he worked on a paper in Providence and then went to Boston, where he established in 1827 the *Advocate*; he made it the organ of the temperance Antimasonic party. In 1831 he ceased conducting it, because his crusades against Masonry, against slavery, and in behalf of temperance were ruining the subscription list. He turned against Henry Clay when the latter refused to commit himself to the Antimasonic party; and when Masonry no longer was an issue, Hallett joined the Democratic party. Long chairman of its national committee, he did much to secure the nomination of Pierce and Buchanan. He was appointed district attorney by the former in 1853 and wrote the Democratic platform in 1856.

HALLETTE, á'lét', A. (1788-1846). A French mechanic, born at Arras, where he founded a machine shop. He improved the hydraulic press used for the extraction of oil and invented a new system of propulsion tubes for atmospheric locomotives, the *tube propulseur Hallette*. Consult his monograph with that title (Paris, 1844).

HALLETTSVILLE. A city and the county

seat of Lavaca Co., Tex., 102 miles by rail west by south of Houston, on the San Antonio and Aransas Pass Railroad and on the Lavaca River (Map: Texas, D 5). It trades largely in cotton, cottonseed oil, garden truck, dairy products, and live stock, and has several cotton gins, a cottonseed-oil mill, a creamery, etc. The water works and electric-light plant are owned by the municipality. Hallettsville was founded about 1838. Pop., 1910, 1379.

HALLEY, JUDAH. See JUDAH, BEN SAMUEL.
HALLEY, EDMUND (1656-1742). An English astronomer and mathematician, born at Haggerston, London, the son of a soap manufacturer. He was educated at St. Paul's School, and afterward at Queen's College, Oxford, which he entered in 1673. In 1678 he published a paper on the orbits of the principal planets; also observations on a spot on the sun, from which he inferred its rotation round its axis. In November of the same year he went to St. Helena, where for two years he applied himself to the formation of a catalogue of the stars in the Southern Hemisphere, which he published in 1679 under the title *Catalogus Stellarum Australium*. On his return he was chosen a fellow of the Royal Society and deputed by that body to go to Danzig to settle a controversy between Hooke and Hevelius as to whether it was more profitable to use telescopic or plain sights for astronomical observations. In 1680 he made a tour of the Continent, during which he met Cassini at Paris and with him observed the great comet of that year. Halley returned to England in 1681 and in 1682 made observations on the great comet which goes by his name, and the return of which he predicted. (See COMET.) His observations on the comets of 1680 and 1682 formed part of the foundation of Newton's calculation of a comet's orbit. In 1683 he published his theory of the variation of the magnet and the next year made the acquaintance of Newton. In 1686 Halley published an account of the trade winds and monsoons on seas near and between the tropics, and in 1692 his hypothesis relative to the change in the variations of the magnetic needle. In 1696 he was appointed deputy controller of the mint at Chester. To test the truth of his theory of magnetism by obtaining measures of the variations in different parts of the world, he was sent in 1698 in command of the war sloop *Paramour Pink* to the western Atlantic; but his crew mutinied, and he was obliged to return. The next year, however, he sailed again, and in 1701 he published his observations in *A General Chart of the Variation of the Compass*, for which he was rewarded by the rank of captain in the navy with half pay for life. Soon after he made a chart of the tides in the channel and surveyed the coast of Dalmatia for the Emperor of Austria. On the death of Wallis, in 1703, he was appointed Savilian professor of geometry at Oxford. In 1705 he published his researches on the orbits of the comets under the title *Astronomiæ Cometice Synopsis*, in which he predicted the return of the comet of 1682 in 1758. In 1713, on the resignation of Sir Hans Sloane, he became secretary of the Royal Society; in 1716 he made valuable experiments with the diving bell, which were afterward published; and in 1720, after the death of Flamsteed, he became Astronomer Royal. In this office, and engaged especially in studying the moon's motions, he passed the rest of his life.

In 1729 he was chosen a foreign member of the Academy of Sciences, Paris. Halley was the author of numerous other researches of great importance besides those mentioned. His *Tabulæ Astronomiæ* did not appear till 1749. Among his principal discoveries may be mentioned the proper motions of the fixed stars, the long inequality of Jupiter and Saturn, and the slow acceleration of the moon's mean motion. He was the first to predict the return of a comet and also to recommend the observation of the transits of Venus with a view to determine the sun's parallax. Consult: Bailly, *Histoire de l'astronomie moderne* (3 vols., Paris, 1770-82); Delambre, *Histoire de l'astronomie au dix-huitième siècle* (ib., 1827); Wolf, *Geschichte der Astronomie* (Munich, 1877); Poggendorff, *Geschichte der Physik* (Leipzig, 1879); Grützer, *Edmund Halley und Caspar Neumann* (Breslau, 1883).

HALLEY'S COMET. See COMET.

HALLGRÍMSSON, hál'gríms-son, JÓNAS (1807-45). An Icelandic lyric poet and naturalist, born at Steinsstadir, and educated at Bessastadir. He studied at the University of Copenhagen in 1832 and in 1837-42 traveled through Iceland, making observations on the geology of the island. His knowledge of the German poets made him realize the decadent condition of Icelandic poetry, and he began to write poems in the pure Icelandic tongue. Animated with noble patriotism and deep love of Icelandic scenery and language, in 1835, together with Gíslason and Saemundsson, he established the periodical *Fjölnir* at Copenhagen. The aim of this publication, to which were contributed most of his poems and essays, was to waken the national spirit and to purify the language and inspire love of it. As an exquisite stylist he played a prominent part in the reformation of the Icelandic language in the nineteenth century. Although his lyric verse fills but one small volume, *Ljóðmáli og önnur rit*, its range is from the classical metres revived by him to the new foreign metres which he had introduced. Consult *Fjölnir*, ix; biography in *Ljóðmáli og önnur rit* (Copenhagen, 1883).

HALLIARDS, hál'yards, or **HAILYARDS** (probably a variant of *hallier*, from OS. *haliam*, OLG. *halon*, *holōn*, Ger. *holen*, Eng. *hale*, to haul; connected with Lat. *calare*, Gk. *kalein*, *kalein*, to summon; explained by popular etymology as *haulyards*, or *haleyards*). Ropes used to hoist yards, gaffs, sails, etc. They usually take their name from the object hoisted—as, *topsail halliards*, *jib halliards*, *ensign halliards*, etc.; but in some instances they have other designations—the *crowfoot halliards* (so called because they are made fast to the awnings by several small lines spread out in fancied resemblance to a bird's foot), *throat* and *peak halliards* on gaffs, etc.

HALLIBURTON, WILLIAM DOMINSON (1800-). An English physiologist, born in London and educated at University College, London. He became a fellow of the Royal College of Physicians in 1800 and was assistant professor in 1883-89, and then professor of physiology, in University College, London. He was president of the physiological section of the British Association in 1902 and of the corresponding section of the British Medical Association in 1900 and 1906, and in 1911 received the Baly medal of the Royal College of Physicians. With Brodie (1893) and Pickering

(1897), he did important experimental work in intravascular injection of albino rabbits. He published: *Text Book of Chemical Physiology and Pathology* (1891); *Essentials of Chemical Physiology* (1901; 7th ed., 1909); *Chemical Side of Nervous Activity* (Croonian lectures, 1901); *Handbook of Physiology* (1902; 11th ed., 1913); *Biochemistry of Muscle and Nerve* (1904); *Physiology* (1911).

HALLIWELL-PHILLIPPS, JAMES ORCHARD (1820-89). An English antiquary and biographer of Shakespeare, born in Chelsea, London. His taste for original research was exhibited while yet a student at Cambridge, and he was made a fellow of the Royal Society and of the Society of Antiquaries when but 18 years old. After the founding of the Shakespeare Society in London (1841), he gradually devoted more and more of his time to the study of the great dramatist. Rejecting the popular method of constructing the poet's biography from internal evidence, Halliwell discredited the personal application even of the sonnets and set himself through years of investigation to collect and sift contemporary and traditional evidence to be found chiefly in Stratford on Avon and neighboring villages. The result of his labor was issued in his *Outlines of the Life of Shakespeare* (1881), which in 1913 had run through 10 editions. Before he left the ranks of Shakespearean critics he had published a superb folio edition of the plays (16 vols., 1852-65). In 1863 he was largely instrumental in preventing the sale of Shakespeare's birthplace, and the foundations of New Place, where he died, and he aided generously in turning the one into a museum and clearing the site of the other. Ever open to give and receive suggestions or criticisms from other Shakespearean students, his assistance was valuable, both directly and indirectly, through the collections of old literature and Shakespearean and other documents which he presented or bequeathed to the Chetham Library, Manchester (1851), Smithsonian Institution, Washington (1852), the Penzance Public Library (1868-88), the Edinburgh University Library (1872), and the Birthplace Museum (1889). Many of his own numerous books were printed for private circulation only. Among his works may be mentioned *Nursery Rhymes and Nursery Tales of England* (1845), and *Dictionary of Archaic and Provincial Words* (1847), which has been often reprinted.
